Trees. *Leaves* large, 1-pinnate. *Flowers* large; panicles terminal, woolly. *Calyx* ovoid, closed when young, irregularly 3-5-lobed during flower. *Corolla* tubular-ventricose, glabrous or densely tomentose without, rose or yellow; lobes 5, rounded, subequal. *Capsule* elongate, cylindric or compressed, falcate or twisted, loculicidally 2-valved; septum flat or 4-angu-

lar. *Seeds* compressed with a membranous wing on each side.—Species 5, 3 Indian, 2 African.

1. **H. sulfureum**, *Kurz in Journ. As. Soc.* 1873, pt. ii. p. 90, and *For. Fl.* ii. 234; leaflets elliptic crenulate mature nearly glabrous, corolla yellow, tube $1\frac{1}{2}$ in., capsule straight linear much compressed densely woolly.

PEGU; Prome and Pegu Yomah, *Kurz*.

A tree, 25–40 ft. *Leaves* 2–3 ft.; leaflets 9–11, 6 by 3 in.; petiolule $\frac{1}{10}$ in. *Panicles* short, densely tomentose, appearing before the leaves; pedicels $\frac{1}{2}$ in., tomentose. *Calyx* $\frac{3}{4}$ in., 2–3-lobed to the middle, woolly without. *Corolla* floccose without, afterwards nearly glabrate; mouth 2 in. diam.; lobes crisped. *Capsules* 18–24 by 1–1 $\frac{1}{2}$ in. *Seeds* $1\frac{1}{2}$ by $\frac{1}{2}$ in.—*Kurz* remarks that the capsules are exactly as those of *Dolichandrone stipulata*, which is the case with the (unattached) capsules transmitted. The leaves are also very like those of *Dolichandrone stipulata*, but the flowers are considerably smaller. The tree is referred by *Kurz* to *Heterophragma*, because the calyx is irregularly lobed, not spathaceous; but in one example of *Kurz* the calyx is split to the base on one side, and the tree appears a *Dolichandrone*.

2. **H. Roxburghii**, *DC. Prodr.* ix. 210; leaflets elliptic entire or crenate mature nearly glabrous, corolla rose, tube $1\frac{1}{2}$ in., capsule straight narrowly oblong slightly compressed smooth. *Dalz. & Gibs. Bomb. Fl.* 160; *Bedd. For. Fl.* 169. *Bignonia quadrilocularis*, *Roxb. Cor. Pl.* ii. 24, t. 145, and *Fl. Ind.* iii. 107; *Wall. Cat.* 6507. *Spathodea Roxburghii*, *Spreng. Syst.* ii. 835; *Brand. For. Fl.* 350.

W. DECCAN PENINSULA; from Bombay southwards, *Wight, Ritchie, &c.* CENTRAL INDIA; Godavery Forests, *sic* *Brandis*.

A large tree; innovations woolly. *Leaves* 1–2 ft.; leaflets 7–9, $4\frac{1}{2}$ by 2 in., obtuse with a short point; petiolule 0– $\frac{1}{2}$ in. *Corymbs* compound, dense, many-fl.; pedicels short, stout, woolly. *Calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., irregularly lobed half-way down, or on one side more deeply or obscurely 2-lipped. *Corolla* floccose, ultimately glabrate, mouth 2 in. diam., lobes crisped. *Anther-cells* elliptic, divaricate at base. *Capsule* 8–12 by $1\frac{1}{2}$ –2 in., divided into 4 cells by the 4-ridged septum. *Seeds* $1\frac{1}{2}$ by $\frac{3}{4}$ –1 in.

3. **H. adenophyllum**, *Seem.; Benth. in Gen. Pl.* ii. 1047; leaflets large broadly elliptic mature pubescent, corolla brown-yellow densely tomentose, tube $1\frac{1}{2}$ in., capsule long linear cylindric ribbed twisted. *Kurz For. Fl.* ii. 236. *Bignonia adenophylla*, *Wall. Cat.* 6502. *Spathodea adenophylla*, *A. DC. Prodr.* ix. 206; *Wight Ill.* t. 160.

FROM ASSAM and E. BENGAL to TENASSEERIM and the ANDAMANS; frequent.—DISTRIB. Ava.

A tree, 30–50 ft.; innovations tomentose. *Leaves* 1–1 $\frac{1}{2}$ foot; leaflets 5–7, 7 by 5 in. (or in some examples 12–14 in. long), acute or obtuse, sessile. *Panicle* 8–10 in. diam., stout, many-fl.; bracts $\frac{1}{2}$ in., narrowly lanceolate, deciduous. *Calyx* $\frac{3}{4}$ –1 in., rusty tomentose, irregularly 5-lobed half-way down. *Corolla* when expanded densely woolly-tomentose without, mouth 2 in. diam., lobes hardly crisped or crenate. *Anther-cells* nearly separate, pendulous. *Capsule* 1–3 ft. by 1 in. diam., cylindric, cork-screw-like; septum flat. *Seeds* $1\frac{1}{2}$ by $\frac{1}{2}$ – $\frac{1}{2}$ in.

VII. MAYODENDRON, *Kurz*.

A glabrous tree. *Leaves* ternately decomposed. *Racemes* small, terminal on short lateral shoots. *Calyx* spathaceous, split on one side half-way down. *Corolla* tubular, almost narrowed at the mouth; lobes very short, subequal. *Stamens* 4, scarcely didynamous, rudiment of the fifth present; anther-cells almost parallel. *Capsule* linear cylindric slender, sub-4-celled, loculicidally 2-valved, valves thin. *Seeds* flat, winged on the sides.

M. igneum, *Kurz Preliminary Pegu For. Rep. App. D, with a fig.*, and *For. Fl.* ii. 233. *Spathodea ignea*, *Kurz in Journ. As. Soc.* 1871, pt. ii. p. 77.

MARTABAN up to 3000 ft., not infrequent; *Kurz*.—DISTRIB. Ava, Yunnan.

A tree, 30–40 ft.; innovations minutely puberulous. *Leaves* ample, lower pinnæ 2-pinnate; leaflets 3–4 in., elliptic, acuminate. *Racemes* 5-fld., pedicels $\frac{1}{2}$ in. *Calyx* $\frac{3}{4}$ in., puberulous. *Corolla* $2\frac{3}{4}$ by $1\frac{1}{2}$ in., orange crimson; narrow cylindric portion of the tube much shorter than the funnel-shaped part; lobes $\frac{1}{4}$ – $\frac{1}{2}$ in. long. *Capsule* 18 by $\frac{1}{2}$ in., subterete, glabrous. *Seeds* including the pellucid wings, narrow-linear, $\frac{1}{2}$ in. long.

VIII. STEREOSPERMUM, Cham.

Trees. *Leaves* 1- or 2-pinnate. *Panicles* large, lax, terminal. *Calyx* ovoid, open or closed in the bud, during flower truncate or shortly unequally lobed. *Corolla* tubular-ventricose, yellow or pale rose; lobes 5, nearly equal, round, crisped toothed or laciniate. *Capsule* elongate, terete, subcompressed or obscurely quadrangular, loculicidally 2-valved; septum thickened, subterete. *Seeds* in 1 or 2 series, compressed or subtrigonal, with a membranous wing on each side.—Species 10, in tropical Asia and Africa.

Sect. 1. **Eustereospermum**. *Leaves* 1-pinnate.

1. **S. chelonoides**, DC. *Prodr.* ix. 210; leaflets elliptic caudate-acuminate glabrous, panicle-branches slender glabrous, corolla $\frac{3}{4}$ in., capsule linear obscurely quadrangular, seeds subtrigonal embedded in notches in the septum. *Wight Ic.* t. 1341; *Bedd. Fl. Sylv.* t. 72; *Brand. For. Fl.* 352; *Kurz For. Fl.* ii. 230. *Bignonia chelonoides*, Linn. f. *Suppl.* 282; *Roxb. Fl. Ind.* iii. 106; *Wall. Cat.* 6501. *B. caudata*, Miq. in *Pl. Hohe-nack*, n. 182, not of DC. *Heterophragma chelonoides*, Dalz. & Gibs. *Bomb.* Fl. 160.—*Rheede Hort. Mal.* vi. t. 25.

Through moister INDIA; from the Terai of Oudh and Assam to Ceylon and Pegu.—DISTRIB. Ava.

A tree, 30–60 ft., nearly glabrous except the flowers. *Leaves* 12–18 in.; leaflets 7–11, 5 by 2 in.; petiolule $\frac{1}{2}$ – $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in., shortly 3–5-toothed. *Corolla* thinly villous within and without; tube rose, lobes yellow or pale flesh-colour, crisped. *Capsule* 12–20 by $\frac{1}{2}$ – $\frac{1}{2}$ in., smooth or speckled. *Seeds* 1 by $\frac{1}{2}$ in., easily splitting through the centre.

2. **S. neuranthum**, *Kurz in Journ. As. Soc.* 1873, pt. ii. 91, and *For. Fl.* ii. 230; leaflets oblong or ovate shortly acuminate hairy beneath, panicle short corymb-like viscos-hairy, corolla $1\frac{1}{4}$ in., capsule linear slender subterete keeled, seeds subtrigonal embedded in notches in the septum.

PEGU and MOULMEIN; M'Lelland, *Parish*, *Kurz*.

A tree, 40–60 ft.; innovations softly villous or subumentose. *Leaves* 1–1 $\frac{1}{2}$ foot; leaflets 5–7, 5 by $2\frac{1}{2}$ in.; petiolule $\frac{1}{2}$ in. *Panicle* loose, about 12-fld. *Calyx* $\frac{1}{2}$ in., hairy; lobes 3–5, very short, broad. *Corolla* very pale lilac or blueish white (*Kurz*), sparsely pilose; lobes rounded, crisped crenate hardly toothed. *Capsule* 12 by $\frac{1}{2}$ – $\frac{1}{2}$ in., less woody than that of *S. chelonoides*; valves 1-ribbed on the back; seeds and septum as in *S. chelonoides*.

3. **S. suaveolens**, DC. *Prodr.* ix. 211; leaflets broadly elliptic acuminate or acute entire or serrulate young hairy, panicle very compound many-fld. viscos hairy, corolla 1–1 $\frac{1}{4}$ in., capsule linear terete woody, seeds subtrigonal embedded in notches of the septum. *Wight Ic.* t. 1342; *Bedd. For. Man.* 169; *Brand. For. Fl.* 351; *Kurz For. Fl.* ii. 231. *Bignonia suaveo-*

lens, *Roxb. Fl. Ind.* iii. 104; *Wall. Cat.* 6499. *Tecoma suaveolens*, *G. Don Gen. Syst.* iv. 244. *Heterophragma suaveolens*, *Dalz. & Gibs. Bomb. Fl.* 161.

Throughout moister INDIA from the Himalayan Terai to Travancore and Tenasserim. CEYLON (Thwaites thinks only planted in).

A tree, 30–60 ft.; innovations viscous-hairy. *Leaves* 12–18 in.; leaflets 7–9, 5½ by 3 in.; petiolule hardly $\frac{1}{10}$ in. *Calyx* $\frac{1}{2}$ in., hairy; lobes 3–5, very short, broad. *Corolla* pale or dark purple, puberulous without, hairy in the throat; lobes rounded, crisped-crenate. *Capsule* 18 by $\frac{3}{4}$ in., slightly rough with tubercles, obscurely 4-ribbed, glabrous. *Seeds* 1½ by $\frac{1}{4}$ in., deeply notched at the middle.

4. ***S. fimbriatum***, *DC. Prodr.* ix. 211; leaflets oblong caudate-acuminate subentire young hairy, panicle very compound viscous hairy, corolla 2 in. lobes fimbriate into laciniae $\frac{1}{4}$ in. long. *Kurz For. Fl.* ii. 231. *Bignonia fimbriata*, *Wall. Cat.* 6500.

MALAY PENINSULA; Moulmein, *Wallich*; Tenasserim, *Griffith*; Karen country up to 3000 ft., *Kurz*; Malacca, *Maingay*.

Attaining 80 ft., *Kurz*. *Leaves* 1–2 ft.; leaflets 7–9, 6 by 2 in.; petiolule $\frac{1}{2}$ in. *Corolla* pale-lilac. *Capsule* 12 by $\frac{1}{2}$ in.; valves somewhat woody, smooth, slightly keeled.—Exceedingly like *S. suaveolens*, except as to the fimbriate corolla; the leaflets are usually narrower.

5. ***S. glandulosum***, *Miq. Fl. Ind. Bat. Suppl.* 565; glabrous or the innovations puberulous, leaflets large elliptic acute or acuminate entire, panicles subracemose, calyx campanulate subtruncate, corolla 1½ in., capsule narrowly linear slender smooth. *Spathodea glandulosa*, *Blume Bijl.* 762; *DC. Prodr.* ix. 207. *Bignonia Porteriana*, *Wall. Cat.* 6509; *DC. l. c.* 165. *Lagarophyxis glandulosa*, *Miq. in Ann. Mus. Lugd.* i. 199. *Radermachera stricta*, *Zoll.*; *Bureau Monogr. Bign.* t. 28.

PENANG; *Wallich*. MOULMEIN; *Lobb*. MALACCA; *Maingay*.—DISTRIB. Malay Archipelago.

Leaflets 3–7, 7 by 3 in.; petiolule $\frac{1}{4}$ in. *Panicles* 1 foot long; branches short, 1–2-fld. *Calyx* $\frac{1}{2}$ in., glabrate, in fruit often urceolate. *Corolla* glabrous; narrow cylindric portion of the tube shorter than the campanulate part; lobes $\frac{1}{2}$ in. diam., round, subentire, not crisped. *Capsule* 9 by $\frac{1}{2}$ in.; valves thin, tough. *Seeds* (including the wings) $\frac{3}{4}$ by $\frac{1}{8}$ in., thinly discoid.

6. ***S. ? Wallichii***, *Clarke*; leaflets large rhomboid acuminate subentire mature pubescent, pod linear very long compressed smooth. *Spathodea stipulata*, *Wall. Cat.* 6518 B and part C.

IBRAWADDY ESTUARY; *Wallich*.

Leaflets 7, 8 by 4 in., cuneate at the base, subsessile. *Corolla* not seen. *Capsule* 45 by $\frac{3}{4}$ in.; septum spongy, $\frac{1}{2}$ by $\frac{1}{4}$ in. *Seeds* sub-4-seriate, 1½ by $\frac{1}{2}$ in., subrectangular, compressed flat, wings membranous.—This imperfectly known tree evidently differs from all the other species, and is marked by D. Don (in *Herb. Wallich*) as *Spathodea Wallichii*, D. Don: the septum appears too spongy for *Dolichandrone*. Seemann has merely noted that the seeds are biserial (i.e. in each cell) without making any guess at the genus.

Sect. 2. ***Xylocarpæa***. Leaves 2-pinnate.

7. ***S. xylocarpum***, *Wight Ic.* t. 1335–6; leaflets elliptic acute entire mature glabrous, panicles compound dense pubescent, corolla 1½–2 in. white tinged yellow, capsule stout linear cylindric rugged. *Bignonia xylocarpa*, *Roxb. Fl. Ind.* iii. 108; *Wall. Cat.* 6511; *DC. Prodr.* ix. 169; *Bedd. Fl.*

Sylv. t. 70; *Dalz. & Gibs. Bomb. Fl.* 159. *Tecoma xylocarpa*, *G. Don Gen. Syst.* iv. 225. *Spathodea xylocarpa*, *Brand. For. Fl.* 349, t. 43.

DECCAN PENINSULA; common, extending north to the Satpura Range, *Brandis*.

A tree, 30–60 ft.; innovations pubescent. *Leaves* 1–4 ft.; leaflets 3 by 1½ in., subsessile. *Panicle* somewhat rigid, erect. *Calyx* ¼–⅔ in., pubescent or mature glabrate; lobes 3–5, very short, broad. *Corolla* ventricose from near the base, subglabrous; lobes round, crisped. *Filaments* hairy below. *Capsule* 12–30 by 1–1½ in., glabrous, tubercular. *Seeds* (including the wings) 1½ by ½ in., thinly discoid.

8. *S. hypostictum*, *Miq. Fl. Ind. Bat. Suppl.* 565; glabrous, leaflets oblong or elliptic acuminate entire, panicles compound branches slender, corolla 2 in., pod linear very slender not woody smooth. *Spathodea gigantea*, *Blume Bijl.* 761; *DC. Prodr.* ix. 207. *S. amœna*, *A. DC. Prodr.* ix. 208; *Brand. For. Fl.* 349. *S. Lobbii*, *Teyss. & Binnend. in Nat. Tijdsch.* xxv. 413. *Bignonia amœna*, *Wall. Cat.* 6512, and *Pl. As. Rar.* ii. 78, t. 183. *Lagaropyxis gigantea*, *Miq. in Ann. Mus. Lugd.* i. 198. *Radermachera amœna*, *Seem. in Seem. Journ. Bot.* viii. 146; *Kurz For. Fl.* ii. 232. *R. gigantea & Lobbii*, *Miq. in Ann. Mus. Lugd.* iii. 250.

TAVOY; *Wallich*. MALACCA and SINGAPORE; *Griffith*, *Maingay*.—DISTRIB. Java, Sumatra.

Attaining 80 ft. *Leaves* 2-pinnate (and ex *Kurz* 3-pinnate); leaflets 5 by 2 in.; petiolule ½ in. *Calyx* ¾–1 in., closed in the bud, in flower shortly 2-lipped or subspathaceous. *Corolla* glabrous, white, tube rose; lobes crenulate, hardly crisped. *Capsule* 15 by ½ in.; valves thin, tough. *Seeds* (including the wings) ¾ by ½–⅔ in., thinly discoid.

9. *S. Ghorta*, *Clarke*; glabrous or innovations puberulous, leaflets sessile elliptic acute, partial rachises narrowly winged, corolla 2 in. elongate tubular lobes round subentire. *Bignonia Ghorta*, *Ham. in Wall. Cat.* 6510; *DC. Prodr.* iv. 167.

“DEVIDUBA;” *Hamilton*.

Leaves opposite, bipinnate; leaflets 2 by ¾ in., unequal-sided, subsessile, entire. *Peduncle* terminal; panicle many-fld., branches slender; pedicels ¼–½ in., subfascicled. *Calyx* ½ in., campanulate; lobes 4–5, short, triangular. *Corolla* broadly cylindric, slightly wider upwards, glabrous; mouth hardly 1 in. diam. *Stamens* 4, didynamous; anther-cells narrowly oblong, separate, divaricate. *Capsule* not seen.

IX. PAJANELIA, DC.

A large tree, glabrous except the corolla. *Leaves* large, 1-pinnate; leaflets numerous, entire. *Flowers* large in terminal, thyrsoid panicles. *Calyx* large, ovoid, closed in the bud, in flower ventricose-campanulate, 5-fid. *Corolla* large, tubular-ventricose; lobes 5, crisped. *Capsule* large, narrowly oblong, winged, compressed, loculicidally 2-valved. *Seeds* compressed, with a membranous wing on each side.

P. Rheedii, *DC. Prodr.* ix. 227, excl. syn. *Lour. & Pers.; Wight Ic.* tt. 1343–4; *Bureau Monogr. Bign.* t. 20; *Bedd. For. Man.* 169. *Bignonia indica* var. β , *Linn. Sp. Pl.* 871. *B. Pajanelia*, *Ham. in Trans. Linn. Soc.* xiii. 316. *B. longifolia*, *Willd. Sp. Pl.* iii. 306. *B. multi-juga*, *Wall. Cat.* 6503, and *Pl. As. Rar.* i. 81, tt. 95, 96. *Payanelia multi-juga*, *Kurz For. Fl.* ii. 227.

SILHET and KHASIA HILLS; *Wallich*, *Griffith*. PEGU, TENASSERIM, and ANDAMANS; *Kurz*. MALABAR, common up to 2000 ft., *Beddome, &c.*

A tree, 30–60 ft. *Leaves* 1½–3 ft.; leaflets 19–25, 3–8 in., elliptic, acuminate,

unequal at the base; petiolule $\frac{1}{8}$ in. *Panicles* 12-18 in. *Calyx* $\frac{3}{4}$ -1 in.; lobes irregular, extending about half-way down. *Corolla* $2\frac{1}{2}$ in.; lobes 1 in., hairy especially on the margins, dilated and rounded at the tips. *Capsule* 12-20 by $2\frac{1}{2}$ - $3\frac{1}{2}$ in., glabrous; wing on each margin split, so that the capsule appears 4-winged; septum flat, but with a ridge on each face. *Seeds* $\frac{3}{4}$ by $\frac{1}{2}$ in.

X. **DIPLANTHERA**, R. Br.

Trees, tomentose or villous. *Leaves* undivided, large, opposite or whorled. *Panicles* terminal, sessile, dense, globose. *Calyx* campanulate, closed in the bud, in flower shortly 2-5-lobed. *Corolla* yellow, tubular-ventricose; lobes round, entire, subequal. *Stamens* 4, didynamous; anther-cells lanceolate, separate, pendulous. *Capsule* broadly spindle-shaped, woody, loculicidally 2-valved; septum flat, thick. *Seeds* compressed, discoid, with a hyaline wing.—Species 6, extending from Malacca to N. Australia and New Caledonia.

D. bancana, Scheffer in *Nat. Tidschr.* xxxi. 334.

MALACCA; Walker, Maingay.—DISTRIB. Bangka.

A lofty tree. *Leaves* 8-13 by 5-8 in., round-ovate, subentire, pubescent, tawny villous on the nerves beneath, 1-2 large glands above near the apex of the petiole; petiole 4 in. *Panicles* 4-5 in. diam., tawny-villous. *Calyx* $\frac{3}{4}$ in., puberulous, articulated on the pedicel. *Corolla* 1 in. *Stamens* and style ultimately long exsert. *Capsule* 6 by $1\frac{1}{2}$ in., smooth. *Seeds* $1\frac{1}{2}$ by $\frac{3}{4}$ in., wing continued all round except the base.

XI. **AMPHICOME**, Lindl.

Herbs; rootstock woody. *Leaves* alternate, 1-pinnate; leaflets toothed. *Racemes* terminal; bracts small, linear, persistent. *Calyx* campanulate, truncate or 5-toothed. *Corolla* red, tube elongate widened upwards; lobes 5, round, entire, nearly equal. *Stamens* 4, didynamous, included; anthers glabrous or hairy, cells separate, divaricate, with a tooth-like appendage near the base. *Ovary* subsessile; ovules sub-2-seriate. *Capsule* linear, slender, terete, smooth, loculicidally splitting on one side, subfollicular; septum thin. *Seeds* in one row on each margin of the septum, narrowly oblong, tuberculate, the hyaline wing on each side more or less laciniate.—Species 2, in North-west India and Cabul.

1. **A. arguta**, Lindl. *Bot. Reg.* 1838, t. 19; glabrous, leaflets lanceolate, calyx-teeth very acute, corolla attaining $1\frac{1}{2}$ by $\frac{1}{2}$ in. *DC. Prodr.* ix. 237; *Bureau Monogr. Bign.* t. 24. *Incarvillea arguta*, Royle *Ill.* 296. 1. diffusa, Royle *Ill.* t. 72, fig. 1 (corolla shown too small). *I. emodi*, Wall. *Cat.* 487, first example.

N.W. HIMALAYA, Blinkworth, Royle; Kumaon, alt. 7000 ft., Strachey & Winterbottom; Simla, Fielding; Kunawur and Wangtu, T. Thomson, Stoliczka.

Stems 20 in., sometimes divided. *Leaves* 5 in.; leaflets 5-9, $1-1\frac{1}{2}$ in.; petiolules $\frac{1}{2}$ in. *Racemes* 6-8 in.; pedicels 1 in. *Calyx* $\frac{1}{2}$ in., teeth caudate-acuminate from a triangular base. *Corolla* glabrous; cylindric base of the tube $\frac{1}{2}$ in., campanulate portion of the tube $\frac{3}{4}$ in. *Capsule* 6-8 by $\frac{1}{2}$ - $\frac{3}{4}$ in.; valves thin. *Seeds* (including the wings) $\frac{1}{2}$ by $\frac{1}{2}$ in.

2. **A. emodi**, Lindl. *Bot. Reg.* 1838, t. 19, in note; leaflets elliptic or oblong scarcely acute, calyx truncate or with triangular scarcely acuminate teeth, corolla attaining 2 by $\frac{3}{4}$ in. *DC. Prodr.* ix. 237; *Bot. Mag.* t. 4890. *Incarvillea emodi*, Wall. *Cat.* 487, second example; Royle *Ill.* 296, in note.

W. HIMALAYA, alt. 2-9000 ft., from Kashmir to Nepal; *Wallich*, *Blinkworth*, &c.—DISTRIB. Cabul?

Glabrous. *Racemes* not rarely 2-3, subpanicled. *Flowers* often not larger than those of *A. arguta*.—This species is very near *A. arguta*: the Afghanistan examples referred to *A. emodi* are all hairy.

ORDER CVIII. PEDALINEÆ. (By C. B. Clarke.)

Herbs or undershrubs. *Leaves* opposite, or the upper alternate, entire toothed or divided. *Flowers* irregular, (in the Old-World species) axillary, solitary or rarely clustered; pedicels short; bracts 0 or very small. *Calyx* deeply 4-5-lobed. *Corolla* tubular-ventricose; limb obscurely 2-lipped; lobes 5, imbricate. *Stamens* 4, didynamous; rarely 2. *Ovary* 2- (sometimes 1-) celled; style filiform, stigma shortly 2-lobed; ovules few or many, superposed. *Capsule* 2- or 3-4-celled, indehiscent or dehiscent. *Seeds* (in the Indian species) wingless, exalbuminous.—Species 40, in the warmer parts of both hemispheres.

The Indian species are readily distinguished from *Bignoniaceæ* by their herbaceous habit and wingless seeds, and from most *Scrophularinææ* by their few or 1-seriate seeds.

Martynia diandra, Glox. (DC. Prodr. ix. 253), an American weed (called Tiger-claw or Devil's-claw), is now common in the Gangetic Plain and elsewhere in India; it is a rank coarse herb with capsules beaked by strong curved spines.

Capsule spinous, indehiscent. Seeds 2-1 in each cell 1. PEDALIUM.
Capsule spineless, 2-4-valved. Seeds many in each cell 2. SESAMUM.

I. PEDALIUM, Linn.

A glabrous annual. *Leaves* opposite or alternate, petioled, ovate, incised. *Pedicels* axillary, solitary, short, 2-glandular at the base. *Calyx* small, 5-partite. *Corolla* yellow; lobes round, patent. *Stamens* 4, didynamous, included; anther-cells ovate, parallel, separate, pendulous. *Ovary* 2-celled; ovules 2 in each cell. *Capsule* hard, indehiscent, upper portion pyramidal-ovoid with 4 patent spines from its base. *Seeds* 2-1 in each cell, pendulous, oblong, testa black.

P. Murex, Linn.; DC. Prodr. ix. 256; *Burm. Fl. Ind.* 139, t. 45, fig. 2; *Gaertn. Fruct.* i. 276, t. 58; *Lamk. Ill.* t. 538; *Roxb. Fl. Ind.* iii. 114; *Wall. Cat.* 6410; *Wight Ic.* t. 1615; *Dalz. & Gibs. Bomb. Fl.* 162.

DECCAN PENINSULA AND CEYLON, frequent.—DISTRIB. Trop. Africa.

A weedy herb, 6-15 in. *Leaves* 2-4 in., irregularly toothed or almost lobed; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Pedicels* $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in.; teeth linear. *Corolla* 1 in., funnel-shaped, glabrous. *Fruit* $\frac{3}{4}$ by $\frac{1}{2}$ in.

II. SESAMUM, Linn.

Erect or prostrate herbs. *Leaves* opposite, upper alternate, entire toothed lobed or divided. *Flowers* axillary, solitary, or few and fascicled, short-pedicelled, pale or purplish, sometimes yellow-marked. *Calyx* small, 5-partite. *Corolla* tubular-ventricose, base subgibbous; limb 2-lipped, lobes 5, rounded. *Stamens* 4, didynamous, included; anthers sagittate, cells 2 subparallel. *Ovary* 2-celled, early falsely 4-celled, cells many-ovuled. *Capsule* oblong or ovoid, loculicidally 2-valved, unarmed, in appearance

4-celled. *Seeds* numerous, obliquely oblong.—*DISTRIB.* Species 10, Indian and tropical or southern Africa.

1. ***S. indicum***, *DC. Prodr.* ix. 250; erect, leaves oblong or ovate lower often pedatisect, capsule tetragonous oblong, seeds brown smooth. *Wall. Cat.* 6408; *Wight Ill.* t. 163; *Bot. Mag.* t. 1688; *Dalz. & Gibs. Bomb. Fl.* 161. *S. orientale*, *Linn.*; *Gaertn. Fruct.* ii. 132, t. 110; *Lamk. Ill.* t. 528; *Roxb. Fl. Ind.* iii. 100. *S. luteum*, *Retz. Obs.* vi. 31; *DC. l.c.* *S. occidentale*, *Heer & Regel*; *DC. l.c.*; *Thwaites Enum.* 442.—*Rumph. Herb. Amboin.* t. 76, fig. 1. *Rheede Hort. Mal.* ix. tt. 54, 55.

Throughout the warmer parts of INDIA and CEYLON, cultivated.—*DISTRIB.* Cultivated in all hot countries. Native country doubtful, probably Asiatic.

Height 1-2 ft., pubescent or puberulous. *Leaves* 3-5 in., variable on the same plant; upper often narrowly oblong subentire, middle ovate toothed, lower lobed or pedatisect; petiole $\frac{1}{2}$ -2 in. *Pedicels* $\frac{1}{2}$ in., solitary, rarely 2-3-nate. *Sepals* $\frac{1}{4}$ in., lanceolate. *Corolla* $1\frac{1}{2}$ in., pubescent, whiteish or with red purplish or yellow marks. *Capsule* 1 by $\frac{1}{2}$ in., erect, scabrid-pilose, the same width from top to bottom, usually shortly acuminate; 2-valved half-way down, or sometimes to the base, or ultimately 4-valved.

2. ***S. laciniatum***, *Klein*; *Willd. Sp. Pl.* iii. 359; prostrate, hispid, leaves ovate lobed and deeply subpedately pinnatifid, capsule ovoid compressed, seeds black reticulate. *DC. Prodr.* ix. 209; *Wight Ic.* t. 1345.

S. DECCAN PENINSULA, *Rottler, Wight, &c.*; *Cochin, Johnstone.*

Appressedly prostrate, 1-3 ft., branching. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., orbicular or elliptic in outline, lacinations acute; petiole $0-\frac{1}{2}$ in. *Pedicels* $\frac{1}{2}$ in., solitary. *Sepals* $\frac{1}{2}$ in., lanceolate. *Corolla* 1 in., minutely pubescent, purple, yellow in the palate. *Capsule* $\frac{1}{2}$ by $\frac{1}{3}$ in., scabrous-pilose, shortly mucronate; valves 2, dorsally compressed.

3. ***S. prostratum***, *Retz. Obs.* iv. 23; prostrate, villous, leaves orbicular or obovate crenate or obtusely lobed with white indumentum beneath, capsule ovoid compressed, seeds black reticulate. *Wall. Cat.* 6409; *Wight Ic.* t. 1346.

MADRAS; especially on sandhills near the sea, *Rottler, Wight, Shuter.*

Closely allied to *S. laciniatum*, and hardly separable therefrom by the characters given. The leaves are generally entire, sometimes 3-lobed half-way; the teeth never sharp as in *S. laciniatum*.

ORDER CIX. **ACANTHACEÆ.** (By C. B. Clarke.)

Herbs or shrubs, rarely trees. *Leaves* opposite, exstipulate, very rarely divided. *Flowers* rarely solitary, bracteate and 2-bracteolate. *Calyx* 5-partite (in *Thunbergia* small often multifid). *Corolla* 2-lipped, or subequally 5-lobed; lobes imbricated or twisted in bud. *Stamens* 4 or 2, inserted on the corolla-tube; anthers 2- or 1-celled; cells sometimes remote. *Disc* often conspicuous. *Ovary* superior, 2-celled; style filiform, notched or bifid (1 branch often obsolete); ovules one or more in each cell. 1- or 2-seriate, anatropous. *Capsule* loculicidal; valves often elastically recurved, carrying the seeds on the half-septa. *Seeds* (except in *Thunbergia* and the *Nelsoniæ*) hard, seated on upcurved subacute supports (*retinacula*), ovoid or compressed, testa smooth rugose or warted rarely hispid, often clothed with white elastic hairs (best seen when wetted), albumen 0 (except *Nelsoniæ*); radicle next the hilum.—Species 1500, in the tropical and warm temperate regions.

Tribe 1. **Thunbergiæ**. Scandent or twining. *Calyx* minute, annular or 10-15-toothed. *Corolla-lobes* twisted in bud. *Ovules* 2 in each cell, collateral. *Capsule* beaked; retinacula 0 . . . 1. THUNBERGIA.

Tribe 2. **Nelsoniæ**. *Corolla-lobes* imbricate in bud. *Ovules* many, superimposed in two rows in each cell. *Seeds* small, seated on minute papillæ, not on hard retinacula, obscurely albuminous.

Calyx 4-partite.	Stamens 2.	Bracts rigid, imbricate . . .	2. ELYTEABIA.
Calyx 4-partite.	Stamens 2.	Bracts herbaceous . . .	3. NELSONIA.
Calyx 5-partite.	Stamens 4		4. EBERMAIERA.
Calyx 5-partite.	Stamens 2, exserted		5. OPHIORRHIZIPHYLLUM.

Tribe 3. **Ruellieæ**. *Corolla-lobes* twisted to the left in bud. *Seeds* on retinacula. *Sepals* 5, or 4 with one larger. *Anthems* usually 2-celled; cells parallel or one a little below the other. *Style* 2-fid, one lobe often suppressed.

Subtribe 1. POLYSPERMEÆ. *Ovules* 3-12 in each cell. *Capsule* normally 6- or more-seeded.

* *Corolla distinctly 2-lipped.*

Lower leaves often toothed or pinnatifid. Flowers axillary, sessile. Retinacula scarcely hooked . . .	6. CARDANTHERA.
Leaves entire. Flowers axillary, subsessile. Retinacula hooked	7. HYGROPHILA.
Cymes elongate. Branches sympodal	8. NOMAPHILA.

** *Corolla subequally 5-lobed.*

Bracteoles large. Stamens muticous. Capsule clavate. Base of capsule solid	10. RUELLIA.
Cymes elongate with sympodal branches. Anther-cells mucronate at base	11. ECHINACANTHUS.
Flower-clusters separate on the cyme-branches. Connective excurrent at tip. Capsule seed-bearing from the base	17. ÆCHMANTHERA.
Flowers capitate or axillary, subsessile. Bracteoles small, narrow, or 0. Capsule seed-bearing from the base	15. HEMIGRAPHIS.
Flowers clustered at the nodes of the almost leafless branches in terminal panicles. Stamens muticous. Capsule seed-bearing from the base	16. STENOSIPHONIUM.

Subtribe 2. TETRASPERMEÆ. *Ovules* 2 in each cell. *Capsule* 4- or fewer-seeded.

* *Placentæ not rising elastically from the base of the capsule (except in a few Strobilanthes).*

Corolla subequally 5-lobed. Stamens 4 or 2; anthers muticous	18. STROBILANTHES.
Corolla large, deeply 2-lipped. Stamens 4; anthers muticous	19. CALACANTHUS.
Corolla somewhat 2-lipped. Stamens 4; anthers minutely mucronate at base	9. CALOPHANES.
Corolla-tube very long, linear; lobes subequal. Stamens 2	14. DÆDALACANTHUS.

** *Placentæ rising elastically from the base of the ripe capsule.*

Corolla small. Stamens 4. Bracteoles 0	13. PHAYLOPSIS.
Stamens 4. Bracteoles very large, reticulately nerved	12. PETALIDIUM.

Tribe 4. **Acantheæ**. *Corolla-tube* short; upper lip obsolete, lower 3-lobed. *Ovules* 2 in each cell. *Retinacula* curved, hardened.

Anterior filaments with an excurrent process 20. BLEPHARIS.

Anterior filaments without an excurrent process 21. ACANTHUS.

Tribe 5. **Justicieæ**. *Corolla-lobes* imbricate in bud. *Retinacula* curved, hardened. *Anthers* 2-1-celled; cells often spurred at the base, one frequently placed much above the other. *Style* shortly equally 2-fid or subentire.

Subtribe 1. ANDROGRAPHIDEÆ. *Ovules* 3-10 in each cell. *Capsule* normally 6- or more-seeded.

* *Capsule compressed at right angles to the septum; seeds ovoid, hardly compressed.*

Flowers paniced or thyrsoid 28. ANDROGRAPHIS.

Flowers axillary, clustered, with cladodes (suppressed branchlets) among them 29. HAPLANTHUS.

** *Capsule subterete, seeds much compressed.*

Corolla-tube very slender, limb small 30. GYMNSTACHYUM.

Corolla cylindric, curved, not ventricose nor deeply 2-lipped 31. PHLOGACANTHUS.

Corolla ventricose, not deeply 2-lipped 32. CYSTACANTHUS.

Corolla deeply 2-lipped 33. DIOTACANTHUS.

Subtribe 2. BARLERIÆ. *Ovules* 2-1 in each cell. *Corolla-lobes* 5, subequal. *Stamens* 4, of which 2 are small or obsolete, or 4 1-celled.

Sepals 4, 2 outer opposite larger. *Anthers* 2-celled 22. BARLERIA.

Calyx 2-lipped, 5-lobed. *Anthers* 2-celled 23. NEUBACANTHUS.

Outer calyx-lobes much the larger. *Anthers* 1-celled 24. CROSSANDRA.

Subtribe 3. ASYSTASIEÆ. *Ovules* 2 in each cell. *Corolla-lobes* 5, subequal. *Sepals* 5, small, subequal. *Stamens* 4 or 2; anther-cells 2, subequal, parallel, muticous.

Corolla-tube long, narrow or subventricose. *Stamens* 4 25. ASYSTASIA.

Corolla-tube slender. *Stamens* 2 26. ERANTHEMUM.

Corolla-tube ventricose. *Stamens* 2 27. CODONACANTHUS.

Subtribe 4. EUJUSTICIEÆ. *Ovules* 2 in each cell. *Corolla* distinctly 2-lipped.

* *Stamens* 4, *anthers* all subequal 2-celled.

Calyx deeply 5- or 4-lobed 34. LEPIDAGATHIS.

Calyx campanulate, 5-toothed 35. PHIALACANTHUS.

** *Stamens* 2, *anthers* 1-celled.

Bracts small, narrow. *Corolla* small 36. MONOTHECIUM.

Bracts small, narrow. *Corolla* long 37. CLINACANTHUS.

Bracts larger than the calyx-segments 49. HYPSTES.

*** *Stamens* 2, *anthers* 2-celled.

† *Placentæ* rising elastically from the base of the capsule.

Bracts in 1-sided spikes 46. RUNGIA.

Bracts clustered, shortly peduncled 47. DICLIPTERA.

† *Placenta not rising elastically from the base of the capsule.*

¶ *Anther-cells placed one much higher than the other.*

Anther-cells muticous, bracts in opposite pairs, valvate	48. PERISTROPHE.
Anther-cells minutely spurred at base	38. JUSTICIA.
Anther-cells apiculate, scarcely spurred at base	39. ADHATODA.
Anthers muticous. Flowers clustered. Corolla long	40. RHINACANTHUS.
Anthers muticous. Flowers thyrsoid. Corolla not large	41. DIANTHERA.

¶¶ *Anther-cells parallel, subequal.*

Bracts small, narrow. Corolla small	42. PTYSIGLOTTIS.
Corolla-tube ovoid, constricted in the throat	43. SPHINCTACANTHUS.
Bracts large, imbricate. Corolla-tube narrow, long	44. ECBOLIUM.
Bracts small. Corolla-tube elongate	45. GRAPTOPHYLLUM.

I. **THUNBERGIA**, Linn. f.

Scandent. *Leaves* often cordate, hastate or angular. *Flowers* axillary. 1-2-nate, or racemose; bracts at the base of the pedicels leaf-like; bracteoles large, margins coherent at least when young. *Calyx* small, annular, 10-16-toothed, or obscure. *Corolla* conspicuous; tube ventricose, curved; limb oblique; lobes 5, rounded, twisted to the left in bud. *Stamens* 4, didynamous near the base of the corolla-tube; anthers 2-celled, cells parallel, oblique, spurred or not at the base. *Disc* cushion-shaped or annular. *Style* long; stigma funnel-shaped, 2-lobed or subentire, or style 2-fid with capitate stigmas; ovules 2 in each cell, collateral. *Capsule* globose, suddenly narrowed into a barren sword-shaped beak. *Seeds* 2 in each cell, ovoid or dorsally compressed, not hairy, base plane or excavate, funicle minute or conic.—Species 30, in Africa, Asia, and N. Australia.

Sect. 1. **Euthunbergia**. *Flowers* axillary. *Calyx* 10-16-toothed. *Seeds* ovoid, base excavate.

1. **T. fragrans**, Roxb. *Cor. Pl.* i. 47, t. 67, and *Fl. Ind.* iii. 33; leaves ovate or oblong acute, calyx-teeth in flower lanceolate hardly longer than the tube, capsule glabrous. *Lamk. Ill.* t. 549, fig. 2; *Wall. Cat.* 767, type sheet; *Nees in Wall. Pl. As. Rar.* iii. 77, 78, and in *DC. Prodr.* xi. 57; *T. Anders. in Journ. Linn. Soc.* ix. 448; *Kurz For. Fl.* ii. 240. *T. javanica*, Gaertn. f. *Fruct.* iii. 22, t. 183; *Blume Bijd.* 806; *Nees in DC. l. c.* 56. *T. scandens*, Pers. *Syn.* ii. 179. *T. volubilis*, Pers. *Syn.* ii. 179; *Nees in DC. l. c.* 59. *T. angustifolia*, Ham.; *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. l. c.* 56. *T. Roxburghia*, *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. l. c.* 58. *T. subsagittata*, Blanco *Fl. Fil.* 518. *T. arnhemica*, F. Muell. *Fragm. Phyt. Austral.* ix. 73.

Throughout INDIA, alt. 1-4000 ft., from the Himalaya Terai to CEYLON and Tenasserim; ascending to 5-7000 ft.—DISTRIB. Malaya to the Philippines and N. Australia.

Stem slender, retrorsely hairy or glabrate. *Leaves* 2-3 by $\frac{1}{2}$ -1 $\frac{1}{2}$ in., obtuse, base cordate or hastate, toothed, mature glabrate; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Pedicels* 1-3 in., 1 rarely 2 in each axil; bracteoles $\frac{3}{4}$ in., broadly falcate-oblong, subacute. *Calyx* in flower $\frac{1}{2}$ in., divided half-way down into 12-16 teeth, nearly glabrous, in fruit $\frac{1}{2}$ in. *Corolla* 1 $\frac{1}{4}$ in., pure white, fragrant. *Anther-cells* elliptic, acute, base unappendaged. *Ovary* glabrous; style funnel-shaped, 2-lipped. *Capsule* $\frac{3}{4}$ -1 in., glabrous, shining. *Seeds* $\frac{1}{2}$ - $\frac{1}{4}$ in., rugose.—The typical *T. fragrans* of the Bengal Terai is considered by T. Anderson, from the pure white of its fragrant flowers, the most charming of Bengal

plants. According to him (in '*Thwaites Enum.* 234) the plant is not fragrant in Ceylon; but this may apply to *Var. vestita*.

VAR. lævis; glabrous or grey puberulous, pedicels often 2 in each axil much thickened upwards in fruit, corolla not fragrant, tube often greenish, capsules grey puberulous. *T. lævis*, *Nees in Wall. Pl. As. Rar.* iii. 77, and in *DC. Prodr.* xi. 56. *T. fragrans*, *Bot. Mag.* t. 1881; *Dalz. & Gibs. Bomb. Fl.* 183. *T. longiflora*, *Benth. in Pl. Hohenack.* 384. *Meyenia longiflora*, *Benth.*; *Hohenack. in Flora*, 1849, 558.—Deccan Peninsula, extending to Behar and W. Bengal.

VAR. vestita, *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. Prodr.* xi. 57; stem and leaves more hairy, capsule pubescent.—S. Deccan Peninsula and Ceylon.

VAR. heterophylla; leaves subentire lower suborbicular upper narrow-elliptic acute, uppermost lanceolate sometimes almost linear. *T. heterophylla*, *Wall. Cat.* 771.—Prome Hills and Ava; *Wallich*.—Possibly a distinct species, but the material is fragmentary; the calyx is 12-toothed, and the pedicel solitary axillary, so that it is hence near *T. fragrans*.

2. ***T. tomentosa***, *Wall.*; *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. Prodr.* xi. 58; leaves ovate or oblong acute, calyx-teeth in flower filiform much longer than the tube hairy, capsule villous. *T. Anders. in Journ. Linn. Soc.* ix. 449. *T. fragrans*, *Wall. Cat.* 767, partly.

NILGHERRIES, alt. 6500 ft.; *Wight, Sir F. Adam, Hohenacker, &c.*

Calyx-teeth in flower often $\frac{1}{4}$ in. *Bracts* 1 in., ovate, acute. *Corolla* pure white, tube $1\frac{1}{2}$ in., mouth 2 in. diam. *Ovary* densely shortly villous. *Capsule* $1-1\frac{1}{2}$ in.—Closely allied to *T. fragrans*, differing by the filiform calyx-teeth and large villous capsule. The thickening of the peduncles upwards in fruit, insisted on by T. Anderson, is more prominent in *T. fragrans* var. *lævis*.

*3. ***T. ALATA***; *Bojer; Hook. Exot. Fl.* t. 177; softly villous, leaves ovate-cordate, petiole often winged, corolla orange-yellow with a brown or claret eye. *Wall. Cat.* 7141; *Bot. Mag.* t. 2591; *Dalz. & Gibs. Bomb. Fl. Suppl.* 71; *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. Prodr.* xi. 58; *T. Anders. in Journ. Linn. Soc.* ix. 449; *Kurz For. Fl.* ii. 240.

INDIA, widely cultivated; naturalized in lower Assam and N.E. Bengal.—DISTRIB. Native of Africa.

Closely allied to *T. fragrans*, and often confounded with it. It is certainly African, and only introduced in India.

Sect. 2. ***Meyenia***. *Flowers* axillary, rarely imperfectly racemed. *Calyx* an entire or scarcely toothed ring. *Seeds* ovoid, base excavate.

4. ***T. Hawtayneana***, *Wall. Tent. Fl. Nep.* 49, in note, and *Cat.* 769, and *Pl. As. Rar.* ii. 52, t. 164; nearly glabrous, leaves sessile cordate-elliptic or -ovate-acute entire, pedicels short, corolla purple. *T. Hawtayneana*, *T. Anders. in Journ. Linn. Soc.* ix. 448. *Meyenia Hawtayneana*, *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. Prodr.* xi. 60; *Wight Ill.* t. 164 b, fig. 1, and *Id.* t. 1487.

Hills of the S. DECCAN PENINSULA; Canara, Bellary, Dharwar, Mangalore, Nilgherries, Kurg; *Wight, &c.*—CEYLON; *Walker*.

Stem slender. *Leaves* 3 by $1\frac{1}{2}$ in. *Pedicels* $\frac{1}{4}-1\frac{1}{4}$ in., solitary, a tuft of hair at their base; bracteoles $\frac{1}{2}-1$ in., ovate-oblong, nerved. *Corolla* $1\frac{1}{2}$ in., nearly glabrous, violet-purple, tube yellowish. *Filaments* with shortly stalked glands continued to the connective; anther-cells of the shorter stamens parallel, subsimilar, unappendaged; of the longer divergent, the upper oblique cell shortly mucronate at the base. *Stigma* funnel-shaped; lobes 2, oblong. *Capsule* $1-1\frac{1}{4}$ in., glabrous; seeds (ex *Wallich*) semiglobose.—In one example of *Wight's*, the flowers are on axillary branches 2-4 in. long, the floral leaves are reduced by degrees down to $\frac{1}{2}$ in. long, i. e. to "bracts," and the inflorescence becomes a raceme.

5. **T. lutea**, *T. Anders. in Journ. Linn. Soc.* ix. 448; leaves ovate acuminate or lanceolate toothed, pedicels longer than the petioles, corolla yellow or greenish-white.

SIKKIM, alt. 4-7000 ft., frequent; *J. D. H.*, &c.

Pubescent or nearly glabrous. *Stem* slender. *Leaves* 6 by 4 in. or (especially upper ones) on the same stem 4 by $\frac{3}{4}$ in., wide or cuneate, decurrent at the base, feather-nerved; petiole 1-2 in. *Pedicels* $\frac{1}{2}$ -4 in., solitary, glabrous or pubescent, with a tuft of hairs at the base; bracteoles $\frac{1}{2}$ - $\frac{3}{4}$ in., broadly ovate or round, herbaceous, connate when young. *Calyx* minute, shorter than the small pedicel within the bracteoles, crenulate. *Corolla* $1\frac{1}{2}$ in., glabrous, usually a faint yellow, greenish below. *Stamens* 4, subsimilar, fifth rudimentary; filaments hairy (at the base, glandular upwards; anther-cells lanceolate, subpendent, separate below, sparingly hairy, white, cells with a round green ciliate basal appendage. *Style* bifid, branches short, linear, subequal, stigmas subcapitate.

Sect. 3. **Hexacentris**. *Flowers* racemed, or the lower axillary. *Calyx* an entire or obscurely crenulate ring. *Seeds* dorsally compressed, base plane.

6. **T. grandiflora**, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 34; leaves ovate or uppermost lanceolate often angular or lobed scabrid or pubescent palmately 5-7-nerved, bracts deciduous lower often petioled leaf-like, corolla blue. *Wall. Cat.* 768, type sheet; *Bot. Mag.* t. 2366; *Bot. Reg.* t. 495; *Nees in Wall. Pl. As. Rar.* iii. 77, and in *DC. Prodr.* xi. 54; *Dalz. & Gibs. Bomb. Fl. Suppl.* 70; *Wight Ic.* t. 872; *T. Anders. in Journ. Linn. Soc.* ix. 447; *Kurz For. Fl.* ii. 240. *T. cordifolia*, *Nees l. c.* 55. *Flemingia grandiflora*, *Rottl. & Willd. in Nov. Act. Nat. Cur.* iv. 1803 (*vide Nees*).

BENGAL, alt. 0-4000 ft.; from Behar and Sikkim to Assam, Muneypoor and Chittagong, frequent.—DISTRIB. N. Burma (cult.? in China, Singapore, Bombay, &c.).

A large climber; uppermost leaves often passing into bracts. *Leaves* 6 by 3 in., acute, base cordate, toothed, often angularly lobed, pubescent, rarely glabrate; petiole 3 in. *Racemes* usually stout, pubescent, angular, somewhat dense-fld., or more slender, elongate, nearly glabrous; upper bracts small, inconspicuous; pedicels $\frac{1}{2}$ -3 in., opposite or fascicled; bracteoles $\frac{1}{2}$ -1 $\frac{1}{4}$ in., falcate-elliptic, acute, often cohering on one margin. *Calyx* subentire. *Corolla* 2-3 in. long and broad. *Filaments* widened below; anthers subsimilar, $\frac{1}{4}$ - $\frac{1}{2}$ in. long, bearded; cells parallel with a fine linear basal spur. *Ovary* pubescent or glabrescent; stigma very large, funnel-shaped; lobes 2, rounded. *Capsule* 1-2 in., pubescent or glabrous. *Seeds* flat, $\frac{1}{2}$ in. diam., sub-trigonal, covered (except the large base) with soft brown scaly plates.—Ordinary forms are easily distinguished by the pubescent angular leaves and pubescent raceme; but some Khasian examples are altogether glabrate with entire elliptic acute leaves; and, except by the leaves being 5-7-nerved rather than 3-nerved at the base, they might be placed with *T. laurifolia*.

VAR. ? *axillaris*; leaves cordate-ovate acute glabrate, pedicels axillary 2-3 in. 1-fld., capsule and seeds as of *T. grandiflora*.—Khasia; Theria Ghaut, *Clarke*.—Stems very slender for *T. grandiflora*; corolla noted yellow (but?). Marked by *Kurz* as a new species; but the examples do not show the ends of the branches.

7. **T. laurifolia**, *Lindl. in Gard. Chron.* 1856, 260; glabrous or innovations puberulous, leaves elliptic or oblong acuminate sinuate or denticulate palmately 3-nerved, bracts deciduous, corolla blue. *Bot. Mag.* t. 4985; *T. Anders. in Journ. Linn. Soc.* ix. 447, excl. syn. *Nees*; *Kurz For. Fl.* ii. 240. *T. grandiflora*, *Wall. Cat.* 768, partly. *T. Harrisii*, *Hook. Bot. Mag.* t. 4998.

MALAY PENINSULA, from Arracan to Malacca; *Wallich, Griffith*, &c. ANDAMANS; *Kurz*.

Resembling altogether *T. grandiflora*, but leaves narrower. *Seeds* very rugose, hardly scaly.—*T. Anderson* refers here “partly” *Hexacentris acuminata*, *Nees*, which is founded on *Wall. Cat.* 7140, collected in Silhet or Khasia, and described as having the leaves distinctly 5-nerved.

8. **T. coccinea**, *Wall. Tent. Fl. Nep.* 49, 58, t. 37, and *Cat.* 766; nearly glabrous, leaves elliptic acuminate toothed palmately 3-5-nerved, racemes elongate pendent, bracts subpersistent lower subsessile lanceolate, corolla red. *Don Prodr.* 120; *Hook. Exot. Fl.* t. 195; *Bot. Mag.* t. 5124; *T. Anders. in Journ. Linn. Soc.* ix. 448. *T. pendula*, *Hassk. Cat. Hort. Bogor.* 147. *Hexacentris acuminata*, *Nees*; *Wall. Cat.* 7140. *H. coccinea*, dentata & acuminata, *Nees in Wall. Pl. As. Rar.* iii. 78, and in *DC. Prodr.* xi. 61.

HIMALAYA, alt. 2-7000 ft., from Kumaon to Bhotan, frequent; *Wallich*, &c. ASSAM; *Griffith*. KHASIA MTS., alt. 1-4000 ft., frequent; *H. f. & T.*, &c. TEXAS-SEERIM; *Beddome*.—(Ceylon, &c., cultivated.)

A large climber; ‘pendent branches often 10-25 ft., terminated by racemes. *Leaves* 5-8 in., lower ovate, upper oblong, obtuse cordate or angular at the base; petiole $\frac{1}{2}$ -2 in., or of the uppermost leaves 0. *Racemes* 6-18 in., lax, pendent; bracts $\frac{1}{2}$ -1 in.; pedicels $\frac{1}{2}$ -1 $\frac{1}{2}$ in., opposite or fascicled; bracteoles $\frac{1}{2}$ -1 in., broadly oblong or ovate, subacute, often coherent on one side, blackish or purple. *Calyx* a minute rim. *Corolla-tube* 1 in., lobes $\frac{1}{2}$ in. round, from red to orange-rose. *Filaments* glabrous, linear, a tuft of hairs at the base; anther-cells parallel; anthers of the longer filaments have 1 cell long-spurred at base, 1 short-spurred or spurless; anthers of the shorter filaments muticous or with 1 cell shortly spurred. *Style-arms* linear; stigmas subcapitate. *Capsule* 1-1 $\frac{1}{2}$ in., minutely pubescent or nearly glabrous. *Seeds* nearly $\frac{1}{2}$ in. diam., subhemispheric (or at least thicker than those of *T. grandiflora*), rugose not scaly; base plane.—*Nees’* description is very erroneous.

9. **T. mysorensis**, *T. Anders. in Journ. Linn. Soc.* ix. 448; nearly glabrous, leaves elliptic acuminate toothed palmately 3-nerved, racemes elongate pendent, bracts small deciduous, corolla yellow. *Hexacentris mysorensis*, *Wight Ic.* t. 871; *Bot. Mag.* t. 4786; *Dalz. & Gibs. Bomb. Fl.* 183.

NILGHERRIES and MYSORE; *Wight*, &c.

An extensive climber; branches pendent. *Leaves* 6 by 1-3 $\frac{1}{2}$ in., base cuneate or rounded, strongly 3-nerved, a slender outer pair of nerves sometimes added; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Racemes* elongate, lax, long- or short-peduncled; bracts $\frac{3}{4}$ - $\frac{1}{2}$ in., linear-lanceolate, inconspicuous; pedicels $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; bracteoles 1 in., falcate-elliptic, subacute, often coherent on one side, purplish-green. *Corolla* 1 $\frac{1}{2}$ in., mouth 2 in. diam.; tube purplish, limb yellow; in cultivation sometimes with a red border (*Part. Fl. Gard.* iii. t. 88). *Anthers* subsimilar; cells parallel, hairy, all spurred at base. *Stigma* funnel-shaped, margin somewhat 2-lipped. *Capsule* 1 $\frac{1}{2}$ in., glabrous. *Seeds* $\frac{1}{2}$ in. diam., rugose.

10. **T. Wightiana**, *T. Anders. in Journ. Linn. Soc.* ix. 448; nearly glabrous, leaves ovate acuminate toothed palmately 3-5-nerved, bracts inconspicuous, bracteoles large cordate-orbicular nerved, corolla light blue. *Schmidia bicolor*, *Wight Ic.* t. 1848.

NILGHERRIES; Sisparah, *Wight*, *Beddome*.

An extensive climber. *Leaves* 5 by 3 $\frac{1}{2}$ in., base rhomboid or rounded; petiole 1-2 in. *Racemes* axillary or from nodes of the old wood, 6-12 in.; bracts $\frac{3}{4}$ - $\frac{1}{2}$ in., linear-lanceolate, deciduous; pedicels opposite, 1 in., 2-ranked, curved; bracteoles 1 by 1 $\frac{1}{2}$ in., obtuse with a mucro, purple and cream-coloured (*Wight*). *Corolla* 1 $\frac{1}{2}$ -1 $\frac{3}{4}$ in., somewhat narrowly tubular, mouth 1 $\frac{1}{2}$ in. diam. *Anthers* subsimilar; cells parallel, glabrous, spurred at the base. *Ovary* and style glabrous; stigma funnel-shaped, hardly 2-lobed. *Fruit* not seen.

II. **ELYTRARIA**, *Vahl*.

Herbs, nearly stemless. *Leaves* alternate, crowded, subradical. *Scapes* covered by imbricated bracts; spikes close, rigid, simple or divided; bracts spirally imbricate, not opposite; bracteoles smaller than the bracts. *Calyx* sub-4-partite, segments unequal, the largest sometimes 2-fid. *Corolla* small, white or blueish; tube linear, limb 2-lipped; lobes 5, oblong, imbricate in bud. *Stamens* 2 perfect, attached in the corolla-throat; anthers elliptic, acute; cells 2, parallel, with or without a minute spur at the base. *Style* shortly 2-lobed; ovules 6-10 in each cell, superimposed. *Capsule* ellipsoid, acute. *Seeds* minute, ovoid, reticulated, minutely papillose, attached at a minute point without retinacula.—Species 3-4, American, whereof 1 is widely spread in tropical Africa and Asia.

E. crenata, *Vahl Enum.* i. 106; leaves obovate or elliptic obtuse crenate, bracts elliptic acuminate to a single sharp point. *Wall. Cat.* 2420; *Nees in Wall. Pl. As. Rar.* iii. 79, and in *DC. Prodr.* xi. 63; *T. Anders. in Journ. Linn. Soc.* ix. 449; *Dalz. & Gibs. Bomb. Fl.* 183. *E. lyrata*, *Vahl l. c.* *E. virgata*, *Vahl l. c.*; *Nees in DC. Prodr.* xi. 63. *E. marginata*, *Beauv. Fl. Ovar.* ii. 58, t. 93; *Nees in DC. l. c.* 63. *E. indica*, *Pers. Syn.* i. 23. *E. Vahlia*, *Michx. Fl. Bor. Am.* i. 9, t. 1. *Justicia acaulis*, *Linn. f. Suppl.* 84; *Roxb. Cor. Pl.* ii. 15, t. 127, and *Fl. Ind.* i. 119.

DECCAN PENINSULA and CEYLON, common southwards; extending north to Delhi, and to the E. Himalaya, *Griffith*.—DISTRIB. Tropical and S. Africa; tropical and N. America.

Stem 0-2 in., woolly. *Leaves* 2-5 in., sometimes obtusely lobed, pubescent at least on the nerves beneath, sessile or narrowed into a petiole. *Scapes* several, 3-10 in., clothed with bract-like scales. *Spikes* $\frac{1}{2}$ -4 in., harsh, simple or branched; bracts $\frac{1}{2}$ in., margins scarious, ciliate; bracteoles $\frac{1}{2}$ in., scarious, ciliate. *Calyx* $\frac{1}{2}$ in.; segments lanceolate, scarious, ciliate, the broad one entire at the apex. *Corolla* $\frac{1}{2}$ - $\frac{3}{4}$ in., white or blueish. *Anthers* muticous at the base; rudiments of 2 barren stamens sometimes (at least) present. *Capsule* $\frac{1}{2}$ in., rigid; valves resilient.—The stem is in African examples sometimes considerably elongate branched, and in American examples the scape is sometimes very tall.

III. **NELSONIA**, *R. Br.*

A diffuse, softly villous herb. *Leaves* opposite, elliptic, entire. *Spikes* ovate or cylindric; bracts ovate, glandular-villous, closely imbricate, alternate or spirally scattered; bracteoles 0. *Sepals* 4, unequal, lanceolate, the larger often bifid. *Corolla* very small, purplish rose or white; tube slender, limb 2-lipped; lobes 5, obtuse, patent. *Stamens* 2, attached above the middle of the tube; anthers 2-celled, subincluded; cells broadly ellipsoid, distinct, more or less divergent, glabrous or ciliate, muticous or minutely spurred. *Stigma* very shortly 2-lobed; ovules in each cell 8-10. *Capsule* oblong, acute, bearing seeds from the base, barren upwards. *Seeds* small, roundly ellipsoid, smooth with granular marks, attached on minute points without retinacula.

N. campestris, *Br. Prod.* 481; *Endl. Iconogr.* t. 79; *Benth. Fl. Austral.* iv. 543. *N. tomentosa*, *Nees in Wall. Pl. As. Rar.* iii. 79, and in *DC. Prodr.* xi. 65; *Griff. Notul.* iv. 132; *Dalz. & Gibs. Bomb. Fl.* 183; *T. Anders. in Journ. Linn. Soc.* ix. 450. *N. organoides*, *Roem. & Sch. Syst.* i. 173. *N. lamiifolia*, *Spreng. Syst.* i. 42. *N. canescens*, *Nees in DC. l. c.* 67.

N. villosa, senegalensis & Smithii, *Oersted in Vidensk Meddel. Kjobenh.* (1854) iv. 117, 118, t. 4, fig. 3-18. *Justicia canescens* & brunelloides, *Lamk. Ill.* i. 40, 41. *J. hirsuta*, *Vahl Enum.* i. 122. *J. lamifolia*, *Koen.*; *Rozb. Fl. Ind.* i. 134. *J. tomentosa*, *Wall. Cat.* 2370. (Other American, African and Australian synonyms omitted.)

Throughout INDIA, alt. 0-4000 ft., from the Himalaya to Ceylon and Malacca, common: not in western desert India.—DISTRIB. S.E. Asia, Australia, Africa, America.

Stems mostly short, with petioled leaves often 4-8 in. long; flowering stems trailing, 1-3 ft., with subsessile leaves $\frac{1}{2}$ -2 in. *Spikes* $\frac{1}{2}$ -2 in., mostly sessile, terminal on lateral branches; bracts $\frac{1}{6}$ - $\frac{1}{4}$ in., obtuse, herbaceous. *Calyx* $\frac{1}{4}$ in., green, striate, hairy or subscabrous. *Corolla* $\frac{1}{6}$ in. *Ovary* and style glabrous. *Capsule* $\frac{1}{6}$ - $\frac{1}{4}$ in., 8-12-seeded. *Seeds* yellowish with brown granulations.—The picture of the seed by Kippist in *Trans. Linn. Soc.* xix. t. 6, fig. 11, showing the surface with hammer-headed spines, is erroneous.

VAR. vestita; suberect, hairy, leaves very large, corolla-lobes acute. *N. vestita*, *Roem. & Sch. Syst.* i. *Mant.* 145. *Justicia tomentosa*, *Rozb. Hort. Beng.* 4, and *Fl. Ind.* i. 131. *J. bengalensis*, *Spreng. Syst.* i. 82. *Dianthera tomentosa*, *Rozb. Ic. Ined. in Herb. Kew.*—Pegu; *M'Leiland, Brandis, &c.*—Cauline leaves attaining 10 in., uppermost 3-5 in.; petiole 2 in. *Bracts* elliptic, acute.—Dr. King says that it is very easy to distinguish this from every form of *N. campestris*, but that he can give no good character for it, and that it had better be regarded as an extreme form of that plant. Roxburgh says the capsule is 4- or 8-seeded; it is really as that of *N. campestris* type.

IV. **EBERMAIERA**, *Nees*.

Herbs or small undershrubs. *Leaves* opposite (in *E. glauca* alternate), entire or nearly so. *Spikes* or *racemes* terminal or quasi-axillary, simple or compound, dense or lax; bract at the base of the pedicel leaf-like or overtopping the flower or small inconspicuous; bracteoles 2 near the base of the calyx, smaller than the bract. *Sepals* 5, oblong or linear, subequal or one larger. *Corolla-tube* elongate, cylindric (in *E. coriacea* & *parviflora* short-funnel-shaped); lobes 5, short, patent. *Stamens* 4, didynamous, included in the corolla-tube (in *E. coriacea* & *parviflora* shortly exsert); filaments patently hairy (in *E. parviflora* glabrous); anther-cells 2, ovoid, separate, mucinous. *Disc* inconspicuous. *Ovary* glabrous or nearly so; style linear glabrous; lobes 2, oblong, the lower frequently again 2-lobed; ovules very many. *Capsule* small, oblong, bearing seeds from the base to near the apex. *Seeds* 15-30 in each cell, small, globose or cuboid; hilum a minute hollow; retinacula 0; unripe glandular, ultimately nearly smooth or with obscure shallow pits; albumen thin, cartilaginous (*Benth.*).—Species 40, in S.E. Asia, Malaya, Australia, and Brazil.

* *Flowers sessile or subsessile, spikes elongate or capitate rarely divided, sepals $\frac{1}{4}$ in. or more one often distinctly larger than the others.*

1. ***E. glauca***, *Nees in DC. Prodr.* xi. 73; stem patently viscous-pubescent upwards, leaves petioled spatulate-oblong upper alternate, spikes elongate lax interrupted below, lower bracts petioled linear-spatulate much exceeding the flowers, corolla $\frac{1}{4}$ - $\frac{1}{2}$ in. *Wall. Cat.* 9083; *Wight Ill.* t. 164 b, fig. 2, and *Ic.* t. 1488; *Dalz. & Gibs. Bomb. Fl.* 184; *T. Anders. in Journ. Linn. Soc.* ix. 450, in some part and excl. syn. *E. ligulata*, *Bedd. Ic. Pl. Ind. Or.* t. 245.

W. DECCAN PENINSULA and S. MADRAS, frequent; *Wight, &c.* BENGAL; Darjeeling Terai, *Clarke*. TENASSERIM; *Beddome*.

Stems 12-15 in.; lower leaves and branches opposite or leaves nearly all alter-

Leaves 2 by $\frac{3}{4}$ in., obtuse, base attenuate, slightly viscous-pubescent or glabrate, entire or sinuate; petiole $\frac{1}{4}$ in. *Spikes* 2-6 in.; lowest bracts altogether leaf-like (whence T. Anderson says "flowers solitary axillary"); tip of the spike often dense with short bracts resembling the spike of neighbouring species; bracteoles linear, obtuse, shorter than the calyx. *Sepals* 4 subsimilar, $\frac{1}{4}$ in., linear-subulate, sparsely glandular-hairy; the fifth longer, much broader, linear-oblong, obtuse. *Corolla* straight, slightly pubescent without, purplish with rose or yellow stripes. *Auther-cells* mucous or minutely mucronate at base. *Capsule* $\frac{1}{2}$ in.—Described from Nees' type specimen; Wight's figure is taken from a form having a much denser more glandular-pubescent spike. The Australian species referred here by T. Anderson and Bentham differs in its hairy ovary and capsule, and many other minute points; but it might be better to unite it, and make a whole-sale reduction of species here.

VAR. spatulata; leaves very spatulate, spikes denser only a few of the lowest elongate, calyx and bracteoles very glandular-hairy, corolla scarcely $\frac{1}{4}$ in. *Adenosma spatulatum*, *Blume Bijdr.* 757. *Ebermaiera spatulata*, *Hassk.*; *Nees in DC. Prodr.* xi. 74, partly?—Pegu; *Kurz.* Tenasserim; *Beddome.* Bengal; Pubna, *Clarke.*—Distrib. Java.—Growing in rice-swamps; stems erect, thick, quadrangular or striate; many or nearly all the leaves alternate.—*Ebermaiera spatulata*, Nees, is described from a Philippine plant of Caming's, which widely differs from Kurz's Pegu specimens.

2. *E. polybotrya*, *Nees in DC. Prodr.* xi. 74; stems erect adpressedly grey-pubescent upwards, leaves elliptic subobtuse at both ends, spikes cylindric not lax downwards, bracts narrowly oblong scarcely exceeding the calyx, corolla $\frac{1}{4}$ in.

BENGAL; frequent in Terai swamps in Sikkim and Silhet, *J. D. H.*, &c. MOULMEIN and MERGUI; *Griffith.*

Stems 6-8 in., often branched from the base. *Leaves* all opposite, even at the base of the spike, $1\frac{1}{2}$ by $\frac{1}{2}$ in., subentire, minutely pubescent on the nerves beneath or glabrous; petiole 0 or in the lower leaves scarcely $\frac{1}{8}$ in. *Spikes* $1\frac{1}{4}$ in.; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in.; bracteoles linear, shorter than the calyx. *Sepals* 4 subsimilar, narrow-linear, subobtuse; the fifth rather longer, much broader, oblong, obtuse. *Corolla*, *stamens*, and *capsule* nearly as of *E. glauca*.

3. *E. humilis*, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 74; stem erect branched adpressed white-pubescent upwards, leaves opposite subsessile narrowly elliptic, heads terminal small globose, bracts oblong sessile hardly so long as the calyx, corolla $\frac{1}{2}$ in. and upwards. *Wall. Cat.* 7148; *T. Anders. in Journ. Linn. Soc.* ix. 450.

BURMA; Prome Hills, *Wallich.*

Stem 6-8 in., branched from near the base; branches ascending, shorter than the central stem. *Leaves* $1\frac{1}{4}$ by $\frac{1}{2}$ in., obtusely rhomboid at both ends, nearly glabrous, adpressedly white-pubescent on the nerves beneath; petiole hardly $\frac{1}{2}$ in. diam. *Heads* sessile, $\frac{1}{2}$ - $\frac{3}{4}$ in. diam.; bracts and bracteoles $\frac{1}{4}$ in. *Sepals*, 4 linear, subobtuse; the fifth slightly larger, oblong obtuse.—Nearly allied to *E. polybotrya*, but the heads are not elongate cylindric, the bracteoles and sepals are less acute, the corolla is larger.

4. *E. glutinosa*, *Wall. Cat.* 9087; stem trailing rooting pubescent, leaves elliptic, base attenuate, heads subspherical on short branches and quasi-axillary, bracts elliptic sessile hardly so long as the calyx, corolla $\frac{1}{2}$ in. *Ebermaiera* sp., *Wall. Cat.* 9085. *E. glauca*, *T. Anders. in Journ. Linn. Soc.* ix. 450, in great part.

CENTRAL INDIA, N.W. PROVINCES, and BENGAL, frequent; Moradabad, *Thomson*; Behar, *J. D. H.*; Bundelcund, *Edgeworth*; Silhet, *Wallich*, &c.

Stems numerous, 12-18 in.; nodes in the trailing branches distant. *Leaves* all (or nearly all) opposite, $1\frac{1}{2}$ by $\frac{3}{4}$ in., subobtuse, entire, minutely pubescent or glabrous;

petiole 0- $\frac{1}{4}$ in. *Heads* 2-8-fld.; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ in., narrowly obovate-oblong. *Sepals* 4, linear, subobtusely, viscidly pubescent; the fifth slightly longer, oblong, obtuse. *Corolla* blueish with dark veins. *Ovary* minutely pubescent upwards; one stigma-lobe oblong, the other bifid.—Easily separated from *E. glauca* by its habit, opposite leaves and large flowers.

5. *E. zeylanica*, *Nees in DC. Prodr.* xi. 74; trailing branches pubescent, leaves elliptic subobtusely narrowed at the base, spikes cylindric, bracts obovate slightly longer than the flowers, corolla $\frac{1}{4}$ - $\frac{1}{2}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 451, *excl. syn.* *E. glauca*, *T. Anders. in Thwaites Enum.* 224, *not in Nees.* *Erythracanthus elongatus*, *Dalz. & Gibs. Bomb. Fl.* 184, *not of Nees.*

W. DECCAN PENINSULA and CEYLON; Concan, *Dalzell, Stocks, &c.* CEYLON; *Maeræ, Thwaites.*

Stem erect, short, with large leaves, and flowering runners with much smaller leaves. *Leaves* 3 by 1 in., subentire, sparsely hairy on both surfaces, or glabrate with nerves beneath pubescent; petiole $\frac{1}{2}$ in., or in the leaves of the lateral branches 0. *Spikes* 1-2 in., dense; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., obtuse, apiculate, strongly 1-nerved; bracteoles $\frac{1}{2}$ in., linear-spathulate. *Sepals* 4, linear, rather shorter than the bracts; the fifth rather broader, linear, subacute. *Corolla*, stamens, and capsule nearly as of *E. glauca*.

6. *E. thyrsoides*, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 75; stem erect hairy, leaves petioled elliptic-spathulate subobtusely, spikes cylindric thyrsoid, bracts oblong very acute scarcely longer than the flowers, corolla $\frac{1}{2}$ in. *Wall. Cat.* 7149. *E. zeylanica*, *T. Anders. in Journ. Linn. Soc.* ix. 451, *partly.* *E. diffusa*, *Kurz in Journ. As. Soc.* 1871, pt. ii. 74. *Capraria diffusa*, *Roxb. Fl. Ind.* iii. 93, *fide Kurz.*

EAST FRONTIER from Cachar, *Keenan*, to Tenasserim, *Beddome*; plentiful in Chittagong, *J. D. H., &c.*

Stem 8-18 in., decumbent at the very base, then erect, longer than the ascending branches. *Leaves* 3 by $\frac{3}{4}$ in., hairy. *Spikes* axillary and terminal 1-4 in.; pedicels of the lower flowers $\frac{1}{10}$ - $\frac{1}{2}$ in.; bracteoles with fine hairs often $\frac{1}{2}$ - $\frac{1}{4}$ in. long. *Sepals* 4, subsimilar, linear, with fine long hairs; the fifth longer, narrowly lanceolate, twice as broad. *Corolla* (at least often) white or very nearly so. Otherwise as *E. zeylanica*, with which *T. Anderson* united this species; but it appears amply distinct.

7. *E. incana*, *Hassk. Hort. Bogor.* 147; stem short suberect scarcely branched, leaves petioled elliptic shortly softly hairy on both surfaces, spikes cylindric, bracts lanceolate shorter than the calyx not aristate, corolla $\frac{1}{2}$ in. *E. velutina*, *Nees in DC. Prodr.* xi. 76; *T. Anders. in Journ. Linn. Soc.* ix. 452.

MERGUI; *Griffith.* TENASSERIM (or Andamans), *Helfer* (*Kew Distrib.* n. 6080).—DISTRIB. Java?

Stem decumbent, base almost woody, then erect, 3-4 in., closely rusty-villous. *Leaves* 4 by 1 $\frac{1}{2}$ in., obtuse, base narrowed, subentire; petiole $\frac{1}{2}$ -1 in. *Spikes* 1-1 $\frac{1}{2}$ in., dense; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{6}$ in., broadly lanceolate, closely softly hairy. *Sepals*, two $\frac{1}{2}$ in. linear, two nearly $\frac{1}{2}$ in. linear, one $\frac{1}{2}$ in. lanceolate; all slightly pubescent and ciliate. *Corolla* and stamens nearly as in *E. glutinosa*. *Capsule* $\frac{1}{4}$ in.—*Nees* says that this is nearly the same as *E. incana*, *Hassk.*, of which I have seen no specimen; and *Kurz* says (*Journ. As. Soc.* 1870, pt. ii. 78) that it is quite the same. By habit, bracts and indumentum it approaches *E. macrophylla*, *T. Anders.*

8. *E. lanceolata*, *Hassk. Hort. Bogor.* 147; stems short branched suberect, leaves oblong or narrowly elliptic cuneate at both ends glabrate or minutely pubescent beneath, spikes cylindric dense, bracts oblong acute

pubescent hardly ciliate, calyx ciliate shorter than the bract, corolla $\frac{1}{2}$ in. and upwards. *Nees in DC. Prodr.* xi. 76; *Kurz in Journ. As. Soc.* 1870, pt. ii. 78. *E. argentea*, *Nees l. c.*; *T. Anders. in Journ. Linn. Soc.* ix. 451. *Adenosma lanceolatum*, *Blume Bijd.* 757. *Staurogyne*, *Wall. Cat.* 7489.

PENANG; *Wallich*. MALACCA; *Griffith*. TENASSERIM (or Andamans), *Helper* (Kew Distrib. n. 6077).—DISTRIB. Java.

Stems 3–6 in., base almost woody, pubescent. *Leaves* 3 by $\frac{3}{4}$ in., narrowed to an obtuse apex, entire, sinuate, pubescent on the nerves beneath, and sometimes also slightly on the lamina; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Spikes* 2 in., dense; bracts $\frac{3}{4}$ in., not aristate; bracteoles $\frac{1}{2}$ in., narrow-lanceolate, ciliate. *Sepals* 4, $\frac{1}{2}$ in., linear; the fifth slightly longer and broader; all prominently ciliate. *Capsule* $\frac{1}{4}$ in.

9. *E. Staurogyne*, *Nees in DC. Prodr.* xi. 75; stem decumbent short, leaves narrowly elliptic whitened beneath, spikes short cylindric or capitate, bracts lanceolate 3-nerved long-aristate pubescent not ciliate, corolla $\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 451, *excl. all syn.* *Staurogyne argentea*, *Wall. Pl. As. Rar.* ii. 80, t. 186, and *Cat.* 4905.

KHASIA HILLS up to 3000 ft. alt., and N. SILHET, frequent; *Wallich*, *Griffith*, *H. f. & T.*, &c.

Stems 3–8 in., pubescent, prostrate, rooting, base almost woody. *Leaves* 4 by $1\frac{1}{2}$ in., subobtusate, base rounded or cuneate, entire, glabrous, nerves beneath prominent puberulous; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ –2 in.; bracts $\frac{1}{2}$ in. with awns $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., linear, awns $\frac{1}{2}$ in. *Sepals* $\frac{1}{2}$ in., linear, awns $\frac{1}{2}$ in. *Corolla* purple with rose marks. *Style* bifid, lower lobe 2-partite. *Capsule* $\frac{1}{4}$ in.

10. *E. angustifolia*, *T. Anders. in Journ. Linn. Soc.* ix. 451, *excl. many syn.*; stem decumbent short, leaves narrowly elliptic somewhat whiter beneath, spikes short cylindric or capitate, bracts lanceolate 3-nerved long-awned pubescent ciliate, awns of the bracteoles and sepals without hairs or cilia. *E. Staurogyne* β *angustifolia*, *Nees in DC. Prodr.* xi. 75. *Staurogyne angustifolia*, *Wall. Cat.* 4906.

CHITTAGONG, alt. 0–1000 ft., frequent; *H. f. & T.*, &c. PEGU; *J. Scott*. MOULMEIN; *Griffith*. RANGOON; *M'Lelland*. TENASSERIM; King's Island, *Helper*.

Very near *E. Staurogyne*; but the long white cilia on the margin of the lanceolate portion of the bracts and bracteoles at flower-time give the heads a different aspect. The characters drawn from the breadth of the leaves and the cuneation of their bases fail; and Mr. Bentham has noted the species as perhaps only a var. of *E. Staurogyne*. T. Anderson has variously marked it, *E. Staurogyne*, *setigera*, *angustifolia*, and *aristata*. The awns of the bracteoles and sepals have very minute white adpressed bristles.

11. *E. setigera*, *Nees in DC. Prodr.* xi. 76; stems short branched, leaves short-petioled narrowly elliptic, spikes capitate, bracts almost linear, bracteoles and sepals subulate hairy nearly to their tip with patent long tawny hairs from bulbous bases, corolla $\frac{1}{2}$ in. and upwards. *T. Anders. in Journ. Linn. Soc.* ix. 451. *E. trichocephala*, *Miq. Fl. Ind. Bat.* ii. 774.

MALACCA; *Cuming*.—DISTRIB. Sumatra, Borneo.

Stem 3–6 in., pubescent. *Leaves* 2 by $\frac{3}{4}$ in., cuneate, subobtusate at both ends, glabrous above, puberulous whiter beneath; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ –1 in.; bracts $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, long-attenuate, subulate, scarcely awned, herbaceous not nervose (as in the two preceding species); bracteoles similar, but rather shorter. *Sepals* $\frac{1}{2}$ in., linear-subulate, hardly aristate. *Capsule* $\frac{1}{4}$ in.; bracteoles and sepals less stellate in fruit than in *E. angustifolia*.—*E. trichocephala*, *Miq.*, is referred by *Kurz* (*Journ. As. Soc.* 1870, pt. ii. 78) to *E. lanceolata*, and by T. Anderson (*Journ. Linn. Soc.*

ix. 451) to *E. Staurogyne*; but from the description and habitat is surely *E. setigera*.

12. **E. longifolia**, *Nees in DC. Prodr.* xi. 76; leaves long-petioled lanceolate, spikes cylindric softly hairy, lower flowers somewhat pedicelled, bracts narrow-lanceolate attenuate subulate herbaceous hairy below minutely pubescent upwards, corolla $\frac{1}{2}$ – $\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 451.

MALACCA; *Griffith* (Kew Distrib. n. 6079), *Cuming*.

Branches 3–8 in., divided, pubescent; innovations white-silky, subtomentose. *Leaves* 5 by $1\frac{1}{2}$ in., narrowed to both ends, subobtusely, base cuneate, subtire, sinuate, glabrous above, puberulous whiter beneath; petiole $\frac{1}{2}$ –2 in. *Spikes* 1–2 $\frac{1}{2}$ in.; lower pedicels often $\frac{1}{2}$ in.; bracts $\frac{3}{4}$ in.; bracteoles similar but rather narrower and shorter. *Sepals* $\frac{1}{2}$ in., very like the bracteoles. *Capsule* $\frac{1}{4}$ in., rather broader than in the preceding species.

13. **E. axillaris**, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 75; branches almost woody, leaves elliptic narrowed at both ends minutely punctate above, spikes cylindric drooping very hairy, bracts lanceolate acuminate hairy, corolla $\frac{1}{2}$ in. very hairy without. *T. Anders. in Journ. Linn. Soc.* ix. 452. *Ruellia?* *comosa*, *Wall. Cat.* 2414.

PENANG; *Wallich*.

Leaves 6 by $1\frac{1}{2}$ –2 $\frac{1}{4}$ in., subobtusely, base cuneate, nearly entire, glabrous, pubescent on the nerves beneath; petiole $\frac{1}{4}$ –1 in. *Spikes* 2–4 in., dense, several among the penultimate leaves on the branch; bracts $\frac{1}{2}$ in., flaccid; pedicels hardly any; bracteoles resembling the bracts, but narrower and rather shorter. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, acuminate, softly hairy. *Capsule* $\frac{1}{2}$ in.

** *Lower flowers of the racemes more or less distinctly pedicelled, racemes often paniced, sepals $\frac{1}{2}$ in. or more not very unequal.*

14. **E. Simonsii**, *T. Anders. in Journ. Linn. Soc.* ix. 451; leaves large elliptic narrowed at both ends, racemes paniced white-hairy, bracts linear, sepals linear covered to the tips on all sides with glistening white hairs, corolla $\frac{1}{2}$ in.

KHASIA HILLS; Bor Pani, alt. 2500 ft., *Simons*.

Stems 6 in., stout, woody, branched, villous upwards. *Leaves* 8 by $3\frac{1}{2}$ in., subobtusely, base cuneate, nearly entire, sparsely hairy or finally glabrate above, glabrous, paler beneath, puberulous on the nerves; petiole 1–2 in. *Racemes* dense, sparingly branched or laxly paniculate, 1–4 in.; bracts $\frac{1}{2}$ in., very narrowly linear, obtuse; pedicels often $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ – $\frac{1}{2}$ in., narrowly linear. *Sepals* nearly $\frac{1}{2}$ in., two of them somewhat shorter. *Corolla* nearly glabrous without. *Capsule* $\frac{1}{4}$ in.

15. **E. Helferi**, *T. Anders. in Journ. Linn. Soc.* ix. 452, chiefly; stem short stout, leaves obovate-oblong closely minutely pubescent on the surface above and the nerves beneath, peduncles bearing 1 or several racemes, bracts petioled elliptic obtuse whitened membranous nearly glabrous, sepals linear obtuse nearly glabrous.

TENASSERIM; Attaran, *Helfer* (Kew Distrib. n. 6075). PEGU; Thoungyun, *Brandis*.

Stem 4 in., villous, simple. *Leaves* 9 by 5 in., obtuse, base attenuated, somewhat whitened beneath; petiole $\frac{1}{2}$ –1 in. *Peduncles* 1–5 from the penultimate axils, 1–3 in., reddish, minutely pubescent. *Racemes* 1–3 in., somewhat dense; bracts $\frac{1}{2}$ by $\frac{1}{4}$ in., nervose; pedicels sometimes $\frac{1}{2}$ – $\frac{1}{6}$ in.; bracteoles $\frac{1}{2}$ in., narrowly oblong, resembling the bract, upper shorter and narrower. *Sepals* 4, $\frac{1}{4}$ in., of which 2 rather shorter; the fifth rather longer, twice as broad, 3-nerved. *Corolla* $\frac{1}{2}$ in., glabrous or nearly so.

Capsule $\frac{1}{4}$ in.—T. Anderson l. c. describes one of the bracts as at the same time 1-nerved and 3-nerved, but he subsequently himself separated in the Herbarium his *E. macrophylla*.

16. ***E. macrophylla***, T. Anders. in *Herb. Kew*; stem hardly any, leaves short-petioled obovate-oblong obtuse minutely closely pubescent on the surface above and on the nerves beneath, peduncle simple or branched, racemes slender pubescent, bracts and bracteoles small spatulate-elliptic herbaceous pubescent. *E. Helfer*, T. Anders. in *Journ. Linn. Soc.* ix. 452, in part.—Ebermaiera, Wall. Cat. 9086.

LOWER BURMA; Chappedong, Wallich; Moulmein, Parish, Lobb.

Stem 1–3 in., stout, villous. *Leaves* 7 by 4 in., base broadly rhomboid; petiole $\frac{1}{8}$ – $\frac{3}{8}$ in. *Peduncles* $\frac{1}{4}$ in.; spikes 3 in.; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in.; pedicels $\frac{1}{10}$ in.; bracteoles $\frac{1}{8}$ – $\frac{1}{4}$ in., resembling the bracts, unequal. *Sepals* $\frac{1}{2}$ in., linear, scarcely acute, pubescent. *Corolla* $\frac{1}{2}$ in., glabrous or nearly so.—Exceedingly near *E. Helfer*, but the bracts and bracteoles are much smaller, not white membranous nervose.

17. ***E. Griffithiana***, T. Anders. in *Journ. Linn. Soc.* ix. 452; stem short, leaves petioled elliptic rounded at both ends minutely closely pubescent above, racemes elongate paniced, bracts elliptic pubescent, sepals $\frac{1}{4}$ – $\frac{1}{2}$ in. linear. *Erythracanthus Griffithianus*, Nees in *DC. Prodr.* xi. 78. *E. obtusus*, Wight *Ic. t.* 1491, not of Nees.

MALACCA; Griffith (Kew Distrib. n. 6078).

Stem 3–6 in., herbaceous, branched, pubescent. *Leaves* 5 by 3 in., pubescent beneath or finally on the nerves only; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. *Peduncles* 1–2 in., reddish; racemes up to 5 in.; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., hardly acute; pedicels 0– $\frac{1}{4}$ in.; bracteoles $\frac{1}{3}$ by $\frac{1}{2}$ in., similar to the bracts. *Sepals* subequal, narrowly linear, somewhat striate longitudinally. *Capsule* $\frac{1}{4}$ in.

18. ***E. elongata***, Nees in *DC. Prodr.* xi. 721; leaves oblong acute at both ends punctate obscurely pubescent above, racemes elongate lax, bracts linear-lanceolate, sepals $\frac{1}{2}$ in. almost equal sublinear pubescent. T. Anders. in *Journ. Linn. Soc.* ix. 452. *Adenosma elongatum*, Blume *Bijd.* 757. *Erythracanthus elongatus*, Nees in *DC. Prodr.* xi. 78, excluding *Var. β*.

PENANG; Wallich (fide T. Anderson).—DISTRIB. JAVA.

Stem 6 in., erect, pubescent. *Leaves* 6 by 2 in., obscurely pubescent beneath, herbaceous, concolorous or nearly so, nerves beneath inconspicuous; petiole 1–2 $\frac{1}{2}$ in. *Raceme* 10 in., branched near the base; bracts $\frac{1}{2}$ by $\frac{1}{10}$ in., acuminate, scarcely awned; pedicels 0– $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., linear. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., minutely pubescent without. *Capsule* nearly $\frac{1}{2}$ in.—The example from Java marked *E. subpaniculata*, Hassk., is *E. elongata*, Nees; but it may perhaps be wrongly named, as the description of Hasskarl (in *Retzia*, 77) says inter alia that the leaves of *E. subpaniculata* are mostly alternate, much whitened beneath.

19. ***E. lasiobotrys***, Nees in *DC. Prodr.* xi. 721; stem erect sub-tomentose upwards, leaves narrowly elliptic cuneate at both ends glabrate above, racemes elongate very lax, bract filiform very small, sepals $\frac{1}{4}$ in. linear with patent white hairs to the tips on all sides. Wall. Cat. 9084; T. Anders. in *Journ. Linn. Soc.* ix. 452.

LOWER BURMA; Chappedong Hills, Wallich; Mergui, Griffith; Moulmein, Falconer; Tavoy, Parish.

Stem decumbent, rooting, then 6–15 in. erect. *Leaves* 5 $\frac{1}{2}$ by 2 in. (usually smaller), mature glabrous minutely pubescent on the nerves beneath; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. *Panicles* 6–12 in., straggling; racemes 2–5 in., lower flowers distant; bracts $\frac{1}{2}$ – $\frac{3}{4}$ in.;

lower pedicels $\frac{1}{8}$ – $\frac{1}{6}$ in.; bracteoles $\frac{1}{10}$ in., filiform. *Sepals* subequal, somewhat larger in fruit. *Corolla* $\frac{1}{2}$ in., narrow tubular, sparsely minutely hairy. *Capsule* $\frac{1}{4}$ in.

20. **E. paniculata**, *Wall. mss.*; *T. Anders. in Journ. Linn. Soc.* ix. 453; stem erect subtomentose upwards, leaves narrowly elliptic cuneate at both ends glabrate above, panicle compound, racemes lax, bracts filiform very small, sepals $\frac{1}{4}$ in. linear nearly glabrous.

MUNEYPOOR; *Hort. Calcutt.* S.E. ASSAM (or Ava), *Griffith* (Kew Distrib. n. 6082). *Stems* 1 foot, woody, sometimes branched. *Leaves* 7 by 3 in. (often smaller) scarcely acute, prominently reticulated, pubescent on the nerves beneath; petiole $\frac{1}{4}$ – $\frac{3}{8}$ in. *Panicles* (including peduncles) 6–9 in., reddish, minutely pubescent; bracts $\frac{1}{8}$ – $\frac{1}{6}$ in., minutely pubescent; pedicels $\frac{1}{8}$ – $\frac{1}{6}$ in.; bracteoles $\frac{1}{10}$ in., filiform. *Sepals* $\frac{1}{8}$ in. in flower, $\frac{1}{4}$ in. or more in fruit. *Corolla* $\frac{1}{2}$ in., slender, nearly glabrous. *Capsule* $\frac{1}{8}$ – $\frac{1}{2}$ in.—Closely allied to *E. lasiobotrys*, but with smaller flowers and fruit, and the panicle without the abundant hair of *E. lasiobotrys*.

VAR. *glabrior*; leaves less reticulated, panicle thin very glabrous, sepals very slender glabrous.—Patkoy Mts., alt. 4000 ft.; *Griffith* (Kew Distrib. n. 6085).

21. **E. obtusa**, *T. Anders. in Journ. Linn. Soc.* ix. 453; stem short subtomentose, leaves elliptic rounded at both ends closely shortly hairy above, panicles compound shortly pubescent, bracts very small filiform, sepals $\frac{1}{2}$ in. linear minutely pubescent. *Erythracanthus obtusus*, *Nees in DC. Prodr.* xi. 78.

MERGU; *Griffith* (Kew Distrib. n. 6083). MOULMEIN, *Falconer*.

Stem 3–4 in. *Leaves* 3 $\frac{1}{2}$ by 1 $\frac{1}{2}$ in., very obtuse, base sometimes subcordate, beneath glabrous, the nerves pubescent; petiole $\frac{1}{4}$ –2 in. *Peduncles* often numerous from the upper axils; panicles 3–5 in., racemes lax; bracts $\frac{1}{8}$ – $\frac{1}{4}$ in.; lower pedicels $\frac{1}{8}$ – $\frac{1}{6}$ in.; bracteoles $\frac{1}{10}$ in., filiform. *Sepals* $\frac{1}{8}$ in. in flower, in fruit $\frac{1}{4}$ in. *Corolla* $\frac{1}{2}$ in., slender, minutely hairy. *Capsule* $\frac{1}{8}$ in.

22. **E. Maclellandii**, *T. Anders. in Journ. Linn. Soc.* ix. 454; stem erect branched, leaves oblong narrowed at the base obscurely pubescent above, panicles small numerous patently softly hairy lateral and terminal, bracts small oblong herbaceous, sepals $\frac{1}{2}$ in. linear patently hairy.

PERGU; *McLelland*.

Stems 6–12 in., herbaceous, pubescent. *Leaves* 2 $\frac{1}{2}$ by $\frac{1}{2}$ in., obtuse, mature nearly glabrous; petiole 0– $\frac{1}{4}$ in. *Panicles* 1–2 in., on short branches beginning near the base of the stems; lower bracts passing gradually into leaves, upper scarcely $\frac{1}{2}$ in.; pedicels mostly short, some attaining $\frac{1}{6}$ in.; bracteoles $\frac{1}{8}$ in., narrowly oblong. *Corolla* $\frac{1}{4}$ – $\frac{1}{2}$ in.—Allied to *E. glauca* and *E. polybotrya*, but is driven to this position in the linear series by its slender racemes and subequal sepals.

*** *Racemes elongate, lax, calyx small* ($\frac{1}{8}$ – $\frac{1}{6}$ in. long).

23. **E. racemosa**, *Miq. Fl. Ind. Bat.* ii. 775; stem erect somewhat stout, leaves narrowly elliptic cuneate at both ends minutely hairy above, racemes long simple or divided, sepals $\frac{1}{8}$ in. lanceolate minutely pubescent, corolla $\frac{1}{2}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 452. *Ruellia racemosa*, *Roxb. Fl. Ind.* iii. 42; *Wall. Cat.* 2336. *Erythracanthus racemosus*, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 78.

MALAY PENINSULA, from Moulmein southwards, and Penang, frequent; *Wallich*, &c.—DISTRIB. JAVA.

Stems attaining 15 in., branched, closely brown-villous. *Leaves* 4 $\frac{1}{2}$ by 1 $\frac{1}{4}$ in., scarcely acute, reddish brown, glabrous beneath, pubescent on the nerves; petiole $\frac{1}{2}$ –1 $\frac{1}{4}$ in. *Peduncles* 2–3 in., subterminal; racemes 2–5 in., often simple, sometimes divided; bracts $\frac{1}{8}$ – $\frac{1}{6}$ in., narrowly oblong or linear; pedicels sometimes $\frac{1}{8}$ – $\frac{1}{6}$ in., often

hardly any, the raceme becoming altogether a spike; bracteoles smaller than the bracts. *Corolla* glabrous. *Capsule* $\frac{1}{4}$ by $\frac{1}{8}$ in.

24. **E. merguensis**, *T. Anders. in Journ. Linn. Soc.* ix. 452; stem very short, leaves obovate-oblong obtuse nearly glabrous, base cordate, panicles minutely pubescent, sepals $\frac{1}{2}$ in. lanceolate, corolla $\frac{1}{4}$ — $\frac{1}{2}$ in.

MERGUI; *Helper* (Kew Distrib. n. 6081).

Stem 1–3 in., closely villous. *Leaves* 3 by $1\frac{1}{4}$ in., tip rounded, subcoriaceous; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Peduncles* several, 1–3 in., reddish; racemes 1–4 in., slender, simple or little divided, minutely pubescent or glabrate; bracts $\frac{1}{2}$ in., narrow-lanceolate; lower pedicels scarcely $\frac{1}{8}$ in.; bracteoles smaller than the bracts. *Corolla* narrow, glabrous. *Capsule* scarcely $\frac{1}{2}$ in., broad lanceolate.

25. **E. gracilis**, *T. Anders. in Journ. Linn. Soc.* ix. 453; stem hardly any, leaves short-petioled large obovate-oblong nearly glabrous, panicles slender pubescent, sepals $\frac{1}{2}$ in. sublinear, corolla $\frac{1}{2}$ in. (and upwards) narrowly tubular.

MARTABAN; *Parish*.

Leaves 8 by 3 in., obtuse, minutely pubescent on the nerves beneath; petiole $\frac{1}{4}$ in. *Peduncles* several, 3–5 in., slender; panicles compound; bracts $\frac{1}{16}$ in., linear; pedicels 0– $\frac{1}{8}$ in.; bracteoles $\frac{1}{16}$ in., linear. *Sepals* minutely pubescent. *Corolla* glabrous without when expanded, or nearly so. *Capsule* $\frac{1}{4}$ in.

26. **E. coriacea**, *T. Anders. in Herb. Kew*; stem short closely villous, leaves elliptic nearly glabrous, raceme long densely softly minutely grey hairy, sepals $\frac{1}{2}$ in. lanceolate, corolla $\frac{1}{2}$ in. tube short, anthers shortly exsert.

MOULMEIN; *Lobb*.

Stem 4 in., almost woody at the base. *Leaves* 2 by 1 in., obtuse, base rhomboid, subcoriaceous, secondary nerves obscure; petiole $\frac{1}{8}$ – $\frac{1}{2}$ in. *Peduncle* $1\frac{1}{2}$ in.; raceme 4 in., many-fld.; bracts $\frac{1}{2}$ in., narrow-lanceolate; lower pedicels $\frac{1}{2}$ in.; bracteoles in., narrow-lanceolate. *Calyx* with dense soft, short, grey hair. *Corolla* with a very short cylindric base, a short funnel-shaped portion at the base of which the filaments are inserted, elliptic or oblong erect-patent lobes, closely patently glandular-hairy. *Stamens* and *pistil* of *Ebermaiera*; filaments densely patently hairy upwards. *Capsule* $\frac{1}{2}$ in., oblong, as of *Ebermaiera*.—The corolla is nearly as in *Ophiorrhizophyllum*.

27. **E. parviflora**, *T. Anders. in Herb. Kew*; stem very short, leaves obovate-oblong glabrate except the nerves beneath, panicle compound slender minutely hairy, sepals $\frac{1}{2}$ in. sublinear, corolla $\frac{1}{2}$ – $\frac{1}{4}$ in. tube short, anthers subexsert.

MOULMEIN; *Lobb*.

Stem 1 in., subtomentose. *Leaves* 6 by $2\frac{1}{4}$ in., obtuse, base rhomboid or almost rounded; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. *Peduncle* 4 in., pubescent, with 9 scattered bracts $\frac{1}{2}$ in. long; panicle $4\frac{1}{2}$ by 3 in.; bracts $\frac{1}{2}$ – $\frac{1}{4}$ in., linear; lower pedicels scarcely $\frac{1}{8}$ in.; bracteoles $\frac{1}{16}$ in., subulate. *Corolla* as of *E. coriacea* but smaller, the external hairs shorter. *Filaments* glabrous except near the base; anther-cells ovoid, minutely puberulous. *Pistil* as of *E. coriacea*.—Closely allied to *E. coriacea*, but with much larger leaves, and smaller flowers.

28. **E. Beddomei**, *Clarke*; leaves elliptic acuminate at both ends puberulous on the nerves beneath, racemes solitary simple linear minutely pubescent, corolla $\frac{1}{2}$ – $\frac{1}{4}$ in. funnel-shaped.

TENASSERIM; Mt. Mooleeyit, *Beddome*.

Stems densely pubescent. *Leaves* $4\frac{1}{4}$ by $1\frac{1}{2}$ in., membranous, whitened underneath;

petiole $1\frac{1}{4}$ in., pubescent; the uppermost leaf sometimes short-petioled, rounded at the base. *Peduncle* $\frac{1}{2}$ in.; raceme 4-5 in.; bract near the base of the pedicel $\frac{1}{10}$ in., linear-lanceolate; bracteoles $\frac{1}{2}$ in., linear-lanceolate, minutely pubescent. *Calyx-segments* 5, unequal, $\frac{1}{2}$ - $\frac{1}{3}$ in., linear-lanceolate, minutely pubescent. *Corolla* funnel-shaped, tube very short. *Filaments* glabrous; anther-cells ovoid, irregularly subdivaricate.—Allied to *E. coriacea*, T. Anders.

V. OPHIORRHIZIPHYLLON, Kurz.

An erect herb. *Leaves* opposite, petioled, elliptic, entire. *Spikes* very long, many-fl'd.; bracts narrowly oblong, exceeding the calyx; bracteoles small. *Sepals* 5, subequal, narrowly lanceolate. *Corolla* shortly tubular, curved at the mouth; lobes 5, elliptic, suberect. *Stamens* 2; filaments long, exsert, glabrous; anther-cells 2, oblong, mucous, separate, approximate, erect. *Disc* inconspicuous. *Ovary* glabrous; style long, glabrous, shortly 2-lobed; ovules very many. *Capsule* oblong and seeds as of *Ebermaiera*.

O. macrobotryum, Kurz in Journ. As. Soc. 1871, pt. ii. 76.

MARTABAN; Thoungyen, Brandis. KAREN HILLS; Kurz.

Stem 6-10 in., undivided, pubescent upwards. *Leaves* 6 by $2\frac{1}{2}$ in., cuneate, subacute at each end, glabrous, or pubescent on the nerves beneath; petiole $\frac{1}{4}$ - $1\frac{1}{4}$ in. *Peduncles* 1-3, subterminal, 1-3 in.; spikes 3-7 in.; bracts $\frac{1}{2}$ in., glabrescent; bracteoles $\frac{1}{2}$ in., linear. *Sepals* $\frac{1}{2}$ - $\frac{1}{3}$ in., pubescent. *Corolla* $\frac{1}{2}$ in., white or pale rose, minutely pubescent without. *Stamens* inserted in a ring of hairs, 2 small staminodes added. *Capsule* $\frac{1}{2}$ in.

VI. CARDANTHERA, Ham.

Herbs, often viscid, aromatic. *Leaves* opposite, upper toothed rarely entire, lower often pinnatifid or in water pectinate. *Flowers* spiked or whorled, or 1-3 together in opposite axils; bract or bracteoles often suppressed. *Sepals* narrow, often unequal. *Corolla* nearly straight, tube shorter than the calyx; limb long, 2-lipped, twisted to the left in bud; palate transversely plicate-rugose, purple-rose and white. *Stamens* 4, didynamous; anthers of the posterior often smaller; anther-cells parallel. *Ovary* narrow; style sparsely hairy. *Capsule* sessile, narrow, 40-100-seeded, bearing seeds from the very base. *Seeds* small, ovoid, somewhat compressed, glandular-puberulous or glabrous; retinacula minute, conical, soft, not curved.—Species 10, Indian and Tropical African.

C. Thwaitesii has solitary flowers, a plane palate, 2 stamens, and stronger retinacula.

Subgenus 1. **Eucardanthera**. *Stamens* 4, fertile. *Flowers* mostly in opposite axils.

* *Spikes* terminal, bracts 4-ranked imbricated in fruit.

1. **C. uliginosa**, Ham. mss.; Benth. in Gen. Pl. ii. 1074; stem pubescent upwards, leaves subsessile oblong or subovate entire or crenate, bracts round ovate. *Ruellia uliginosa*, Linn. f. Suppl. 290; Roth Nov. Sp. 306, obs.; Roxb. Fl. Ind. iii. 52; Wall. Cat. 2378, chiefly. *Adenosma uliginosa*, Nees in Br. Verm. Schrift. iii. 298, and in Wall. Pl. As. Rar. iii. 79, and in DC. Prodr. xi. 69 (excl. syn. *Ruellia ringens*); T. Anders. in Journ. Linn. Soc. ix. 455.

In drying-up rice-swamps, S. MADRAS; frequent. CEYLON; *Walker*. SIKKIM TERRAI; *Herb. Griffith*.

Annual, 1-1½ ft., erect or decumbent, branching from the base. *Leaves* 1 by ½ in., glabrous or subpubescent. *Spikes* 1-3 in., scarcely interrupted at the base even in fruit; bracts ½ in., from elliptic to cordate, glabrous or puberulous; bracteoles ½ in., obovate or elliptic. *Sepals* ½ in., linear, pubescent. *Corolla* ½ in., puberulous. *Anthems* of the posterior stamens half as large as of the anterior. *Capsule* ½ in., minutely pilose upwards.—Much confused by the older botanists with the universal *Hygrophila polysperma*, to which I suspect Miquel's Javanese *C. uliginosa* should be referred.

†† *Whorls or spikes axillary; fruiting interrupted at the base.*

2. **C. Griffithii**, *Benth. in Gen. Pl.* ii. 1074; leaves spatulate oblong or elliptic crenulate pubescent, spikes terminal interrupted at the base in fruit, corolla ¼ in. *Adenosma Griffithii*, *T. Anders. in Journ. Linn. Soc.* xi. 454.

UPPER ASSAM; Suddiya, *Griffith* (Kew Distrib. n. 6087).—DISTRIB. N. Burma.

Annual, decumbent, rooting; branches 1 foot, pubescent. *Leaves* 1½ by ¾ in., subpetioled, obtuse; on the barren shoots smaller, broader. *Spikes* 1-4 in., pubescent, axillary and forming terminal panicles; lower bracts distant (at least in fruit), leaf-like, often containing 2-3 flowers; proper bract ¼ by ½ in., elliptic; bracteoles ½ in., narrowly oblong. *Sepals* linear-lanceolate. *Corolla* purple, puberulous. *Anthems* of the posterior stamens smaller than those of the anterior. *Ovary* nearly glabrous, a few gland-tipped hairs about its apex. *Capsule* ½ in.

3. **C. balsamica**, *Benth. in Gen. Pl.* ii. 1074; branches glabrous upwards, leaves petioled oblong crenate, flowers mostly in axillary whorls, sepals longer than the bracts linear-lanceolate one larger than the others. *Ruellia balsamica*, *Linn. f. Suppl.* 289. *Adenosma balsamea*, *Spreng. Syst.* ii. 829; *Wall. Cat.* 9082; *Wight Ic. t.* 446; *Nees in DC. Prodr.* xi. 68; *T. Anders. in Journ. Linn. Soc.* ix. 454.

S. DECCAN PENINSULA and CEYLON; in rice-swamps, frequent.

Annual, decumbent or erect, branches 6-15 in.; glabrous, or the inflorescence puberulous; lineolate with raphides. *Leaves* 2 by ¾ in., obtuse, base attenuate; petiole ¼ in.; lower leaves sometimes pectinate or pinnatifid. *Whorls* usually numerous, distinct; flowers 1-5-nate; bract ½-⅓ in., obovate or elliptic; bracteoles similar, but smaller, in crowded whorls, often suppressed. *Sepals* ½ in., not widened upwards. *Corolla* ½ in., nearly glabrous. *Anthems* of the posterior stamens smaller than the anterior. *Capsule* nearly ½ in., puberulous upwards.

VAR. *Thymus*; leaves ½ in., corolla ¼ in., capsule scarcely ¼ in. *Adenosma Thymus*, *Nees in Wall. Pl. As. Rar.* iii. 79, and in *DC. Prodr.* xi. 69, *excl. syn.*; *T. Anders. in Journ. Linn. Soc.* ix. 454. *Ruellia cernua*, *Heyne*; *Wall. Cat.* 2380 (part of letter B only), *not of Roxb.*—Deccan Peninsula, *Heyne*. *Nees* and *T. Anderson* place this next *C. triflora*, *Ham.*, from which *Nees* carefully distinguishes it; the example is almost certainly a starved specimen of *C. balsamica*.

4. **C. verticillata**, *Benth. in Gen. Pl.* ii. 1074; branches pubescent upwards, leaves often petioled oblong or elliptic crenate, flowers mostly in axillary whorls, sepals longer than the bracts linear-spathulate. *Ruellia verticillata*, *Wall. Cat.* 2409. *Adenosma verticillata*, *Nees in Wall. Pl. As. Rar.* iii. 79, and in *DC. Prodr.* xi. 69; *Wight Ic. t.* 1524; *T. Anders. in Journ. Linn. Soc.* ix. 454.

DECCAN PENINSULA; Carnatic, *Heyne*, *Wight*; Concan, *Stocks*, &c. CEYLON; *Thwaites*.

Leaves often somewhat pubescent, especially on the midrib beneath. *Inflorescence*

ciliate-pubescent. *Sepals* wider upwards.—Scarcely specifically separable from *C. balsamica*.

5. **C. triflora**, *Ham. mss.*; *Benth. in Gen. Pl.* ii. 1074; pubescent, leaves ovate or round crenate-serrate, flowers mostly in axillary whorls, sepals equalling the bracts linear. *Ruellia triflora*, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 52. *Adenosma triflora*, *Nees in Wall. Pl. As. Rar.* iii. 79, and in *DC. Prodr.* xi. 68; *Wall. Cat.* 7147; *T. Anders. in Journ. Linn. Soc.* ix. 454.

On the margin of water; BENGAL, very common. ASSAM, PEGU and SINGAPORE.

Annual, decumbent, rooting at the base, 1 foot. Lower leaves often pinnatifid, in water large, pectinate, membranous; cauline $\frac{1}{2}$ –1 in. diam., tip rounded, base cuneate or subpetioled, somewhat closely sharply toothed. Flowers 1–3-nate; bracts nearly $\frac{1}{2}$ in., obovate, sometimes toothed; bracteoles $\frac{1}{4}$ in., oblong. *Sepals* hairy, one longer than the others, very acute. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in. *Anthers* nearly equal. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., pubescent.

6. **C. avana**, *Benth. in Gen. Pl.* ii. 1074; subhirsute, leaves sessile oblong dentate, base obtuse, spikes elongate interrupted, flowers solitary, sepals exceeding the bracts linear. *Pedicularis* ? *avana*, *Wall. Cat.* 1007; *Benth. Scroph. Ind.* 52. *Synnema avanum*, *Benth. in DC. Prodr.* x. 538. *Adenosma biplicata*, *Nees in Wall. Pl. As. Rar.* iii. 79, and in *DC. Prodr.* xi. 68; *Wall. Cat.* 7146; *T. Anders. in Journ. Linn. Soc.* ix. 454.

BURMA; Wallich, McLelland, &c.—DISTRIB. Ava.

An annual-weed, 1 foot, decumbent, rooting in mud, branches erect or procumbent. Lower leaves usually pinnatifid; upper 1–1 $\frac{1}{2}$ in., obtuse, base often subquadrate, with many patent white hairs. Spikes 1–5 in., weak; bract $\frac{1}{4}$ – $\frac{1}{2}$ in., narrowly elliptic; bracteoles $\frac{1}{2}$ in., narrowly oblong, obtuse. *Sepals* $\frac{1}{2}$ in. and upwards, white-hirsute. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., pubescent without, purple. *Anthers* nearly equal. *Capsule* $\frac{1}{2}$ in., puberulous.

7. **C. pinnatifida**, *Benth. in Gen. Pl.* ii. 1074; dusky pubescent, leaves petioled oblong or elliptic pinnatifid or crenate, flowers solitary axillary or in lax spikes, sepals linear slightly wider upwards sometimes toothed. *Nomaphila pinnatifida*, *Dalz. in Hook. Kew Journ.* iii. 38; *Dalz. & Gibs. Bomb. Fl.* 184; *Hook. Ic. Pl.* t. 843. *Adenosma pinnatifidum*, *T. Anders. in Journ. Linn. Soc.* ix. 455; *Bedd. Ic. Pl. Ind. Or.* t. 246.

W. DECCAN PENINSULA; Concan and Canara, Dalzell, Beddome, &c.; Mangalore, Wight.

Biennial; branches 1–2 ft. Leaves 2–4 in., deeply pinnatifid; lobes numerous, oblique, oblong; or smaller, or $\frac{1}{2}$ in. and crenate on the same plant, cuneate or spatulate, more or less petioled. Spikes 1–4 in., terminal, weak, hardly interrupted, many-fld.; or more commonly flowers few, distant, solitary, sometimes on very short axillary branches appearing pedicelled; bracts $\frac{1}{4}$ in., elliptic; bracteoles $\frac{1}{2}$ in., oblong. *Sepals* $\frac{1}{4}$ in. *Corolla* $\frac{1}{2}$ in. *Anthers* subequal; cells parallel, base not divaricate nor cordate. *Capsule* nearly $\frac{1}{2}$ in., glabrous.

Subgenus 2. **Plæsiantha**. Stamens 2, fertile. Flowers solitary, on alternate axils. Seeds densely elastically hairy.

8. **C. Thwaitesii**, *Benth. in Gen. Pl.* ii. 1075; pubescent, leaves spatulate-oblong entire, flowers small subsessile in lax compound cymes. *Adenosma Thwaitesii*, *T. Anders. in Thwaites Enum.* 224, and in *Journ. Linn. Soc.* ix. 455.

CYLON; Batticaloa, in the tropical region, Thwaites.

Annual, 6-12 in., erect, branched, viscid. *Leaves* 1-1½ in., obtuse, base much attenuate or petioled. *Flowers* very numerous; cymes dichasial, going off into sym-podes; upper branches of the cyme in appearance scorpioid with distant flowers, i. e. at each bifurcation one branch with one flower is suppressed; bracts $\frac{1}{2}$ to $\frac{1}{2}$ in., ovate or elliptic; bracteoles small or 0. *Sepals* $\frac{1}{2}$ in., linear, unequal. *Corolla* $\frac{1}{2}$ in., puberulous; lobes twisted to the left; palate not transversely plicate. *Anthers* subquadrate; posterior stamens reduced to filaments. *Ovary* glabrous, tip glandular-hairy; style sparsely hairy. *Capsule* $\frac{1}{2}$ in., bearing seeds from the base. *Seeds* 40-60, ovoid, slightly compressed, the white fine hairs starting out on all sides when moistened; retinacula conical, slightly curved, scarcely hardened.—Possibly a distinct genus, resembling *Brillantaisia* except that it is the posterior stamens that are imperfect in this.

VII. **HYGROPHILA**, Br.

Herbs, (in *H. spinosa*) spinescent. *Leaves* opposite, lanceolate or obovate, entire. *Flowers* sessile, in terminal heads or in axillary whorls; bracts elliptic or lanceolate; bracteoles oblong or lanceolate, shorter than the calyx. *Calyx* tubular, 5-fid (or in *H. spinosa* 4-partite); teeth lanceolate or linear. *Corolla* blueish-purple, nearly glabrous; tube ventricose at the apex; limb deeply 2-lipped, oblong, straight. *Stamens* didynamous, posterior similar to the anterior, or smaller, or rudimentary, filaments glabrous; anthers oblong, cells equal, divaricate or connate at the base. *Ovary* oblong, tip hairy; style long hairy, stigma simple linear. *Capsule* linear or narrowly oblong, bearing seeds from the base, 40-100-seeded, or in *H. spinosa* 2-8-seeded. *Seeds* ovoid, compressed, elastically white-hairy when wetted; retinacula hardened, curved and acute.—Species 18, tropical and subtropical.

Subgenus. **Euhygrophila**. Unarmed. *Calyx* 5-toothed. *Capsule* with 8-100 minute seeds.

* *Spikes terminal*.

1. **H. polysperma**, *T. Anders. in Journ. Linn. Soc.* xi. 456; small, procumbent, leaves oblong or ovate nearly entire glabrous or puberulous, spikes terminal dense oblong or linear, fertile stamens 2. *Boiss. Fl. Orient.* iv. 519. *Justicia polysperma*, *Roxb. Hort. Beng.* 3, and *Fl. Ind.* i. 119; *Wall. Cat.* 2483. *Ruellia uliginosa*, *Wall. Cat.* 2378, partly. *Hemiadelphis polysperma*, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 80 (excl. syn. Roth); *Wight Ill.* t. 164 b, fig. 3, and *lc.* t. 1492; *Griff. Notul.* iv. 135.

Throughout INDIA in wet places, alt. 0-5000 ft., from the Punjab and Bhotan to the S. Deccan and Malacca.—DISTRIB. Cabul.

Annual, 6-18 in., branching and rooting. *Leaves* $\frac{1}{2}$ -1½ in., from narrowly oblong to ovate, base spatulate or petioled. *Spikes* 1-5 in., somewhat pubescent; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., broadly elliptic, imbricate; bracteoles $\frac{1}{4}$ in., lanceolate. *Sepals* $\frac{1}{4}$ in., linear, hairy. *Corolla* $\frac{1}{2}$ in., slender, pubescent, pale blue or white. *Anthers* oblong, cells slightly divaricate at the base; posterior stamens reduced to teeth. *Ovary* hairy at the apex. *Capsule* $\frac{1}{4}$ - $\frac{1}{2}$ in.; seeds 20-32.—The examples from Tenasserim and Malacca are larger and more glabrous; the capsules $\frac{1}{2}$ in.

2. **H. Serpyllum**, *T. Anders. in Journ. Linn. Soc.* ix. 456; procumbent, leaves small short-petioled ovate or oblong hairy, spikes ovate or shortly oblong, anthers of the posterior stamens half as long as of the anterior. *Ruellia polysperma*, *Roth Nov. Sp.* 305. *Adenosma polysperma*, *Spreng. Syst.* ii. 829. *Physichilus Serpyllum*, *Nees in Hook. Comp. Bot.*

Mag. ii. 311, and in *DC. Prodr.* xi. 81; *Dalz. & Gibs. Bomb. Fl.* 184; *Wight Ic.* t. 1493.

W. DECCAN PENINSULA, from Malwa (*Edgeworth*) to Mysore; frequent in the Concan.

Rootstock woody; stems 4–16 in., procumbent or creeping. *Leaves* $\frac{1}{4}$ –1 in., from lanceolate to orbicular, entire, minutely strigose and with long lax white hairs, lineolate with raphides, nearly glabrate or minutely closely tomentose beneath; petiole $0\frac{1}{2}$ in., but in some basal leaves $\frac{1}{2}$ –1 in. *Spikes* dense, white-strigose; bracts $\frac{1}{2}$ in., elliptic; bracteoles $\frac{1}{4}$ in., oblong. *Sepals* $\frac{1}{4}$ in., linear. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in.; tube ventricose upwards, limb long, deeply 2-lipped. *Style* hairy. *Capsule* $\frac{1}{2}$ in., 8–10-seeded.—The figure of *Wight* (*Ic.* t. 1493) shows the 4 anthers subequal, but this is not the case in his example from which he notes his *Icon* was taken. The synonym, *Ruellia polysperma*, Roth, has been always supposed to have been *Hygrophila polysperma*, T. Anders.; but as Roth says his plant had didynamous stamens and ovate heads, his description must belong here, whatever his plant was.—The leaves of *H. Serpyllum* vary very much in form and indumentum.

VAR. Hookeriana; leaves orbicular obtuse cauline often distinctly petioled.—*Physichilus* sp. nn. 2, 3, *Herb. Ind. Or. H. f. & T.*—Concan; *Stocks.* Bombay, *Lav.* A larger plant; cauline leaves often 1 in. diam., petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., with minute white bristly hairs, but none of the long white hairs characteristic of *H. Serpyllum* type.

3. *H. Stocksii*, *T. Anders. ms.*; cauline leaves petioled spatulate-elliptic, spikes ovate or shortly oblong, anthers of the posterior stamens $\frac{1}{2}$ the length of the anterior.—*Physichilus* n. 4, *Herb. Ind. Or. H. f. & T.*

CONCAN; *Stocks.*

Branches 18 in., stout; internodes 2–3 in. *Cauline leaves* $2\frac{1}{2}$ by 1 in.; petiole $\frac{3}{4}$ in. *Corolla* $\frac{1}{2}$ in. *Anthers* of the posterior stamens minute, but (at least sometimes) they appear to contain a few pollen-grains.—Reduced to a *Var.* of *H. Serpyllum* by T. Anders. (*in Journ. Linn. Soc.* ix. 456), but subsequently marked by him as a species.

** *Whorls axillary, distinct.*

4. *H. salicifolia*, *Nees in Wall. Pl. As. Rar.* iii. 81, and in *DC. Prodr.* xi. 92; erect, leaves lanceolate glabrous, bracteoles lanceolate acute, calyx in flower divided half-way down lobes linear hispid-ciliate, capsule a little longer than the calyx. *Wight Ic.* t. 1490; *Dalz. & Gibs. Bomb. Fl.* 184. *Ruellia salicifolia*, *Vahl Symb.* iii. 84; *Roxb. Fl. Ind.* iii. 50; *Wall. Cat.* 2373. *R. longifolia*, *Roth Nov. Sp.* 306.

Throughout INDIA and CEYLON, very common.

Stems 1–3 ft., nearly glabrous. *Leaves* $2\frac{1}{2}$ by $\frac{1}{2}$ – $\frac{3}{4}$ in., narrowed at both ends, lineolate by raphides; petiole $0\frac{1}{4}$ in.; bract $\frac{1}{4}$ – $\frac{1}{2}$ in., ovate or elliptic; bracteoles $\frac{1}{2}$ as long as the calyx. *Calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., divided to the base in fruit. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., pale purple. *Stamens* 4, fertile; anthers subequal. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., 20–28-seeded.—The whole of the species of this section are included under the present by T. Anders. (*in Journ. Linn. Soc.* ix. 456), which then has a geographic area extending through S.E. Asia, Malaya, Trop. Australia, Trop. America; but if this view be taken, the name of the species should be *H. angustifolia*, Br. (*Prodr.* 479; *Nees in DC. Prodr.* xi. 91).

VAR. assurgens; stem decumbent or geniculate rooting with erect branches, leaves obovate-oblong or elliptic subacute. *H. assurgens*, *Nees in DC. Prodr.* xi. 90, excl. syn. and var. *B.* *H. radicans*, *Nees in Wall. Pl. As. Rar.* iii. 81, and in *DC. l. c.* 92. *Ruellia radicans*, *Wall. Cat.* 2410.—E. Bengal, frequent; *Wallich, &c.* Malacca; *Maingay* (Malaya).

VAR. dimidiata; leaves obovate or elliptic glabrous densely lineolate especially on the upper surface, base attenuate. *H. dimidiata*, *Nees in Wall. Pl. As. Rar.* iii. 81;

Wall. Cat. 7150. *H. obovata*, *Nees in Wall. Pl. As. Rar.* iii. 81, and in *DC. Prodr.* xi. 91 (not of Wight, nor *Ruellia obovata*, *Roxb.*). *H. undulata*, *Nees in DC. l. c.* 91, partly (not *Ruellia undulata*, *Vahl*).—Prome; *Wallich*. Mergui; *Griffith*.—Distrib. Java, Borneo. Lateral nerves of the leaves patent, arcuate, prominent, regular. Whorls often dimidiate, but entire often, as in *Wallich's* type specimen.

5. *H. quadrivalvis*, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 89; erect, leaves lanceolate or elliptic narrowed at both ends glabrate, bracteoles oblong obtuse, calyx in flower divided $\frac{1}{2}$ the way down lobes lanceolate minutely strigillose, capsule much exceeding the calyx. *H. obovata*, *Wight Ic. t.* 1489; *Nees in Pl. Hohenack.* n. 292. *H. undulata*, *Nees in DC. Prodr.* xi. 91, partly. *Ruellia quadrivalvis*, *Wall. Cat.* 2374, type sheet. *R. undulata*, *Vahl Symb.* iii. 82.—*Rheede Hort. Mal.* ii. t. 46.

From BENGAL to CEYLON and MALACCA, common.

Closely resembling *H. salicifolia* except in the points stated. *Leaves* usually larger, in *Ruellia undulata* attaining 4 by $1\frac{1}{2}$ in., undulate on margin. *Calyx* often gamosepalous long after flowering. *Capsule* frequently $\frac{3}{4}$ in., stouter than in *H. salicifolia*.—*Ruellia barbata*, *Vahl Symb.* iii. 83, adduced here by *Nees*, is stated by *Vahl* to have biaristate anthers, and his description does not otherwise fit well.

6. *H. phlomoides*, *Nees in Wall. Pl. As. Rar.* iii. 80, and in *DC. Prodr.* xi. 90; erect, leaves subsessile elliptic or oblong hairy, whorls of flowers hirsute often distant, calyx in flower divided half-way down teeth linear hispid. *Ruellia phlomoides*, *Wall. Cat.* 2376, type sheet. *R. hirsuta*, *Roxb. Fl. Ind.* iii. 51. *Dipteracanthus ciliatus*, *Nees in Wall. Cat.* 715.

BENGAL, SIKKIM and ASSAM, near the base of the hills; CACHAR, CHITTAGONG, PEGU.

Stems 2–3 ft., hirsute upwards. *Leaves* often 3–6 in., base narrowed, mostly quite sessile. Whorls of flowers dense; bracteoles linear-oblong, as long as the calyx-tube. *Corolla* $\frac{3}{4}$ in. *Capsule* $\frac{1}{2}$ in., somewhat exceeding the calyx.

VAR. *Roxburghii*; branched or decumbent, leaves obovate often shortly petioled usually small hairy or nearly glabrous, calyx-teeth linear-lanceolate, corolla $\frac{1}{2}$ in. *H. obovata*, *Griff. Notul.* iv. 134. *Ruellia obovata*, *Roxb. Fl. Ind.* iii. 51; *Wall. Cat.* 2375, type sheet.—Chittagong, *Roxburgh*; Soonderbunds, *J. D. H.*, &c.; Pegu, *Beddome*; Mergui, *Griffith*.

VAR. *repens*; procumbent, rooting, leaves $\frac{1}{2}$ – $1\frac{1}{2}$ in. obovate, flowers rather smaller. Silhet; *H. f. & T.*, &c.

7. *H. incana*, *Nees in DC. Prodr.* xi. 91 (excl. syn. *Roxb.*); erect, innovations closely softly white-hairy, leaves narrowly lanceolate adult densely lineolate on both surfaces, calyx in flower divided more than half-way down, teeth linear softly white-hairy and hispid. *Ruellia incana*, *Heyne in Herb. Rottler.* *R. mollissima*, *Klein ms.*, not of *Vahl*.

DECCAN PENINSULA; *Rottler*.

Leaves 4 by $\frac{3}{4}$ in., very acute at both ends; petiole hardly any. *Capsule* $\frac{1}{2}$ in., shortly exceeding the calyx.—Very distinct by its soft close white hairiness, to which scattered long white hispid hairs are added. It is altogether remote from *Ruellia obovata*, *Roxb.* (= *H. phlomoides*, *Nees* Var.), of which *Roxburgh's* picture is in *Herb. Kew*.

Subgenus 2. **Asteracantha.** Spinous. *Calyx* 4-partite. *Seeds* 4–8.

8. *H. spinosa*, *T. Anders. in Thwaites Enum.* 225, and in *Journ. Linn. Soc.* vii. 22; stout, erect, hispid, leaves lanceolate, whorls axillary spinose

hispid. *H. longifolia*, *Kurz in Journ. As. Soc.* 1870, ii. 78. *Barleria longifolia*, *Linn. Amœn. Acad.* iv. 320; *Wall. Cat.* 2505. *B. hexacantha*, *Morisi in Mem. Acad. Torin.* xxxvi. 200, t. 7. *Ruellia longifolia*, *Roxb. Fl. Ind.* iii. 50. *Asteracantha longifolia*, *Nees in Wall. Pl. As. Rar.* iii. 90, and in *DC. Prodr.* xi. 247; *Dalz. & Gibs. Bomb. Fl.* 189; *Wight Ic.* t. 449. *A. auriculata*, *Nees in DC. Prodr.* xi. 248, with syn.—*Rheede Hort. Mal.* ii. t. 45; *Jones in As. Research.* iv. 291.

Throughout INDIA in ditches, abundant; from the Himalaya to CEYLON (not seen from Malay Peninsula).

Stems 2-5 ft., usually fascicled and undivided. *Leaves* 3-7 in., subsessile, acute at both ends, sparsely hispid with long white hairs. Whorls large, dense, with (normally 6) straight stout spines $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ -1 in., lanceolate; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in., narrow. *Sepals* $\frac{1}{2}$ - $\frac{3}{4}$ in., lanceolate; upper rather the largest, lower obtuse emarginate or shortly bifid. *Corolla* 1 in., nearly glabrous, pale blue-purple. *Anthers* oblong, subequal. *Capsule* $\frac{1}{2}$ in., shorter than the sepals, linear-oblong, 4-8-seeded from the base.

VIII. *NOMAPHILA*, Blume.

Erect herbs. *Leaves* petioled, entire. *Cymes* axillary, subsessile; branches unilateral, sympodal upwards; flowers pedicelled; bracts linear, minute; bracteoles 0. *Sepals* 5, linear, one somewhat larger. *Corolla* tubular, ventricose upwards; limb deeply 2-lipped; lobes 5, twisted to the left, edges narrowly overlapping in bud. *Stamens* 4, didynamous, glabrous; anthers 2-celled; lower somewhat smaller; cells oblong, parallel; muticous. *Ovary* oblong; style linear, stigma simple linear. *Capsule* linear, seed-bearing from the base, 8-32-seeded. *Seeds* ellipsoid, reticulate, elastically white-hairy when wetted; retinacula hardened, hooked, but slender.—Species 7, in S.E. Asia, Madagascar, and Trop. Africa.

1. *N. Parishii*, *T. Anders. in Journ. Linn. Soc.* ix. 455; leaves lanceolate pubescent or mature nearly glabrous, cymes and calyx glandular-pubescent, sepals subulate. *N. pubescens*, *Kurz in Journ. As. Soc.* 1871, pt. ii. 74, excl. all syn.

MOULMEIN; *Falconer, Parish*. PEGU; *Kurz, Brandis*. TENASSERIM; *Beddome*.—DISTRIB. Java.

Stem 1-2 ft., pubescent upwards. *Leaves* 3 by $\frac{1}{2}$ - $\frac{3}{4}$ in., acute at both ends (larger ovate fide T. Anders.), young minutely softly pubescent, mature glabrate lineolate above, sparsely pubescent or glabrate beneath; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Cymes* 1 $\frac{1}{2}$ in. diam.; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., opposite; pedicel in one axil $\frac{1}{2}$ - $\frac{3}{4}$ in., in the other suppressed. *Sepals* $\frac{1}{2}$ in., one slightly longer than the others, acute. *Corolla* $\frac{3}{4}$ -1 in., nearly glabrous. *Ovary* glandular; style patently hairy. *Capsule* $\frac{1}{2}$ in., 32-seeded, pubescent from the base.—Very near to, and doubtfully distinct from the Javan *N. corymbosa* (Blume *Bijd.* 804; *Nees in DC. Prodr.* xi. 84). Col. Beddome has collected in Tenasserim two forms, one with the calyx and corolla half as large again as in the other; but no other difference can be found.

2. *N. stricta*, *Nees in DC. Prodr.* xi. 84, excl. syn.; leaves broadly lanceolate mature glabrate, cymes nearly glabrous, sepals linear subobtusate glabrate or minutely puberulous, ovary nearly glabrous except at the tip. *Ruellia paniculata*? *Heyne in Herb. Rottler*.

DECCAN PENINSULA?; *Rottler*.—DISTRIB. Malaya to the Philippines.

This plant is in Rottler's Madras collection at Kew, but it may be doubted (see T. Anders. in *Journ. Linn. Soc.* ix. 456) whether it was collected wild in India. It closely resembles *N. corymbosa*, Bl., except in the points specified. *Nees'* synonymy is all wrong: *Justicia stricta*, *Vahl Symb.* ii. 6, has calyx shorter than the bracts; *J. pubescens*, *Lamk. Ill.* i. 40, has ovate bracts, and is from Guinea; while *J. caulescens*,

Lamk. Ill. i. 40 (referred here by Nees in DC. Prodr. xi. 722), is an American plant of another genus.

IX. **CALOPHANES**, *D. Don*.

Perennial herbs. *Leaves* opposite, petioled, entire. *Flowers* in axillary clusters or short cymes; bracts and bracteoles narrow. *Calyx* tubular; teeth 5, subequal, lanceolate or subulate. *Corolla* tubular, mouth obscurely 2-lipped; lobes 5, obtuse, twisted to the left in bud, patent in flower. *Stamens* 4, perfect, didynamous, filaments glabrous or hairy; anthers similar, 2-celled; cells oblong, parallel, base minutely mucronate or spurred. *Ovary* glabrous, shortly stalked; ovules 2 in each cell; style linear, hairy, stigma simple linear. *Capsule* oblong, base for a short space narrowed solid. *Seeds* 4, orbicular, much compressed, densely elastically white-hairy when wetted; retinacula strong, curved.—Species 30, in S.E. Asia, Africa and America.

* *Pedicels hardly any, flowers axillary 2-8 together or solitary.*

1. **C. Nagchana**, *Nees in DC. Prodr. xi.* 109; prostrate, glabrous or hoary, leaves spatulate-elliptic or obovate, flowers clustered, bracteoles small linear, calyx-teeth longer than the tube, filaments glabrous, anther-cells mucronate. *C. depressa*, *T. Anders. in Thwaites Enum.* 225, and in *Journ. Linn. Soc. ix.* 459. *Ruellia Nagchana*, *Ham. in Wall. Cat.* 2396. *R. erecta*, *Burm. Fl. Ind.* 135, t. 41, fig. 3. *R. depressa & cernua*, *Wall. Cat.* 2379, 2380, chiefly. *Dipteracanthus Nagchana*, *Nees in Wall. Pl. As. Rar. iii.* 82. *Dyschoriste depressa & cernua*, *Nees in l. c.* 81, and in *DC. Prodr. xi.* 106.

DECCAN PENINSULA; *Rottler, Dr. Shuter, &c.* BEHAR; *Patna, Ham., J. D. H. CEYLON; Thwaites.*

Stems 6-18 in., branched, lineolate, sometimes obscurely scabrid. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., obtuse, base attenuate; petiole 0- $\frac{1}{4}$ in. *Bracts* small, spatulate-elliptic or 0; bracteoles $\frac{1}{2}$ in. *Calyx* lineolate, glabrous or puberulous; tube $\frac{1}{2}$ in., teeth $\frac{1}{2}$ in. *Corolla* scarcely so long as the calyx, puberulous, flesh-coloured or bluish, palate not corrugate. *Filaments* connate near the base; anther-cells very shortly but distinctly mucronate. *Capsule* $\frac{1}{2}$ in.—*T. Anderson* has not indicated the grounds on which he keeps *C. Nagchana* and *C. depressa* distinct; *Nees* says *C. Nagchana* differs by having the bracteoles spatulate, which is not the case in his type specimen. In *C. Nagchana*, where the flowers are clustered, the bracts of the upper flowers are much smaller, the bracteoles 0- $\frac{1}{2}$ in., but this is exactly as in *Ruellia cernua*, *Wall.*

2. **C. littoralis**, *T. Anders. in Thwaites Enum.* 225, and in *Journ. Linn. Soc. ix.* 460; shrubby, nearly glabrous, leaves small obovate, flowers solitary or 2-3 together axillary, bracteoles elliptic, calyx-teeth shorter than the tube, filaments glabrous, anther-cells mucronate. *Justicia madurensis*, *Burm. Fl. Ind.* 9, t. 4, fig. 3. *Ruellia littoralis*, *Linn. f. Suppl.* 289; *Roth Nov. Sp.* 300; *Wall. Cat.* 2381. *Dyschoriste littoralis*, *Nees in Wall. Pl. As. Rar. iii.* 81, and in *DC. Prodr. ix.* 106; *Wight Ic. t.* 447.

S. DECCAN PENINSULA; near the sea, *Perottet, Wight, &c.*; and inland at Coimbatore, *Beddome*. CEYLON; N. of the island, *Gardner*.

Stems 1-3 ft., sometimes woody, much branched, or elongate less stiff; innovations lineolate, sometimes hoary. *Leaves* $\frac{1}{2}$ in. diam., obtuse, base cuneate or rounded; petiole 0- $\frac{1}{4}$ in. *Flowers* mostly solitary; bracteoles $\frac{1}{2}$ in. *Calyx* densely lineolate, sometimes hoary; tube $\frac{1}{2}$ in., teeth $\frac{1}{2}$ in. lanceolate. *Corolla* $\frac{3}{4}$ in. and upwards, nearly glabrous, narrowly cylindric below, funnel-shaped upwards. *Stamens, ovary, and capsule* nearly as in *C. Nagchana*.

** *Cymes small, flowers pedicelled.*

3. **C. vagans**, *Wight Ic. t. 1526*; leaves ovate or oblong more or less pubescent, calyx-teeth long-linear hairy, filaments hairy, anther-cells with prominent white divaricate spurs at the base. *T. Anders. in Journ. Linn. Soc. ix. 459, excl. syn.* *Ruellia racemosa*, *Heyne in Herb. Rottler, not of Roxb.*

DECCAN PENINSULA, *Rottler*; Kurg, *Wight*; Concan, *Stocks*; Belgaum, *Ritchie*. *Stems* 1–2 ft., erect or diffuse, branched; innovations softly pubescent, not lineolate. *Leaves* $1\frac{1}{2}$ – $2\frac{1}{2}$ in., usually narrowed at both ends, mature pubescent on both surfaces or glabrate except a few hairs on the nerves or margin; petiole $\frac{1}{4}$ in. *Cymes* $1\frac{1}{2}$ in., or some short 3-fld., softly hairy; bracts $\frac{1}{4}$ in., oblong; bracteoles $\frac{1}{2}$ in., linear. *Calyx-tube* $\frac{1}{6}$ in., teeth $\frac{1}{3}$ – $\frac{1}{2}$ in. *Corolla* $\frac{3}{4}$ in., pubescent, blueish, palate transversely plicate. Spurs of the anther-cells much larger than in the preceding species. *Capsule* $\frac{1}{2}$ in.

4. **C. Dalzellii**, *T. Anders.*; *Bedd. Ic. Pl. Ind. Or. t. 248*; leaves ovate or oblong pubescent or nearly glabrate, calyx-teeth linear hairy, filaments glabrous or minutely hairy, anther-cells minutely mucronate at base or mucous. *C. rigidus*, *Dalz. ms.*—*Dipteracanthus* sp. n. 11, *Herb. Ind. Or. H. f. & T.*

CONCAN, *Dalzell, Stocks*; Poona, *Dalzell, Beddome.*

Closely resembling *C. vagans*, but cymes denser, pedicels rarely exceeding $\frac{1}{4}$ in., calyx-teeth broader, sometimes linear-lanceolate, flowers rather larger, sometimes exceeding 1 in., and capsule $\frac{1}{3}$ – $\frac{1}{2}$ in., 4-seeded (entirely of *Calophanes*).—The larger flowers and the stamens are quite as of *Ruellia*; the mucro of the anther-cells is either absolutely wanting or so minute that it requires a microscope to find it. Hence the plant was marked a *Dipteracanthus* by Benth (not *Dipteracanthus vagans*, as T. Anders. states, which was T. Anderson's own mistake, not Benth's); but as the ovules appear never more than 4, it must remain in *Calophanes*. It invalidates the genus *Calophanes* as distinguished from *Ruellia*.

X. RUELLIA, Linn.

Herbs or undershrubs. *Leaves* opposite, entire. *Flowers* sessile or subsessile, solitary or clustered; bract 0; bracteoles large, exceeding the calyx except in *R. ciliata*. *Calyx* 5-partite or 5-fid; teeth subequal, narrow, acute. *Corolla* tubular-ventricose; limb more or less oblique; lobes subequal, rounded, twisted to the left in bud, patent in flower. *Stamens* 4, didynamous, filaments glabrous, unless near the base; anthers subequal, 2-celled; cells oblong, mucous, glabrous. *Ovary* glabrous; ovules in each cell 3–10; style long-linear, hairy, stigma simple linear (except in *R. macrosiphon*). *Capsule* clavate, base solid, cylindric, ellipsoid, seed-bearing upwards. *Seeds* large, thinly discoid, marginate, much imbricated, densely elastically hairy when wetted; retinacula large, hooked, strong.—Species 150, in all warm regions.

The generic character here given is narrowed to the section *Dipteracanthus* (Genus, Nees), to which section all the Indian species strictly belong. In other sections (Genera of Nees), reunited now with *Ruellia* in the Gen. Pl., the bracts, capsules and seeds recede materially from the characters of *Dipteracanthus*.

Ruellia flagelliformis, Roxb. Fl. Ind. iii. 47, came from the Moluccas.

1. **R. prostrata**, *Lamk. Encycl. vi. 349*; prostrate pubescent upwards, leaves small ovate sparsely hairy or nearly glabrous, bracteoles spathulate-elliptic or petioled ovate foliaceous, corolla 1 in. pale purple caducous.

T. Anders. in Journ. Linn. Soc. ix. 460; *Bedd. Ic. Pl. Ind. Or.* t. 282. *R. Wightiana*, *Wall. Cat.* 2397. *R. repens*, *Heyne in Herb. Rottler.* *Dipteracanthus prostratus*, *Nees in Wall. Pl. As. Rar.* iii. 81, and in *DC. Prodr.* xi. 124.

DECCAN PENINSULA, extending North to BEHAR; *J. D. H.*

Stems 6–18 in., much branched, nodes short, glabrous downwards. *Leaves* $\frac{3}{4}$ in., subobtusely, lineolate by raphides and minutely sparsely pilose; petiole $\frac{1}{8}$ in. *Flowers* few together or often solitary; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., often altogether like the leaves. *Sepals* $\frac{1}{2}$ in., linear, ciliate. *Corolla* pubescent, ventricose portion of the tube twice the cylindric portion. *Capsule* $\frac{3}{4}$ in., pubescent, seed-bearing $\frac{2}{3}$ its length. *Seeds* 16–20, $\frac{1}{8}$ in. diam.

VAR. dejecta; diffuse sometimes rambling among bushes with very long nodes, leaves larger often 3 in. frequently acute. *Ruellia ringens*, *Roxb. Fl. Ind.* iii. 44; *Wall. Cat.* 2403. *R. repens*, *Wall. Cat.* 2384, chiefly. *R. deccanensis*, *Grav. Cat. Pl. Bomb.* 162. *Dipteracanthus dejectus*, *Nees in Wall. Pl. As. Rar.* iii. 82, and in *DC. Prodr.* xi. 125; *Dalz. & Gibs. Bomb. Fl.* 185, excl. syn. *D. prostratus*, *Griff. Notul.* iv. 135.—Throughout India, from the N. Punjab and Assam to Ceylon, very common (not seen from the Malay Peninsula).—Distrib. E. Africa. This variety passes into *R. prostrata* type by insensible gradations.

2. *R. repens*, *Linn. Mant.* 89 (not of *Burm. nor of Heyne*); stem nearly glabrous, leaves ovate acuminate or lanceolate mature nearly glabrous, bracteoles spatulate elliptic or petioled ovate foliaceous, corolla $\frac{3}{4}$ in. *Blume Bijdr.* 794; *T. Anders. in Journ. Linn. Soc.* ix. 460. *Dipteracanthus lanceolatus*, *Nees in Wall. Pl. As. Rar.* iii. 82, and in *DC. Prodr.* xi. 124.

MALAY PENINSULA; Moulmein, *Parish*; Mergui and Malacca, *Griffith*; Singapore, *Lobb*.—DISTRIB. Throughout Malaya to the Philippines. Siam.

Usually more glabrous with narrower leaves than *R. prostrata*, but can only be clearly separated by the smaller flowers; the capsule rarely exceeds $\frac{1}{2}$ in.

3. *R. patula*, *Jacq. Misc. Bot.* ii. 358, and *Ic. Pl. Rar.* i. t. 119; hoary pubescent, leaves ovate, bracteoles spatulate elliptic or petioled ovate foliaceous, corolla 1– $1\frac{1}{4}$ in. *Lamk. Ill.* t. 550 (smaller than nat. size); *Wall. Cat.* 2385; *Roxb. Fl. Ind.* iii. 45; *T. Anders. in Journ. Linn. Soc.* ix. 460. *R. erecta*, *Roth Nov. Sp.* 308. *Dipteracanthus patulus*, *Nees in Wall. Pl. As. Rar.* iii. 82, and in *DC. Prodr.* xi. 126; *Wight Ic.* t. 1505; *Oerst. in Vidensk. Meddel. Kjob.* 1854, t. 4, fig. 19–21. *D. erectus*, *Nees in Wall. Pl. As. Rar.* iii. 82, and *Cat.* 7186. *Petalidium patulum*, *Dalz. & Gibs. Bomb. Fl.* 185.

DECCAN PENINSULA, extending to Scinde, Rajpootana and Bundelkund (*Edgeworth*). CEYLON, frequent.—DISTRIB. Arabia, Abyssinia, Ava.

Resembling *R. prostrata*, but densely closely pubescent. *Corolla* pubescent, very pale grey purple, the cylindric portion of the tube as long as the ventricose part.

4. *R. longifolia*, *T. Anders. in Journ. Linn. Soc.* ix. 460; hairy, leaves linear-lanceolate, bracts linear-spatulate, calyx-lobes lanceolate scarcely longer than the tube, corolla $\frac{3}{4}$ in. *Boiss. Fl. Orient.* iv. 519. *Dipteracanthus longifolius*, *Stocks in Hook. Kew Journ.* iv. 177.

SCINDE; *Stocks, Dalzell*.—DISTRIB. Beloochistan.

Woody at the base, with many ascending stems 12 in. high; whole plant with glandular viscous white or hoary pubescence. *Leaves* 2 by $\frac{1}{2}$ in.; petiole continuous with the attenuate leaf-base. *Flowers* mostly solitary; bracteoles $\frac{3}{4}$ in. *Calyx* $\frac{1}{2}$ in. *Corolla* pubescent, blue. *Capsule* $\frac{3}{4}$ in., pubescent, nearly as of *prostrata*.

5. **R. cernua**, *Roxb. Fl. Ind.* iii. 45; leaves oblong or elliptic acuminate hairy, bracteoles petioled elliptic acute leaf-like, sepals $\frac{1}{2}$ in., corolla $1\frac{1}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 460.

CHOTA NAGPORE; Parasnath, alt. 2000–4500 ft., *Thomson, Anderson, Clarke.*

Rootstock woody; annual stems 6–24 in., hairy upwards. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{4}$ in., much acuminate, with scattered short white hairs on both surfaces; petiole $\frac{3}{4}$ in. *Flowers* 1–3 together, axillary and terminal; bracteoles 1 in. *Sepals* exceeding $\frac{1}{2}$ in., linear, hairy. *Corolla* pubescent, white with rose or pink-purple marks, tubular portion equalling the ventricose. *Stamens* of the genus. *Capsule* $\frac{1}{2}$ in., as of *R. prostrata*.—The plant here described is the Parasnath one, which is a typical *Ruellia* sect. *Dipteracanthus*, and which Anderson identifies confidently with Roxburgh's *R. cernua*, of which nothing is known but that the seeds came from Mysore, and Roxburgh's description and picture. In his description Roxburgh says the flowers were small, and his picture shows them $\frac{3}{8}$ in. long, so that it must be a striking variety of the Parasnath plant.

6. **R. suffruticosa**, *Roxb. Fl. Ind.* iii. 53; leaves elliptic hairy not acuminate, bracteoles petioled elliptic leaf-like, sepals $\frac{1}{4}$ in., corolla $1\frac{1}{2}$ in. white. *T. Anders. in Journ. Linn. Soc.* ix. 461. *R. repens*, *Wall. Cat.* 2384, letter F only. *Dipteracanthus* Sibua, *Nees in Wall. Pl. As. Rar.* iii. 81, and in *DC. Prodr.* xi. 121.

BENGAL; Dinajpur, *Hamilton*; throughout CHOTA NAGPORE, alt. 1–2000 ft., *Clarke*. UPPER GANGETIC PLAIN; Moradabad, *Thomson*.

Rootstock woody; annual stems sometimes 1–3 in. only (especially after the fires), sometimes 1–2 ft. *Leaves* 4 by $1\frac{1}{2}$ in., obtuse in the typical form, or acute hardly acuminate in Thomson's specimens. *Bracteoles* $\frac{3}{4}$ in., hardly acute. *Sepals* linear, puberulous or glabrate. *Capsule* $\frac{3}{4}$ –1 in.—Very closely allied to *R. cernua*.

7. **R. Beddomei**, *Clarke*; leaves elliptic acute hairy on both surfaces, bracteoles subpetioled ovate acute leaf-like, sepals $\frac{1}{2}$ in., corolla 3 in. *R. cernua*, *Anders. in Journ. Linn. Soc.* ix. 460, partly, not of *Roxb.*

CENTRAL INDIA; Jubbulpore, *Beddome*.

This seems nearer *R. suffruticosa* than *R. cernua*, of which T. Anderson reckoned it a form; but it differs from both in the very large corolla, the lobes of which are $1\frac{1}{2}$ by $\frac{3}{4}$ in., roundly elliptic.

8. **R. ciliata**, *Hornem. Hort. Hafn.* ii. 585; pubescent, leaves ovate shortly obtusely acuminate, bracteoles scarcely so long as the calyx-tube, corolla $1\frac{1}{2}$ in. *T. Anders. in Journ. Linn. Soc.* xi. 120. *Dipteracanthus ciliatus*, *Wall. Cat.* 7151; *Nees in Wall. Pl. As. Rar.* iii. 81, and in *DC. Prodr.* xi. 120. *Larysacanthus ciliatus*, *Oerst. in Vidensk. Meddel. Kjobenh.* 1854, 123.

BURMA; Prome, *Wallich*.

Stems 2 ft., shortly pubescent upwards. *Leaves* $3\frac{1}{2}$ by 2 in., base shortly cuneate, obscurely sinuate-crenulate; petiole $\frac{1}{2}$ –1 in. *Bracteoles* $\frac{1}{4}$ – $\frac{1}{2}$ in., oblong or spatulate-elliptic. *Calyx-tube* $\frac{1}{2}$ in.; teeth $\frac{1}{2}$ in., linear, pubescent. *Corolla* nearly glabrous, cylindric tubular much shorter than the ventricose part. *Filaments* hairy at the base. *Ovules* about 12. *Capsule* not seen.

9. **R. macrosiphon**, *Kurz in Journ. As. Soc.* 1873, pl. ii. 92; hairy, leaves linear-lanceolate or linear, bracteoles linear-lanceolate foliaceous, calyx-segments $2\frac{1}{2}$ in. linear-subulate, corolla 2 in. *Ruellia* sp., *T. Anders. in Journ. Linn. Soc.* ix. 461.

PEGU; *Beddome*.

Perennial, 2–3 in., woolly with crisped white hairs. *Leaves* 2 in., entire, narrowed at both ends; petiole obscure. *Flowers* sessile, solitary; bracteoles $\frac{1}{2}$ by $\frac{1}{2}$ in., linear-

oblong, white-hirsute. *Sepals* $\frac{1}{4}$ in., linear-lanceolate, glabrous, densely lineolate. *Corolla* pubescent; tube long-linear, ventricose for $\frac{1}{3}$ its length. *Stamens* 4, subequal; anther-cells similar, parallel, minutely white-tailed. *Style* elongate, branches $\frac{1}{10}$ in., subequal. *Capsule* many-seeded.—This recedes from the genus in the subequally bifid style; but the corolla-lobes are twisted in bud, and it must be a *Ruellia* or very near it.

DOUBTFUL SPECIES.

R. ? INVOLUCRATA, *Vahl Symb.* iii. 83; leaves short-petioled lanceolate attenuate at both ends entire glabrous, spikes small ovoid hirsute, bracts ovate attenuate quadri-farious. *Nees in DC. Prodr.* xi. 150.

INDIA (Madras?); *Koenig*.

General aspect of *Justicia Gendarussa*. *Leaves* 6-8 by 1- $\frac{3}{4}$ in., shining, conspicuously lineolate above. *Spikes* as large as a hazel-nut; bracteoles linear, hairy, shorter than the bracts. *Calyx* as long as the bracts. *Corolla* hairy in the throat. *Anthems* subsagittate at base. *Style* simple lanceolate branch. *Ovary* "pluri-ovulate."—Described by Nees from Koenig's specimen. The number of the ovules uncertain, and it is impossible to guess the genus.

R. ? GLANDULOSA, *Roth Nov. Sp.* 312; shortly villous, leaves petioled ovate-lanceolate subserrate, racemes axillary short subsecund, bracts minute linear-subulate glandular-villous. *Nees in DC. Prodr.* xi. 153. *Ruellia glabra*, *Heyne*.

INDIA (Madras?); *Heyne*.

Stem 4-angled, geniculate. *Leaves* 1 in. or a little longer; petiole $\frac{1}{8}$ in. *Racemes* nearly horizontal; peduncle solitary, shorter than the petiole, 5- or 6-fld.; bracts at the apex of the pedicels 2. *Sepals* $\frac{1}{2}$ in., equal, linear-subulate, glandular-villous. *Corolla* scarcely longer than the calyx, unequal, pubescent.—The combination of minute bracts with a corolla hardly longer than the calyx has defeated all attempts to ascertain the genus of this plant.

XI. *ECHINACANTHUS*, *Nees*.

Erect herbs or undershrubs. *Leaves* opposite, ovate or oblong, acute-toothed. *Cymes* lax, short, few-fld., or long compound, axillary, upper forming a terminal panicle; pedicels short or 0; bracts small, linear; bracteoles small or 0. *Sepals* 5, long, linear, subequal. *Corolla* tubular-ventricose, nearly straight, widened about the middle; lobes 5, subequal, rounded, twisted to the left in bud. *Stamens* 4, didynamous, included; anthers sub-similar, 2-celled; cells oblong, parallel, base spurred or not. *Ovary* with 6-8 ovules in each cell; style linear, stigma simple linear. *Capsule* oblong-linear, 8-16-seeded nearly from the base; retinacula stout, hooked. *Seeds* compressed, discoid, densely hairy, the hairs starting out on applying water.—Species 5, all Indian.

The character of the genus has been here widened to include plants closely resembling *Echinacanthus* except that the anther-cells are muticous.

* *Anther-cells spurred at the base*.

1. *E. attenuatus*, *Nees in Wall. Pl. As. Rar.* iii. 90, and in *DC. Prodr.* xi. 168; leaves oblong or ovate subdentate, sepals linear viscoso-pubescent, corolla $1\frac{1}{4}$ in. puberulous. *T. Anders. in Journ. Linn. Soc.* ix. 459. *Ruellia attenuata*, *Wall. Cat.* 2345; *Nees in Wall. Pl. As. Rar.* iii. 83 (not *Strobilanthes attenuatus*, *Nees in DC. Prodr.* xi. 193).

CENTRAL and EASTERN HIMALAYA; Nepal, *Wallich*; Tambur River, alt. 2-4000 ft., *J. D. H. Sikkim*, alt. 4000 ft., *Treutler*, &c.

Stems 1-2 ft., pubescent upwards. Lower *leaves* $3\frac{1}{2}$ by 2 in., broadly elliptic;

middle cauline oblong, narrowed to both ends, upper $1\frac{1}{2}$ by $\frac{1}{2}$ in.; mature subsessile, glabrate, lined or obscurely pubescent. *Cymes* 1–2 in., viscous pubescent, forming a quasi-panicle 6–8 in. long; bracts $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, secund, opposite, one barren, the other stipitate 0– $\frac{1}{2}$ in.; bracteoles 0. *Calyx-tube* $\frac{1}{8}$ – $\frac{1}{6}$ in.; lobes $\frac{1}{2}$ in. *Corolla* dark purple with lilac veins, cylindric equalling the ventricose portion. *Filaments* and *anthers* sparsely hairy. *Ovary* glabrous, style hairy. *Capsule* $\frac{3}{4}$ in., oblong scarcely ventricose; solid cylindric portion scarcely $\frac{1}{10}$ in.—(See 6, *E. Pumilio*.)

2. ***E. parviflorus***, *T. Anders. in Journ. Linn. Soc.* ix. 459; leaves ovate acuminate serrate, sepals linear glabrous, corolla 1– $1\frac{1}{4}$ in. glabrous.

KHASIA MTS.; *Griffith, Simons* (fide T. Anderson).

Glabrous, erect, divaricate. *Leaves* 3–6 by 2–3 in., base obliquely rounded; petiole 2–3 in. *Panicles* axillary and compound, terminal 6–10 in. long; flowers opposite, sessile; flowers often secund; bracts $\frac{1}{2}$ in., linear; bracteoles minute. *Calyx* divided to the base. *Corolla* straight, thrice as long as the calyx, funnel-shaped portion thrice as long as the cylindric. *Capsule* compressed, 8-seeded; seeds small, compressed.—Not seen; the foregoing abstracted from T. Anderson.

3. ***E. Brugmansianus***, *Nees in DC. Prodr.* xi. 168; leaves oblong attenuate at both ends repand sub-crenate hirsute-tomentose.

INDIA? in Vahl's Herbarium (Nees).

Calyx-segments a little shorter and less attenuate than those of *E. attenuatus*.—Not seen; the foregoing copied from Nees.

** *Anther-cells muticous at the base.*

4. ***E. Andersoni***, *Clarke*; leaves ovate acuminate mature glabrate, cymes lax large zigzag glabrous, corolla $\frac{3}{4}$ in.—*Echinacanthus* sp., *T. Anders. ms.*

SIKKIM HIMALAYA; Darjeeling; Pomong, alt. 3000 ft., *Clarke*. KHASIA MTS.?; *Calcutta Herbarium*.

An undershrub, 3 ft.; young parts (at least sometimes) with dense snow-white wool. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{2}$ in., base rounded, crenate-serrate, raphides obscure; petiole $1\frac{1}{2}$ in. *Cymes* in terminal panicles 12 by 15 in., flowers all solitary, mostly opposite on the ultimate branches; pedicels $\frac{1}{2}$ in.; bract at the base of the pedicel $\frac{1}{2}$ in., linear; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{2}$ in. and upwards, narrow, glabrous or nearly so; segments long-linear acute, connate at base for $\frac{1}{4}$ – $\frac{1}{6}$ in. *Corolla* nearly glabrous, bluish. Anterior *filaments* hairy at their base, sparsely so upwards; posterior *filaments* glabrous, anthers rather smaller. *Style* glabrous, stigma rather short. *Capsule* exceeding $\frac{1}{2}$ in., narrowly-oblong, 12–16-seeded from the base. *Seeds* discoid; on applying water the hairs start out.—Habit and inflorescence of a sympodal *Strobilanthes*, but the capsule is many-seeded. The inflorescence differs from that of *E. attenuatus* in that, of the 2 flowers in the axils of opposite bracts, one is not usually obsolete.

VAB. *viscosa*; panicle and sepals viscous-pubescent, corolla $\frac{1}{2}$ in. pubescent.—Sikkim, alt. 4000 ft.; Lingcham, *Clarke*.

5. ***E. longistylus***, *Clarke*; leaves ovate acuminate mature nearly glabrate, cymes lax large zigzag viscous-pubescent, corolla $1\frac{1}{2}$ in.

SIKKIM HIMALAYA, alt. 1–4000 ft.; Punkabari and Kursiong, *Clarke*.

Closely resembling the viscous-pubescent Var. of *E. Andersoni*, but the corolla very much larger. *Style* hairy, thickened upwards, stigma linear-lanceolate (resembling the pistil of *Æchmanthera*). *Seeds* 8–12 to the capsule, the hairs on them starting out when wetted.—The position of this and of *E. Andersoni* is doubtful between *Strobilanthes* and *Echinacanthus*.

6. ***E. Pumilio***, *Clarke*; finely glandular-pubescent, leaves small

elliptic crenate or toothed, cymes lax compound zigzag pubescent, corolla $\frac{3}{4}$ in.

KHASIA MTS., alt. 4200 ft.; Cherpa Coal-hill, *Clarke*.

An undershrub, 6–15 in., very woody, much branched, densely covered on all sides with cymes. *Leaves* 1 by $\frac{1}{2}$ in., narrowed at both ends (many $\frac{1}{2}$ – $\frac{1}{3}$ in. ovate), blackish; hairs scattered, very fine, often gland-tipped; petiole $\frac{1}{2}$ in. *Cymes* as of *E. Andersoni*; bracts $\frac{1}{4}$ in., linear; pedicels often $\frac{1}{4}$ in.; bracteoles $\frac{1}{8}$ – $\frac{1}{6}$ in., linear. *Sepals* $\frac{1}{2}$ in., linear, finely glandular-pubescent. *Corolla* light-purple, nearly glabrous. *Filaments* glabrous except near the base, where they are shortly connate; anthers subequal, 2-celled; cells oblong, mucicous, connective not excurrent. *Ovary* glabrous; style very sparsely hairy, stigma long narrowly lanceolate; ovules 3 in each cell. *Capsule* not seen.—This may prove to be *E. parviflorus*, T. Anders., but it is not likely that T. Anderson would have put that species in *Echinacanthus* without remark, had the anther-cells been mucicous.

XII. PETALIDIUM, Nees.

Minutely hairy undershrubs. *Leaves* ovate or narrowly oblong, entire or toothed. *Flowers* sessile or nearly so, solitary, usually crowded on abbreviated lateral branches; bracts 0; bracteoles large, ovate, reticulate-nerved becoming scarious. *Sepals* subequal, linear-lanceolate. *Corolla-tube* straight, ventricose nearly from the base; lobes rounded, twisted to the left in bud, patent in flower. *Stamens* 4, didynamous; anthers subsimilar, 2-celled; cells parallel, spurred at the base. *Ovary* with 2 ovules in each cell; style long-linear, stigma unequally 2-lobed. *Capsule* clavate, compressed parallel to the septum, 2- or 4-seeded; placentæ dehiscing elastically from the bottom of the capsule, raising the discoid seeds with them.—Species 12, one Indian, the rest African.

The above character is drawn chiefly from the Indian species; the number of African species received since the Gen. Pl., vol. ii., pl. 2, was published, may necessitate widening of the generic character.

P. barlerioides, Nees in *Wall. Pl. As. Rar.* iii. 82, and in *DC. Prodr.* xi. 114, excl. syn. *Eranthemum barlerioides*, *Roxb.*; leaves ovate crenate, bracteoles $\frac{3}{4}$ in., corolla 1 in. *Bot. Mug.* t. 4053; *Dalz. & Gibs. Bomb. Fl.* 185; *T. Anders. in Journ. Linn. Soc.* ix. 461. *Ruellia barlerioides*, *Roth Nov. Sp.* 310; *Wall. Cat.* 2389. *R. bracteata*, *Roxb. Fl. Ind.* iii. 47.

N.W. HIMALAYA and N. DECCAN PENINSULA, alt. 1–3000 ft.; extending from Canara and the Concan to Rajmahl and Rajpootana, frequent; reappearing in the Oude and KUMAON dry Terai, alt. 1500 ft.

Stems several, 2–3 ft., terete. *Leaves* 2–4 in., acuminate, hoary or dusky puberulous; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in.; leaves on the shortened flower-bearing spurs $\frac{1}{2}$ –1 in. *Bracteoles* ovate or elliptic, acute. *Sepals* $\frac{1}{2}$ in., linear, puberulous or pubescent. *Corolla* narrow-campanulate, pale-blue or white, yellow-tinged; palate with long deflexed fulvous hairs within. *Filaments* and *anthers* minutely sparsely hairy (all but glabrous). *Ovary* glandular upwards, style shortly hairy. *Capsule* $\frac{1}{2}$ in., usually 2-seeded. *Seeds* shaggy, hairs somewhat elastic when wetted; retinacula (with the placentæ) stout, rigid.—*Eranthemum barlerioides*, *Roxb.*, placed here by Nees (and T. Anderson), is either *Eranthemum Parishii* or very near it, and came from the Andamans.

XIII. PHAYLOPSIS, Willd.

Prostrate, perennial herbs. *Leaves* opposite, petioled, ovate, entire or obscurely crenate. *Spikes* terminal, 1-sided, dense; bracts orbicular, closely

imbricate, each usually 3-fld.; bracteoles 0. *Sepals* 5, one ovate, nervose, the others linear like bracts. *Corolla* small; tube slender, cylindric; lobes 5, slightly unequal, rounded, contorted in the bud, patent in flower. *Stamens* 4, didynamous; anthers subsimilar, 2-celled; cells parallel, shortly oblong, base minutely mucronate. *Ovary-cells* 2-ovuled; style long-linear, hairy, stigma simple linear. *Capsule* clavate, compressed parallel to the septum, 4-seeded; placenta dehiscing elastically from the base of the capsule, raising the seeds with them. *Seeds* compressed, discoid, densely elastically white-hairy when wetted.—Species 10, all Tropical and African, one Indian and one Arabian.

P. parviflora, Willd. *Sp. Pl.* iii. 342; hairy, leaves opposite unequal ovate, bracts orbicular or reniform membranous becoming in fruit whitened nervose. *T. Anders. in Journ. Linn. Soc.* ix. 461. *Micranthus oppositifolius*, Wendl. *Obs.* 39. *Ruellia imbricata*, Vahl *Symb.* ii. 73; *Rorb. Fl. Ind.* iii. 48; *Wall. Cat.* 2353. *R. dorsiflora*, Retz. *Obs.* vi. 31. *Ætheilema reniforme*, Nees in *Wall. Pl. As. Rar.* iii. 94, and in *DC. Prodr.* xi. 261; *Wight Ic.* t. 1533; *Dalz. & Gibs. Bomb. Fl.* 192. *Æ. parviflorum*, Spreng. *Syst.* ii. 826. *Æ. mucronata?* Griff. *Notul.* iv. 137.—*Ætheilema*, Griff. *Notul.* iv. 136.

Throughout INDIA (except the N.W.), alt. 0–3000 ft., from the Himalaya to CEYLON and Tenasserim; common in Bengal both in the plains and in the lower hills.—DISTRIB. Madagascar, Tropical Africa.

A prostrate, closely-branched herb; branches often flagellate, 2–3 ft. *Leaves* 3½ by 1½ in., acuminate at both ends, obscurely pubescent, petiole ½ by 1½ in.; leaves of lateral branches ½–1½ in. *Spikes* ½–2 in., densely or thinly hairy; bracts ¼–½ in. *Calyx* ¼ in., hairy. *Corolla* ½ in., nearly white. *Stamens* glabrous. *Capsule* ¼ in.; valves with rigid backs and scarious sides. *Seeds* ⅛ in. diam.

XIV. DÆDALACANTHUS, T. Anders.

Shrubs or perennial herbs. *Leaves* opposite, petioled, entire or obscurely toothed, lineolate by raphides. *Spikes* linear with distant flowers, or dense or capitate; bracts usually large; bracteoles linear-lanceolate, hardly so long as the calyx. *Corolla-tube* linear, long, widened only near the top or in a few species from the middle; lobes obovate, twisted to the left in bud, horizontal in flower, blue, rarely rose, veined. *Stamens* 2, glabrous; anthers narrowly oblong, 2-celled, mucous, exerted or subincluded. *Ovary* glabrous, 4-ovuled; style long, sparingly hairy, stigma simple linear. *Capsule* clavate, base solid cylindric. *Seeds* normally 4, compressed, discoid, densely finely elastically hairy when wetted.—Species 17, Indian and Malayan.

This genus, in the long corolla and 2 stamens with mucous anthers, greatly simulates *Eranthemum*; the species are in general easily distinguished by the bracts much exceeding the calyx; in *D. microstachyus* & *concanensis*, however, the bracts are small, and they can only be recognized by their twisted corolla-lobes.

* *Corolla lower half cylindric, upper half ventricose or funnel-shaped.*

1. **D. tubiflorus**, T. Anders. in *Journ. Linn. Soc.* ix. 485; leaves elliptic acuminate at both ends glabrate, spikes axillary simple dense, corolla 1½ in. upper half ventricose.

E. BENGAL (? Mishmee); Griffith (Kew Distrib. n. 6122).

Stem upwards and innovations pubescent. *Leaves* 8½ by 3 in., obscurely crenulate, lineolate with raphides on both surfaces; nerves 12 pair; petiole 1 in. *Spikes*

3 in., short-peduncled; bracts $\frac{3}{4}$ in., closely imbricate, 1-fl'd., obovate, shortly acute, glabrous, white with green reticulating nerves; bracteoles $\frac{1}{4}$ in., lanceolate, acuminate. *Calyx* nearly $\frac{1}{2}$ in., divided $\frac{2}{3}$ the way to the base; lobes lanceolate, acuminate, puberulous. *Corolla* slightly curved, glabrate; lobes $\frac{1}{2}$ by $\frac{1}{4}$ in., roundly elliptic, nervose. *Stamens* glabrous; anthers exserted. *Capsule* not seen.

2. **D. Griffithii**, *T. Anders. in Journ. Linn. Soc.* ix. 486; leaves oblong or elliptic acuminate at both ends glabrate, spikes long-peduncled simple dense, corolla $1\frac{1}{4}$ in. upper half funnel-shaped.—*Eranthemum* sp., *Griff. Itin. Notes*, 96, n. 1437.

BHUTAN; Ghoorgong, *Griffith* (Kew Distrib. n. 6126).

Branchlets upwards tetragonous, obscurely pubescent. *Leaves* 6 by 2 in., lineolate with raphides on both surfaces; nerves 9 pair; petiole $\frac{3}{4}$ in. *Peduncles* 3-4 in., 4-angled; spikes 2-5 in.; bracts 1 in., densely imbricated, 1-fl'd., ovate, acuminate, glabrous, whitish with green reticulating nerves; bracteoles $\frac{1}{4}$ in., linear-lanceolate. *Calyx* $\frac{1}{4}$ - $\frac{1}{2}$ in., divided more than half-way down; lobes linear-lanceolate, minutely puberulous. *Corolla* slightly curved, flesh-coloured without, rose within (*Griffith*), nearly glabrous, narrower at the summit and less suddenly narrowed in the middle than that of *D. tubiflorus*. *Stamens* glabrous; anthers exserted. *Capsule* $\frac{1}{2}$ in., glabrous. *Seeds* $\frac{1}{8}$ - $\frac{1}{4}$ in.—Seems very near *D. tubiflorus*.

3. **D. splendens**, *T. Anders. in Journ. Linn. Soc.* ix. 486; leaves ovate or elliptic acuminate at both ends somewhat pubescent, spikes short-peduncled usually very long, corolla $1\frac{1}{2}$ in. pubescent upper half of the tube funnel-shaped.—*Eranthemum* sp. n. 23, *Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA; alt. 1-3000 ft., frequent; *Griffith* (Kew Distrib. n. 6129), *J. D. H.*, &c.

Stems 3-5 ft., pubescent upwards. *Leaves* 6 by 3 in., subentire, lineolate with raphides on both surfaces; nerves 12 pair; petiole $\frac{1}{2}$ - $1\frac{1}{2}$ in. *Peduncles* $\frac{1}{2}$ - $1\frac{1}{2}$ in.; spikes 3-12 in.; bracts $\frac{3}{4}$ in., all imbricate, 1-fl'd., obovate, glandular-pubescent, whitish or brownish with reticulated green nerves; bracteoles $\frac{1}{4}$ in., linear-lanceolate. *Calyx* $\frac{1}{2}$ in., lobed half-way down; lobes narrow-lanceolate, puberulous. *Corolla* slightly curved, brick-red; lobes $\frac{1}{2}$ in., roundly elliptic, patent or recurved in flower. *Stamens* glabrous, anthers exserted. *Capsule* $\frac{3}{4}$ in., thinly glandular-pubescent.—Near *D. tubiflorus*.

** *Corolla-tube cylindric, widened below the summit for scarce $\frac{1}{2}$ its length.*

4. **D. nervosus**, *T. Anders. in Journ. Linn. Soc.* ix. 487; leaves ovate acuminate glabrous lineolate, base shortly attenuate, spikes short uninterrupted, bracts elliptic subobtusate or shortly acuminate nervose glabrate margins entire incurved not ciliate, corolla $1\frac{1}{4}$ in. blue glabrous. *Justicia nervosa*, *Vahl Enum.* i. 164; *Bot. Mag.* t. 1358. *Ruellia varians*, *Vent. Jard. Cels.* t. 46. *Eranthemum nervosum*, *Br. Prodr.* 477; *Nees in Wall. Pl. As. Rar.* iii. 106, and in *DC. Prodr.* xi. 445; *Wall. Cat.* 2493, in chief. *E. pulchellum*, *Andr. Bot. Repos.* t. 88, not of *Roxb.* *E. Edgeworthianum*, *Nees in DC. Prodr.* xi. 446.

Base of the HIMALAYA, alt. 1-3000 ft., from the Punjab to Bhotan, frequent. SILHET; *Wallich.* SOONDERBUND; *Clarke.*—(Cultivated in various tropical countries.)

Stems 2-6 ft., glabrous, or very nearly so to the summit. *Leaves* often 8 by 4 in., entire or obscurely crenulate, upper shortly attenuate at the base, raphides copious on both surfaces; nerves 10 pair; petiole $\frac{1}{2}$ - $1\frac{1}{2}$ in. *Spikes* 1-3 in., often ternate, forming close terminal panicles; peduncles $\frac{1}{2}$ - $1\frac{1}{2}$ in., often acutely quadrangular, lineolate, glabrous or obscurely pubescent; bracts $\frac{1}{2}$ in., much more concave than in the neighbouring species, imbricated deeply but somewhat laxly, sometimes obtuse never

long-acuminate, lineolate, puberulous; bracteoles $\frac{1}{2}$ in., narrowly lanceolate. *Calyx* $\frac{1}{2}$ in., lobed half-way down, whitish, minutely but densely pubescent; lobes lanceolate. *Corolla-lobes* $\frac{1}{2}$ – $\frac{3}{4}$ in., broadly elliptic. *Stamens* glabrous; anthers exerted, narrowly oblong. *Ovary* glabrous; style nearly glabrous. *Capsule* $\frac{1}{2}$ in.; solid cylindric base short. *Seeds* $\frac{1}{2}$ in. diam.—The Soonderbund plant has the calyx-lobes unusually short. The Var. *scabra* of Nees is merely a specimen in young flower, and therefore slightly scabrid-puberulous (it is not Anderson's *scabra*).

5. **D. macrophyllus**, *T. Anders. in Journ. Linn. Soc.* ix. 487; stem pubescent upwards, leaves elliptic-lanceolate ovate acuminate attenuate at the base often obscurely scabrid-puberulous, spikes linear subinterrupted, bracts elliptic subobtusely nervose margins entire obscurely pubescent not ciliate, corolla $1\frac{1}{2}$ in. *Bot. Mag.* t. 6686. *Eranthemum macrophyllum*, *Wall. Cat.* 7179; *Nees in Wall. Pl. As. Rar.* iii. 106, and in *DC. Prodr.* xi. 446.

PEGU, BURMA and TENASSERIM; *Wallich, &c.* (Kew Distrib. n. 6128).

Closely allied to *D. nervosus*, but the inflorescence more lax. *Leaves* similar to (not larger than) those of *D. nervosus*, but (even when mature) often with scattered minute hairs on the upper surface, and a scabrid pubescence on the nerves beneath; raphides fewer and less prominent. *Peduncles* 2–5 in., pubescent; spikes 2–5 in.; bracts as of *D. nervosus*, the lower often scarcely overlapping.—A single specimen of this from Hort. Kew put into the Herbarium in 1869 is marked *D. scaber* by T. Anderson, but is not the plant so called of his monograph in *Journ. Linn. Soc.*, which is a *D. nervosus*.

6. **D. strictus**, *T. Anders. in Journ. Linn. Soc.* ix. 487; leaves ovate or elliptic narrowed at both ends glabrous or nearly so, spikes linear interrupted forming a large terminal panicle, bracts narrowly elliptic obtuse herbaceous not whitened, corolla $1\frac{1}{4}$ –2 in. blue. *Eranthemum strictum*, *Colebr.*; *Roxb. Fl. Ind. ed. Carey*, and *Wall.* i. 114; *Wall. Cat.* 2494; *Bot. Reg.* t. 867; *Bot. Mag.* t. 3068; *Nees in Wall. Pl. As. Rar.* iii. 106, and in *DC. Prodr.* xi. 448 (excl. syn. *Wall. Cat.* 2492 a.).

EASTERN FRONTIER, in the lower hills, alt. 0–3000 ft., from KHASIA MTS. to CHITTAGONG, *Wallich, H. f. & T., &c.*, frequent.

A herb, 1–3 ft., with large basal leaves, pubescent, sparingly leafy upwards. Basal leaves 6–12 in., narrowed at the base, short-petioled, subentire, raphides obscure; upper often 1–2 in. only, base sometimes rounded. *Spikes* 3–8 in., hairy in the Chittagong plants, nearly glabrous in some of the Khasian; bracts $\frac{1}{2}$ –1 in., much exceeding the calyx, green, 1-fl.; bracteoles $\frac{1}{2}$ in., linear-lanceolate. *Calyx* $\frac{1}{2}$ in., divided half-way down; lobes lanceolate. *Corolla* often pubescent. *Stamens* glabrous; anthers included. *Style* hairy in the Chittagong specimens, very slightly so in the Khasian. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., glandular-pubescent, or in the Khasian examples nearly glabrous.

7. **D. roseus**, *T. Anders. in Journ. Linn. Soc.* ix. 487; leaves elliptic acuminate at both ends glabrous lineolate, spikes linear subinterrupted, bracts obovate with a short recurved mucro glandular-pubescent strongly nerved, corolla 1– $1\frac{1}{2}$ in. rose subglabrous. *Justicia rosea*, *Vahl Enum.* i. 165. *Eranthemum roseum*, *Br. Prodr.* 447; *Nees in DC. Prodr.* xi. 447; *Dalz. & Gibs. Bomb. Fl.* 195.

W. and S. DECCAN PENINSULA, from the Bombay Ghats to Mangalore, frequent; *Wight, Hohenacker, &c.*

Resembling *D. nervosus*, but inflorescence more lax and bracts different. *Peduncles* 0–2 in., axillary and terminal; spikes often 6 in. *Bracts* (all but the lowest) imbricated, $\frac{1}{2}$ – $\frac{3}{4}$ in., strongly rugose by raised inarching green nerves; margins entire, glabrous, ciliate or very hairy. *Seeds* $\frac{1}{2}$ in. diam., much compressed. Otherwise (except the colour of corolla) as *D. nervosus*.

VAR. *Neesii*; leaves ovate acuminate not lineolate, nerves much raised beneath scabrous, spikes short dense, bracts ciliate.—ASSAM?

8. **D. tetragonus**, *T. Anders. in Journ. Linn. Soc.* ix. 488; leaves lanceolate acuminate at both ends glabrous densely lineolate, spikes solitary short-peduncled oblong very dense, bracts elliptic green long-ciliate, corolla $1\frac{1}{2}$ in. pale blue. *Eranthemum tetragonum*, *Wall. Cat.* 7180; *Nees in Wall. Pl. As. Rar.* iii. 106, and in *DC. Prodr.* xi. 447.

BRITISH BURMA, *Wallich*; Moulmein, *Parish*; Thoungyen Hills, *Beddome*; Beeling Forest, *Brandis*.

Branches upwards slender, quadrangular, nearly glabrous. *Leaves* $7\frac{1}{2}$ by $1\frac{1}{4}$ in., much attenuate, subentire; nerves 7–8 pair; petiole 1 in. *Spikes* 2 in., hairy; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., subobtusely. *Calyx* and *bracteoles* as of *D. nervosus*. *Corolla-tube* glabrous; mouth $\frac{3}{4}$ –1 in. *Anthers* not exerted. *Capsule* $\frac{1}{2}$ in.; solid narrowed base scarcely $\frac{1}{8}$ in.—Not nearly allied to *Eranthemum salaccense* (Blume Bijl. 792), as *T. Anderson* supposed; *Kurz* erroneously reduced it thereto in *Journ. As. Soc.* 1870, pt. ii. p. 78.

9. **D. suffruticosus**, *T. Anders. in Journ. Linn. Soc.* ix. 488; leaves elliptic narrowed at both ends glabrate not lineolate, spikes short dense nearly glabrous, bracts obovate nervose not whitened, corolla $1\frac{1}{4}$ in. pale blue. *Eranthemum suffruticosum*, *Roxb. Fl. Ind.* i. 111; *Nees in Wall. Pl. As. Rar.* iii. 107, and in *DC. Prodr.* xi. 448. *E. barlerioides*, *Roxb. Fl. Ind.* i. 113. *E. amoenum*, *Ham. ms.*

ANDAMANS; *Herb. Hamilton, Kurz*.

Nearly glabrous; branches leafy, obscurely tetragonous. *Leaves* 6 by $2\frac{1}{4}$ in., undulate; nerves 6 pair; petiole $\frac{3}{8}$ in. *Spikes* 1– $1\frac{1}{2}$ in., terminal, solitary, dense with (in *Roxburgh's* drawing) sometimes a few straggling flowers at the base; bracts $\frac{3}{4}$ in., obtuse with a short mucro, glabrous; nerves prominent beneath; bracteoles $\frac{1}{2}$ in., linear-lanceolate. *Calyx* $\frac{1}{2}$ in., divided half-way down; lobes linear-lanceolate. *Corolla-tube* glabrous; mouth $\frac{3}{4}$ in. diam. *Anthers* included.—*E. barlerioides*, somewhat doubtfully referred here by *T. Anderson*, is merely one of the cases where *Roxburgh* changed the name of a species, and his editors *Wallich* and *Carey* printed the description twice over.

10. **D. microstachyus**, *T. Anders. in Journ. Linn. Soc.* ix. 488; leaves elliptic narrowed at both ends glabrate, flowers remote sessile paniced, bracts small none imbricate, corolla $1\frac{1}{2}$ in. purple.

MOULMEIN; *Lobb*.

A herb, 2–3 ft., with large basal leaves, sparingly leafy upwards, habit of *D. strictus*. *Leaves* 8 by 3 in., base attenuate or rounded, subentire, obscurely or not lineolate; nerves 10 pair; petiole 0–1 in. *Panicle* large, compound, trichotomous, glandular-pubescent, branches quadrangular; bracts $\frac{1}{2}$ in., ovate or elliptic; bracteoles $\frac{1}{8}$ in., oblong. *Calyx* $\frac{1}{2}$ in., deeply divided; green; lobes linear, viscid-pubescent. *Corolla-mouth* $1\frac{1}{4}$ in. diam. *Anthers* included. *Ovary* and *style* somewhat glandular-pubescent. *Capsule* $\frac{3}{4}$ in., acute; solid cylindric base longer than the seed-bearing part.—Though the shortened bracts give this so different an aspect, the species appears very closely allied to *D. strictus*.

11. **D. purpurascens**, *T. Anders. in Journ. Linn. Soc.* ix. 488; leaves ovate acuminate upper often rounded at the base, spikes solitary oblong very dense, bracts ovate much acuminate nervose ciliate. *Justicia pulchella*, *Roxb. Cor. Pl.* ii. 41, t. 177. *Eranthemum pulchellum*, *Roxb. Fl. Ind.* i. 111, not of *Andr.* *E. purpurascens*, *Nees in Wall. Pl. As. Rar.* iii. 106, and in *DC. Prodr.* xi. 447. *E. montanum*, *Wall. Cat.* 2492, partly. *E.*

nervosum, Dalz. & Gibs. *Bomb. Fl.* 195, not of others.—*Eranthemum* sp. n. 12, *Herb. Ind. Or. H. f. & T.*

CENTRAL INDIA, alt. 1-4000 ft., common; from the Bombay Ghats, *Jacquemont*, and Belgaum, *Ritchie*, to Parasnath and South Behar, *J. D. H.* UPPER ASSAM; Dibroo-mook, *Griffith*.

Stems 2-4 ft., leafy. *Leaves* attaining 9 by 4 in., base decurrent, uppermost much smaller, subsessile, often cordate, subentire, sometimes glabrate, densely lineolate, sometimes pubescent on the nerves on both surfaces (the raphides in such case obscure); nerves 7-9 pair. *Spikes* 1-2½ in., usually appearing long-peduncled, the uppermost leaves being much reduced; bracts 1 in., base rounded, rigid, green not whitened but with much elevated nerves, apex divaricate, margins not incurved; bracteoles ½ in., linear-lanceolate. *Calyx* ½ in., lobed half-way down; segments lanceolate, whitened, minutely pubescent. *Corolla* 1½ in., bluish, pubescent or nearly glabrous. *Anthers* included. *Capsule* ½-¾ in., lower solid cylindric portion short.—The bracts in Roxb. *Cor. Pl. t. 177* are characteristically those of *D. purpurascens*, and in the description he says bracts ciliate. Moreover Roxburgh got his *E. pulchellum* from "the drier parts of India."

12. **D. montanus**, *T. Anders. in Thwaites Enum.* 229, and in *Journ. Linn. Soc.* ix. 489; leaves elliptic attenuate at both ends subglabrous lineolate, spikes linear or capitate viscidly hairy, bracts lanceolate linear-acuminate green, calyx deeply divided segments linear green glandular hairy, corolla 1½ in. blue. *Eranthemum capense*, *Linn. Amœn. Acad.* i. 385. *E. montanum*, *Roxb. Fl. Ind.* i. 110; *Wall. Cat.* 2492; *Nees in Wall. Pl. As. Rar.* iii. 107, and in *DC. Prodr.* xi. 448. (excl. syn. *Bot. Mag.* t. 4031); *Wight Ic.* t. 466; *Dalz. & Gibs. Bomb. Fl.* 195. *E. fastigiatum*, *Spreng. Syst.* i. 89. *Justicia fastigiata*, *Lamk. Ill.* i. 41. *J. montana*, *Roxb. Cor. Pl.* ii. 41, t. 176.

W. and S. DECCAN and CEYLON, alt. 1-6000 ft., frequent; *Wallich, Wight, &c.*

Herb 2-3 ft., leafy; upper branches or peduncles quadrangular, usually white-hairy or glandular. *Leaves* 4½ by 1½ in., all (except the floral) gradually attenuate at the base; nerves 6-7 pair; petiole ½-1½ in. *Inflorescence* extremely variable; from linear elongate spikes in compound corymbs or panicles with distant flowers to distant short-oblong very dense heads, always more or less glandular-hairy; bracts from elliptic with linear tips to linear-lanceolate, apex subobtusely, viscid-pubescent not whitened, lowest often 2-fld., bracts usually narrower in the elongate spikes broader in the shortened; bracteoles ½ in. *Calyx* ½ in. *Corolla* 1½ in., pale blue. *Anthers* subexserted from the corolla-tube. *Capsule* ½-1 in. *Seeds* ⅛ in. diam.—A variable species best distinguished by the long linear green viscidly hairy calyx-teeth. The high-level form with shortened spikes hardly differs from *D. purpurascens* by any other character than this. The Javan *D. salaccensis* does not much differ but by the bracts being obscurely linear-spathulate upwards.

VAR. Wightiana; leaves large ovate, corymb very compound with linear branches, bracts linear, calyx and capsule small. *Eranthemum Wightianum*, *Wall. Cat.* 2495, letter A only; *Nees in Wall. Pl. As. Rar.* iii. 107, and in *DC. Prodr.* xi. 449.—Deccan Peninsula?, *Russell*.—This is a remarkable specimen, estimated a species by Nees; it seems that T. Anderson never saw it; the remainder of *Wall. Cat.* 2495 with distant capitate heads being that which T. Anders. reduced to a Var. of *D. montana*. In *Russell's* plant the leaves are 7 by 3½ in., shortly suddenly attenuate at the base, the uppermost subcordate; the bracts are exactly linear, parallel-sided (in *D. montanus* they are always dilated downwards); the corolla is not fully expanded, but seems smaller than in *D. montanus*.

VAR. concanensis, *T. Anders. ms.*; panicle compound, spikes linear interrupted, bracts ovate abbreviated, not rarely 2-fld.—Concan; *Law*.

13. **D. Parishii**, *T. Anders. in Journ. Linn. Soc.* ix. 489; leaves ovate or elliptic acuminate at both ends undulate-crenate glabrous, spikes sub-

capitate or oblong dense, bracts leaf-like glabrous often undulate-crenate, corolla $1\frac{1}{2}$ in. blue.

MALAY PENINSULA; Tenasserim, *Helper* (Kew Distrib. n. 6176), *Beddome*; Tavoy and Moulmein, *Parish*.

Whole plant lineolate with raphides. *Stems* erect, elongate, tetragonous, leafy upwards. *Leaves* $5\frac{1}{2}$ by $2\frac{1}{2}$ in., tip long acuminate, base shortly acuminate; nerves 7-8 pair; petiole $0-1\frac{1}{4}$ in. *Flowers* often appearing densely clustered at the nodes on shortened axillary spurs; bracts $1-1\frac{3}{4}$ in., leafy, imbricated usually densely sometimes laxly; bracteoles $\frac{1}{2}$ in., linear-lanceolate. *Calyx* $\frac{1}{2}$ in., divided half-way down; lobes narrow-lanceolate, whitened, puberulous. *Corolla*-limb $\frac{3}{4}$ in. diam. *Anthers* included. *Capsule* 1 in., glabrous.—This much resembles *D. suffruticosus*, but the leaves are conspicuously lineolate. T. Anderson has overlooked the true bracteoles; they are exactly similar in size, form and situation to those of other species. The bracts (bracteoles of T. Anders.) are 1 to each flower; when they are opposite on the spike and the flower in the axil of one is aborted, they appear superficially 2 to each flower; as is the case often in *D. montanus* and several other species and genera.

XV. HEMIGRAPHIS, Nees.

Herbs or shrubs. *Leaves* opposite, toothed or subentire. *Flowers* sessile, in heads or spikes, rarely solitary; heads terminal or quasi-axillary on shortened branchlets, rarely (in *H. flava*) paniced; bracts imbricated, large, 1-fld.; bracteoles small, narrow, or 0. *Calyx* 5-partite nearly to the base; segments 5, subequal, linear-lanceolate or lanceolate. *Corolla* long-tubular, lower half cylindric, upper funnel-shaped or ventricose; lobes 5, rounded, subequal, sinistrosely contorted, blue or yellow. *Stamens* 4, didynamous, included or nearly so; anthers oblong, 2-celled, muticous, sometimes triangular, bases acute. *Style* long, stigma of one linear and one very short lobe; ovules 3-8 in each cell. *Capsule* linear or linear-oblong, 6-20-seeded nearly from the base. *Seeds* compressed, discoid, brown when dry, apparently glabrous with a white margin, when wetted densely hairy with white long unicellular hairs, each with numerous annular thickenings.—Species 20, Indian, Malayan, a few Chinese and Japanese.

Sect. 1. *Corolla* tubular-ventricose, limb blue. Longer *filaments* glabrous in their upper half or very nearly so.

1. **H. dura**, T. Anders. in Journ. Linn. Soc. ix. 461 (excl. syn. *Ruellia crispata*); bristly, leaves spatulate-elliptic crenate, bracteoles 0, calyx $\frac{1}{2}$ in. subscariosous. *Ruellia urens*, Heyne in Herb. Rottler; Roth Nov. Sp. 302; Roxb. Ic. Ined. *R. dura*, Nees in DC. Prodr. xi. 146; Dalz. & Gibs. Bomb. Fl. 186.

DECCAN PENINSULA; Kurnool (in Madras), *Beddome*; Bombay, *Jacquemont*; Central India, *Edgeworth*; Belgaum, *Ritchie*; Nilgherries, *Hohenacker*, &c.

Stems 1-2 ft., branched, diffuse, often almost prickly from white deflexed bristles. *Leaves* $1\frac{3}{4}$ by $\frac{3}{4}$ in., obtuse, harshly scabrous; petiole $\frac{1}{4}$ in. *Heads* many-fld., with white and often much brown hair; bracts $\frac{3}{4}$ in., oblong or spatulate. *Calyx* divided nearly to the base; segments linear, green with scarios margins, setulose. *Corolla* $\frac{3}{4}$ in., subequal, blueish-purple, ventricose portion about as long as the cylindric. Longer *filaments* laxly hairy below. *Capsule* $\frac{1}{2}$ in., 6-8-seeded.—Nees erroneously maintains (DC. Prodr. xi. 146) that *R. urens* of Heyne, Roth and Roxburgh is the same as their *R. latebrosa*.

2. **H. hirta**, T. Anders. in Journ. Linn. Soc. ix. 462; softly hirsute, leaves small ovate crenate, bracteoles 0, calyx $\frac{1}{2}$ in. green. *Ruellia hirta*, Vahl

Symb. iii. 84, t. 67; *Roxb. Fl. Ind.* iii. 46 *Nees in DC. Prodr.* xi. 145, *excl. Var. β.* *R. latebrosa, Roxb. Fl. Ind.* iii. 46?; *Wall. Cat.* 2382, *not of Roth nor of Dalz. nor of Wight.* *R. sarmentosa, Nees in Wall. Pl. As. Rar.* iii. 83.

BENGAL; very common. UPPER GANGETIC PLAIN; Moradabad, Thomson.

Hirsute (not harshly) with white hairs. *Stems* 6–18 in., creeping in grass. *Leaves* $\frac{1}{2}$ –1 in., obtuse; petiole 0– $\frac{1}{3}$ in. *Heads* 2–6-fld.; axillary solitary flowers not rarely added; bracts $\frac{1}{2}$ in., elliptic. *Sepals* linear, or in fruit subspathulate. *Corolla* $\frac{1}{2}$ in., subequal, pale lavender-blue, fugacious, glabrous with 2 hairy lines in the palate; ventricose portion nearly as long as the cylindric. Longer filaments laxly hairy below. *Style* sparsely hairy. *Capsule* $\frac{1}{2}$ in., 12-seeded.—It is doubtful whether Roxburgh described this species under two names, or whether one of these applied to *H. venosa* or some other species. Kurz (*Journ. As. Soc.* 1871, ii. 74) proposed (unhappily) to unite this with *Ruellia Blumeana*.

3. **H. venosa**, Clarke; scabrid-pubescent, leaves petioled ovate crenate, bracteoles as long as the calyx. *Ruellia venosa, Heyne in Herb. Rottler. R. crispa, Nees in Wall. Pl. As. Rar.* iii. 83, and in *DC. Prodr.* xi. 146, *not of Linn.*

DECCAN PENINSULA; Rottler, Wight.

Stems 6–12 in., branched, rooting, sparingly pubescent. *Leaves* 2 by 1 in., acuminate at both ends, crisp, lineolate; petiole $\frac{3}{4}$ in. *Heads* many-fld., axillary and terminal; bracts $\frac{1}{2}$ in., obovate; bracteoles $\frac{1}{2}$ in., lanceolate, densely lineolate, white-hirsute upwards. *Sepals* $\frac{1}{2}$ in., 5, subequal, lanceolate, below glabrous scarious, tips hispid with white hairs. *Corolla* $\frac{3}{4}$ in., tube for $\frac{1}{4}$ in. cylindric, for $\frac{1}{4}$ in. ventricose or almost hemispheric; mouth subequal. *Anthems* subequal, of the longer filaments subexsert. *Ovary* glabrous, tip glandular-pubescent; ovules 6–8, on retinacula. *Capsule* not seen.—Much resembling *Cardanthera triflora*, but the corolla is smaller, not (or obscurely) bilabiate. T. Anderson placed this with his *Stenosiphonium zeylanicum*, which has 4 ovules and a differently shaped corolla, and is *Strobilanthes exsertus* described below.

4. **H. confinis**, T. Anders. in *Journ. Linn. Soc.* ix. 463; thinly softly white-hairy, leaves petioled elliptic narrowed to both ends obsoletely crenate, bracteoles hardly half as long as the calyx. *Ruellia confinis, Nees in DC. Prodr.* xi. 148.

MERGUI and MALACCA; Griffith, Maingay, Cuming.—DISTRIB. Java, Borneo (not Philippines).

Stems 2 ft., sparsely hairy. *Leaves* 3 $\frac{1}{2}$ by 1 $\frac{1}{2}$ in., obtuse or obtusely acuminate, raphides plentiful but obscure; petiole $\frac{1}{2}$ in. *Spikes* terminal, dense, often elongate (especially in fruit) 2–3 in., oblong, or subglobose when young; bracts $\frac{1}{2}$ – $\frac{1}{4}$ in., ovate, subacute, imbricate, sub-4-seriate, hairy often viscidly; bracteoles $\frac{1}{2}$ – $\frac{1}{4}$ in., linear or narrow. *Sepals* $\frac{1}{4}$ – $\frac{1}{3}$ in., narrowly lanceolate sublinear, one slightly larger. *Corolla* $\frac{1}{2}$ in., with few white hairs within; lower cylindric portion about as long as the suddenly ventricose. *Filaments* glabrous or nearly so; anthers 2-celled, long. *Ovary* and style glabrous. *Capsule* about $\frac{1}{2}$ in., usually 8-seeded.—Kurz (*Journ. As. Soc.* 1871, pt. ii. 74) reduces this to *Ruellia Blumeana*, Nees, which differs much, by the spikes short not quadrifarious, the filaments bearded, &c.

Sect. 2. *Corolla* narrowly tubular-funnel-shaped, limb blue. Longer filaments densely bearded in their upper half by long obtuse white papillose hairs.

5. **H. latebrosa**, Nees in *DC. Prodr.* xi. 723; diffuse, hairy, leaves petioled ovate crenate or serrate, bracteoles 0, capsule less than $\frac{1}{2}$ in. 6-seeded. *Wight Ic.* t. 1504. *H. elegans, T. Anders. in Journ. Linn. Soc.* ix. 463, *not of Nees.* *H. Pavala, Kurz in Journ. As. Soc.* 1870, pt. ii. 78.

Ruellia Pavala, *Roxb. Fl. Ind.* iii. 47. *R. latebrosa*, *Roth Nov. Sp.* 307; *Nees in Wall. Pl. As. Rar.* iii. 83, *not of Roxb.* *R. erecta*, *Ham.*; *Wall. Cat.* 2395. *R. fasciculata*, *Wall. Cat.* 2394, *part of A sheet only.* *Ruellia elegans*, *Bot. Mag.* t. 3389; *Dalz. & Gibs. Bomb. Fl.* 186.

Throughout the DECCAN PENINSULA, alt. 0-4000 ft., from S. Behar (*J. D. H.*) to Coorg (*Wight*); common.

Stems 1-2 ft., branching, weak, hairs soft patent white. *Leaves* $2\frac{1}{2}$ by 1-1 $\frac{1}{2}$ in., acuminate at both ends, sparsely hairy, obscurely (or not) lineolate; petiole 1-1 $\frac{1}{2}$ in.; leaves on the secondary flowering branches much smaller. *Bracts* ovate or elliptic, scarcely longer than the calyx, or of the outermost flowers petioled, and greatly exceeding the calyx. *Sepals* $\frac{1}{4}$ - $\frac{1}{2}$ in., subequal, linear-lanceolate, whitened, hairy not obviously lineolate. *Corolla* $\frac{3}{8}$ - $\frac{1}{2}$ in., nearly straight; tube pale or yellowish, gradually narrowed upwards, limb blue. *Shorter filaments* glabrous; anthers narrowly oblong, cells triangular acute (not awned). *Capsule* $\frac{1}{4}$ in., rarely $\frac{1}{2}$ in., minutely patently hairy, 6-seeded.—This hardly differs from *H. elegans*, *Nees*, but by the smaller capsule with 6 (not 8) seeds. T. Anderson considered them one.

VAR. rupestris; more pubescent, often viscid aromatic, heads denser. *Ruellia diffusa*, *Wall. Cat.* 2383, *letters C, D.* *R. satporensis*, *Wawra in Oestr. Bot. Zeit.* 1881, 281, and in *It. Pr. Cob. Bot.* i. 90, t. 8 B.—Deccan Peninsula, Chota Nagpore, Rajpootana. N.W. Himalaya, alt. 2-5000 ft.; Kumaon, *Strachey & Winterbottom*; Sewaliks, *Stewart*.—Even commoner than the type, more rigid, growing in drier places. It was distributed as *Ruellia rupestris* to Wallich and to Roth (see *Roth Nov. Sp.* 307). The authentic sheet named by Heyne in *Herb. Rottler* consists partly of this, partly of *Lepidagathis fasciculata*.

VAR. Beddomei; much less hairy, leaves small ovate serrate or crenate glabrate.—Bellary; *Beddome*.

6. **H. ebracteolata**, *Clarke*; hispid with scattered white hairs, leaves small petioled ovate serrate, bracteoles 0, capsule $\frac{1}{2}$ in. 6-seeded. *H. rupestris*, *T. Anders. in Journ. Linn. Soc.* ix. 462, *partly.* *Ruellia ebracteolata*, *Dalz. in Hook. Kew Journ.* ii. 342. *R. latebrosa*, *Dalz. & Gibs. Bomb. Fl.* 186.

BOMBAY GHATS; *Dalzell, Stocks*.

Leaves $1\frac{1}{4}$ by 1 in. (mostly smaller), obtuse or very shortly acuminate, base obtuse or almost rounded, cuneately decurrent on the petiole, coarsely toothed, hairs stiff (almost bristly) especially on the nerves beneath; raphides plentiful but obscure. Otherwise altogether as *H. latebrosa*, *Nees*, of which *Dalzell* finally considered it a form.—*H. rupestris*, *T. Anders.*, is made up of *Ruellia rupestris* and of *R. ebracteolata*, *Dalz.*; but *Dalzell's R. ebracteolata* is much remoter from *R. rupestris* than is the latter from *Hemigraphis latebrosa*, *Nees*.

7. **H. faccida**, *Clarke*; stems long softly patently hairy, leaves petioled ovate or elliptic subentire or obsoletely crenate, heads small few-fl., bracteoles 0. *Ruellia faccida*, *Kurz in Journ. As. Soc.* 1873, pt. ii. 91.

PEGU; *Kurz*.

Longer filaments bearded upwards, shorter naked. *Bracts* not fimbriate nor flowers solitary (as *Kurz* describes). *Capsule* not seen.—As *Kurz* admitted *H. latebrosa* to be of the genus *Hemigraphis*, he erred in placing this species in *Ruellia*; for it is closely allied to *H. latebrosa*. The white hairs on the stems are $\frac{1}{2}$ in. long, very copious, nearly similar to those of *H. latebrosa*. If this is well separable from *H. latebrosa*, it must be by the very entire leaves; in *H. latebrosa* the larger leaves (on the principal stem) are always prominently toothed.

8. **H. elegans**, *Nees in DC. Prodr.* xi. 722, *of T. Anders. partly*; diffuse, patently softly white-hairy, leaves petioled ovate or elliptic crenate-serrate, bracteoles 0, capsule $\frac{1}{2}$ in. 8-10-seeded. *Ruellia diffusa*, *Wall.*

Cat. 2383, letters A, B; *Nees in Wall. Pl. As. Rar.* iii. 83. *Strobilanthes burmanica*, *Kurz in Journ. As. Soc.* 1873, pt. ii. 92.

PEGU; *Wallich, Kurz.*—DISTRIB. Ava.

Similar to, but stouter than, *H. latebrosa*; leaves less sharply toothed. Inner bracts of the heads $\frac{1}{2}$ – $\frac{3}{4}$ in., narrowly elliptic or oblong, overtopping the calyx. Corolla $\frac{3}{4}$ in. and upwards; larger and broader than that of *H. latebrosa*. Stamens as in *H. latebrosa*, or (fide *Nees*) one anther-cell sometimes rudimentary.—The long inner bracts give this plant a different aspect from the Deccan *H. latebrosa*. Bracteoles 0; *Nees* says lanceolate longer than the calyx, from which it is probable that he means by bracteole that which he has called bract in the diagnosis of the same species. *Kurz's Strobilanthes burmanica* is more hairy than *Wallich's Pegu* examples; and it may be doubtful if several of the species here admitted are other than local varieties of *H. latebrosa*.

VAR. *crenata*; viscid-pubescent, less softly white hairy, leaves crenate. *Ruellia crenata*, *Benth.*; *Hohenack. in Flora* 1849, 558. Malabar; Canara, *Hohenacker*, n. 737; Concan, *Stocks*; Belgaum, *Ritchie*; Bombay, *Law*; Bellary, *Beddome*.

9. **H. Griffithiana**, *T. Anders. in Journ. Linn. Soc.* ix. 463; leaves lanceolate remotely obscurely toothed glabrate, heads terminal shortly cylindric hairy, bracteoles much shorter than the calyx. *Ruellia Griffithiana*, *Nees in DC. Prodr.* xi. 149.

MERGUI; *Griffith* (Kew Distrib. n. 6091); Tenasserim, *Helper* (Kew Distrib. n. 6187).

Rootstock perennial; stems several, 1 foot, erect, scarcely branched, slender, pubescent upwards. Leaves 2 by $\frac{1}{2}$ in., sessile, attenuate to both ends, pubescent when young. Spikes $\frac{1}{2}$ –1 in., viscidly hairy; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in., elliptic, subobtusely; bracteoles $\frac{1}{8}$ – $\frac{1}{6}$ in., narrow. Sepals $\frac{1}{2}$ in. and upwards, linear-lanceolate, not very unequal. Corolla $\frac{1}{2}$ in. and upwards, more ventricose than in others of this section, bearded in the palate within. Longer filaments densely bearded upwards with long white hairs, shorter glabrous. Capsule rather more than $\frac{1}{4}$ in., usually 8-seeded. Seeds $\frac{1}{16}$ in., much compressed, discoid, densely elastically white-hairy when wetted.

10. **H. quadrifaria**, *T. Anders. in Journ. Linn. Soc.* ix. 463; hirsute, leaves ovate or elliptic acute, bracts large, corolla $1\frac{1}{4}$ in. *Ruellia quadrifaria*, *Wall. Cat.* 7152; *Nees in Wall. Pl. As. Rar.* iii. 83, and in *DC. Prodr.* xi. 147.

MOULMEIN; *Parish*, n. 403. TENASSERIM; *Beddome*, nn. 96, 97.—DISTRIB. Ava.

Hirsute with white or yellowish hairs from tubercular bases. Branch stout, shrubby. Leaves $4\frac{1}{2}$ by $2\frac{1}{2}$ in., upper narrower, base obtusely rhomboid, crenate-serrate; petiole $\frac{1}{3}$ in. Heads dense, terminal and peduncled on short axillary branches, hirsute; bracts 1 by $\frac{1}{3}$ – $\frac{1}{2}$ in., inner gradually smaller; bracteoles linear-lanceolate rather shorter than the calyx. Sepals $\frac{1}{2}$ in., narrowly lanceolate, bases subconnate. Corolla sparingly pubescent, more ventricose than in the other species of this section, "deep blue" (*Parish*). Filaments of the longer stamens densely shaggy with long white hairs to the apex; anthers all subequal, mucous. Style simple, hairy; ovules 4–6 in each cell. Capsule $\frac{1}{2}$ in., narrowly oblong, slightly hairy upwards, 8–12-seeded nearly from the base.

11. **H. glaucescens**, *Clarke*; leaves oblong narrowed to each end scabrid pubescent on the nerves beneath, spikes dense strobilate, bracts ovate acute hirsute, bracteoles very small lanceolate. *Strobilanthes glaucescens*, *Nees in Wall. Cat.* 7155, and in *Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 178; *T. Anders. in Journ. Linn. Soc.* ix. 467.

PEGU and TENASSERIM; *Griffith*, &c.

A shrub; branches scabrous. Leaves 6 by 2 in., crenulate, lineolate, sparingly

setulose above, more pubescent beneath; nerves 9-10 pair; petiole $\frac{3}{4}$ in. *Spikes* 1-3 in., ovoid or cylindric, very shortly peduncled, solitary; bracts $\frac{3}{4}$ in., green, persistent; bracteoles $\frac{1}{2}$ - $\frac{1}{3}$ in. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, hairy. *Corolla* 1 in. (purple?) straight, subsymmetric, upper half narrowly ventricose. Longer *filaments* densely bearded with long white hairs turned to one side. *Ovary* glandular-hirsute upwards; style sparsely hairy. *Capsule* $\frac{1}{2}$ in., pubescent, 6-seeded. *Seeds* $\frac{1}{2}$ in., compressed, orbicular, when wet the fine white hairs spring out abundantly on all sides; areoles 0.—Habit and fruit-spikes so exactly those of a typical *Strobilanthes* that neither Nees nor T. Anderson appear to have tried the ovules; they are always 6, and the capsule has 6 seeds on 6 retinacula.

Sect. 3. *Corolla* large, tubular, yellow. Longer *filaments* bearded in their upper half by long obtuse white papillose hairs.

12. *H. flava*, Kurz in *Journ. As. Soc.* 1871, pt. ii. 74; leaves large obovate narrowed at both ends scabrous finally glabrate, bracts elliptic long acuminate, bracteoles lanceolate acuminate, corolla $1\frac{1}{2}$ - $1\frac{3}{4}$ in. *Ruellia flava*, Roxb. *Fl. Ind.* iii. 43, and *lc. Ined.*; Nees in *DC. Prodr.* xi. 153. *Strobilanthes scaber*, T. Anders. in *Thwaites Enum.* 227, excl. all syn.; Benth. in *Gen. Pl.* ii. 1087 (as to the Pegu plant). *S. flavus*, Kurz *For. Fl.* ii. 243.

PEGU; Roxburgh, Kurz. MOULMEIN; Griffith (Herb. Propr. n. 278), Lobb. TENASSERIM; Beddome. CEYLON?; Walker (? cultivated).—

A shrub; branches glabrous. *Leaves* 8 by 3 in., minutely crenulate, tubercular, scabrous, becoming nearly glabrous; petiole $\frac{1}{2}$ in. *Heads* terminal on the arms of a panicle, dense, sparingly ciliate or glabrous; bracts $\frac{3}{4}$ in.; bracteoles $\frac{1}{2}$ in. *Sepals* nearly $\frac{1}{2}$ in., linear. *Corolla* densely hairy within, ventricose portion about as long as the cylindric. *Anthers* connivent in pairs. *Ovary* with (at least) 6 ovules. *Capsule* (fide Kurz) 8-seeded.—The inflorescence is *Strobilanthes*-like, and it might be more naturally placed in *Strobilanthes*; but it is very distinct specifically from *S. scaber*, Nees, by the 6-8 ovules, very much longer flower and bearded filaments.—The 3 examples ticketed as from Ceylon have 6 ovules, and seem identical with the Pegu plant. Nees' *S. scaber* was a purple-fl. species founded on Wight n. 1945, on which type-sheet T. Anderson has written *S. heteromallus*, T. Anders., nov. sp.

XVI. STENOSIPHONIUM, Nees.

Shrubs. *Leaves* ovate or elliptic, acuminate, lower tapering into the petiole, upper subsessile, subcordate, crenate, upper surface densely covered by raphides. *Flowers* sessile, solitary or 2-3-nate in opposite axils; clusters running into close or interrupted spikes, or paniced; bract ovate or lanceolate; bracteoles 2, narrow, about as long as the calyx. *Calyx* subequally 5-fid, segments linear or lanceolate, imperfectly connate often for half their length. *Corolla* tubular-ventricose, suddenly widened about the middle; limb oblique, lobes 5, subequal, twisted to the left in bud. *Stamens* 2 perfect, or 4 perfect the 2 posterior much the smaller, anterior usually exserted; anthers oblong, 2-celled, muticous. *Ovary* and style glabrous, or at the apex of the ovary glandular. *Disc* small, annular. *Stigma* simple; ovules 3-4 in each cell. *Capsule* oblong-linear, seed-bearing nearly from the base. *Seeds* 6-8, on stout hooked retinacula, compressed, discoid, apparently glabrous; when moistened the abundant white hairs of extreme tenuity straighten out.—Species 5, all of the Deccan and Ceylon.

1. *S. diandrum*, Wight *lc.* t. 1502 (not of Nees); leaves rhomboid-elliptic or ovate, spikes interrupted viscous-pubescent, bracts ovate shorter than the calyx, flowering calyx divided more than half-way down teeth

linear viscous-pubescent, stamens 2. *S. confertum*, *T. Anders. in Journ. Linn. Soc.* ix. 464, *partim*.

S. MADRAS; Courtallum, *Wight*.

Branches glabrous. *Leaves* 3 by $1\frac{1}{2}$ in., young obscurely scabrous beneath; petiole $\frac{1}{2}$ in. *Spikes* 2-3 in., in terminal panicles, densely clothed with minute patent gland-headed hairs; lower whorls mostly 4-6-fld., distant even at flower-time; bract $\frac{1}{2}$ in., ovate with a short obtuse apex; bracteoles rather longer than the bract, similar to the calyx-segments. *Calyx* $\frac{1}{2}$ in.; segments linear-ligulate (not subulate), united at flower-time about $\frac{1}{2}$ their length, in fruit free. *Corolla* exceeding $\frac{1}{2}$ in. Anterior *filaments* minutely hairy at the base, posterior reduced to 2 microscopic teeth.

2. ***S. confertum***, *Nees in DC. Prodr.* xi. 105; leaves rhomboid-elliptic or ovate, spikes scarcely interrupted viscous-hairy, bracts obovate shorter than the calyx, flowering calyx divided nearly half-way down segments linear viscidly hairy, stamens 4. *T. Anders. in Journ. Linn. Soc.* ix. 464, *partim*. *S. Russellianum*, *Wight Ic.* t. 873, not t. 1503, as see *Wight's note under the latter*.

S. DECCAN; Pulney Mts. and near Courtallum, *Wight*.

Very near *S. diandrum*, *Wight*, and united therewith by *T. Anderson*; probably the posterior stamens may be present or absent in the same species. The present plant differs from *S. diandrum* in the leafy habit and shortened very hairy spikes, which have numerous white simple hairs in addition to the gland-tipped hairs. The stamens differ from those of all the other species, being all exerted; but the anthers of the posterior pair are hardly $\frac{1}{2}$ as long as those of the anterior (this is not correctly shown by *Wight*).

3. ***S. setosum***, *T. Anders. in Journ. Linn. Soc.* ix. 464; leaves rhomboid-elliptic or ovate, flowering spikes dense somewhat interrupted below very hairy, bracts linear as long as the calyx, stamens 2.—*Strobilanthes* n. 67, *Herb. Ind. Or. H. f. & T.*

MYSORE or *CARNATIO*; *G. Thomson*.

Leaves altogether as of *S. diandrum*. *Spikes* 2-5 in., with white simple and gland-tipped hairs; bracts $\frac{1}{2}$ in. and upwards, linear only slightly widened towards the base. *Calyx-segments* united for about $\frac{1}{2}$ their length at flower-time, subulate, very hairy. *Flowers, stamens and capsules* exactly as of *S. diandrum*, from which this species hardly differs except by the bracts.

4. ***S. Russellianum***, *Nees in Wall. Pl. As. Rar.* iii. 84, and in *DC. Prodr.* xi. 105; leaves rhomboid-elliptic or ovate glabrous beneath, spikes linear much interrupted, bracts ovate as long as the calyx, corolla $\frac{3}{4}$ -1 in., stamens 4. *Wight Ic.* t. 1503 (not t. 873); *T. Anders. in Journ. Linn. Soc.* ix. 464, *partly*. *Ruellia Russelliana*, *Wall. Cat.* 2400. *R. arcuata*, *Wall. Cat.* 2334 a & b.

S. DECCAN PENINSULA; plentiful in and around the Nilgherries, *Wight*, &c. *Ceylon*; *Walker, Thwaites*.

Stems and leaves as of *S. diandrum*. *Spikes* 3-6 in., elongate, all the whorls generally distinct even at flower-time, glabrous except a few minute bristles at the sepal-tips or (in *Wight's* n. 2189) sparingly glandular-pubescent; bracts (from the middle of the spike) $\frac{1}{2}$ in., rhomboid, shortly obtusely mucronate, but the lower bracts often pass into leaves being $\frac{3}{4}$ in. broad cordate-ovate, and the upper are often narrowly obovate. *Calyx* $\frac{1}{2}$ in., segments united to the middle, teeth narrowly lanceolate acuminate, glabrous with minute white bristles or glandular-pubescent. Anterior *filaments* very hairy at their base; posterior about half as long, included. *Pistil* and *capsule* as in *S. diandrum*.

VAR. subsericea, *T. Anders. in Journ. Linn. Soc.* ix. 464; younger leaves densely white-silky beneath mature silky or glabrous beneath. *S. subsericeum*, *Nees in Wall.*

Pl. As. Rar. iii. 84, and in *DC. Prodr.* xi. 105. *Ruellia cordifolia*, *Vahl Symb.* iii. 84. *R. sesamoides*, *Wall. Cat.* 2408, part of sheet A only. *R. subsericea*, *Wall. Cat.* 2416. *R. canescens*, *Heyne in Herb. Rottler.*—*S. Deccan Peninsula*, *Rottler*; *Courtallum*, *Wight*.

Often twiggy, with small leaves.

5. ***S. parviflorum***, *T. Anders. in Journ. Linn. Soc.* ix. 464; leaves rhomboid-elliptic or ovate glabrate, spikes linear subinterrupted at base, bracts lanceolate, calyx small, teeth linear glandular-pubescent, corolla $\frac{1}{2}$ – $\frac{2}{3}$ in., stamens 2.—*Strobilanthes* sp. n. 68, *Herb. Ind. Or. H. f. & T.*

MYSORE or CARNATIC; *G. Thomson*.

Very near *S. Russellianum*, differing mainly by the smaller calyx and corolla and narrower bracts. *Bract* $\frac{1}{2}$ in. *Calyx* scarcely $\frac{1}{4}$ in., divided half-way down. *Stamens* 2 only in n. 68 *H. f. & T.*; when T. Anderson says 4, he must have examined *Wall. Cat.* 2334 a & b; which T. Anderson referred to *S. parviflorum*, but which is typically *S. Russellianum*, *Nees*.

XVII. **ÆCHMANTHERA**, *Nees*.

Small, hairy *shrubs*. *Leaves* broad-elliptic acute, crenate, often viscid. Clusters of *flowers* sessile on the branches of a trichotomous or 1-sided panicle, distant or close; bracts linear, as long as the calyx; bracteoles similar smaller. *Calyx* sub-5-partite; segments linear, subequal. *Corolla* tubular-ventricose, nearly straight, widened suddenly near the middle, glabrous, 2 hairy lines on the palate within; segments 5, subequal, rounded, twisted to the left in bud, pale-violet or purplish. *Stamens* 4, didynamous, included, longer filaments hairy, shorter glabrous; anthers subsimilar, ovate or oblong, 2-celled, cells mucous; connective excurrent at the tip or not. *Ovary* densely hairy at the apex; style sparsely hairy thickened upwards, stigma large simple linear-lanceolate; ovules 4–6 in each cell. *Capsule* narrowly oblong, 6–8- (or ex Benth. 12-) seeded from the base, retinacula strong, hooked. *Seeds* discoid, densely hairy, or thicker glabrous.—Species 2, Indian.

1. ***Æ. tomentosa***, *Nees in Wall. Pl. As. Rar.* iii. 87; leaves elliptic acute hairy, bracts linear-ligulate as long as the calyx, anthers oblong connective not excurrent, seeds densely hairy. *Ruellia tomentosa*, *Wall. Cat.* 2333.

TEMPERATE HIMALAYA, alt. 3–5000 ft.; Kumaon and Nepal, *Wallich, Thomson*.

A small shrub, 1–3 ft., dusky grey or whiteish, villous, not with snowy or silvery wool. *Leaves* $4\frac{1}{2}$ by 2 in., base rounded, slightly crenate, densely (not prominently) lineolate with raphides; petiole $1\frac{1}{2}$ in. *Panicles* often 1 foot, one-sided; clusters 3–8-fld., distant or approximate; bracts $\frac{1}{2}$ in. or more; bracteoles narrowly ligulate, as long as the calyx or more often about half as long. *Sepals* $\frac{1}{2}$ – $\frac{1}{2}$ in., linear-ligulate, somewhat unequal, herbaceous, pubescent, usually viscous. *Corolla* 1 in. *Anthers* particularly obtuse in *Wall. Cat.* 2333, and the examples closely similar therewith, even in the buds just before expansion. *Capsule* $\frac{1}{2}$ in., 8-seeded; hairs of the seeds starting out when wetted.

VAR. *Wallichii*; stem and leaves with snow-white wool or glabrate sparsely hairy, anthers ovate, tip of the connective excurrent recurved. *Æ. Wallichii*, *Nees in DC. Prodr.* xi. 170; *T. Anders. in Journ. Linn. Soc.* ix. 485. *Æ. gossypina*, *Nees in Wall. Pl. As. Rar.* iii. 87. *Ruellia gossypina*, *Wall. Cat.* 2332, and *Pl. As. Rar.* i. 38, t. 42.—*Acanthacea*, *Griff. Itin. Notes*, 119, n. 308.—Temperate Himalaya, alt. 3–5000 ft., from Kashmir to Bhotan. Chittagong; Seetakoond, alt. 1000 ft., *H. f. & T.*—*Wallich's* figure shows the connective non-excurrent, but it always is more or

less so in the white-woolly form. In the two examples on one sheet marked by Nees' hand *Wallichii* and *tomentosa*, the former has the connective conspicuously, the latter minutely, excurrent. The East Himalaya examples are flowerless, and may belong to *Æ. tomentosa*, type. The Chittagong example is densely snowy-woolly with 6 hairy seeds, and is therefore *Æ. tomentosa* var. *Wallichii*, or a new species.

2. *Æ. leiosperma*, Clarke; hairy, leaves ovate or elliptic acute, bracts linear-ligulate as long as the calyx, anthers oblong connective excurrent at the tip, seeds glabrous.

JAINTEA and E. KHASIA, alt. 3-4000 ft.; abundant, Clarke.

A small shrub, 2-3 ft. high, very hairy, often viscid, with both brown and white hairs. *Leaves* 3 by $1\frac{1}{2}$ in., rounded at the base, crenulate; petiole $\frac{1}{2}$ in. *Panicle* resembling that of *Æ. tomentosa*, often somewhat leafy; bracts $\frac{1}{2}$ in., linear-ligulate; bracteoles $\frac{1}{2}$ in., similar to the bracts. *Sepals* $\frac{1}{2}$ in., subequal, linear-ligulate, very hairy. *Corolla, stamens* and *pistil* as of *Æ. tomentosa*, but the connective more excurrent than in any form of *Æ. tomentosa*. *Capsule* $\frac{1}{2}$ in., 6-seeded. *Seeds* much thicker than in *Æchmanthera*, and without hairs.—I cannot match these seeds without going to quite another part of the Acanthaceæ Order. They are glabrous when wetted, not discoid. On the other hand, except the seeds, the plant is hardly distinguishable from *Æ. tomentosa*. There are abundant specimens with seeds *in situ*.

XVIII. STROBILANTHES, Blume.

Large or small shrubs, or herbs. *Leaves* opposite, often unequal, in *S. anisophyllus* often apparently alternate, toothed or subentire, often bearing raphides. *Flowers* capitate, or in strobiliform or interrupted spikes, or paniced, sessile or sometimes pedicelled, purple yellow or white; bracts and bracteoles large or small or 0, persistent or caducous. *Calyx* deeply subequally 5-fid; or (in Sect. Buteræa) 2-lipped, with one lip very shortly 3-toothed; segments narrow, equal or unequal. *Corolla* tubular-ventricose, straight or curved; lobes 5, ovate or round, subequal, contorted in bud. *Stamens* 4, didynamous, or (in Sect. Endopogon) 2; anthers oblong, 2-celled, mucous. *Disc* small, or prominent as a stalk to the ovary. *Ovary* 4-ovulate; style linear, stigma of one long linear-lanceolate branch, the other suppressed. *Capsule* 4- or 2-seeded; placentæ (in a few species only) rise elastically from the base, carrying the seeds with them. *Seeds* much compressed, glabrous or hairy, hairs elastic when wetted; retinacula curved, strong.—Species 180, Asiatic and 1 in Africa.

This genus contains a great number of species differing widely in habit, inflorescence and size of the flowers. It is here limited to species with 2 ovules in each cell of the ovary. All with more than 2 in each cell have been carried to *Ruellia*, *Echinacanthus*, *Hemigraphis*, *Stenosiphonium* and *Æchmanthera*.

Strobilanthes roseus, Wall. Cat. 7154, is an Ava plant, not known from British India.

Strobilanthes salicifolius, T. Anders. in Journ. Linn. Soc. ix. 484, is a plant of altogether uncertain origin.

Strobilanthes biceps, T. Anders. in Journ. Linn. Soc. ix. 476 = *Goldfussia biceps*, Wall. Cat. 7161, Nees in DC. Prodr. xi. 172, is an Ava plant.

Key to the Sections of *Strobilanthes*.

Subgenus 1. BUTERÆA. Calyx bilabiate. Species 1-4, of Pegu and Tenasserim.

Subgenus 2. ENDOPOGON. Stamens 2.

Seeds glabrous. Species 5-12, of Ceylon with 1 in S. Deccan.

Seeds hairy. Species 13-18, of S. Deccan.

Species 19, 20, of Khasia.

Subgenus 3. **EUSTROBILANTHES**. Calyx subequally deeply 5-fid. Stamens 4.

Series A. *Bracteata*. Bracts persistent. Flowers spiked or opposite, not mostly alternate.

* Flowers capitate or shortly spicate.

† Seeds glabrous. Species 21–32, of Ceylon and Deccan.

†† Seeds hairy.

‡ Species 33–46, of Ceylon and Deccan.

‡‡ Species 47–56, of N. India and Malay Peninsula.

** Flowers strobilate.

† Seeds glabrous. Species 57–64, of Ceylon and Deccan.

†† Seeds hairy. Species 65–78.

*** Spikes elongate often much interrupted. Species 79–87.

Series B. *Nudata*. Bracts caducous. Flowers capitate or opposite, not mostly alternate.

* Heads in fruit capitate. Species 88–100.

** Heads in fruit elongate or flowers distant. Species 101–119.

Series C. *Alternifloræ*. Flowers mostly distant alternate, or panicled. Species 120–136, of N. India and Malaya.

Series D. *Paniculata*. Bracts persistent. Flowers panicled or interruptedly spicate. Capsule wide, very acute. Species 137–145, of Ceylon and S. Deccan.

Residuary. Species 147–154, not seen.

Subgenus 1. **Buteræa**. Calyx 2-lipped to the base; one lip 3-fid less than one-third the way down, the other 2-fid or 2-partite.—(Spikes strobiliform; bracts prominent, imbricate. Stamens 4. Seeds (where known) elastically hairy when wetted.—Species of Pegu and Tenasserim.)

1. **S. rufescens**, *T. Anders. in Journ. Linn. Soc.* ix. 472; leaves ovate acute crenate more or less rufous-hairy, spikes dense strobilate hirsute, bracts broadly ovate, calyx 2-partite both segments very shortly toothed. *Ruellia rufescens*, *Roth Nov. Sp.* 304. *R. comosa*, *Roxb. Fl. Ind.* iii. 43, and *lc. Ined. in Herb. Kew.* *R. ulmifolia*, *Wall. Cat.* 2360. *Buteræa ulmifolia*, *Nees in Wall. Pl. As. Rar.* iii. 84, and in *DC. Prodr.* xi. 196.

PEGU; *Brandis*.—DISTRIB. Moluccas (*Roxburgh*).

A shrub; branches perfectly glabrous, or intensely shaggy with red hairs $\frac{1}{4}$ – $\frac{1}{2}$ in. long. Leaves $1\frac{1}{2}$ –4 in., often unequal, base obtuse or rounded, hirsute on both surfaces in the type examples, nerves 6 pair; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. Spikes 1–2 in., short-peduncled; bracts $\frac{1}{2}$ in., fulvous-hirsute; bracteoles scarcely $\frac{1}{2}$ in., sublinear. Calyx $\frac{1}{2}$ in., 2-partite to the base, rufous-ciliate towards the apex; segments very shortly toothed, one 2-toothed, the other 3-toothed with the middle tooth broader subemarginate. Corolla 1 in., pale-purple, cylindric base of the tube rather shorter than the moderately ventricose part. Capsule $\frac{1}{4}$ in., densely pubescent, 4-seeded. Seeds less than $\frac{1}{12}$ in., orbicular, fine elastically white-hairy, areoles 0.

VAR. *rubiginosa*; leaves larger thinner glabrate lineolate above, bracteoles $\frac{1}{16}$ in., ovate.—Tenasserim; *Helfer* (*Kew Distrib.* n. 6118). Chittagong; *Clarke*.—Stems thinly shortly rufous-hirsute; leaves $5\frac{1}{2}$ by $2\frac{3}{4}$ in., base shortly acuminate, crenate, green, herbaceous; nerves beneath thinly rufous-hairy.—*Helfer's* example is unlike those of *Ruellia ulmifolia*, but very like the figure of *R. comosa*, *Roxb.* *Clarke's* examples have the stems sparsely or densely rufous-hirsute, the leaves glabrate lineolate above or rufous-hirsute; the corolla is $1\frac{1}{2}$ in., pale-purple, nearly glabrous with glabrous filaments, altogether as in *Roxburgh's* picture.

2. **S. acuminatus**, *T. Anders. in Journ. Linn. Soc.* ix. 473, partly; leaves lanceolate acuminate at both ends crenate nearly glabrous, spikes oblong short-peduncled glandular, bracts ovate shorter than the calyx, calyx sub-2-partite one lip shortly trifid the other bifid nearly to the base. *S. subflaccidus*, *Kurz in Journ. As. Soc.* 1873, pt. ii. 94, ex descr. *Adena-*

canthus acuminatus, *Nees in Wall. Cat.* 7153, and in *Wall. Pl. As. Rar.* iii. 84, and in *DC. Prodr.* xi. 197 (*excl. tab. cited*).

BURMA; "locus incertus," *Wallich*.

A herb; branches elongate, nearly glabrous. *Leaves* 5 by $1\frac{1}{2}$ in., base long attenuate, often subserrate, lineolate above; nerves 6-7 pair, minutely fuscous pubescent beneath; petiole $0-\frac{1}{2}$ in. *Peduncles* $\frac{1}{2}$ -2 in.; spikes $\frac{1}{2}$ -1 in.; bracts $\frac{1}{2}$ in., ovate; bracteoles $\frac{1}{2}$ in., elliptic, wider upwards than the bracts. *Calyx* scarcely $\frac{1}{2}$ in., glandular-ciliate. *Corolla* (ex *Nees*) $\frac{1}{2}$ in. at least, glabrous, tubular; limb equal with obtuse segments. *Ovary* 4-ovulate. *Capsule* not known.—Description mainly from *Nees*, the single sheet of *Wallich* being too imperfect to verify several points. *T. Anderson*, proceeding on the similarity in the leaves, has assumed that *Nees'* description is materially wrong, and that *Wall. Cat.* 7152 is really identical with *S. longipes*, n. 76 *infra*. If that be so, it remains as *S. subflaccidus*, *Kurz*.

3. **S. Parishii**, *Clarke*; leaves elliptic acuminate thinly hirsute, spikes linear-oblong strobilate white-hairy, bracts oblong or slightly wider upwards, calyx 2-partite both segments very shortly toothed.

MOULMEIN; *Parish*. TENASSERIM; *Beddome*.

A branching herb; stems subterete rufous-pubescent or subhirsute. *Leaves* $5\frac{1}{2}$ by $2\frac{1}{2}$ in., base cuneate or obtuse, crenate, nerves 6 pair; petiole $\frac{1}{2}$ -2 in. *Spikes* 2 by $\frac{1}{2}$ in., short-peduncled; bracts $\frac{1}{2}$ by $\frac{1}{8}-\frac{1}{6}$ in., obtuse; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{3}$ in., nearly as of *S. rufescens*. *Corolla* $1\frac{1}{4}$ in., nearly straight, glabrous, blue; cylindric base of the tube hardly half so long as the campanulate; lobes short, round. *Capsule* $\frac{1}{4}-\frac{1}{3}$ in., pubescent, 4-seeded. *Seeds* scarcely $\frac{1}{2}$ in., orbicular, elastically white-hairy; areoles hardly any.

4. **S. foetidissima**, *Kurz in Journ. As. Soc.* 1873, pt. ii. 93; leaves ovate acuminate at both ends serrate-dentate hirsute on both surfaces, spikes short-peduncled lax short tawny-hirsute, bracts obovate-cuneate obtuse, calyx-segments deeply lobed.

MARTABAN; *Kurz*.

A herb; branches fulvous-hairy. *Leaves* 3-5 in., membranous, long-petioled. *Bracts* $\frac{1}{2}$ in., glandular-hirsute; bracteoles similar, but shorter and broader. *Calyx* as long as the bracts, adpressedly glandular-puberulous. *Corolla* $1\frac{1}{2}$ in., and filaments glabrous. *Style* hirsute. *Capsule* $\frac{1}{2}$ in., glabrous. *Seeds* $\frac{1}{2}$ in. diam., adpressedly villous.—Copied from *Kurz*, who says it is allied to *S. rufescens*, whence it is presumed the calyx is definitely 2-lipped; but in the large capsule and seeds it differs from the other species allied to *S. rufescens*.

Subgenus 2. **Endopogon**. *Calyx* deeply subequally 5-fid. *Stamens* 2 fertile.—(Spikes mostly continuous, sometimes shortened into heads, less commonly interrupted at the base, the lowest flowers then in opposite pairs; bracts persistent).

* *Seeds (even in water) glabrous, without areoles on the faces.*—Lower half of the corolla-tube cylindric, suddenly widening into the ventricose part.—Species of Ceylon, with one (*S. foliosus*) in the S. Deccan Peninsula.

5. **S. viscosus**, *T. Anders. in Thwaites Enum.* 226, *excl. syn.* *Wight*, and in *Journ. Linn. Soc.* ix. 465, *partly*; leaves elliptic acuminate at both ends crenulate sparsely pubescent or glabrate, spikes linear subinterrupted viscous-hairy, flowering calyx $\frac{1}{2}$ in. divided less than half-way down. *Endopogon viscosus*, *Nees in DC. Prodr.* xi. 104, *excl. Var. humilis, not of Wight*.

CEYLON, up to 7000 ft. alt., frequent; *Gardner, Walker, Thwaites* (n. 2898, n. 2002, *partly*), &c.

A shrub, 2-5 ft. *Leaves* 4 by $1\frac{3}{8}$ in.; nerves 7-8 pair, not conspicuously parallel; petiole $\frac{3}{4}$ in. *Spikes* 3-8 in., axillary, simple or compound, and running into terminal panicles; flowers opposite, lowest pair usually distant; bracts $\frac{1}{2}$ in., elliptic or oblong, attenuated upwards; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in., narrow. *Calyx* viscidly hairy, teeth lanceolate; calyx in fruit enlarged often $\frac{3}{8}$ in. or more, split to the base into lanceolate segments. *Corolla* $1\frac{1}{2}$ in., densely pubescent without; linear-base of the tube $\frac{1}{4}$ in., very narrow, ventricose portion $\frac{1}{2}$ by $\frac{1}{2}$ in., oblique, lobes ovate. *Filaments* glabrous except near the base; anthers large, pendulous, subexserted. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* more than $\frac{1}{8}$ in., ovoid, thinning towards the apex, smooth, hairless.

VAR. *microphyllus*, Nees in DC. Prodr. xi. 104; leaves $\frac{1}{2}$ - $1\frac{1}{4}$ in., spikes very weak few-fl.—Ceylon.—The type specimen of this has no fruit; but Walker, n. 122, has similar small leaves and fruit exactly as of *S. viscosus* type.

VAR. *digitalis*; bracts abbreviated, spikes elongate slender, minutely deciduously cinereous-woolly not hairy nor viscous. *Endopogon digitalis*, Nees in DC. Prodr. xi. 104 (sp.).—Ceylon; Walker.—This is possibly nearer *S. exareolatus*, but the example is in young flower.

VAR. *arguta*; leaves more rigid more acutely (though minutely) toothed, spikes dense, bracts $\frac{1}{2}$ in. oblong imbricate, calyx minutely cinereous-woolly. *Endopogon argutus*, Nees in DC. Prodr. xi. 104.—Ceylon; Gardner.—The examples referred here by Nees (probably on the characters of the leaves) having fulvous viscid hairy spikes seem nearer *S. viscosus*, T. Anders. type.

6. *S. stenodon*, Clarke; glabrous, leaves ovate acuminate crenate, spikes linear scarcely interrupted, bracts short obovate, calyx divided half-way down, corolla-lobes narrowly oblong.

CEYLON; Matelle East, Beckett, Thwaites, C. P. n. 3874.

Leaves $4\frac{1}{2}$ by 2 in., shortly narrowed into the petiole; nerves 8 pair; petiole $1\frac{1}{2}$ in.; leaves white underneath in Beddome's Ceylon specimen. *Spikes* 2-5 in., axillary, simple or compound, running into terminal panicles; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., narrowly oblong. *Calyx* glabrous, teeth lanceolate. *Corolla* glabrous in bud, white-hairy within; cylindric base $\frac{1}{2}$ in., very narrow; ventricose tube $\frac{1}{2}$ in. long and broad; lobes $\frac{3}{4}$ -1 in. *Anthers* exserted, pendulous. *Ovules* 2 in each cell. *Capsule* not seen.—A remarkable plant with the habit, inflorescence and bracts of *Stenosiphonium Russellianum*; the narrow lobes of the corolla are unlike any neighbouring species or genus.

7. *S. exareolatus*, Clarke; leaves elliptic acuminate at both-ends slightly undulate crenate glabrous, spikes linear lax hairy, calyx narrow overtopping the bracts divided less than half-way down. *S. consanguineus*, T. Anders. in Thwaites Enum. 226, and in Journ Linn. Soc. ix. 465, partly. *Stenosiphonium diandrum*, Nees in DC. Prodr. xi. 105, not of Wight. *Endopogon consanguineus*, Nees l. c. as to the Ceylon material.

CEYLON, alt. 3000 ft.; Walker.

A shrub. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in.; nerves 6 pair; petiole $\frac{3}{4}$ in. *Spikes* 2-4 in., running into terminal panicles; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., ovate or oblong; bracteoles $\frac{1}{2}$ in., narrow. *Calyx* (in flower) $\frac{1}{4}$ - $\frac{1}{2}$ in., teeth sublinear; in fruit enlarged. *Corolla* $\frac{3}{4}$ in., resembling that of *S. viscosus* but smaller. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* scarcely $\frac{1}{10}$ in., ellipsoid, smooth, hairless, without lateral areoles.—Near *S. viscosus*, differing by the short bracts, narrow cylindric calyx, smaller flowers and much smaller seeds. As to the synonyms, the type specimens of Nees and T. Anderson, written on by their own hands, are preserved at Kew.

VAR. *densa*; spikes denser, bracts elliptic imbricate often as long as the calyx.—Ceylon, alt. 2-6000 ft.; Thwaites, n. 2002 chiefly, &c.

8. *S. rhytisperma*, Clarke; leaves elliptic acuminate at both ends denticulate thinly white-cottony beneath, spikes linear uninterrupted glabrous, bracts lanceolate about equalling the calyx. *S. hypoleucus*, T. Anders. in Thwaites Enum. 226, not *Endopogon hypoleucus*, Nees.

CEYLON; Central Province, *Thwaites*, C. P. 2897, collected by Gardner.

Stem glabrous. *Leaves* 5 by $1\frac{3}{4}$ in., mature glabrous above; nerves 8 pair; petiole $\frac{3}{8}$ in. *Spikes* 3-4 in., clustered in the axils (end of the branch not seen); bracts $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in., divided half-way down, hardly enlarged in fruit; teeth narrowly lanceolate, glabrous. *Corolla* glabrous without in bud. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* $\frac{1}{10}$ in., obovate-elliptic, smooth, hairless, longitudinally wrinkled, without lateral areoles.

9. ***S. nigrescens***, *T. Anders. in Thwaites Enum.* 226, and in *Journ. Linn. Soc.* ix. 465; leaves narrowly elliptic acuminate at both ends serrulate glabrous, spikes linear uninterrupted hirsute, bracts lanceolate mostly overtopping the calyx. *Bedd. Ic. Pl. Ind. Or.* t. 217.

CEYLON, alt. 3000 ft.; *Thwaites*, C. P. n. 3353.

A shrub, 4-5 ft., blackish-green when dry. *Leaves* 5 by $1\frac{1}{2}$ in., lineolate above, reticulate beneath; nerves 7 pair; petiole $1\frac{1}{4}$ in. *Spikes* 2-5 in., axillary, simple or compound, and running into terminal panicles; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in., narrow. *Calyx* $\frac{1}{2}$ in. and upwards hairy, divided about half-way down, enlarged in fruit. *Corolla* pale-purple, very nearly as of *S. viscosus*. *Capsule* $\frac{3}{4}$ in., very broad and stout, 2-seeded (in *Thwaites*, 3353). *Seeds* $\frac{1}{4}$ in. diam. (unripe), hairless and without lateral areoles.

10. ***S. rhamnifolius***, *T. Anders. in Thwaites Enum.* 226, and in *Journ. Linn. Soc.* ix. 466; leaves ovate shortly acuminate crenate-serrulate glabrous, spikes linear-oblong very hairy densely paniced, bracts widely-elliptic imbricated. *Buteraa rhamnifolia*, *Nees in DC. Prodr.* xi. 725. *Endopogon rhamnifolius*, *Wight Ic.* t. 1521.

CEYLON, *Gardner*; alt. 3000 ft., *Thwaites*, C. P. n. 2007.

A shrub, 1-2 ft., hairy upwards. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{2}$ in., base obtusely rhomboid; nerves 6 pair; petiole $1\frac{1}{4}$ in. *Spikes* 1-4 in.; bracts $\frac{3}{4}$ in., not acuminate; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in., linear-oblong. *Calyx* $\frac{1}{2}$ in., very hairy, divided hardly half-way down (not so deeply as figured by *Wight*); teeth narrowly lanceolate. *Corolla* $1\frac{1}{4}$ in., purple, pubescent, cylindric portion more than $\frac{1}{2}$ in., very narrow, ventricose portion $\frac{1}{2}$ - $\frac{3}{4}$ in.; teeth ovate. *Stamens* 2; filaments sparsely hairy more than half their length. *Ovules* 2 in each cell.—The habit, bracts and shape of the corolla are much as in *S. exareolata* var. *densa*; but the capsule and seeds being unknown, the exact position is doubtful.

11. ***S. deflexus***, *T. Anders. in Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 470; glabrous, leaves lanceolate acuminate at both ends denticulate, heads peduncled few-fl. closely capitate. *Bedd. F. Pl. Ind. Or.* t. 218.

CEYLON, alt. 3-4000 ft.; *Gardner, Thwaites*, C. P. 1998.

A shrub, 4-5 ft., green. *Leaves* $4\frac{1}{2}$ by $1\frac{1}{4}$ in.; nerves 6 pair; petiole 1 in. *Peduncles* axillary, $1\frac{1}{2}$ in., thickened upwards, deflexed; outer bracts $\frac{3}{4}$ in., elliptic, often nearly enclosing the whole head; proper bract $\frac{3}{4}$ in., lanceolate; bracteoles rather shorter, linear. *Calyx* $\frac{3}{4}$ in., divided half-way down, glabrous or the linear-lanceolate teeth puberulous. *Corolla* $\frac{3}{4}$ -1 in., pale purple, nearly glabrous, hairy in the palate within; cylindric base of the tube as long as (and suddenly widened into) the ventricose portion, not so funnel-shaped as in *Beddome's* figure. *Stamens* 2, glabrous. *Pistil* glabrous. *Capsule* not seen; and, the seeds being unknown, the affinity is doubtful.

12. ***S. foliosus***, *T. Anders. in Journ. Linn. Soc.* ix. 467; leaves ovate serrulate glabrous, heads sessile ovoid densely capitate. *Goldfussia Leschenaultiana*, *Nees in DC. Prodr.* xi. 172. *Endopogon foliosus* & *capitatus*, *Wight Ic.* tt. 1501, 1499.

NILGHERY Mts., alt. 6-7000 ft., frequent; *Gardner, Wight, &c.*

Stems 1-2 ft., much branched, rigid. *Leaves* 2 by $1\frac{1}{2}$ in., shortly acuminate at both ends, conspicuously lineolate above; nerves 5-6 pair; petiole $\frac{1}{2}$ in. *Heads* numerous, terminal, $\frac{1}{2}$ in. diam., each closely embraced by the two uppermost leaves (exclusive of the proper bracts); bracts $\frac{3}{4}$ in., linear-oblong, at first nearly glabrous or hairy; bracteoles $\frac{3}{4}$ in., linear, at first nearly glabrous or hairy. *Calyx* $\frac{3}{4}$ in., divided hardly half-way down, obscurely or prominently hairy at flower-time, hirsute in fruit, segments narrowly lanceolate. *Corolla* $1\frac{1}{4}$ in., blue or whitish, glabrous without, hairy along 2 lines within; linear base of the tube about as long as the suddenly-widened ventricose part. *Filaments* hairy nearly to the summit; rudiments often 3, whereof 2 often carry minute rudimentary anthers. *Ovary* slightly hairy upwards. *Capsule* $\frac{3}{4}$ in., 4-seeded. *Seeds* $\frac{1}{2}$ in. long, very thin, glabrous; areoles 0.—There is no difference between the typical *foliosus* and the Var. *capitatus*; the heads on one stem which appear (superficially) glabrous in flower are very hairy in fruit, owing to the development of the hairs on the bract, bracteoles and calyx.

**** Seeds** (in water) densely hairy except on two lateral circular areoles near the base on each face.—(Linear or subcylindric base of the corolla short, more gradually narrowing into the ventricose portion than in the preceding section.—Species of the S. Deccan Peninsula.)

13. **S. Kunthianus**, *T. Anders. in Journ. Linn. Soc.* ix. 465; leaves elliptic narrowed into the petiole crenate-serrate rigid strongly nerved beneath, spikes dense, bract ovate, calyx deeply divided, corolla 1 in. blue. *Ruellia Kunthiana*, *Wall. Cat.* 2367. *Phlebophyllum Kunthianum*, *Nees in Wall. Pl. As. Rar.* iii. 83, and in *DC. Prodr.* xi. 102; *Wight Ic.* t. 448. *P. angustifolium*, *Benth. in Pl. Hohenack.* n. 1178.

Mts. of S. DECCAN PENINSULA, alt. 5000-7500 ft.; plentiful in the Nilgherries, *Wight*, &c.

Stems 12-20 in., numerous, erect, rigid, quadrangular upwards. *Leaves* 2 by 1 in., obtuse or subacuminate, bristly or scabrid above; primary nerves beneath close, parallel, prominent, secondary reticulated more or less concealed by close hard white tomentum; petiole $\frac{1}{4}$ in., very broad. *Spikes* 1-3 in., hairy; bract $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., linear-ligulate. *Calyx* $\frac{1}{2}$ in., floccose-villous; segments linear-lanceolate, base shortly connate. *Corolla* ventricose from near the base, palate hairy within, blue or whitish. *Filaments* pilose. *Ovary* glabrous; style hairy. *Capsule* $\frac{1}{2}$ in., oblong, rigid. *Seeds* 4, densely hairy (hairs spreading when wet) except on the circular basal areola on each of its faces.

14. **S. gossypinus**, *T. Anders. in Journ. Linn. Soc.* ix. 466; leaves ovate acute entire woolly beneath, spikes linear-oblong woolly, corolla $1\frac{1}{2}$ in. woolly without. *Bedd. Ic. Pl. Ind. Or.* t. 198.

Mts. of S. DECCAN PENINSULA, alt. 4000-5500 ft.; Mysore, *Lobb*; *Sispara* plentiful, &c., *Beddome*.

Shrubby, covered (except the leaves above) with dense yellowish wool, flowering at 6-7 years old, then dying. *Leaves* 4 by 2 in., base broadly rhomboid, subcoriaceous, wool of upper surface deciduous; nerves 13 pair, approximate, subparallel; petiole $\frac{3}{4}$ in. *Spikes* 1-3 in., compound and (by the reduction of the upper leaves) running into terminal panicles; bracts $\frac{1}{2}$ in., elliptic, obtuse; bracteoles $\frac{1}{2}$ in., linear-oblong. *Calyx* nearly $\frac{1}{2}$ in., divided about half-way down; segments narrowly lanceolate, subobtus. *Corolla* nearly straight; ventricose portion of the tube much longer than the cylindric base. *Filaments* hairy. *Ovary* glabrous, with a few long hairs near the apex; style glabrous; ovules 4. *Seeds* not seen.

15. **S. canaricus**, *Bedd. Ic. Pl. Ind. Or.* t. 215; leaves ovate acuminate subentire mature puberulous on the nerves beneath, spikes linear-oblong minutely cinereous-lanate, bracts ovate, corolla $\frac{3}{4}$ in. white.

DECCAN PENINSULA; S. Canara, on the Kudra Mukh Mt., alt. 6000 ft., *Beddome*.

A rigid shrub, 3-4 ft.; tips of the branches and young leaves densely clothed with caducous yellowish wool. *Leaves* crowded towards the ends of the branches, 3 by $1\frac{1}{2}$ in., base rhomboidal, mature nearly glabrous except the nerves beneath; nerves 9 pair, approximate, subparallel; petiole $\frac{1}{2}$ in. *Spikes* 1-2 in., clustered in the upper axils, forming a dense terminal panicle, thinly, duskily, deciduously woolly; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., ovate, obscurely acuminate; bracteoles scarcely $\frac{1}{4}$ in., narrowly lanceolate. *Calyx* $\frac{1}{2}$ in., divided half-way down; segments narrowly lanceolate. *Corolla* very pubescent, ventricose portion much longer than the cylindric base. *Filaments* hairy. *Ovary* glabrous, style minutely sparsely hairy; ovule solitary in each cell (in the only ovary examined), probably never as in *Beddome's* figure, which shows the ovules 2 in each cell, the lower pendulous.

16. ***S. cuspidatus***, *T. Anders. in Journ. Linn. Soc.* ix. 465; leaves ovate acuminate subentire densely white silky beneath, spikes linear oblong glandular fulvous hairy, bracts narrowly elliptic acuminate, corolla 1 in. blue-purple. *Bedd. Ic. Pl. Ind. Or.* t. 221. *Endopogon cuspidatus*, *Benth. in Pl. Hohenack.* n. 1169, and in *Linnaea*, xxiv. 646. *E. versicolor*, *Wight III.* t. 164 b. fig. 4 (left-hand), and *Ic.* t. 1497, both figure and description.

NILGHERRIES, alt. 4-7000 ft., frequent; *Wight, Gen. Munro, &c.*

A shrub, 2-5 ft. *Leaves* 4 by $2\frac{1}{2}$ in., base shortly acuminate, mature glabrous above, raphides not prominent; nerves 8 pair, approximate, subparallel; petiole $1\frac{1}{4}$ in. *Spikes* 1-3 in., often laxly paniced at the ends of the branches; bracts $\frac{3}{4}$ in., base concave, acuminate, tip recurved; bracteoles $\frac{1}{4}$ in., linear. *Calyx* $\frac{1}{2}$ in., divided $\frac{3}{4}$ the way down; teeth linear, very glandular-hairy (not so lanceolate as in *Beddome's* figure). *Corolla* nearly glabrous; 2 rows of long white hairs on the palate within, between which the style (itself nearly glabrous, not as in *Beddome's* figure) lies. *Filaments* glabrous, except near the base. *Capsule* $\frac{1}{2}$ in., 4-seeded; seeds discoid, with a circular areola on each face, densely hairy except on the areola.—*T. Anderson* refers *Wight Ic.* t. 1497 to *S. viscosus*, but the plant from which that figure was drawn is at Kew, and is *S. cuspidatus*.

17. ***S. consanguineus***, *Clarke, not of T. Anders.*; leaves ovate acuminate obscurely toothed glabrous beneath, spikes linear-oblong glandular hairy, bracts narrowly elliptic hardly so long as the calyx, corolla $\frac{3}{4}$ in. *S. neglectus*, *T. Anders. ms.* *Endopogon consanguineus*, *Nees in Wall. Pl. As. Rar.* iii. 99, and partly in *DC. Prodr.* xi. 104. *Ruellia spicata*, *Roth Nov. Sp.* 310; *Nees in DC. Prodr.* xi. 153.

S. MADRAS; Negapatam and Nilgherries, *Wight*; Courtallum, *Wight*, n. 1982.

Very similar to the last species; but the leaves are more distinctly toothed, the flowers smaller. *Leaves* glabrate, prominently lineolate above; nerves 7 pair. *Spikes* compound, axillary and terminal, often slender, sublinear. *Calyx* $\frac{1}{2}$ in., divided half-way down or more; segments narrowly lanceolate, glandular-hairy. *Corolla-lobes* ovate, acute. *Filaments* glabrous, except at the very base. *Capsule* $\frac{1}{2}$ - $\frac{3}{4}$ in., 4-seeded. *Seeds* discoid, areolate on both faces, densely hairy except on the areolae.—This is the original *Endopogon consanguineus* of *Nees*, which was founded on *Wight* n. 1982, the example of which authenticated in *Nees' hand* is at Kew. Subsequently, in *DC. Prodr.*, *Nees* united with this species the totally remote *S. exareolatus*. *T. Anderson* published (in *Thwaites Enum.* 226) this latter species as *S. consanguineus*, *T. Anders.*, while he separated in the herbarium the old *Wight* n. 1982 on which he has written *S. neglectus*, nov. sp.

VAR. *Amomum*; leaves more clearly toothed, spikes slender minutely pubescent or very nearly glabrous, bracts acuminate to an obtuse apex often overtopping the calyx. *S. consanguineus*, *T. Anders. in Journ. Linn. Soc.* ix. 465, partly; *Bedd. Ic. Pl. Ind. Or.* t. 216. *Ruellia sesamoides*, *Wall. Cat.* 2408, c and a chiefly. *Endopogon Amomum*, *Nees in Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 104.—*Nilgherries*; *Wight*, n. 1980, &c.

VAR. hypoleuca; as Var. *Amomum*, but the leaves often (when young) silky white beneath. *Ruellia sesamoides*, *Wall. Cat.* 240 B. *Endopogon hypoleucus*, *Nees in Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 104. *E. viscosus*, *Nees*, Var. *humilis*, *Wight Ic.* t. 1498; *Nees in DC. Prodr.* xi. 104.—Mts. of S. Madras, *Wight*; Bellary, *Beddome*.—A very trifling var. of the preceding Var. *Amomum*; but the Ceylon plant, the *S. hypoleucus* of T. Anderson, is the very different *S. rhytisperma*.

18. **S. jeyporensis**, *Bedd. Ic. Pl. Ind. Or.* t. 1214; leaves ovate acuminate crenulate mature nearly glabrous, spikes linear-oblong viscidly patently hairy, bracts lanceolate acuminate recurved, corolla $\frac{1}{2}$ in. white.

S. DECCAN PENINSULA; Golconda in Vizigapatam, alt. 2500 ft., and Mts. in Jeypore, *Beddome*.

A large shrub. *Leaves* $7\frac{1}{2}$ by 4 in., base shortly acuminate, mature densely obscurely lineolate above, thinly puberulous beneath; nerves 11 pair; petiole $2\frac{3}{4}$ in. *Spikes* 1–2½ in., uninterrupted; bracts $\frac{2}{3}$ in.; bracteoles $\frac{1}{2}$ in., narrow. *Calyx* $\frac{1}{2}$ in. and upwards, divided $\frac{2}{3}$ the way down; segments linear from a short lanceolate base, patently hairy. *Corolla* nearly straight, ventricose portion of the tube much longer than the cylindric. *Ovary* 4-ovulate in *Beddome's* figure. *Capsule* $\frac{1}{2}$ in., 2-seeded in *Beddome's* example. *Seeds* discoid, areolate on each face, densely hairy except on the areolæ.

*** *Species of the Khasia Hills.*

19. **S. adnatus**, *Clarke*; leaves widely elliptic acuminate at both ends subtentire glabrous, spikes linear stout dense strobiliform, bracts ovate acute adnate, calyx and corolla small. *S. decurrens*, *T. Anders. in Journ. Linn. Soc.* ix. 470, not of *Nees* (in *DC. Prodr.* xi. 189). *Endopogon decurrens*, *Nees in DC. Prodr.* xi. 105.

KHASIA MTS., alt. 3–5000 ft., frequent; *Griffith, H. f. & T.*, &c. UPPER ASSAM; *Jenkins*.

A shrub, 2–4 ft., nearly glabrous. *Leaves* 6 by 2½ in.; nerves 10 pair; petiole $1\frac{1}{4}$ in. *Spikes* 3–5 in., axillary and terminal in short dense panicles; bracts $\frac{2}{3}$ by $\frac{1}{2}$ in., glabrous, ciliate, persistent, reticulate, scarious; bracteoles 0. *Calyx* scarcely $\frac{1}{2}$ in., divided nearly to the base into linear segments. *Corolla* $\frac{1}{2}$ – $\frac{1}{2}$ in., glabrous without. *Stamens* 2, glabrous except at their point of attachment, 2 linear rudiments added. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* ovate, glistening, glabrous, hairless, without lateral areoles.

20. **S. khasyanus**, *T. Anders. in Journ. Linn. Soc.* ix. 471; hirsute, leaves ovate acuminate toothed, spines axillary clustered linear lax, bracts linear-spathulate as long as the calyx, corolla slender white. *Endopogon khasyanus*, *Nees in DC. Prodr.* xi. 104.

KHASIA MTS., alt. 2–4000 ft.; *Griffith, H. f. & T.*, &c. SIKKIM; Darjeeling (*Herb. Griffith*).

A shrub, 2–4 ft., densely patently brown-hairy, somewhat glandular-viscid. *Leaves* 4 by 2 in., shortly narrowed into the petiole, strongly crenate or subserrate, mature hirsute on both surfaces; nerves 9 pair; petiole $1\frac{1}{4}$ in. *Spikes* 1–4 in., forming axillary tufts of unequal length, linear but scarcely interrupted; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ in., linear. *Sepals* $\frac{1}{4}$ in., linear, somewhat enlarged in fruit. *Corolla-tube* $\frac{1}{2}$ in., linear, funnel-shaped only towards the top, lobes $\frac{1}{4}$ – $\frac{1}{2}$ in., roundish, patent. *Filaments* glabrous, unless at the very base, anthers much exsert. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* ovate, with an areola on each side; hairy (except on the areoles) with adpressed hairs inelastic when wetted.

Subgenus 3. **Eustrobilanthes**. Calyx deeply subequally 5-fid. *Stamens* 4, perfect; anthers not very unequal.

Series A. *Bracteata*. Bracts prominent, persistent or only late deciduous. Flowers spiked, clustered or strobilate; spikes sometimes interrupted below, but flowers never all scattered.

* *Flowers capitate or shortly spicate*. (An artificial section passing by gradations into the strobiliform or interruptedly spicate sections.)

† *Seeds glabrous* (in a few not known).—Species of Ceylon and the Deccan Peninsula.

21. **S. barbatus**, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 179; leaves broad-elliptic acuminate at both ends glabrous, bracts obovate cuspidate squarrose, corolla white very hairy within, seeds usually 2. *T. Anders. in Journ. Linn. Soc.* ix. 468; *Bedd. Ic. Pl. Ind. Or. t.* 212. *S. tetrapterus*, *Dalz. in Hook. Kew Journ.* ii. 342; *Dalz. & Gibs. Bomb. Fl.* 187; *T. Anders. in Journ. Linn. Soc.* ix. 468. *Ruellia ciliata*, *Heyne in Herb. Rottler*; *Wall. Cat.* 2392 (not *Wall. Cat.* 2415).

W. DECCAN PENINSULA; from the Bombay Ghats to Cape Comorin, alt. 3000 ft., *Wight, Dalzell, &c.*

A gregarious shrub, flowering once at about 7 years old, then dying (*Beddome*); stem often winged. Leaves 7 by 3 in., crenulate or subentire, lineolate especially above; nerves 7-8 pair; petiole 1-3 in., base often auriculate, sometimes winged. Heads 1-2 in., sessile, very dense; bracts $\frac{3}{4}$ in., obscurely quadrifarious, green, ciliate; bracteoles $\frac{1}{2}$ in., linear, ciliate. Calyx $\frac{1}{2}$ in., divided more than half-way down, green, ciliolate; segments linear-lanceolate. Corolla $\frac{3}{4}$ -1 in.; cylindric base as long as the suddenly-widened subcampanulate portion; limb nearly erect, subequal. Filaments sparsely hairy upwards. Pistil sparsely hairy and glabrous. Capsule $\frac{1}{2}$ - $\frac{2}{3}$ in., clavate, always 2-seeded. Seeds nearly $\frac{1}{4}$ in. long, very thin, elliptic, areoles 0.—The fruit has only been seen in the form *S. tetrapterus*, *Dalz.* In the old examples of *S. barbatus* the corolla is barely $\frac{1}{2}$ in., the heads and bracts are smaller, the calyx less deeply divided; but *Beddome* says (from knowledge of the living plant) that there is only one species here.

22. **S. lanceolatus**, *Nees in DC. Prodr.* xi. 181; glabrous except the calyx, leaves lanceolate acuminate at both ends nearly entire, heads small capitate few-fl., calyx-segments in flower lanceolate acute slightly hairy in fruit, capsule 4-seeded. *S. adenophorus*, *Nees l. c.* 182; *T. Anders. in Thwaites Enum.* 228, and in *Journ. Linn. Soc.* ix. 466, not of *Beddome*. *Martynia lanceolata*, *Moon Cat. Pl. Ceyl.* *Goldfussia Myrtinia*, *Nees l. c.* 174.

CEYLON; Four Korles and Saffragam, *Macrae, Thwaites, &c.*

A small shrub; branches quadrangular. Leaves 3 by $\frac{3}{4}$ in., prominently lineolate above; nerves 6 pair; petiole $\frac{1}{2}$ in. Heads $\frac{1}{2}$ in. (exclusive of the corolla), 2-4-fl., in appearance solitary peduncled, peduncles slightly thickened upwards quadrangular or subulate; floral leaves 2, elliptic, $\frac{1}{2}$ in., in the dried examples erect, overtopping closely enveloping the flower-head; proper bract $\frac{1}{2}$ in., oblong; bracteoles 2, $\frac{1}{4}$ in., sublinear, often suppressed in the upper flowers as commonly in close heads. Calyx $\frac{1}{2}$ in., divided half-way down, segments in fruit elongate obtuse. Corolla $1\frac{1}{4}$ -1 $\frac{1}{2}$ in., nearly glabrous without, light-blue; cylindric nearly as long as the ventricose part. Filaments hairy downwards. Ovary hairy at the apex. Capsule $\frac{3}{4}$ in., narrowly oblong. Seeds $\frac{1}{8}$ in. long, thin, elliptic, glabrous; areoles $\frac{1}{2}$ the length of the seed.

23. **S. heteromallus**, *T. Anders. ms.*; villous, subhispid, leaves ovate acute, heads ovoid, bracts oblong overtopping the calyx, ovary densely hairy at the tip. *S. scaber*, Var. γ *Nees in Wall. Pl. As. Rar.* iii. 84. Var. β *Nees in DC. Prodr.* xi. 178, as to *Wight's Deccan material*. *Ruellia scabra*, *Wall. Cat.* 2377 (not *Wall. Cat.* 2393).

NILGHERRIES; Canoor, *Wight* (nn. 1945, 2207, herb. propr.).

A coarsely hairy shrub, resembling *S. Wightianus*. *Leaves* attaining $5\frac{1}{2}$ by $3\frac{1}{4}$ in. (mostly much smaller), base obtuse shortly decurrent on the petiole, nearly entire, thick, rugose, upper surface subhispid with hairs from tubercular bases, under villous; nerves 7-8 pair; petiole $1\frac{1}{2}$ in. *Heads* sessile, 1 in., dense, hairy; bracts $\frac{3}{4}$ -1 in., erect; bracteoles $\frac{3}{4}$ in., sublinear. *Calyx* $\frac{1}{2}$ in. or more, divided more than half-way down; segments linear-lanceolate, hairy upwards. *Corolla* 1 in., glabrous without, hairy within, subsymmetric, cylinder portion of the tube as long as the ventricose. *Stamens* 4; filaments very hairy at the base. *Ovary* dense fulvous-hairy at the tip; style sparsely hairy; ovules 4. *Capsule* scarcely $\frac{1}{2}$ in., narrowly ellipsoid, 2- or 4-seeded. *Seeds* more than $\frac{1}{4}$ in., glabrous; areoles 0.—This in the dry state greatly resembles *S. Wightianus*, but the ovary, style and seeds differ. Col. Beddome says the shrub is well known to him at Canoor, but has not flowered during his whole residence in the Nilgherries.

24. ***S. Wightianus***, *Nees in Wall. Pl. As. Rar.* iii. 86, and in *DC. Prodr.* xi. 180; coarsely hairy, leaves ovate, heads ovoid, bracts elliptic-acuminate overtopping the calyx, ovary glabrous at the tip, capsule 4-seeded. *Wight Ic.* t. 1514; *T. Anders. in Journ. Linn. Soc.* ix. 466.

NILGHERRY MTS., alt. 7-8000 ft., frequent; *Gardner, Wight, Gen. Munro, &c.*

Stems 2-3 ft., stout, often almost shaggy. *Leaves* $1\frac{1}{2}$ -2 by 1 in., obtuse, base shortly cuneate, thick, rugose. *Bracts* $\frac{3}{4}$ -1 in., acute; bracteoles $\frac{3}{4}$ in., linear-spathulate. *Calyx* $\frac{3}{4}$ in., divided nearly to the base; segments linear-oblong, sub-obtuse, softly hairy; in fruit somewhat membranous nervose. *Corolla* $\frac{3}{4}$ -1 in., blueish, nearly glabrous without, with hairy lines within; cylindric base of the tube much shorter than the ventricose part. *Ovary* glabrous; style sparsely hairy. *Capsule* $\frac{1}{2}$ in., oblong, 4-seeded. *Seeds* $\frac{1}{10}$ in. long, thin, elliptic, glabrous; areoles 0—Otherwise as the preceding species, which *Wight* appears to have included under *Wightianus*.

25. ***S. pulneyensis***, *Clarke*; hirsute, leaves ovate shortly acute, heads subglobose abbreviated dense with foliaceous bracts, style-base patently hairy, corolla-tube with long linear-cylindric base. *S. punctatus*, *Bedd. Ic. Pl. Ind. Or.* t. 204 in note, not of *Nees*.

S. DECCAN; Pulney Hills and Anamallays, *Beddome*.

Resembling *S. Wightianus*, but with a differently shaped corolla. *Leaves* 3 by 2 in., base rounded or cuneate, crenate, thick, tubercular-hairy above, more softly hairy beneath; petiole $1\frac{1}{2}$ in. *Heads* much depressed, as if into flattened rosettes, the rounded bracts patent on all sides; bracteoles $\frac{1}{2}$ - $\frac{3}{4}$ in., linear-lanceolate. *Calyx* $\frac{1}{2}$ - $\frac{3}{4}$ in., divided more than half-way down; segments linear-lanceolate, hairy. *Corolla* 1 in., somewhat hairy in the bud; cylindric base as long as the ventricose part. *Filaments* glabrous, except at the base. *Ovary* slightly patently hairy towards the apex, 4-ovulate. *Capsule* not seen.—Communicated by Col. Beddome as probably *Ruellia* ? *punctata* of *Wight*, which differs very considerably. In the absence of seeds, it is placed by guess next *S. Wightianus*.

26. ***S. neilgherrensis***, *Bedd. Ic. Pl. Ind. Or.* t. 196; hirsute, sub-hispid, leaves large ovate acuminate, heads ovoid; bracts narrow-oblong, bracteoles and calyx-segments in fruit elongate caudate patently bristly, capsule 4-seeded.

S. DECCAN, common in the mountains, Nilgherries, Pulneys, Coorg, &c., *Beddome*.

A shrub, general aspect of *S. Perrottetianus*. *Leaves* 6 by $3\frac{1}{2}$ in., base obtuse, crenate, coarsely hispid with white or yellow hairs from tubercular bases; nerves 8 pair; petiole 1-2 in. *Heads* sessile, capitate, not elongate even in fruit; bracts 1 by $\frac{1}{6}$ in.; bracteoles at flower-time $\frac{1}{2}$ in., linear, in fruit elongate very long-tailed. *Sepals* $\frac{1}{3}$ in.; in fruit at least 1 in., base lanceolate with leaden glabrous scarious margins.

Corolla $1\frac{1}{2}$ – $1\frac{1}{2}$ in., glabrous without, white (Beddome), cylindric base nearly as long as the urceolate part. *Filaments* hairy, especially downwards. *Style* sparsely patently hairy. *Capsule* $\frac{3}{4}$ in., oblong ellipsoid. *Seeds* thin, obovate, obtuse, glabrous; areoles 0.—Beddome says “ovary very hairy at the apex,” but in his figure and specimens it is very slightly so. Possibly the note applied to *heteromallus*?

27. **S. Perrottetianus**, *Nees in DC. Prodr.* xi. 179; rufous-hirsute, leaves ovate acuminate, heads ovoid or subclavate, bracts ovate acute overtopping the calyx, capsule 2-seeded. *Wight Ic.* t. 1513; *T. Anders. in Journ. Linn. Soc.* ix. 466.

NILGHERY MTS., alt. 6–8000 ft., frequent; *Wight, &c.*

Stem 2–3 ft. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{2}$ in. (often smaller), base broadly rhomboid, crenate; nerves 7 pair; petiole $1\frac{1}{2}$ in. *Heads* 1–2 in., often wider upwards, or substrobiliform, hirsute, in appearance peduncled or paniced, but the two outermost bracts are empty, and more or less leafy; bracts $\frac{3}{4}$ in.; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{3}{4}$ in., divided $\frac{3}{4}$ the way down, subscarios with numerous red hairs; segments sublinear, acute. *Corolla* 1 in., pale-lilac, subsymmetric; narrow portion of the tube short; glabrous without. *Filaments* hairy. *Ovary* glabrous; base of style patently hairy. *Capsule* $\frac{1}{2}$ in., oblong-ellipsoid, 2-seeded. *Seeds* $\frac{1}{2}$ in. long and upwards, very thin, ovate, not hairy, but minutely scabrous-lamellate; areoles 0.

28. **S. Zenkerianus**, *T. Anders. in Journ. Linn. Soc.* ix. 467; glabrous except the fruiting calyx-tips, leaves ovate shortly acuminate, spikes ovoid or oblong, bracts narrowly elliptic-oblong overtopping the calyx, capsule 4-seeded. Goldfussia Zenkeriana, *Nees in DC. Prodr.* xi. 172. *G. Leschenaultiana*, *Nees l. c. p.* Endopogon *Strobilanthes*, *Wight Ic.* t. 1500.

NILGHERY MTS., alt. 6–8000 ft., frequent; *Sir F. Adam, Schmidt, Wight, &c.*

A shrub, 2–3 ft., much resembling *S. foliosus* (n. 8), and really closely allied to it. *Leaves* 3 by $1\frac{3}{4}$ in., base cuneate, serrulate, upper surface prominently lineolate; nerves 7 pair; petiole $1\frac{1}{2}$ –2 in. *Spikes* 1–2 $\frac{1}{2}$ in.; young globose or oblong, mature oblong; bracts $\frac{3}{4}$ in.; bracteoles $\frac{3}{4}$ in., sublinear. *Calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., divided nearly to the base; segments linear-lanceolate, glabrous or in the fruiting examples with scattered patent gland-tipped hairs. *Corolla* $1\frac{1}{2}$ in., blueish, glabrous without; cylindric nearly as long as the ventricose part. *Filaments* hairy in their lower half. *Pistil* glabrous or nearly so. *Capsule* $\frac{1}{2}$ in., oblong-ellipsoid. *Seeds* $\frac{1}{2}$ in. long, very thin, elliptic, glabrous; areoles 0.

29. **S. warreensis**, *Dalz. in Hook. Kew Journ.* ii. 341; leaves broad-lanceolate acuminate at both ends glabrous, spikes oblong hairy, calyx greatly enlarged in fruit, corolla $\frac{1}{2}$ in., capsule 4-seeded. *Dalz. & Gibs. Bomb. Fl.* 187. *S. ciliatus*, *T. Anders. in Journ. Linn. Soc.* ix. 468, partly. *S. parviflorus*, *Bedd. Ic. Pl. Ind. Or.* t. 197.

W. DECCAN PENINSULA; near Belgaum, Warree country, *Dalzell*; Ram Ghant, *Ritchie*; Coorg and S. Canara, alt. 3000 ft., *Beddome*.

Shrub, 2–5 ft. *Leaves* 6 by 2 in., much acuminate, crenate, lineolate on both surfaces; nerves 7 pair; petiole $\frac{3}{4}$ in. *Spikes* 1–2 in., peduncles hairy, erect in fruit; bracts (flowering) $\frac{1}{4}$ – $\frac{1}{2}$ in., elliptic, hairy; bracteoles $\frac{1}{2}$ in., linear. *Calyx* (flowering) $\frac{1}{4}$ in., divided nearly to the base; segments linear pubescent upwards. *Corolla* straight, nearly symmetric, glabrous, linear-cylindric about as long as the subcampanulate portion; white purple-spotted. *Filaments* hairy below, not more monadelphous than in many other species. *Pistil* glabrous. *Capsule* $\frac{1}{2}$ in., clavate-oblong; fruit-sepals $\frac{3}{4}$ in., narrowly oblong, hairy. *Seeds* $\frac{1}{2}$ in. long, thin, elliptic, glabrous; areoles 0.—The extraordinary enlargement of the calyx in fruit was noted by Dr. Ritchie, whose examples have flowering and fruiting spikes on the same branch.

30. **S. ciliatus**, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.*

xi. 183; glabrous, leaves broad-lanceolate acuminate at both ends, spikes small oblong often deflexed at flower-time, corolla small. *T. Anders. in Journ. Linn. Soc.* ix. 468, partly; *Bedd. Ic. Pl. Ind. Or.* t. 211. *Ruellia ciliata*, *Wall. Cat.* 2415 (not *Wall. Cat.* 2392). *Goldfussia Zenkeriana*, *Wight Ic.* t. 1517?, not of *Nees*.

S. DECCAN PENINSULA; the Ghauts up to 4000 ft., common, *Beddome*; Nilgherries, Mangalore, &c., Courtallum, *Wight* (n. 1949, Herb. Propr.).

Resembling *S. warreensis* in leaves and spikes; but the peduncles and bracts are perfectly glabrous, the spikes slenderer. *Corolla* in the dried examples $\frac{1}{2}$ – $\frac{3}{4}$ in.; *Wight's* figure shows them very much too large; *Beddome* figures (and describes) them an inch, but his description appears largely taken from *S. warreensis*.

31. **S. adenophorus**, *Bedd. Ic. Pl. Ind. Or.* t. 225, not of *Nees* nor of *T. Anders.*; glabrous, leaves lanceolate acuminate at both ends subintire, heads oblong, bracts obovate, calyx-segments lanceolate subobtus.

S. DECCAN; Anamallay Mts., alt. 4–5000 ft., *Beddome*.

Shrubby, 3–4 ft. *Leaves* 4 by 1 in., conspicuously lineolate above; nerves 6 pair, slender; petiole $\frac{1}{2}$ in. *Heads* 1–2 in., often deflexed; bracts $\frac{1}{2}$ – $\frac{1}{2}$ in., obtuse, sometimes mucronate, glabrous, lineolate; bracteoles $\frac{1}{2}$ in., narrowly ligulate. *Calyx* nearly $\frac{1}{2}$ in., divided about half-way down; segments membranous. *Corolla* 1–1 $\frac{1}{4}$ in., glabrous without, very hairy within, nearly straight; cylindric rather shorter than the urceolate part. *Filaments* hairy downwards. *Pistil* glabrous. *Capsule* not seen.—*Beddome* says that *T. Anderson* identified this plant with the Ceylon *S. lanceolatus*, but there must have been some mistake, as except in the leaves there is little resemblance between the two. In its habit, deflexed peduncles, and bracts, this seems very nearly allied to *S. ciliatus*, *Nees*, but in the absence of seeds it is hazardous to guess at affinity.

32.? **S. decurrens**, *Nees in DC. Prodr.* xi. 189; glabrous, leaves elliptic acuminate at both ends, spikes clavate-oblong, bracts large narrowly elliptic obtuse decurrent. *S. pallidus*, *T. Anders. in Journ. Linn. Soc.* ix. 470. *Goldfussia decurrens*, *Wight Ic.* t. 1522 (not *Endopogon decurrens*, *Nees*).

S. DECCAN; Coimbatore, Courtallum and Nilgherries, *Wight*; Anamallays, *Beddome*.

Herbaceous (fide *Wight*), green. *Leaves* 7 by 2 $\frac{1}{2}$ in., entire or obscurely crenate, conspicuously lineolate above; nerves 10 pair; petiole 1 in. *Peduncles* 1–2 in., slightly thickened upwards, quadrangular or subulate, divaricate or deflexed, often with 2 bract-like leaves below the head; heads 1 $\frac{1}{2}$ in., tapering at the base; bracts 1 by $\frac{1}{2}$ in. bracteoles $\frac{1}{2}$ in., linear-ligulate. *Calyx* $\frac{1}{2}$ in., subscarios, divided more than half-way down, segments lanceolate. *Corolla* 1 $\frac{1}{4}$ in., glabrous without; cylindric portion scarcely so long as the ventricose. *Filaments* hairy-downwards. *Pistil* glabrous. *Capsule* not seen.—This species is placed here from its similarity to *S. ciliatus* and *S. adenophorus*.

†† *Seeds hairy.*

¶ *Species of the Deccan Peninsula and Ceylon.*

33. **S. Walkeri**, *Nees in DC. Prodr.* xi. 181; nearly glabrous, leaves broadly elliptic acuminate at both ends, spikes ovoid few-fl'd. cymose, bracts ovate adnate obtuse bullate, capsule with 2 very large seeds. *Bedd. Ic. Pl. Ind. Or.* t. 222; *T. Anders. Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 470.

CEYLON; alt. 4–7000 ft., *Walker*, &c.

A shrub, 6 ft., gregarious, flowering when about six years old, then dying. *Leaves* 6 $\frac{1}{2}$ by 2 $\frac{3}{4}$ in., crenate, minutely sparsely scabrid-pubescent; nerves 7–8 pair; petiole

1½ in. *Cymes* often of 3 heads, sometimes compound; peduncles clavellulate or winged; heads $\frac{2}{3}$ in., 2-4 fld., enveloped by the two outer bract-like erect leaves; proper bracts $\frac{1}{2}$ in., green, slightly ciliate; bracteoles $\frac{1}{4}$ in., sublinear. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, obtuse, scarious, nearly glabrous. *Corolla* $\frac{3}{4}$ in., subsymmetric, glabrous without, hairy within, white or purplish; contracted base short. *Filaments* hairy at the base. *Pistil* glabrous. *Capsule* $\frac{3}{4}$ in., ellipsoid. *Seeds* nearly $\frac{1}{2}$ in., very thin, ovate, shaggy with adpressed wavy silky hair not elastic in water; areoles 0.—Beddome's figure shows the corolla within and filaments glabrous, which they may be sometimes, for it is not a very constant character in *Strobilanthes*; but none of the numerous specimens are so.

VAR. ? *stenocarpa*; leaves broadly ovate pubescent beneath somewhat flaccid, capsules $\frac{1}{2}$ in. 2-seeded, seeds $\frac{1}{2}$ in. shaggy with silky hair, areoles hardly any.—Ceylon; Thwaites, C. P. n. 3517. This probably differs specifically from *S. Walkeri*, the difference in the size of the fruit being startling; but it must stand next to it.

34. **S. Thwaitesii**, *T. Anders. in Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 470; leaves elliptic acuminate at both ends scabrous pubescent beneath, spikes oblong few-fld. cymose, bracts sessile elliptic elongate acute bullate. *Bedd. Ic. Pl. Ind. Or.* t. 219.

CEYLON; Ambagamowa, *Thwaites*.

A shrub, 4-5 ft. *Leaves* 6½ by 2½ in., crenulate, subcoriaceous, mature glabrate above fuscous pubescent beneath; nerves 7 pair; petiole 1½ in. *Peduncles* fascicled or cymose, thickened upwards, more or less pubescent; outermost empty, bracts $\frac{1}{2}$ in., ovate; bract proper nearly 1 in., ciliate; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{2}$ in., divided $\frac{2}{3}$ the way down; segments narrowly lanceolate, ciliate. *Corolla* exceeding 1 in., subsymmetric, white, glabrous without, hairy within; linear-cylindric base of the tube hardly so long as the campanulate part. *Filaments* and *style* sparsely hairy. *Capsule* not seen.

35. **S. caudatus**, *T. Anders. in Thwaites Enum.* 228, and in *Journ. Linn. Soc.* ix. 470; leaves lanceolate caudate-acuminate fuscous-pubescent beneath, heads oblong fuscous-villous, bracts oblong, corolla nearly glabrous within. *Bedd. Ic. Pl. Ind. Or.* t. 213.

W. DECCAN PENINSULA; S. Canara, 2-6000 ft., *Beddome*; common also in Koorg and Wynaad, *sic* *Beddome*. CEYLON; Hantani, *Thwaites* (C. P. n. 364).

A shrub, 4-5 ft. *Leaves* 6 by 1½ in., base tapering, subentire, mature glabrate lineolate above; nerves 10-12 pair; petiole $\frac{1}{2}$ in. *Peduncles* 1-2 in., hairy, divaricate, carrying 1-3 nodding spikes $\frac{1}{2}$ -1½ in. long; bracts $\frac{1}{2}$ in., oblong; bracteoles $\frac{1}{2}$ in., narrowly oblong. *Calyx* nearly $\frac{1}{2}$ in., oblong, softly brown-hairy, divided nearly to the base; segments sublinear, obtuse. *Corolla* $\frac{3}{4}$ -1 in., nearly glabrous, white tinged orange or reddish; cylindric portion shorter than the ventricose; limb suboblique, segments short round. *Filaments* glabrous. *Ovary* scabrous, slightly glandular-hairy; style thinly hairy. *Capsule* $\frac{3}{4}$ in., broadly ellipsoid, fuscous-pubescent, 2-seeded. *Seeds* $\frac{1}{4}$ in. diam., rufous, inelastically shaggy; areoles small.—Col. Beddome's Malabar plant has rather longer hairs on the stem and leaves than the Ceylon.

VAR. *laniceps*; tips of the branchlets purple, peduncles and spikes densely white with patent hairs $\frac{1}{4}$ - $\frac{1}{2}$ in. long, corolla 1½ in. very hairy within, filaments hairy.—Ceylon; *Thwaites*.—Sent by Thwaites, numbered 364, subsequently to the rest of n. 364, and probably not seen by T. Anderson before Thwaites' Enum. was published.

36. **S. tristis**, *T. Anders. in Journ. Linn. Soc.* ix. 470; leaves elliptic acuminate at both ends nearly glabrous, heads oblong 2-3-fld. panicle, bracts elliptic acuminate overtopping the densely hairy calyx-teeth, capsule 2-seeded. *Goldfussia tristis*, *Wight Ic.* t. 1508.

NILGHERRIES; *Gardner*; below Sispara, *Wight*. S. TINNEVELLY; *Beddome*.

An erect shrub. *Leaves* 7 by $2\frac{1}{2}$ in., crenate, lineolate on both surfaces; nerves 6-7 pair beneath, minutely scabrid; petiole 2 in. *Heads* several (sometimes 35) to the panicle; panicle branches slender, glabrescent; outermost pair of pollen bracts usually $\frac{1}{4}$ in., lanceolate, next pair resembling the proper bracts but empty, patently glistening hairy or quite glabrous; bract proper $\frac{3}{4}$ in., sessile, green; bracteoles 0. *Sepals* nearly $\frac{1}{2}$ in., linear, scarious below, terminating in a dense tuft of multicellular hairs. *Corolla* 1 in., subsymmetric, pale-blue, hairy within; ventricose portion longer than the contracted; segments round. *Filaments* hairy towards the base. *Style* sparsely hairy. *Capsule* $\frac{1}{2}$ in., narrowly ellipsoid. *Seeds* $\frac{1}{4}$ in., thin, subquadrate elliptic, shaggy with adpressed wavy silky hair not elastic when wetted, glabrous on the oblong large areoles.

37. **S. anceps**, *Nees in DC. Prodr.* xi. 189; thinly hairy, leaves ovate acuminate, heads small oblong, bracts obovate obtuse tips green squarrose or reflexed. *T. Anders. in Journ. Linn. Soc.* ix. 466; *Bedd. Ic. Pl. Ind. Or.* t. 204.

CEYLON; alt. 3-6000 ft., frequent, *Gardner, &c.*

A small undershrub, much branched. *Leaves* 3 by $1\frac{1}{4}$ in., obtuse or acuminate at the base, subentire, with scattered hairs and occasionally a few red glands beneath; nerves 6 pair; petiole $\frac{1}{2}$ in. *Peduncles* 0- $1\frac{1}{2}$ in., numerous, often in clusters of 3, thickened upwards, 1-headed; heads $\frac{1}{2}$ in., ovoid, in fruit often 1-2 in. oblong; bracts $\frac{1}{2}$ - $\frac{1}{2}$ in., adpressed downwards often densely red, glandular, tips prominently reflexed; bracteoles $\frac{1}{4}$ in., linear. *Calyx* $\frac{1}{4}$ in., divided nearly to the base; segments linear, thin, hairy, much enlarged in fruit. *Corolla* $\frac{3}{4}$ in., slightly pubescent without, slightly hairy within, straight, subsymmetric, white; contracted base much shorter than the urceolate portion, segments rounded. *Filaments* with long hairs. *Ovary* densely glandular at the tip, style glabrous. *Capsule* $\frac{1}{2}$ in., oblong, pubescent, 4-seeded. *Seeds* $\frac{1}{10}$ in., ovoid, closely hairy with short thick annulate hairs, elastically springing out when wetted.

VAR. *microstachya*; leaves and heads more hairy less glandular, calyx very small, corolla more hairy without. *S. macrostachya*, *Benth. in Flora* 1849, 557. *Ruellia*? punctata, *Nees in DC. Prodr.* xi. 147; *Wight Ic. t.* 1563.—Hills of S. Deccan; Courtallum, *Wight*; Mangalore, *Hohenacker*, n. 463; Anamallays, *Beddome*. Leaves 5 in.; filaments nearly glabrous. *Beddome* says that this plant is "very scabrous, the hairs arising from harsh papillæ." *Wight's* figure of *Ruellia*? punctata is drawn from his *Herb. Propr.* n. 656, preserved at Kew, written up by *Wright*, and quoted by *Nees*; but it is a particularly softly hairy form. As *Beddome* remarks, it is not taken up by *T. Anderson*.

VAR. ? *punctata*, *T. Anders. in Thwaites Enum.* 229; leaves small ovate glabrous densely glandular beneath, bracts orbicular glabrous ciliated densely glandular tips not reflexed. *Strobilanthes punctatus*, *Nees in DC. Prodr.* xi. 182 (sp.), not of *Bedd.*—Ceylon; *Walker*. Leaves $\frac{1}{2}$ - $1\frac{1}{4}$ in., subobtusely, base often subcordate. Perhaps specifically distinct, but there is only one example, without fruit, named by *Nees*.

38. **S. Arnottianus**, *Nees in DC. Prodr.* xi. 179; softly laxly hairy, leaves cordate-ovate acute, heads obovoid nodding, bracts ovate acuminate, corolla subcampanulate lobes somewhat acute. *T. Anders. in Thwaites Enum.* 228, and in *Journ. Linn. Soc.* ix. 466; *Bedd. Ic. Pl. Ind. Or.* t. 261.

CEYLON; Newera Ellia, *Walker, &c.*

An undershrub, branches hirsute upwards. *Leaves* 4 by 2 in., crenate-serrate, thinly hairy on both surfaces; nerves 4-5 pair; petiole 1-2 in. *Heads* $\frac{1}{2}$ -1 in., white-hairy; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., sessile; bracteoles $\frac{1}{2}$ - $\frac{1}{2}$ in., linear-oblong. *Calyx* $\frac{1}{2}$ - $\frac{1}{2}$ in., divided nearly to the base; segments linear-lanceolate. *Corolla* $\frac{3}{4}$ in., straight, symmetric, almost funnel-shaped from the very short contracted base, slightly hairy within and without, whitish. *Filaments* attached very low down the corolla, glabrous; anthers exserted. *Ovary* and *style* hairy. *Capsule* 4-seeded; seeds (unripe) hairy.

—The segments of the corolla are ovate, longer and much more acute than in Beddome's figure.

39. **S. asperimus**, *Nees in DC. Prodr.* xi. 183; leaves broadly elliptic acuminate at both ends hairy, heads paniced, bracts elliptic concave glabrous, bracteoles 0. *S. lupulinus*, *T. Anders. in Journ. Linn. Soc.* ix. 469, *partly*. *S. Hookeri* Var. β , *Nees l. c.* 185.

CEYLON; *Walker, Gardner, &c.*

Apparently a large shrub; branches swollen at the joints, scabrous, hirsute upwards. *Leaves* 9 by 4 in., crenate; nerves 11 pair; petiole $1\frac{1}{2}$ in. *Panicles* in *Walker's* examples very compound; heads $1-1\frac{1}{2}$ in., broadly oblong; bracts $\frac{3}{4}$ in. *Calyx* less than $\frac{1}{2}$ in., divided nearly to the base; segments ligulate, scarious, lineolate. *Corolla* $\frac{3}{4}$ in., little contracted below, subsymmetric, glabrous without, hairy within. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* $\frac{1}{2}$ in., thin, suborbicular, densely elastically hairy on the margin, areoles very large extended over all the seed but the margin.

40. **S. trifidus**, *Nees in DC. Prodr.* xi. 185; nearly glabrous, leaves elliptic acuminate, heads globose solitary or in small cymes, bracts ovate or elliptic concave, bracteoles 0. *S. tener*, *Nees l. c.* 184. *S. coloratus*, *Nees l. c.* 86, *not of T. Anders.* *S. lupulinus*, *T. Anders. in Thwaites Enum.* 228, and in *Journ. Linn. Soc.* ix. 469, *partly*.

CEYLON, frequent; *Gardner, &c.*

Regarded by *T. Anderson* as a glabrescent form of *S. asperimus*, which it may be, but the capsule is unknown and the inflorescence much less compound. *Leaves* 3-10 in., base attenuated or rounded, drying black. *Bracts* membranous, the upper even in the young heads often coloured membranous.

41. **S. lupulinus**, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 184; hairy, leaves elliptic acuminate at both ends, spikes in small dense cymes, bracts elliptic obtuse concave softly hairy, bracteoles obsolete. *S. Dalzellii*, *T. Anders. ms. in Herb. Kew.* *Ruellia lupulina*, *Wall. Cat.* 2355 *a & c.*

W. DECCAN PENINSULA; Concan, *Dalzell, Stocks*; Ram Ghaut near Belgaum, *Ritchie*. COURTALLUM; *Wight*.

Branches stout, woody, hairy upwards. *Leaves* 6 by 2-3 in., denticulate, laxly villous on both surfaces or subsetulose above; nerves 8 pair; petiole $1\frac{3}{4}$ in. *Peduncles* axillary, very short; spikes $1\frac{1}{2}$ in., oblong, subumbellate or solitary; bracts $\frac{3}{4}-1$ in. *Calyx* $\frac{1}{2}-\frac{3}{4}$ in., divided nearly to the base; segments ligulate, obtuse, scarious, glabrous, tips bristly. *Corolla* $\frac{3}{4}-1$ in., glabrous without, hairy within, straight, subsymmetric; cylindric part as long as the suburceolate, lobes short. *Filaments* hairy downwards. *Pistil* glabrous or the style upwards microscopically hairy. *Capsule* scarcely $\frac{1}{2}$ in., oblong, 4-seeded. *Seeds* $\frac{1}{2}$ in., elliptic, elastically white hairy only on the very margin.—The Bombay botanists took this species for a hairy-bracteate form of *S. rugosus* (*Wight Ic. t.* 1619).

42. **S. Heyneanus**, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 184; leaves broadly elliptic acuminate at both ends hairy, spikes subglobose cymose, bracts elliptic ventricose glabrous, bracteoles 0, corolla $\frac{3}{4}$ in. *Dalz. & Gibs. Bomb. Fl.* 187. *S. rugosus*, *Wight Ic. t.* 1619. *S. lupulinus*, *T. Anders. in Journ. Linn. Soc.* ix. 469, *partly*. *Ruellia bracteata*, *Heyne in Herb. Rottler*; *Wall. Cat.* 2357, *type sheet only, not Goldfussia bracteata, Nees.*

W. DECCAN PENINSULA from the Bombay Ghats to the Bababooduns and Nilgherries; *Heyne, Wight, Dalzell, &c.*

Stems never exceeding 18 in. high (*Dalzell, Stocks*), hirsute upwards. *Leaves* 6 by $2\frac{3}{4}$ in., closely serrate, tubercular-hairy above, softly hairy beneath, drying green

(not black); nerves 7 pair; petiole 2 in. *Peduncles* short or 0; spikes 1–1½ in.; bracts ¾ in., ventricose, membranous. *Calyx* ½ in., divided nearly to the base; segments ligulate, subobtuse, membranous, lineolate. *Corolla* glabrous without, hairy within, pale blue; contracted portion scarcely shorter than the ventricose; limb equal, segments round. *Filaments* and *style* hairy. *Capsule* scarcely ½ in., oblong, 4-seeded. *Seeds* ⅓ in., ovoid, glabrous except on the very margin.

VAR. ? campanulata; leaves ovate subacute hairy, spikes subglobose solitary or few together, bracts elliptic ventricose glabrous, bracteoles 0, corolla scarcely ½ in. *S. campanulata*, *Wight Ic. t.* 1562. *S. involucratu* *Var. B*, *Nees in DC. Prodr.* xi. 184. *S. lupulinus*, *T. Anders. in Journ. Linn. Soc. ix.* 469, partly. *Ruellia lupulina*, *Wall. Cat.* 2355 b, partly.—*Coorg*; *Wight*.—Plant 5–10 in. *Leaves* 1–2 in., drying green. *Heads* ½–1 in. *Corolla* subcampanulate; lobes very short. *Capsule* less than ½ in., seeds glabrous. Possibly an alpine var. of *S. Heyneanus*, but the corolla is a different shape, as well shown in *Wight's* figure. The example of *Wall. Cat.* 2355 b in his own *Herb.* is nearer *S. Heyneanus*, *Nees*, type; that in *Herb. Hook.* agrees closely with *Wight's campanulatus*.

VAR. ? fusca; leaves broadly elliptic acuminate at both ends very sparsely hairy, heads globose nodding mostly solitary, bracts broadly elliptic ventricose glabrous, bracteoles 0. *S. lupulinus*, *Benth. in Pl. Hohenack. n.* 814; *T. Anders. in Journ. Linn. Soc. ix.* 469 partly, not of *Nees*.—*Mercara* in *Canara, Hohenacker*. *Branches* 15 in., nearly glabrous. *Leaves* 5 by 2½ in., somewhat black in drying, densely lineolate on both surfaces, very minutely sparsely hairy. *Heads* 1–1½ by ¾–1 in.; bracts and calyx as of *S. Heyneanus*. *Corolla* not known.

VAR. viridis; stem stout rough, leaves 1–3 in. very scabrous, heads small bracts (at flower-time) closely adpressed. *S. asperimus*, *Dalz. & Gibs. Bomb. Fl.* 187, not of *Nees*.—*Strobilanthes* sp. n. 32, *Herb. Ind. Or. H. f. & T.*—*Mysore*; *G. Thomson*.—The specimens do not match those of *S. lupulinus*, but *Col. Beddome* after seeing them says it is that species.

43. *S. ixiocephalus*, *Benth. in Flora* 1849, p. 557; leaves lanceolate or elliptic acuminate slightly hairy, heads ovoid closely cymed, bracts elliptic acuminate to an obtuse apex viscous hairy. *Bedd. Ic. Pl. Ind. Or. t.* 203. *S. Neesianus*, *Wight Ic. t.* 1523; *Dalz. & Gibs. Bomb. Fl.* 188. *S. eriocephalus*, *T. Anders. in Journ. Linn. Soc. ix.* 466.—*Strobilanthes* sp. n. 64, *Herb. Ind. Or. H. f. & T.* *S. glutinosus*, *Grah. Cat. Pl. Bomb.* 162 ?.

W. DECCAN PENINSULA and S. MADRAS, alt. 1–3000 ft., frequent; *Wight, Hohenacker, &c.*

A small shrub. *Leaves* 5 by 2 in., or oftener smaller narrower, base cuneate (sometimes very shortly), crenate, mature nearly glabrous, conspicuously lineolate above; nerves 7 pair; petiole ¾ in. *Heads* ½–1½ in., bracts and calyx enlarged in fruit, usually very glutinous, sometimes softly hairy; bract ¾ by ½ in.; bracteoles ½ in., linear-spathulate. *Calyx* ¼–½ in., divided nearly to the base; segments ligulate, fruiting spatulate, obtuse, membranous. *Corolla* ¾–1 in., glabrate without, hairy within, subsymmetric, white; cylindric portion nearly as long as the ventricose. *Filaments* hairy towards the base. *Pistil* glabrous. *Capsule* ½ in., often 2-seeded. *Seeds* ⅓ in., thin, ovate, densely elastically hairy on all sides; areoles very small.

44. *S. micranthus*, *Wight Ic. t.* 1519; leaves ovate acuminate sparsely thinly pubescent, heads solitary ovoid nodding, bracts broadly lanceolate pubescent, bracteoles longer corolla shorter than the calyx. *T. Anders. in Journ. Linn. Soc. ix.* 468.

NILGHERY MTS.; *Wight*.

Suffruticose or herbaceous (*Wight*), erect; stems glabrous. *Leaves* 6 by 3½ in., base broad, shortly decurrent, closely serrate; nerves 11 pair; petiole 1½ in. *Heads* 1½–2½ in.; bracts 1 in., widest close to the base, thinly herbaceous; bracteoles ¾ in., linear-lanceolate. *Calyx* ¾–¾ in., divided nearly to the base; segments linear-lanceolate, very acute, pubescent. *Corolla* ½ in., subcampanulate, dry appearing dull red; lobes very short, round. *Filaments* glabrous; anthers exserted. *Pistil* glabrous.

Capsule unknown.—This imperfectly known species may very possibly have its true position nearer to *S. Heyneanus* var. *campanulata*.

45. **S. scrobiculatus**, *Dalz. ms.*; leaves elliptic acuminate at both ends nearly glabrous, spikes numerous subsessile along the naked branches, corolla 1 in. blue.

BOMBAY GHATS; *Dalzell*; Mahabeshwur, *Ralph*.

Woody branches elongate, much divided, leafless, covered with flowers, tips leafy. *Leaves* 3 by 1 in., nearly entire; nerves 7 pair; petiole $\frac{1}{2}$ in. *Spikes* 1 in., subsessile, viscid hairy; bracts $\frac{1}{4}$ in., narrowly obovate, persistent in fruit; bracteoles $\frac{1}{4}$ in., sublinear. *Calyx* $\frac{1}{2}$ in., divided nearly to the base; segments linear, hairy. *Corolla* symmetric, nearly glabrous, pale below, a beautiful blue upwards; ventricose part rather narrow longer than the contracted; lobes ovate, crenulate. *Stamens* included, glabrous. *Style* with a few hairs. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* $\frac{1}{10}$ in., thin, ovate, densely covered with fine long hairs, elastic when wet, except the small areoles.—Appears to be the most beautiful species of the genus; it is allied to *S. tricephalus*.

46. **S. papillosus**, *T. Anders. in Journ. Linn. Soc.* ix. 468; scabrous hispid, leaves ovate acute, heads ellipsoid, bracts elliptic elongate scabrous hispid, corolla $1\frac{1}{2}$ – $1\frac{3}{4}$ in. *Bedd. Ic. Pl. Ind. Or.* t. 201. *S. scaber*, Var. ? β , *Benth. in Pl. Hohenack.* n. 1431.

NILGHERY MTS.; alt. 7000 ft., *Hohenacker, Beddome.* MYSORE; *Lobb*.

A large shrub (*Beddome*); branches very harshly scabrous. *Leaves* 2½ by 1½ in., obtuse, base very shortly cuneate, callous-dentate, hispid with tubercle-based hairs above, setulose beneath; nerves 6 pair; petiole $\frac{3}{4}$ in. *Heads* 1½–2 in., strictly capitate; peduncles thickened upwards, acutely 4-angled, very harshly scabrous; floral leaves 2 in., empty, overtopping the head; bract very rigid; bracteoles 1 in., narrowly lanceolate, membranous, ciliate. *Calyx* divided nearly to the base; segments 1½ in., linear-lanceolate, very acute, membranous, ash-coloured, ciliate. *Corolla* subsymmetric, nearly glabrous, blueish; cylindric part hardly so long as the ventricose; lobes ovate. *Stamens* glabrous, included. *Pistil* thinly hairy. *Capsule* unknown.—Allied to *S. Perrottetianus* according to *Beddome*, and it may turn out so to be when the seeds are known.

47. **S. exsertus**, *Clarke*; leaves petioled ovate acute at both ends scabrid-pubescent, spikes densely capitate solitary terminal, bracts obovate as long as the calyx, corolla $\frac{3}{4}$ in., anthers exsert. *Stenosiphonium zeylanicum*, Var. α , *T. Anders. in Thwaites Enum.* 225, and in *Journ. Linn. Soc.* ix. 463.

Ceylon; *Thwaites* (C. P. 3577); Damboul, *Beckett*.

A shrub, 1–2 ft., creeping, rooting; branches suberect, quadrangular, pubescent. *Leaves* 1½ by ¾ in., crenate, rather harsh, lineolate on both surfaces, sparsely setose above, more softly beneath; nerves 5–6 pair; petiole $\frac{1}{2}$ in. *Heads* sessile between 2 somewhat enveloping leaves; quasi-peduncles 0–1½ in., often thickened upwards; bracts $\frac{1}{2}$ in., subobtuse, green, persistent, patently white-hairy. *Calyx* $\frac{1}{2}$ in., divided about half-way down at flower-time, teeth lanceolate, hairy. *Corolla* curved, nearly glabrous without; cylindric base $\frac{1}{2}$ in., funnel-shaped part nearly as long; lobes ovate. *Filaments* glabrous except at the base, 2 longer distinctly exserted; anthers all subequal. *Ovary* glabrous, tip glandular, 4-ovulate; style glabrous, stigma simple. *Capsule* $\frac{1}{2}$ in., oblong, glabrous, 4-seeded from near the base. *Seeds* $\frac{1}{8}$ in. diam., much compressed, orbicular, densely elastically hairy, except on the conspicuous areoles.—Placed in *Stenosiphonium* by T. Anderson, and regarded as a var. of *Hemigraphis venosa*. The inflorescence does not do for *Stenosiphonium*, nor the leaves, and the ovules are never more than 4 to the ovary.

VAR. β *integra*, *T. Anders.* l. c.; leaves entire glabrous, corolla 1 in. ventricose, constricted cylindric base of the tube short.—Ceylon; *Thwaites* (C. P. n. 3661).

The only scrap of this does not permit of dissection; it can hardly be conspecific with *S. exsertus*, but may not be congeneric; it closely resembles *S. lanceolatus*.

48. **S. Gardnerianus**, *T. Anders. in Thwaites Enum.* 226; hairy, leaves sessile ovate, spikes ovoid or interrupted at base, bracts and bracteoles longer than the calyx, corolla 1 in. purple, anthers included. Endopogon *Gardnerianus*, *Nees in DC. Prodr.* xi. 723.

CEYLON; *Gardner, Thwaites*.

Shrubby, 1-2 ft.; stems terete, scabrous below, white-hirsute upwards. *Leaves* 2 by $1\frac{1}{2}$ in., acute or subobtusely, base rounded, subrenate. *Spikes* capitate, $\frac{3}{4}$ in., nearly enclosed by bracts, few-fl., or lower axillary flowers being added becoming interrupted, linear-oblong; bracts $\frac{3}{4}$ in., ovate; bracteoles $\frac{1}{2}$ in., linear-oblong. *Calyx* $\frac{1}{2}$ in., slightly hairy. *Corolla-tube* linear-cylindric below, suddenly inflated upwards, as of *Stenosiphonium*. *Capsule* and *seeds* unknown: hence the place of this species is uncertain; some of the examples might, so far as the inflorescence is concerned, be placed next *S. sexennis* among the Series D. "Paniculatæ."

¶¶ *Species of N. India and the Malay Peninsula.*

49. **S. scaber**, *Nees in Wall. Pl. As. Rar.* iii. 84, and in *DC. Prodr.* xi. 177, partly; leaves elliptic or obovate acuminate scabrous or ultimately glabrate, spikes dense often clustered, bracts lanceolate large hairy, corolla $\frac{3}{4}$ -1 in. yellow very hairy within. *Bot. Reg.* xxvii. t. 32; *T. Anders. in Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 467, partly. *Ruellia scabra*, *Wall. Cat.* 2393, not *Wall. Cat.* 2377. *R. aspera*, *Nees in DC. Prodr.* xi. 147, as to the Bengal material. *R. crispa*, *Herb. Linn. Propr.*

N. and E. BENGAL PLAINS; Silhet, *Wallich*; Purneah, *J. D. H.*; Maldah, Mymensingho, Dacca, &c., *Clarke*.—DISTRIB. Burma.

Stems 1-3 ft., pubescent or hairy upwards. *Leaves* $4\frac{1}{2}$ by 2 in., base narrowed, crenate, sometimes very coarsely scabrous-subhispid, sometimes nearly smooth but hard; nerves 7-8 pair; petiole $\frac{3}{4}$ in. *Spikes* 1-2 in., hairy; bracts 1 by $\frac{1}{2}$ in., obtusely acuminate, green; bracteoles $\frac{1}{2}$ in., linear-oblong. *Calyx* $\frac{1}{2}$ - $\frac{3}{4}$ in., divided nearly to the base; segments linear, pubescent. *Corolla* symmetric, glabrous; cylindric base nearly as long as the ventricose portion; lobes rounded. *Stamens* included; filaments hairy towards the base. *Ovary* glandular at the apex, always 4-ovulate; style nearly glabrous. *Capsule* nearly $\frac{1}{2}$ in., 4-seeded. *Seeds* $\frac{1}{12}$ in. diam., discoid; numerous fine hairs near the margin, elastic when wet; areoles very large, glabrous.—This is only *S. scaber*, *Nees*, in so far as that includes *Ruellia scabra*, *Wall.*; *Nees'* description (purple flowers, &c.) is totally different. *S. scaber* only occurs in Ceylon as a cultivated plant, according to *Thwaites* and *Beddome*.

50. **S. phyllostachyus**, *Kurz in Journ. As. Soc.* 1871, pt. ii. 75; leaves elliptic or obovate acuminate scabrous, spikes dense often in close cymes, bracts large elliptic with a ligulate apex softly hairy, corolla $\frac{3}{4}$ -1 in. yellow somewhat hairy within. *S. crispus*, *T. Anders. in Journ. Linn. Soc.* ix. 467, not of *Blume*.

PEGU; *Kurz*. MOULMEIN; *Parish*. TENASSEIM; *Beddome*.

Herbaceous, 2-3 ft.; stems glabrate. *Leaves* 4-9 in.; petiole 2 in. *Spikes* nearly as of *S. scaber*; bracts 1 in., ligulate tips often recurved; bracteoles $\frac{3}{4}$ -1 in., linear. *Calyx* $\frac{1}{2}$ - $\frac{3}{4}$ in., divided nearly to the base; segments linear silky. *Corolla* nearly as of *S. scaber*. *Capsule* $\frac{1}{2}$ in., 4-seeded; seeds $\frac{1}{2}$ - $\frac{3}{4}$ in., thin, ovate, with dense long elastic hairs on all sides except the small areoles.—So like *S. scaber* (except the seeds) that it is difficult to distinguish it.

VAR. *dura*; leaves smaller bracts narrowed upwards without ligulate tip.—*Strobilanthes* sp. n. 14, *Herb. Ind. Or. H. f. & T.*—Chittagong; Seetakoond, *H. f. & T.* Rangoon; *M'Leelland*. *T. Anderson* refers this to *S. scaber* (in *Journ. Linn. Soc.* ix. 467), which the bracts resemble; he subsequently saw it was different, and wrote it up

as *S. durus*, *T. Anders. sp. nov.*; from the imperfectly ripe seeds it is either a var. of *S. phyllostachyus*, or a new species very closely allied to it.

51. ***S. fimbriatus***, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 180, not of *T. Anders. nor of Kurz*; leaves oblong acuminate at both ends glabrous lineolate on both surfaces, heads ovoid 1-3 together subsessile, bracts obovate-oblong acuminate inciso-serrate rufous hairy. *Ruellia fimbriata*, *Wall. Cat.* 2363.

KHASIA MTS.; *Wallich*.

Shrubby; branches glabrous. *Leaves* 4 by 1 in., denticulate; nerves 8 pair; petiole $\frac{3}{4}$ in. *Heads* $\frac{1}{2}$ -1 in., closely capitate, mostly on very short axillary spurs; bracts $\frac{3}{4}$ in., shortly acuminate, the innermost lanceolate, the outermost often subtruncate; bracteoles $\frac{1}{4}$ in., linear. *Corolla* $1\frac{1}{4}$ -1 $\frac{1}{2}$ in., glabrous without. *Capsule* $\frac{1}{2}$ -1 in., oblong, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, shaggy; areoles small.—*Nees'* account of the bracteoles is erroneous; and *T. Anderson* has taken for *fimbriatus* the remote *S. macrostegius*.

52. ***S. pectinatus***, *T. Anders. in Journ. Linn. Soc.* ix. 474; leaves elliptic acuminate at both ends hairy, heads short-peduncled subsolitary ellipsoid, bracts large ovate truncate or pectinate, corolla $1\frac{1}{2}$ -2 $\frac{1}{4}$ in. pale purple. *S. echinatus*, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 181. *Ruellia pectinata*, *Wall. Cat.* 2356.

SIKKIM and BHOTAN, alt. 6000-7500 ft., frequent; *Griffith*, &c. KHASIA and JAINTIA MTS., alt. 4000 ft., frequent; *Wallich*, &c.

A spreading shrub; often 10 ft. *Leaves* 5 by 2 $\frac{1}{4}$ in., serrate, usually thinly hairy, villous or submentose beneath; nerves 9 pair; petiole $\frac{1}{2}$ -1 in. *Heads* 1 in., hairy or hirsute; bracts $\frac{3}{4}$ -1 in., concave, green; bracteoles $\frac{3}{4}$ in., linear, widened upwards. *Calyx* $\frac{2}{3}$ - $\frac{3}{4}$ in., deeply divided; segments linear, glabrous, scarious. *Corolla* wide-funnel-shaped, nearly glabrous. *Filaments* and *pistil* sparsely puberulous. *Capsule* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Seeds* $\frac{1}{2}$ in., thin, ovate, mature shaggy with brown, somewhat deciduous, scarcely elastic hairs; areoles small.—From *Nees'* quotation (in *Wall. Pl. As. Rar.*) it is clear that he adopted the name *echinatus* from misreading *Wallich's* ticket.

VAR. *Daltoni*; brown-villous, leaves tubercular subrugose above, bracts serrulate.—*Darjeeling*; *J. D. H.*—Possibly a distinct species, but the examples are in early bud, and very near *S. pectinatus*.

53. ***S. Simonsii***, *T. Anders. in Journ. Linn. Soc.* ix. 474; leaves broadly lanceolate acuminate softly shortly hairy, heads ellipsoid elongate hairy, bracts elliptic apex produced crenate, bracteoles linear acuminate at both ends softly hairy. *Kurz For. Fl.* ii. 244.

ASSAM; Dewangiri Hills, *Simons*; Namroop in the Patkoye Mts., *Griffith* (*Herb. Propr.* n. 249). MARTABAN and TENASSERIM, in the tropical forests, *Kurz*.

A shrub; branches pubescent or viscous-hairy. *Leaves* 5 $\frac{1}{2}$ by 2 in., base cuneate, crenate, minutely lineolate above, more hairy (especially on the 7-8 pair of nerves); petiole $\frac{1}{2}$ in. *Heads* $1\frac{1}{4}$ by $\frac{1}{2}$ in., on very short quasi-peduncles, often 2-3 together; outer pair of bracts (of *T. Anderson*) leaf-like, sometimes like the true bracts; bract $1\frac{1}{4}$ in., softly shortly hairy; bracteoles 2, $\frac{3}{4}$ in., more acuminate than in the allied species. *Sepals* nearly as the bracteoles. *Corolla* 2 in. (*Anderson*), glabrous. *Capsule* glabrous, 4-seeded (*Anderson*).—*Anderson* apparently had better material than exist now at Kew; he says "buds yellow fide *Griffith*;" but it is more probable that the flowers are purplish: he certainly erred in reading "Kamroop" in Lower Assam (for Namroop).—It is not probable that a Patkoye Mt. plant should be common in the tropical Tenasserim forests: no example has been seen thence, but *Kurz's* description coincides with the Patkoye plant. He describes the flowers as blue.

54. ***S. glabratus***, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC.*

Prodr. xi. 183; leaves elliptic acuminate at both ends mature glabrate, heads ovoid peduncled pubescent or glabrate, bracts ovate or elliptic narrowed upwards concave entire. *T. Anders. in Journ. Linn. Soc.* ix. 474. *Ruellia*? glabrata, *Wall. Cat.* 2390.—*Acanthaceæ*, *Griff. Ic. Pl. As.* t. 425.

KHASIA and JAINTEA MTS., alt. 3–4000 ft.; *Wallich, Griffith, &c.*

A shrub, 3–4 ft., erect; branches pubescent, glabrate or with spreading fulvous hairs. *Leaves* 5 by $1\frac{1}{2}$ in., undulate, crenulate or nearly entire, raphides very obscure on either surface; nerves 7–9 pair; petiole scarcely $\frac{1}{4}$ in. *Peduncles* 1–3 in., often subcymose, quadrangular, slightly thickened upwards, fulvous pubescent or glabrate; heads $1\frac{1}{4}$ in., dense; bracts $1\frac{1}{2}$ in., coriaceous in fruit; bracteoles $\frac{3}{4}$ in., sublinear, scarious. *Sepals* resembling the bracteoles. *Corolla* 1 in., subsymmetric, glabrous (blue, *Nees*). *Capsule* $\frac{3}{4}$ in., broadly oblong, glabrous, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, shaggy with silky, dusky, subinelastic hair, except on the small areoles.—*Wallich's* examples are subglabrous, but others are very pubescent.—In *Griff. Notul.* iv. 145, the plate cited t. 425 is named *Phlogacanthus curviflorus*: there is some great blunder here, and the description is puzzling.

55. **S. Maingayi**, *Clarke*; leaves lanceolate acuminate at both ends somewhat pubescent, heads subsessile ovoid nearly glabrous, bracts ovate or elliptic large concave often crenate upwards glabrous.

MALAYA, probably Malacca or Penang; *Maingay* (*Kew Distrib.* n. 1182).

A shrub, apparently allied to *S. pectinatus* & *glabratus*; branches pubescent. *Leaves* 4 by 1 in., serrulate, puberous and interspersed with most minute raphides; nerves 8 pair, brown-pubescent beneath at least when young; petiole scarcely $\frac{1}{4}$ in. *Peduncles* 0– $\frac{1}{2}$ in., rusty-pubescent; heads 1 in.; bracts $\frac{3}{4}$ –1 in., outermost barren ovate, inner elliptic, usually with a few coarse crenations near the apex; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, glabrous. *Sepals* rather larger than, similar to, the bracts. *Corolla* $1\frac{1}{4}$ in. at least, glabrous.—No capsule nor expanded flowers seen. There are specimens (unnamed) from Sumatra which may be conspecific with this, but they have hairy heads.

56. **S. glomeratus**, *T. Anders. in Journ. Linn. Soc.* ix. 475; leaves ovate acute serrate hairy, heads ovoid subsessile hairy, bracts elliptic elongate or oblong entire or toothed, corolla $1\frac{1}{4}$ – $2\frac{1}{4}$ in. purplish glabrous. *Ruellia glomerata*, *Wall. Cat.* 2361. *Goldfussia glomerata*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 173; *Bot. Mag.* t. 3881; *Maund Botanist*, t. 155.

KHASIA MTS., alt. 1000–3500 ft., frequent; *Wallich, &c.* BRITISH BURMA, in the hills, *Brandis, Parish*.

A shrub, 2–6 ft.; branches hairy upwards, often horizontal with complanate foliage. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{2}$ in., base narrowed or rounded (often unequal), villous above, less so beneath; nerves 6 pair; petiole $\frac{1}{4}$ –1 in. *Heads* $1\frac{1}{2}$ in., often pseudo-axillary; bracts 1 by $\frac{1}{2}$ in., herbaceous, softly hairy, outermost pair usually serrate subfoliaceous, inner entire; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., linear-lanceolate. *Calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., divided nearly to the base; segments linear-oblong, in fruit nervose, membranous, subobtusate. *Corolla* subsymmetric; cylindric nearly as long as the ventricose part. *Filaments* and *pistil* sparsely hairy. *Capsule* $\frac{3}{4}$ in., broadly oblong, 4-seeded. *Seeds* $\frac{1}{2}$ in., densely silkily subinelastically hairy; areoles very small.—*T. Anderson* has placed this in his *Goldfussia* section, which has “the spikes naked in flower-time and bracts early deciduous;” but the outermost bracts, including the empty pair (floral leaves), are persistent when the capsule is dehiscent.

57. **S. Brandisii**, *T. Anders. in Journ. Linn. Soc.* ix. 475; leaves elliptic acuminate each end thinly hairy, heads obovoid softly densely white-hairy, bracts linear-spathulate, corolla $1\frac{1}{4}$ in. nearly glabrous.

PEGU; Karen Hills, *Kurz*; Tóngoo, alt. 4000 ft., *Brandis* (fide *T. Anderson*).

Stems slender, shrubby, pubescent or softly shaggy. *Leaves* 4 by 2 in., crenate, lineolate and sparsely slenderly bristly above, paler more glabrate beneath; nerves 6 pair; petiole $\frac{3}{4}$ in. *Heads* $\frac{3}{4}$ in., numerous, on axillary and terminal peduncles; bracts $\frac{3}{4}$ in., very narrow, outermost pair often more or less leaf-like, persistent; bracteoles $\frac{1}{4}$ in., linear. *Sepals* $\frac{1}{4}$ in. and upwards, linear, densely softly white-hairy. *Corolla* nearly straight and symmetric; cylindric part shorter than the ventricose, lobes ovate. *Stamens* glabrous (T. Anders.). *Capsule* $\frac{1}{4}$ in., oblong, glabrous, with a tuft of hairs at the apex, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, densely subinelastically silky; areoles very small.

58. **S. Falconeri**, *T. Anders. in Journ. Linn. Soc.* ix. 484; leaves ovate or elliptic acuminate hairy, heads small subsessile dense with long soft silvery bristles, bracts ovate hirsute herbaceous, corolla $\frac{1}{4}$ in. straight slightly hairy without. *S. Karensium*, *Kurz in Journ. As. Soc.* 1873, pt. ii. 94, *ex descr.*

MOULMEIN; *Falconer*. TENASSERIM; *Beddome*.

Stem tetragonous, ciliate with long, patent, weak, white hairs. *Leaves* 4 by $1\frac{1}{4}$ in., narrowed at both ends (upper ovate base obtuse), sparsely white-hairy on both surfaces, not lineolate; nerves 6 pair; petiole $\frac{2}{3}$ in. *Heads* $2\frac{1}{2}$ in., surrounded by leaves; bracteoles $\frac{1}{2}$ in., linear. *Calyx* deeply 5-partite; segments shorter than the bracteoles, linear, hirsute. *Corolla* $1\frac{1}{4}$ in., curved near the mouth, a little hairy without, deep blue; stamens included. *Capsule* tomentose at the apex. *Seeds* large, ovate, hirsute.—The species seems allied to *S. Brandisii*, but is remarkable by the copious long soft white bristles upon the flower-heads, which extend in less numbers to the leaves and stem.

** *Flowers strobilate.*

† *Seeds glabrous.* (Species of Ceylon and S. Deccan Peninsula.)

59. **S. vestitus**, *Nees in DC. Prodr.* xi. 180; hirsute, leaves rhomboid-elliptic acuminate, bracts ovate acuminate hirsute. *T. Anders. in Journ. Linn. Soc.* ix. 466; *Bedd. Ic. Pl. Ind. Or.* t. 260.

CEYLON, alt. 5-7000 ft.; *Walker, Thwaites*.

Herbaceous (fide *Beddome*); branches stout. *Leaves* $5\frac{1}{2}$ by $2\frac{3}{4}$ in., narrowed downwards, cuneate or shortly rounded on the petiole, serrulate, hirsute on both surfaces; nerves 7 pair; petiole $1\frac{1}{2}$ in. *Spikes* 1- $3\frac{1}{2}$ in.; bracts $\frac{3}{4}$ in., somewhat squarrose; bracteoles $\frac{1}{4}$ in., oblong. *Calyx* $\frac{1}{2}$ in. (in fruit $\frac{2}{3}$ in.), divided nearly to the base; segments lanceolate, shaggy with white or tawny hairs. *Corolla* $1\frac{1}{4}$ in., subsymmetric, glabrous; cylindric base short, broad. *Filaments* and *pistil* glabrous. *Capsule* $\frac{1}{2}$ - $\frac{2}{3}$ in., 4-seeded. *Seeds* $\frac{1}{4}$ in., thin, ovate, apiculate, glabrous; areoles very small, oblong.

60. **S. Hookeri**, *Nees in DC. Prodr.* xi. 185, *excl. Var. β*; leaves broadly lanceolate, base cuneate sparsely hairy or glabrate, bracts orbicular or ovate glabrous or slightly ciliate. *T. Anders. in Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 469; *Bedd. Ic. Pl. Ind.* t. 262.

CEYLON, alt. 7000 ft.; *Gardner, Thwaites, &c.*

A shrub, 5-6 ft., branches nearly glabrous. *Leaves* $5\frac{1}{2}$ by 2 in., acuminate, serrulate, upper surface with scattered weak hairs above or mature glabrous; nerves 8 pair; petiole 1 in. *Spikes* 1-3 in.; bracts 1 in., entire or minutely toothed, obtuse or subacute, white; bracteoles $\frac{1}{2}$ in., spatulate-oblong. *Calyx* $\frac{3}{4}$ in., divided nearly to the base; segments lanceolate, often setulose, white. *Corolla* $1\frac{1}{4}$ in., campanulate, subsymmetric, glabrous, white with purple streaks; cylindric base broad, very short. *Stamens* and *pistil* glabrous. *Capsule* $\frac{1}{2}$ in., frequently 2-seeded. *Seeds* $\frac{1}{4}$ in., very thin, ovate, apiculate, glabrous; areoles very small, oblong.—The colours are from a field note of Col. Walker. This is placed by T. Anderson in a section

far removed from *S. vestitus*; but it is so nearly allied that the specimens have been sometimes confounded by the best botanists.

61. ***S. calycinus***, *T. Anders. in Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 469; leaves elliptic acuminate at both ends hairy on both surfaces, bracts spathulate ovate obtuse glabrous or hairy. *Bedd. Ic. Pl. Ind. Or.* t. 209. *S. coloratus*, *Nees in DC. Prodr.* ix. 186, not of *T. Anders.*

CEYLON, alt. 5-7000 ft.; *Gardner, &c.*

A shrub, 4-6 ft., stem glabrous below, more or less hairy upwards. *Bracts* spathulate, often subpetioled, lower passing sometimes into leaves as shown in *Beddome's* figure. *Corolla* varying from green to a lurid reddish yellow. *Seeds* 4 to the capsule, scarcely $\frac{1}{2}$ in., obovate.—Otherwise as *S. Hookeri*, from which this species (which is *Nees' S. coloratus*) differs at sight by being a little more hairy. The *S. calycinus* var. β of *Nees* is founded on a sheet of 3 fragments, whereof 2 are *S. calycinus* *T. Anders.*, 1 is *S. Hookeri*.

VAR. ? parvifolia; leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. long, heads small 2-5-flid., corolla scarcely $\frac{3}{8}$ in., anthers subexserted. *S. calycinus*, *Nees in DC. Prodr.* ix. 469.—Ceylon; *Walker*.

62. ***S. laxus***, *T. Anders. in Thwaites Enum.* 228, and in *Journ. Linn. Soc.* ix. 469; leaves cordate ovate acuminate minutely scabrous-hairy or glabrate, bracts ovate or orbicular subentire glabrous or. ciliate. *Bedd. Ic. Pl. Ind. Or.* t. 223.

CEYLON; Hantani, alt. 4000 ft., *Thwaites*.

A shrub, 4-6 ft.; branches glabrate. *Leaves* 6 by $3\frac{1}{2}$ in., crenate or toothed; nerves 6 pair; petiole 2 in. *Spikes* 2-5 in., often in dense subsessile clusters on the old wood; bracts $\frac{1}{2}$ –1 in.; bracteoles $\frac{1}{2}$ in., linear-oblong. *Sepals* $\frac{1}{2}$ in. (or more in fruit), lanceolate or broadly lanceolate, ciliate. *Corolla* $\frac{3}{4}$ –1 in., glabrous except hairy lines within, orange-red; ventricose portion short, about as long as the contracted portion; lobes ovate, elongate, subacute, as described by *T. Anderson*, not well shown in *Beddome's* figure. *Stamens* and *pistil* glabrous. *Capsule* $\frac{1}{2}$ in., narrowly ellipsoid, 4-seeded. *Seeds* $\frac{1}{8}$ – $\frac{1}{2}$ in., thin, obovate or subquadrate, glabrous; areoles obsolete.—Easily distinguished from the allied Ceylon species by the broad decisively-cordate base of the leaves.

63. ***S. Andersonii***, *Bedd. in Trans. Linn. Soc.* xxv. 222, and *Ic. Pl. Ind. Or.* t. 208; leaves rhomboid-elliptic or ovate acuminate loosely villous on both surfaces, bracts elliptic obtuse glabrous ciliate. *T. Anders. in Journ. Linn. Soc.* ix. 469.

S. DECCAN; Anamallay Mts., alt. 6000 ft., *Beddome*.

A very large shrub up to 20 ft. (*Beddome*); branches hairy upwards. *Leaves* 7 by 4 in., rhomboid, base rounded or subcordate, crenulate; nerves 7 pair; petiole $1\frac{1}{2}$ in. *Spikes* 1–2 $\frac{1}{2}$ in., axillary, nodding; bracts $\frac{3}{4}$ in.; bracteoles $\frac{3}{8}$ in., linear-oblong. *Sepals* $\frac{3}{8}$ – $\frac{1}{2}$ in., linear-oblong, ciliate. *Corolla* $1\frac{1}{2}$ in., subcampanulate, contracted base very short, subsymmetric, glabrous except hairy lines within, pale-blueish. *Stamens* and *pistil* glabrous. *Capsule* not seen; but the species is doubtless closely allied to *S. calycinus*, as *Beddome* says, and the leaves still more resemble *S. vestitus*.

64. ***S. luridus***, *Wight Ic.* t. 1515–6; leaves ovate acuminate closely softly hairy on both surfaces, bracts large orbicular entire glabrous. *T. Anders. in Journ. Linn. Soc.* ix. 469.

NILGHERY MTS., alt. 3-5000 ft.; *Gardner, Wight, &c.* ANAMALLAY MTS. (fide *Beddome's* list).

Gregarious shrubs, 10-18 ft. high, often forming entire coppices, flowering every

spring from the old wood, often from near the ground. *Leaves* 6 by 3 in., tapering at the base, crenulate; nerves 9 pair; petiole $1\frac{1}{2}$ in. *Spikes* 3–11 in., often clustered, pendulous; bracts $\frac{3}{4}$ in., blackish-purple; bracteoles $\frac{3}{4}$ in., ligulate, minutely scabrous. *Calyx* $\frac{3}{4}$ in., divided nearly to the base; segments lanceolate, minutely scabrous. *Corolla* $1-1\frac{1}{2}$ in., glabrous except lines within, lurid purple, somewhat 2-lipped; ventricose portion short, longer than the contracted portion; lobes ovate. *Stamens* and *pistil* glabrous. *Capsule* $\frac{3}{4}$ in., usually 4-seeded. *Seeds* $\frac{1}{2}$ in., thin, obovate, obtuse, glabrous; areoles obsolete.

65. ***S. bolamputtensis***, *Bedd. Ic. Pl. Ind. Or.* t. 200; leaves ovate acuminate glabrous except few scattered minute bristles, bracts large orbicular serrate softly hairy afterwards glabrate.

S. DECCAN; Bolamputti Hills near Coimbatore, alt. 6000 ft., *Beddome*.

A shrub, 15 ft., flowering every year from the old wood; habit of *S. luridus*. *Leaves* 6 by 3 in., base attenuate, crenulate or toothed, lineolate, white-bristly sparsely on the surface above and on the 6–7 pair of nerves beneath; petiole $1\frac{1}{2}$ in. *Spikes* 2–4 in., very broad, from the old wood and also terminal; bracts $\frac{3}{4}-1\frac{1}{2}$ in. wide, obtuse; bracteoles $\frac{1}{2}$ in., narrowly oblong. *Sepals* $\frac{3}{4}$ in. (at least in fruit), broadly lanceolate, ciliate, somewhat white-bristly. *Corolla* 1 in., subcampanulate, glabrous, brown (*Beddome*); lobes short in *Beddome's* picture, appear longer more as of *S. luridus* in his example. *Stamens* and *pistil* glabrous. *Capsule* $\frac{3}{4}$ in., broadly oblong, 4-seeded. *Seeds* $\frac{1}{4}$ in., thin, subquadrate, glabrous; areoles obsolete.

†† *Seeds hairy* (where known).

66. ***S. callosus***, *Nees in Wall. Pl. As. Rar.* iii. 85 chiefly, and in *DC. Prodr.* xi. 185 chiefly; leaves elliptic acuminate at both ends sparsely hairy above glabrate beneath, bracts ovate or elliptic concave obtuse glabrous, bracteoles 0, capsule 2-seeded. *Dalz. & Gibs. Bomb. Fl.* 188; *T. Anders. in Journ. Linn. Soc.* ix. 469. *S. Grahamianus*, *Wight Ic.* t. 1520; *Dalz. & Gibs. Bomb. Fl.* 187; *T. Anders. in Journ. Linn. Soc.* ix. 469. *Ruellia callosa*, *Wall. Cat.* 2359.—*Strobilanthes* sp. n. 69, *Herb. Ind. Or. H. f. & T.*

BOMBAY GHATS and CENTRAL INDIA; *Graham, Dalzell, &c.*

A shrub, 6 ft.; branches glabrate, often warted or scabrous-tubercled. *Leaves* 7 by 3 in., sometimes much larger, crenate, conspicuously lineolate above; nerves 8–16 pair; petiole 2 in. *Spikes* 1–4 in., often densely or laxly cymose; bracts $\frac{1}{2}-1$ in., orbicular or elliptic. *Calyx* $\frac{1}{2}$ in., in fruit often exceeding $\frac{3}{4}$ in., lobed nearly to the base, segments oblong, obtuse, softly hairy. *Corolla* $1\frac{1}{2}$ in., subsymmetric, glabrous without, very hairy within, deep-blue (*Dalzell*); cylindric base as long as the ventricose portion. *Filaments* hairy downwards. *Pistil* glabrous. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}$ in. *Seeds* more than $\frac{1}{2}$ in. long, thin, obovate acute, densely shaggy with white adpressed inelastic hairs, except on the large oblong areoles.—As *Dalzell* says his *S. callosus* had the seeds “quite smooth,” it might be supposed that he considered the present plant *S. Grahamianus*, and called *S. Dalzellii*, *T. Anders.* his *S. callosus*; but a reference to his Herbarium and notes shows this was not so. He distinguished *S. Dalzellii* as a species, but proposes no name for it; while he (most erroneously) notes on his own excellent fruiting specimen of *S. callosus* that it differs from *S. Grahamianus* in having the seeds glabrous.

VAR. hispida; bracts copiously white-hispid.—Dasgown, in the Mahratta country, *Hove*.

67. ***S. zeylanicus***, *T. Anders. in Thwaites Enum.* 227, and in *Journ. Linn. Soc.* ix. 470; glabrescent, leaves ovate shortly acuminate at both ends, bracts ovate often with a ligulate apex, bracteoles about as long as the calyx. *Bedd. Ic. Pl. Ind. Or.* t. 224. *S. callosus*, *Nees in Wall. Pl. As. Rar.* iii. 85, and in *DC. Prodr.* xi. 185, the Ceylon material.

CEYLON; *Walker*; alt. 2000 ft., *Thwaites*.

A shrub, 3–5 ft. *Leaves* 7 by $3\frac{1}{2}$ in., crenate, lineolate on both surfaces; nerves 7 pair; petiole $1\frac{1}{2}$ in. *Spikes* quasi-peduncled, mostly solitary, sometimes 1 in. ovoid capitate, sometimes $2\frac{1}{2}$ in., distinctly densely strobiliform; bracts 1 in., entire or denticulate, the ligulate tip often squarrose sometimes closely reflexed in fruit, sometimes obsolete. *Calyx* $\frac{1}{2}$ in., divided more than half-way down; segments lanceolate, slightly hairy. *Corolla* $1\frac{1}{4}$ in., narrow, hairy, white (*T. Anderson*); linear-cylindric base shorter than the long urn-shaped upper part; lobes short. *Filaments* hairy towards the base. *Pistil* glabrous. *Capsule* not seen.—Evidently different from the Bombay *S. callosus*, but may not belong to this part of the series.

68. **S. asper**, *Wight Ic. t. 1518, not of Dene.*; thinly softly hairy, leaves ovate shortly acuminate at both ends, spikes in close panicles or subfasciculate, bracts oblong or ovate, base narrowed. *T. Anders. in Journ. Linn. Soc. ix. 466.*

MTS. of S. INDIA, alt. 5–8000 ft.; Nilgherries, Anamallays, Bababooduns, *Gardner, Wight, &c.* MALABAR GHATS; Concan, *Stocks*.

A shrub, 2–4 ft. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{4}$ in., crenate; nerves 7 pair; petiole $1\frac{1}{2}$ in. *Spikes* in flower 1– $1\frac{1}{2}$ in., oblong; in fruit 2–3 in., with bracts and calyces enlarged; thinly softly hairy, somewhat viscous; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in., often reddish; bracteoles $\frac{1}{4}$ in., linear. *Sepals* $\frac{1}{2}$ in., linear-lanceolate. *Corolla* $\frac{3}{4}$ in. (or in *Wight's* figure much larger), glabrous without, hairy within; linear-cylindric base about as long as the ventricose portion; limb somewhat oblique, segments short rounded. *Filaments* hairy towards the base. *Pistil* glabrous. *Capsule* $\frac{1}{2}$ in., oblong, 4-seeded. *Seeds* $\frac{1}{12}$ in., orbicular, elastically hairy; areoles prominent, round, glabrous.—The form of the bracts seems very variable; the typical Nilgherry plant has them broadly ovate; a Bababoodun example (reckoned by *Wight* distinct) has them linear-oblong; and there are a great number of intermediate forms.

69. **S. sessilis**, *Nees in Wall. Pl. As. Rar. iii. 85*, and in *DC. Prodr. xi. 177*; leaves sessile ovate acute hairy, spikes cylindric exactly strobiliform, bracts large ovate acute hairy, bracteoles 0, corolla $1\frac{1}{4}$ in. pale purple. *Bot. Mag. t. 3902*; *Wight Ill. t. 164 b*, fig. 4 (right-hand), and *Ic. t. 1511*; *T. Anders. in Journ. Linn. Soc. ix. 467.*

NILGHERRY MTS., alt. 6–8000 ft.; *Wight, &c.*, frequent. WYNAAD and TRAVANCORE; *Beddome*.

Stems 12–18 in., numerous, erect, little divided, from a woody perennial root, patently villous. *Leaves* $\frac{3}{4}$ – $1\frac{1}{2}$ in., base rounded or subcordate, crenate, softly villous on both surfaces. *Spikes* 1–2 in., short-peduncled, quasi-axillary and terminal; bracts $\frac{3}{4}$ in., softly hairy. *Sepals* $\frac{1}{2}$ in., lanceolate. *Corolla* nearly straight, subsymmetric, slightly hairy within and without; cylindric base nearly as long as the ventricose part; segments rounded. *Filaments* included; longer shaggy, shorter glabrous with much smaller anthers. *Ovary* glabrous, gland-bearing near the tip; style thinly hairy; ovules 4. *Capsule* not seen.

VAR. sessiloides (*Wight Ic. t. 1512*); leaves larger bristle-hirsute rugose, spikes larger, bracts (especially the upper) corolloid glabrate upwards, corolla rather larger more hairy both within and without. *S. sessiloides*, *Wight Ic. t. 1512, not of T. Anders.*—Nilgherries; *Wight*.—A very trifling variety (or mere form, *Beddome*) of *S. sessilis*.

VAR. Ritchiei; bristly without any soft hairs, leaves nearly glabrous beneath except the bristly nerves, bracts acuminate long-bristly. *S. sessiloides*, *Dalz & Gibs. Bomb. Fl. 187*; *T. Anders. in Journ. Linn. Soc. ix. 467, not of Wight.*—Malabar Ghats; near Bombay, *Dalzell*; Purwhar Ghat, *Ritchie*; Tulkut (perhaps i.e. Talikote), *Stocks*.—Noted by *Ritchie* as flowering only once in 7 years, but the woody root with annual undivided stems seems the same as in *S. sessilis*. *Stems* densely hispid with very long stout white bristles or glabrate. *Leaves* scabrous-hispid lineolate above, much more glabrous than in *S. sessilis*. *Bracts* and *spikes* with white or tawny bristles nearly $\frac{1}{4}$ in. long, sometimes dense sometimes few scattered.

70. **S. Dupeni**, *Beddome ms.*; leaves subcordate ovate acuminate bristly pubescent on both surfaces, spikes large oblong dense viscous slightly hairy, bracts 4-ranked large ovate obtuse adnate at base closely imbricate, capsule 4-seeded, seeds hairy.

ANAMALLAY MTS.; top of Neliamputti Ghat, *Beddome*.

A shrub. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{2}$ in., crenate, bristly above, chiefly on the 9 pair of nerves beneath; rachides small, obscure; petiole 1-2 in. *Spikes* $2\frac{1}{2}$ by $\frac{3}{4}$ in., appearing terminal on short axillary peduncles; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., coloured, nervose, very sticky; bracteoles small, lanceolate. *Calyx* $\frac{1}{2}$ in., deeply 5-lobed; linear green acumination of the segments longer than the short elliptic scarious base. *Corolla* large, blue. *Capsule* $\frac{1}{2}$ in., ellipsoid, sessile, glabrous. *Seeds* $\frac{1}{2}$ in. diam.; areolæ nearly half the diam. of the seed.

71. **S. auriculatus**, *Nees in Wall. Pl. As. Rar.* iii. 69, 86, t. 295, and in *DC. Prodr.* xi. 191; leaves sessile auriculate oblong or ovate acuminate hairy, spikes linear oblong closely velvety, bracts obovate obtuse, bracteoles 0. *T. Anders. in Journ. Linn. Soc.* ix. 472; *Bedd. Ic. Pl. Ind. Or.* t. 210. *S. amplexens*, *Nees in Wall. Cat.* 7158, and in *DC. Prodr.* xi. 191. *Ruellia auriculata*, *Wall Cat.* 2341.

CENTRAL INDIA, alt. 1-4000 ft., common; Behar; Jubbulpore to Chota Nagpore, *J. D. H., Beddome*, &c.—DISTRIB. Ava.

A shrub, 2-6 ft.; branches many divaricate often zigzag, quadrangular, glabrous, tips more or less hairy. *Leaves* often very unequal, sometimes one 10 by $2\frac{1}{2}$ in. oblong, the other 3 by $1\frac{1}{2}$ ovate, sometimes subequal, serrulate, sparsely hairy above; nerves (in the longer leaves) 10-13 pair, minutely hairy beneath. *Spikes* $3\frac{1}{2}$ by $\frac{1}{2}$ in., mostly terminal, solitary, quasi-peduncled; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., broader than long, very obtuse, apex often recurved in fruit. *Calyx* divided nearly to the base; segments $\frac{1}{4}$ - $\frac{1}{2}$ in., unequal, linear, obtuse, closely velvety. *Corolla* 1 in., curved, very slightly hairy, pale purple; cylindric base much shorter than the ventricose part; limb somewhat 2-lipped. *Stamens* and *pistil* nearly glabrous. *Capsule* $\frac{1}{2}$ in., glabrous, 4-seeded. *Seeds* scarcely $\frac{1}{2}$ in. thin, orbicular, elastically white-hairy; areoles very small.

VAR. *Edgeworthiana*; bracts with spreading white cilia $\frac{1}{2}$ in. long, sepals long white-ciliate at the tips. *S. Edgeworthiana*, *Nees in DC. Prodr.* xi. 190.—Subtropical Himalaya, alt. 500-2000 ft., from the Siwaliks (*Stewart*) to Sikkim (*Gamble*), frequent in the dry Terai. *Parasnath, Edgeworth.* Tenasserim; alt. 2000 ft., *Beddome*.—Distrib. Upper Burma.

VAR. *plumulosa*; leaves broadly elliptic, spikes short axillary subsessile densely white-ciliate. *S. plumulosus*, *Nees in Wall. Cat.* 7157, and in *Wall. Pl. As. Rar.* iii. 86, and in *DC. Prodr.* xi. 191.—Mts. of Prome; *Wallich*.—*Leaves* 8 by $3\frac{1}{2}$ in., subequal, spatulate to the widened auriculate base. *Spikes* 1-1 $\frac{1}{2}$ in.

VAR. *bracteolata*; leaves sessile auriculate oblong acuminate hairy, spikes linear-oblong ciliate, bracts obovate, bracteoles $\frac{1}{2}$ in. linear-spathulate.—Khasia Mts., alt. 5000 ft.; Nunklow and Myrung, *H. f. & T.*—Branches divaricate, hairy. *Leaves* unequal, the larger $4\frac{1}{2}$ by $\frac{3}{4}$ -1 in., serrate. *Spikes* 1-2 $\frac{1}{2}$ in., quasi-peduncled, mostly solitary; bracts $\frac{1}{2}$ in., less obtuse than those of *S. auriculatus*.

72. **S. Maclellandi**, *Clarke*; leaves large elliptic acuminate at both ends sparsely hairy, spikes linear, bracts obovate obtuse white hairy, bracteoles 0.

RANGOON; *McLelland*.

Branches stout, quadrangular, zigzag, hairy. *Leaves* 12 by $4\frac{1}{2}$ in., lower petioled, uppermost subsessile, none auricled; nerves 20 pair. *Spikes* 3 by $\frac{1}{4}$ in., slender, white, hairy, pendent mostly 3 together from short axillary peduncles.—This has been supposed a form of *S. auriculatus*, but the large many-nerved leaves and slender pendent spikes give it a different aspect: the capsule is rather larger, the seeds nearly the same as in *S. auriculatus*. It would appear distinct enough but for the subjoined variety.

VAR. ? *latipes*; leaves sessile suddenly narrowed subauriculate, bracts narrowly obovate.—Tenasserim; *Beddome*.—*Leaves* 13 by $4\frac{1}{2}$ in., primary nerves 20 on each side the midrib.

73. **S. Sabinianus**, *Nees in Wall. Pl. As. Rar.* iii. 86, and in *DC. Prodr.* xi. 190; leaves petioled broadly elliptic shortly acuminate at both ends nearly entire uppermost often sessile cordate, spikes linear pubescent often interrupted towards the base, bracts obovate obtuse, sepals oblong minutely pubescent. *T. Anders. in Journ. Linn. Soc.* ix. 472. *Ruellia Sabiniana*, *Wall. Cat.* 2338; *Bot. Reg.* t. 1238; *Reichb. Exot.* t. 210. *R. argentea*, *Wall. Cat.* 2339.

NEPAL; *Wallich*. KHASIA MTS., alt. 1–4000 ft., frequent; *Wallich*, &c.

A shrub, 2–5 ft.; branches glabrous. *Leaves* $6\frac{1}{2}$ by 3 in., undulate, subrenate, lineolate, minutely setulose above, glabrate or obscurely pubescent beneath; upper leaves often unequal dissimilar, one of each pair smaller sessile cordate. *Spikes* 2–4 in., quasi-peduncled, mostly solitary; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., oblong. *Sepals* scarious, minutely glandular-pilose, obscurely oblanceolate not spatulate. *Corolla* $1\frac{1}{4}$ in., curved, much ventricose nearly glabrous, lavender-coloured, contracted base short. *Filaments* glabrous. *Capsule* scarcely $\frac{1}{2}$ in., pubescent, 4-seeded. *Seeds* $\frac{1}{2}$ in., much compressed, orbicular; when wet the fine white hairs spring out abundantly; areoles nearly half the diam. of the seed, glabrous.—The figures *Bot. Mag.* t. 3517 and *Lodd. Bot. Mag.* t. 1712, adduced for this species by Nees and T. Anderson, show the uppermost leaves petioled much acuminate at the base. Some examples of *S. Sabinianus* have the spike much interrupted, and the species might be placed in the next section. *Wallich* notes, in the Nepal example named *R. argentea*, that the flowers were white.

74. **S. tamburensis**, *Clarke*; leaves ovate shortly acuminate serrate, spikes linear interrupted towards the base ciliate subhirsute, bracts ovate, sepals spatulate ciliate.

E. NEPAL; at the Tambur River, alt. 4–5000 ft., *J. D. H.*

Capsule upwards of $\frac{1}{2}$ in., 4-seeded. *Seeds* $\frac{1}{2}$ in., much compressed, orbicular in outline, covered all over with short inelastic hairs; areoles 0. The general habit and corolla as of *S. Sabinianus*, but the serrate leaves, subhirsute spike, and seeds will not match.

75. **S. nutans**, *T. Anders. in Journ. Linn. Soc.* ix. 475; leaves ovate or broadly elliptic acuminate serrate hairy, spikes ellipsoid or oblong very dense glabrous, bracts large elliptic concave. *Ruellia strobilina*, *Wall. Cat.* 2362. *R. hirta*, *Don Prodr.* 119. *Goldfussia nutans*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 174.

NEPAL; *Wallich*.

A shrub, 1–2 ft.; branches hairy. *Leaves* 3 by $1\frac{1}{2}$ in., base attenuate or rounded, with scattered hairs on both surfaces, not lineolate; nerves 7 pair; petiole $\frac{1}{4}$ –1 in. *Peduncles* $\frac{1}{2}$ – $1\frac{1}{2}$ in., divaricate or deflexed, hairy; spikes 1 – $1\frac{1}{2}$ by $\frac{2}{3}$ in.; bracts $\frac{1}{2}$ in., subacute; bracteoles $\frac{1}{2}$ in., oblong. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., divided nearly to the base, segments linear glabrous. *Corolla* 1 – $1\frac{1}{4}$ in., curved; ventricose part longer than the contracted base. *Capsule* not seen; and the place of the species is dubious; the spike resembles that of some of the strictly strobiliform Malabar species; Nees says the bracts are deciduous, but they cannot be so till long after flower.

76. **S. acrocephalus**, *T. Anders. in Journ. Linn. Soc.* ix. 473; leaves ovate acute crenate hirsute, spikes peduncled solitary linear-cylindric dense hairy, bracts ovate, seeds puberulous subglabrate. *Adenosma affinis*, *Griff. Notul.* iv. 133.

KHASIA MTS., alt. 4–5000 ft., plentiful in the northern half, *Griffith, H. f. & T.*, &c.

Shrubby, 1-2 ft., branching; stems hirsute. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{2}$ in., base obtuse or rounded, densely minutely lineolate above; nerves 7-8 pair; petiole $\frac{3}{8}$ in. *Peduncles* 1-4 in., hirsute; bracts $\frac{1}{2}$ - $\frac{1}{2}$ in., obtuse or scarcely acute, closely strobilate; bracteoles $\frac{1}{2}$ in., spatulate-oblong. *Calyx* $\frac{1}{2}$ in., divided $\frac{3}{8}$ the way down; segments narrowly oblong, obtuse, hairy. *Corolla* 1 in., curved, glabrous without, purplish; cylindric base scarcely so long as the ventricose portion; limb somewhat 2-lipped. *Stamens* glabrous. *Ovary* hirsute at the apex, style sparsely hairy. *Capsule* $\frac{1}{2}$ in., hairy, 4-seeded. *Seeds* $\frac{1}{16}$ in., orbicular, distinctly pubescent when young, mature subglabrous, the base of the short hairs only remaining; areoles 0.—A species not very closely allied to any other in the genus.

77. **S. imbricatus**, *Nees in Wall. Pl. As. Rar.* iii. 86, and *Cat.* 7156, and in *DC. Prodr.* xi. 186; leaves spatulate elliptic acute sparsely hairy on both surfaces, spikes cylindric strobiliform in axillary quasi-panicles, corolla very small, placentæ rising elastically from the bottom of the dehiscent capsule. *T. Anders. in Journ. Linn. Soc.* ix. 473. *S. pterocaulis*, *Kurz in Journ. As. Soc.* 1873, pt. ii. 93.

PEGU and TENASSERIM; *Helfer, M. Lelland, Kurz.*—DISTRIB. Ava.

An annual herb fide Kurz, but the examples have all the appearance of the other perennial species; stems stout, sharply quadrangular, hirsute or glabrate. *Leaves* attaining $12\frac{1}{2}$ by 5 in. (or the upper much smaller 2 by 1 in.), crenate or toothed, lineolate on the upper surface; nerves (in the larger leaves) 15 or more pair; petiole very short owing to the long-decurrent leaf-base. *Spikes* $1\frac{1}{2}$ in., mostly 5-11 in lax hirsute axillary panicles; leaves at the trichotomous divisions scarcely $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ in., obovate-oblong, hirsute towards the apex; bracteoles $\frac{1}{2}$ in., linear-spatulate. *Sepals* $\frac{1}{4}$ in., linear, obtuse, hirsute at the tips. *Corolla* $\frac{1}{2}$ in., subcampanulate, violet ex *Nees*, yellow ex *Kurz*. *Capsule* $\frac{1}{2}$ in., hairy at the tip, 4-seeded. *Seeds* $\frac{1}{16}$ in., orbicular, hairy; areoles nearly half the diam. of the seed, glabrous.—The spikes in fruit are like those of *Rungia*. *Wallich's* specimens from Ava have much smaller leaves than the Pegu examples.

78. **S. longipes**, *Clarke*; leaves elliptic acuminate at each end subentire pubescent or glabrate, spikes oblong hairy or glandular-puberulous, bracts narrowly obovate obtuse or emarginate, calyx nearly equally sub-5-partite segments linear-spatulate obtuse, corolla $1\frac{3}{4}$ in. *S. acuminatus*, *T. Anders. in Journ. Linn. Soc.* ix. 478, chiefly (not *Adenacanthus acuminatus*, *Nees*).

TENASSERIM; *Helfer* (*Herb. Propr.* n. 304, *Kew Distrib.* n. 6114); *Mooleyit, Beddome*.

Branches slender. *Leaves* 6 by $2\frac{1}{2}$ in., obscurely toothed, raphides conspicuous in the lower paler surfaces, embedded obscure in the upper; nerves 8 pair; petiole $\frac{1}{4}$ in. *Spikes* 1- $2\frac{1}{2}$ in., clavate-oblong, continuous; bracts $\frac{1}{2}$ - $\frac{1}{2}$ in., lower deciduous in fruit; bracteoles $\frac{1}{2}$ in., linear-obovate. *Calyx* $\frac{1}{2}$ in. and upwards; segments distinctly wider at the tips. *Corolla* nearly straight, puberulous; ventricose portion nearly 1 in., linear portion $\frac{1}{2}$ in.; lobes rounded, subequal. *Capsule* $\frac{1}{2}$ in., pubescent at the tip, 4-seeded. *Seeds* $\frac{1}{16}$ in., ovoid, inelastically shaggy; areoles subobsolete.—*Kurz* has founded his *S. subflaccidus* on *Helfer's* plant (*Kew*, n. 6114), but, as he says the calyx is 2-lipped with the upper lip three-lobed only $\frac{1}{2}$ the way down, it is clear that his *S. subflaccidus* cannot be this plant; there may have been some error in distribution, or *Kurz* may have relied on *T. Anderson's* reduction of this n. 6114 under *Adenacanthus*, *Nees*.

79. **S. subcapitatus**, *Clarke*; leaves elliptic acuminate subentire glabrous, spikes ellipsoid or subovoid small laxly peduncled, bracts elliptic concave or obovate minutely ciliate-pubescent.

TENASSERIM; *Helfer* (*Kew Distrib.* n. 6111).

Shrubby; branches slender, quadrangular, glabrous. *Leaves* 4 by $1\frac{1}{2}$ in., base

attenuate or obtuse, conspicuously lineolate above, obscurely so beneath; nerves 6 pair; petiole $\frac{1}{4}$ in. *Peduncles* 2-4 in., slender, quadrangular, glabrous, numerous, axillary, often divided, sometimes bearing reduced caducous leaves; bracts $\frac{1}{2}$ in., rounded at the tip, densely lineolate; bracteoles $\frac{1}{2}$ in., linear-obovate, densely lineolate. *Calyx* $\frac{1}{4}$ in., divided subequally nearly to the base; segments linear-spathulate, minutely ciliate. *Corolla* not seen. *Capsule* $\frac{1}{2}$ in., pubescent at the tip, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, densely shaggy; areoles small.—Seems very nearly allied to *S. subflaccidus*, Kurz; but the spikes are in general so much shortened that it might be looked for among the capitate series. As in *S. subflaccidus*, the fruiting spikes have the upper bracts, but some of the lower fallen.

*** *Spikes elongate more or less interrupted, or flowers nearly all distant but mostly opposite.*—(Seeds in all hairy.)

80. **S. Helferi**, *T. Anders. in Journ. Linn. Soc.* ix. 472; leaves ovate acuminate rounded or subcordate at the base nearly glabrous, spikes simple elongate lax submentose, flowers distant opposite, bracts broadly obovate obtuse, corolla $1\frac{1}{4}$ - $1\frac{1}{2}$ in.

TENASSERIM, "Three Pagodas," *Helper* (Kew Distrib. n. 6117).

Branches divaricate, somewhat zigzag, terete, pubescent upwards. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., crenate, puberulous and lineolate above, subpubescent on the 7 pair of nerves beneath; petiole 1 in. *Spikes* axillary, short-peduncled, solitary, opposite, 2-5 in.; flowers nearly all paired and distant; bract 1 to each flower, $\frac{1}{2}$ in., densely minutely fuscous-pubescent, ciliate, apex $\frac{1}{2}$ in. broad green patent or reflexed; bracteoles 0. *Calyx* $\frac{1}{2}$ in., equally sub-5-partite; segments linear-ligulate, pubescent, subobtusate. *Corolla* nearly glabrous, straight; cylindric base twice as long as the calyx. *Capsule* $\frac{1}{4}$ in. *Seeds* $\frac{1}{2}$ in., orbicular, dusky pubescent; areoles small.—T. Anderson errs in saying "corolla small;" the buds, which appear on the point of expansion, are scarcely $\frac{1}{2}$ in. long; but there is one fully expanded flower overlooked by T. Anderson, which is (dry) nearly $1\frac{1}{2}$ in.

81. **S. macrostegius**, *Clarke*; leaves elliptic acuminate subentire nearly glabrous, spikes axillary sessile lax scarcely interrupted, bracts obovate suddenly linear-acuminate, capsule and seeds large. *S. fimbriatus*, *T. Anders. in Journ. Linn. Soc.* ix. 470 partly, not of *Nees*. *Endopogon macrostegius*, *Nees in DC. Prodr.* xi. 470.

ASSAM and KHASIA MTS.; *Griffith*. CHITTAGONG; *Kasalong, Clarke*.

A straggling, inelegant shrub, 2-5 ft.; branches terete, pubescent upwards or nearly glabrous. *Leaves* 6 by $2\frac{1}{4}$ in., base cuneate, lineolate above, obscurely so beneath, minutely pubescent on the 9 pair of nerves beneath; petiole $1\frac{1}{2}$ in. *Spikes* 2-5 in., with 6-8 flowers in opposite pairs; bracts $\frac{3}{4}$ -1 in., including the linear acumen $\frac{1}{2}$ in. long, pubescent, or in *Griffith's* examples subglabrous; bracteoles $\frac{3}{4}$ in., linear-oblancoate cuspidate, fulvous-pubescent upwards. *Sepals* in fruit similar to the bracteoles. *Corolla* not seen. *Ovary* glabrous, a dense fulvous tuft of hairs at the apex. *Capsule* 1 in., oblong, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, shaggy; areoles obsolete.—Probably *S. fimbriatus*, Kurz (*For. Fl.* ii. 244), from the forests of the Pegu Yomah and Tenasserim, the bracts of which Kurz says are entire, so that it could not have been *Nees' S. fimbriatus*.

82. **S. polythrix**, *T. Anders. in Journ. Linn. Soc.* ix. 470; leaves elliptic acuminate rufous-ciliate, spikes axillary subseßile continuous very rufous-ciliate, bracts 1 - $1\frac{1}{2}$ in. linear-lanceolate.

KHASIA MTS.; *Herb. Kew* and *Herb. Calc.*

A shrub; branches terete, with patent long rufous hairs. *Leaves* $6\frac{1}{2}$ by $2\frac{1}{2}$ in., base attenuate or subobtusate, remotely serrate, mature with few scattered long rufous hairs; nerves 9 pair; petiole 1 in. *Spikes* 2-4 in., rufous hairs $\frac{1}{4}$ in. long, slender, patent; bracteoles $\frac{3}{4}$ in., linear, green, rufous-ciliate. *Calyx* in fruit nearly 1 in.,

divided nearly to the base; segments linear-lanceolate, scarious below, rufous-ciliate upwards. *Corolla* not seen. *Capsule* $\frac{3}{4}$ in., linear-oblong, glabrous, tip minutely rufous-hairy, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, silky; areoles hardly any.

83. **S. Brunonianus**, *Nees in Wall. Pl. As. Rar.* iii. 87, and in *DC Prodr.* xi. 188; leaves lanceolate attenuate at both ends nearly glabrous, spikes subpaniculate linear, bracts oblong, sepals linear oblong fulvous hirsute, corolla $\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 472. *S. petiolaris*, *Nees in DC. Prodr.* xi. 189, partly. *Ruellia Brunoniana*, *Wall. Cat.* 2368.

KHASIA MTS., alt. 2-4000 ft., common, *Wallich*, &c.; lower hills of ASSAM, JAINTEA, and NAGAS country.

An erect, dense, annually-flowering shrub, 2-3 ft. *Leaves* 4 by $\frac{1}{2}$ in. subentire in *Wallich's*, often broader, sometimes 2 by $\frac{3}{4}$ in. crenate nearly to the base, base always gradually attenuated; nerves 8 pair, often obscure; petiole $\frac{1}{2}$ in., often narrowly winged. *Spikes* 1-4 in., usually very numerous, dense but often interrupted towards the base, erect; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., spatulate-oblong, obtuse, apex recurved or the lowest ovate narrowed upwards, subglabrous in *Wallich's* specimens, often fulvous-hirsute; bracteoles $\frac{1}{2}$ in., oblong, erect. *Sepals* $\frac{1}{2}$ in. *Corolla* curved, pubescent without in the bud, lavender or white, cylindric base shorter than the much-ventricose upper part. *Stamens* glabrous, more monadelphous than usual. *Capsule* $\frac{1}{2}$ in., oblong, pubescent, 4-seeded. *Seeds* $\frac{1}{10}$ in., orbicular, pubescent; areoles 0.—*S. petiolaris*, *Nees*, is founded on two plants collected by Griffith, one in Khasia, one in Assam, which are both preserved at Kew, authenticated in *Nees' hand*; of these the Khasia one is identically *S. Brunonianus*, *Nees*, the other is taken as *S. petiolaris* below.

84. **S. maculatus**, *Nees in DC. Prodr.* xi. 190; leaves ovate (upper elliptic) acuminate at both ends nearly glabrous, spikes erect linear sub-interrupted at the base compound hairy, bracts oblong or cuneate-oblong, corolla scarcely $\frac{3}{4}$ in. ventricose. *Ruellia maculata*, *Wall. Pl. As. Rar.* iii. 33, t. 250.

KHASIA MTS., alt. 1-3000 ft., frequent, *Clarke*.

Shrub, 2-4 ft., lax. *Leaves* 5 by $2\frac{1}{2}$ - $3\frac{1}{2}$ in. (upper 5 by $1\frac{1}{2}$ -2 in.), serrate, mature glabrous or obscurely scabrid-puberulous on the nerves beneath, densely lineolate on the upper surface, often beautifully blotched with white when fresh, and as often uniformly green; nerves 10-11 pair; petiole $1\frac{1}{2}$ in. *Spikes* 1-3 in., forming lateral and terminal cymes or panicles, the uppermost leaves being small, caducous; bracts $\frac{1}{2}$ by $\frac{1}{8}$ in., linear-oblong (in the most characteristic form), but vary to cuneate-oblong bracteoles $\frac{1}{2}$ in., linear-oblong. *Calyx* $\frac{1}{4}$ - $\frac{1}{2}$ in., sub-5-partite; segments linear-oblong, unequal, subobtusely hairy. *Corolla* slightly curved, nearly glabrous, pale blue or lavender, cylindric base nearly as long as the greatly ventricose upper portion; limb subequal, segments short round reflexed. *Stamens* glabrous, monadelphous, exactly as in *S. Brunonianus*. *Capsule* $\frac{1}{2}$ in., oblong, pubescent, 4-seeded. *Seeds* $\frac{1}{10}$ - $\frac{1}{12}$ in. diam., orbicular, shaggy with long hairs; areoles rather small.—This was sent to *Wallich* from Silhet; it is common along the lower Khasia range 20 miles N. of Silhet. *Wallich's* picture, from a cultivated plant, shows the flowers larger than in any of the wild specimens seen; his statement that the species differs essentially from *S. monadelphus* by having the "filaments free at base" is altogether misleading; *Nees* perhaps went entirely on the somewhat coarse picture in *Wall. Pl. As. Rar.*

85. **S. monadelphus**, *Nees in Wall. Cat.* 7159, and in *Wall. Pl. As. Rar.* iii. 87, and in *DC. Prodr.* xi. 188; leaves ovate acuminate at both ends pubescent on the nerves beneath, spikes erect linear panicle very hairy, bracts ovate often squarrose, corolla scarcely $\frac{3}{4}$ in. ventricose.

KHASIA and JAINTEA MTS., alt. 3-5000 ft., frequent; *Wallich*, &c.

A rather rigid shrub, 2-3 ft.; branches often scabrous, hairy, quadrangular. *Leaves* $3\frac{1}{2}$ by 2 in., serrate, mature usually more or less hairy on both surfaces, not known to

occur blotched; nerves 9–11 pair. *Inflorescence* and *flowers* as of *S. maculatus*, but the bracts usually $\frac{1}{2}$ – $\frac{1}{4}$ in. wide towards their base. *Seeds* $\frac{1}{10}$ in. diam., pubescent.—Certainly closely allied to *S. maculatus*, and may be a high-level hairy form of it, as T. Anderson supposed; but besides the difference in the bracts fixed on by Nees the seeds are about double the diam., much more shortly dusky hairy.

86. ***S. petiolaris***, *Nees in DC. Prodr.* xi. 189, *in part*; leaves ovate acuminate at both ends mature nearly glabrous, spikes linear panicle hairy, bracts obovate-spathulate, corolla $1\frac{1}{4}$ in. ventricose. *S. maculatus*, T. Anders. in *Journ. Linn. Soc.* ix. 473, *chiefly*.

SIKKIM and BHOTAN, alt. 3–10,000 ft., common; Griffith, T. Anderson, &c. ASSAM; Griffith.

A lax shrub, perhaps not specifically distinct from *S. maculatus*; the leaves are often spotted as on it, the small seeds are similar; but the bracts are much broader (as Nees states), and the corolla is much larger, usually purplish or even rose instead of lavender blue; nerves 7 pair, i. e. much more distant than in *S. maculatus* & *monadelphus*. The species reaches a very high level, the Alpine specimens being smaller with smaller leaves but equally large flowers.

VAR. *tubiflos*; spikes divaricate densely glandular-hairy, corolla (unexpanded) more than 1 in. the ventricose portion scarcely $\frac{1}{2}$ in. diam.—Mishmee; Dailoo, Griffith (Kew Distrib. nn. 6095, 6103).—"Corolla deep blue; bracts lead-coloured" (Griffith's field-note).—This is very possibly a distinct species, though it must be closely allied to *S. petiolaris*; but it is very dangerous to assume the shape of the corolla from buds in this genus.

87. ***S. perfoliatus***, T. Anders. in *Journ. Linn. Soc.* ix. 471; leaves sessile lanceolate or elliptic much acuminate at both ends glabrous, spikes axillary cymose lax subcontinuous very viscid ciliate, bracts oblong linear-acuminate, capsule clavate 2-seeded. *Endopogon integrifolius*, Dalz. in *Hook. Kew Journ.* ii. 342; Dalz. & Gibs. *Romb. Fl.* 185. *Leptacanthus alatus*, *Wight Ic.* t. 1527.

W. DECCAN PENINSULA; Concan, Canara, Coorg, Law, Dalzell, &c.

Shrubby, nearly glabrous except the spikes. *Leaves* attaining 15 by $4\frac{1}{2}$ in., more often 6 by $1\frac{1}{4}$ – $2\frac{1}{2}$ in., very variable in size and in width, sparingly toothed, lineolate above; nerves 6–12 pair; petiole winged to the base, there dilated, auriculate, sometimes subdecurrent, never perfoliate. *Spikes* 2–5 in., closely cymed (or solitary) on very short axillary peduncles, very open, hardly interrupted even at the base in fruit; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ in., linear. *Calyx* $\frac{1}{2}$ – $\frac{1}{3}$ in. (elongate in fruit), divided nearly to the base, segments linear. *Corolla* $1\frac{1}{4}$ in., straight, glabrous without, hairy within; cylindric base of the tube nearly as long as the ventricose part. *Stamens* included; longer filaments glabrous. *Ovary* glabrous, style thinly hairy. *Capsule* $\frac{1}{4}$ – $\frac{1}{2}$ in., compressed. *Seeds* $\frac{1}{6}$ in., ovate, shaggy; areoles hardly any.

88. ***S. glutinosus***, *Nees in Wall. Pl. As. Rar.* iii. 86, and in *DC. Prodr.* xi. 194; viscous hairy, leaves ovate acute, spikes short, lowest bracts leaf-like upper obovate or oblong shorter than the calyx, corolla 2 in. T. Anders. in *Journ. Linn. Soc.* ix. 476. *Ruellia glutinosa*, Wall. *Cat.* 2350. *R. Jacquemontiana*, *Nees in DC. Prodr.* xi. 145.

KASHMIR, GURWHAL, KUMAON and NEPAL; Wallich, Jacquemont, &c.

A shrub, 2–5 ft.; branches villous. *Leaves* 3 by $1\frac{1}{2}$ in., base cuneate or rounded, crenate, villous on both surfaces; nerves 5–6 pair; petiole $\frac{1}{4}$ – $\frac{3}{8}$ in. *Spikes* densely capitate, or more often the lowest flowers are remote, solitary, opposite in the axils of bract-like leaves; bract $\frac{1}{4}$ – $\frac{1}{2}$ in., ovate, subfoliaceous, persistent; bracteoles $\frac{1}{2}$ in., oblong. *Calyx* $\frac{1}{2}$ – $\frac{1}{3}$ in., divided nearly to the base; segments linear, obtuse, viscous hairy. *Corolla* nearly glabrous; linear-cylindric base nearly as long as the ventricose part. *Stamens* glabrous. *Capsule* $\frac{3}{4}$ in., viscous-pubescent, 4-seeded.

Seeds $\frac{1}{8}$ – $\frac{1}{6}$ in., ovate, shaggy; areoles hardly any.—In spite of the enormous differences in the capsule and seeds, this plant has been much mixed with *Echmanthera tomentosa*.

Series B. *Nudata*. *Bracts* caducous, often before the flowers expand. *Flowers* clustered or in distant mostly opposite pairs; not most of them scattered alternate. *Seeds* in all hairy.—(All, except *S. Newii* from N. India or Malay Peninsula.)

* *Heads even in fruit capitate or ovate, not interrupted below.*

89. **S. geniculatus**, Clarke; nearly glabrous, leaves elliptic acuminate serrate, heads 2–3-fld., bracts large ovate acuminate caducous, bracteoles 0. *S. gracilis*, T. Anders. in Journ. Linn. Soc. ix. 474, not of Beddome.

MISHMEE; Griffith (Kew Distrib. n. 6116).

A small shrub; branches slender, somewhat zigzag. *Leaves* 5 by $1\frac{1}{2}$ in., base cuneate or rhomboid, serrulate, upper surface dense with raphides; nerves 6–7 pair; petiole $\frac{1}{2}$ in. *Peduncles* 1–3 in., with a node carrying two reduced caducous leaves at the middle, these geniculate and sometimes divided; heads $\frac{3}{4}$ in., 2–4 outer bract-like leaves barren, early caducous; bract $\frac{3}{4}$ by $\frac{1}{2}$ in., lineolate. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., divided nearly to the base; segments linear, unequal, obtuse, glandular. *Corolla* $1\frac{1}{4}$ in., glabrous, purple. *Capsule* $\frac{3}{4}$ in., clavate, 4-seeded, glandular-pubescent. *Seeds* $\frac{1}{10}$ in., ovate, shaggy; areoles small.—Each flower is subtended by one bract, and there are 2–4 outer empty similar bracts; before the expansion of the corolla all the bracts but 1 or 2 of the uppermost fall, and these disappear before fruit.

VAR. *integra*; leaves nearly entire, sepals in fruit nearly $\frac{1}{2}$ in. hairy.—Khasia Mts.; Clarke. *Leaves* 5 by $2\frac{1}{4}$ in., subovate; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Seeds* $\frac{1}{8}$ in. and upwards.—Probably merely the fully-developed state of *S. geniculatus*, which Griffith collected in a colder country.

90. **S. capitatus**, T. Anders. in Journ. Linn. Soc. ix. 475; leaves ovate acuminate at each end nearly glabrous, bracts elliptic-oblong herbaceous pubescent as long as the calyx, bracteoles half as long as the calyx, corolla $1\frac{1}{2}$ –2 in. deep blue. *Ruellia capitata*, Wall. Cat. 2351, partly; Don Prodr. 120. *Goldfussia capitata*, Nees in Wall. Pl. As. Rar. iii. 88, and in DC. Prodr. xi. 173. *G. biceps*, Nees in Wall. Cat. 7161; and in Wall. Pl. As. Rar. iii. 88, and in DC. Prodr. xi. 172.—Acanthacea sp. Griff. Itin. Notes, 116, n. 213.

SUBTROPICAL HIMALAYA, alt. 1–5000 ft., from NEPAL to BHOTAN, common; Wallich, Griffith, H. f. & T., &c. PEGU; Karen Hills (fide T. Anderson).—DISTRIB. Ava.

A shrub, 1–3 ft. *Leaves* 6 by $2\frac{3}{4}$ in., serrate, obscurely lineolate above, minutely hairy on the nerves beneath; nerves 6–7 pair; petiole $1\frac{1}{2}$ in. *Peduncles* usually short, $\frac{1}{2}$ –1 in., sometimes 2–4 in., glabrous or pubescent. *Heads* 1 in. diam., closely capitate even in fruit, many-fld., outer empty bracts sometimes long leaf-like, sometimes hardly half so long as the heads, caducous; bracts proper to each flower elongate upwards, closely adpressedly softly white pubescent; bracteoles $\frac{1}{4}$ – $\frac{1}{2}$ in., ligulate, herbaceous, pubescent, caducous in fruit. *Calyx* $\frac{1}{2}$ in., deeply divided but connate into a hardened short tube at the base; segments narrowly lanceolate, softly hairy even in fruit. *Corolla* curved, tubular-ventricose, nearly glabrous. *Stamens* glabrous. *Ovary* glandular; style thinly patent hairy. *Capsule* $\frac{1}{2}$ in., slightly clavate, pubescent, 4-seeded. *Seeds* $\frac{1}{8}$ – $\frac{1}{6}$ in., ovate, shaggy; areoles small.

VAR. *nitida*; heads larger shining glabrate in fruit, bracteoles nearly as long as the calyx obovate-oblong glabrous fimbriate in fruit.—Khasia Mts.; Mousto, alt. 2500 ft., Clarke.—*Bracts* and *bracteoles* shining scarious in fruit from a short green base. *Seeds* $\frac{1}{2}$ in., densely silky.

91. **S. quadrangularis**, *Clarke*; leaves large subsessile broadly elliptic acuminate at both ends serrate minutely hairy, heads ovoid peduncled, bracts large ovate acute grey pubescent caducous, corolla $1\frac{1}{2}$ in. pubescent without. *Ruellia quadrangularis*, *Wall. Cat.* 2358. *R. bracteata*, *Wall. Cat.* 2357 b only. *Goldfussia bracteata*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 173.

NEPAL; *Wallich*. KUMAON; Mohargari, alt. 6500 ft., and Kalamundi, alt. 8500 ft., *Strachey & Winterbottom*.

Stem 2 ft., herbaceous, acutely quadrangular, somewhat pubescent upwards. *Leaves* 8 by $3\frac{1}{2}$ in., shortly scabrous-setulose above, remotely minutely hairy beneath; nerves 13 pair. *Peduncles* 1-4 in., 1-2 in each axil or the uppermost-subumbellate, hairy, clavate, quadrangular upwards, 1-headed; heads in flower $1\frac{1}{2}$ in.; bracts $\frac{3}{4}$ -1 in., deciduous before the flowers expand; bracteoles 0. *Calyx* $\frac{1}{2}$ in., distinctly gamosepalous, subequally 5-fid; segments linear-oblong, green, very viscidly golden-pubescent. *Corolla* in shape nearly as of *S. Dalhousianus*. *Capsule* not seen.

92. **S. pentstemonoides**, *T. Anders. in Journ. Linn. Soc.* ix. 477, in part; leaves elliptic acuminate at both ends glabrous, bracts orbicular concave whitened glabrous, bracteoles 0, calyx pubescent, corolla $1\frac{1}{2}$ in. nearly glabrous pale purple. *Ruellia pentstemonoides*, *Wall. Cat.* 2340. *R. Cephalotes*, *Wall. Cat.* 2352. *R. capitata*, *Wall. Cat.* 2351, partly. *Goldfussia pentstemonoides*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 175; *Wight Ic.* t. 1510.

SUBTROPICAL HIMALAYA, alt. 1-6000 ft., from NEPAL to BHOTAN, frequent; *Wallich, H. f. & T., &c.*

A much branched shrub, 3-8 ft. diam.; stems glabrous. *Leaves* $6\frac{1}{2}$ by $2\frac{1}{2}$ in., closely serrate, lineolate on both surfaces; nerves 7 pair; petiole $\frac{1}{2}$ in. *Peduncles* 1-3 in., sometimes glandular-hairy, 1-2 together, mostly 1-3-headed; heads $\frac{1}{2}$ -1 in., young exactly globular, outer bracts enclosing the heads; but in some of *Wallich's* examples the young heads are oblong-cylindric, strobiliform; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., obtuse, early caducous. *Calyx* $\frac{1}{2}$ in., in fruit often $\frac{1}{2}$ in., divided nearly to the base, segments linear. *Corolla* more or less curved; narrow part of the tube sometimes minutely pubescent. *Stamens* glabrous. *Capsule* $\frac{3}{4}$ in., oblong-clavate, glandular-pubescent, 4-seeded. *Seeds* $\frac{1}{8}$ in., ovate, silky; areoles very small.

VAR. *flexuosa*; small, branches short flexuose rooting, peduncles long with 1 small head. *Ruellia flexuosa*, *Wall. Cat.* 2412. *Goldfussia flexuosa*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 175.—"India," *Herb. Wight*. Branches 1- $1\frac{1}{2}$ foot, apparently prostrate. *Leaves* $2\frac{1}{2}$ by $\frac{3}{4}$ in., thinly herbaceous; nerves 5 pair.—The example in *Herb. Wight* looks very unlike the Himalayan *S. pentstemonoides*; and, though taken up as a species by *Nees*, *T. Anderson* seems to have been so dissatisfied about it that he has left it out altogether. But there is a piece of the same thing mixed in *Wallich's* herbarium with *Ruellia Cephalotes* (*Wall. Cat.* 2352, type sheet); and it is probably an alpine starved (or cultivated?) form of *S. pentstemonoides*.

93. **S. Dalhousianus**, *Clarke*; leaves elliptic acuminate at both ends hairy, bracts orbicular concave whitened glabrous, bracteoles 0, calyx glabrate or sparingly hairy, corolla nearly 2 in. glabrous purple. *S. pentstemonoides*, *T. Anders. in Journ. Linn. Soc.* ix. 477, partly. *Goldfussia Dalhousiana*, *Nees in DC. Prodr.* xi. 174; *Wight Ic.* t. 1509.

W. TEMPERATE HIMALAYA, alt. 6-8000 ft.; from Kashmir to Kumaon, frequent; *Lady Dalhousie, Thomson, &c.*

A suberect shrub, 2-3 ft.; stems hairy. *Bracts* scarcely $\frac{1}{2}$ in., caducous; outermost oblong, green upwards, small, not enclosing the heads. *Calyx* in the typical form glabrous, subscarios, lobes linear-oblong, sometimes minutely softly hairy.—United with *S. pentstemonoides* by *T. Anders.*, from which it differs in habit, in having much more hairy leaves and less hairy calyx. It also grows at a different level.

94. **S. multidentens**, *Clarke*; leaves ovate shortly acuminate at both ends minutely sparsely hairy on both surfaces, heads panicle viscos hairy, bracts small obovate viscos hairy deciduous, calyx viscos-pubescent, corolla $1\frac{3}{4}$ in. purple.

SIKKIM, alt. 3-6000 ft.; *J. D. H.*, &c. BHOTAN; *Griffith, Herb. Propr.* n. 2398.

Leaves $7\frac{1}{2}$ by 4 in., closely regularly serrate (often with more than 100 teeth to the leaf; both surfaces with few remote minute hairs and small scattered raphides. *Bracts* $\frac{1}{2}$ in., very viscos-hairy; bracteoles $\frac{1}{2}$ in., linear-oblong. *Capsule* $\frac{3}{4}$ in., viscos-pubescent, 4-seeded. *Seeds* $\frac{1}{2}$ in., subquadrate, fulvous-hairy; areoles sub-obsolete.—This is the so-called Sikkim *S. Dalhousianus*; it is nearer the true *S. pentstemonoides*, but the young heads are never glabrous globose as in that, and the panicle is compound very glandular-hairy. The corollas in Griffith's Bhotan example are not more than $1\frac{1}{4}$ in., but are not thoroughly expanded.

95. **S. rhombifolius**, *Clarke*; leaves subsessile rhomboid-ovate shortly acute at both ends glabrous, bracts small elliptic concave caducous, bracteoles 0, corolla $1\frac{1}{2}$ – $1\frac{3}{4}$ in. nearly glabrous. *Goldfussia sessilis*, *Nees in DC. Prodr.* xi. 172, not *Strobilanthes sessilis*, *Nees*.

ASSAM; *Jenkins*.

Branches long, subterete, glabrous. *Leaves* (often unequal) $3\frac{1}{2}$ by 2 in., remotely serrulate, lineolate on both surfaces; nerves 5 pair. *Peduncles* 1–3 in., 1–3-headed; heads $\frac{1}{2}$ in. diam., closely capitate; all the bracts early caducous. *Calyx* in flower $\frac{1}{4}$ – $\frac{1}{2}$ in., divided nearly to the base; segments narrowly lanceolate, fuscous pubescent. *Corolla* nearly as of *S. pentstemonoides*, purple-mouthed. *Filaments* glabrous, longer hairy near the base. *Capsule* not seen.—This seems very near *S. pentstemonoides*, differing little but in the shape of the leaves; the heads however, by the time the first flowers expand, have lost all their bracts, which gives them a very different look.

96. **S. oligocephalus**, *T. Anders. ms. in Herb. Kew*; leaves elliptic caudate-acuminate nearly glabrous ciliate, young heads globose, bracts round concave glabrous, bracteoles 0, calyx hairy, corolla $1\frac{1}{4}$ in. pubescent without dark-purple.—*Goldfussia* sp. n. 24, *Herb. Ind. Or. H. f. & T.*

UPPER SIKKIM, alt. 5-7000 ft.; *Yoksun, J. D. H.*, &c.

A small shrub, 1-2 ft.; branches slender, terete, glabrous. *Leaves* attaining $6\frac{1}{2}$ by 3 in. (usually smaller much narrower), base cuneate, minutely remotely denticulate, sparingly thinly lineolate, sparsely puberulous especially toward the margins beneath; nerves 5-6 pair; petiole $\frac{3}{4}$ in. *Bracts* as in *S. pentstemonoides*, but rather smaller. *Corolla* viscos-pubescent without, usually nearly black.—When dried hardly distinguishable from *S. pentstemonoides* but by the smaller heads and the ciliate leaves.

VAR.? *Treutleri*; heads slightly elongate, bracts ovate-lanceolate herbaceous hairy, bracteoles $\frac{1}{2}$ in. linear, sepals $\frac{2}{3}$ – $\frac{3}{4}$ in.—Sikkim, alt. 9-10,000 ft., frequent on Tonglo and Sundukphoo, *Treutler*, &c.

97. **S. dasyspermus**, *Kurz in Journ. As. Soc.* 1873, pt. ii. 94; leaves elliptic or ovate acuminate very sparsely minutely hairy, heads even in fruit capitate forming (by the falling of the floral leaves) quasi-panicles, bracts small oblong caducous, corolla 1 in. blue glabrous without.

PEGU; *Kurz*.

An erect, nearly glabrous herb, 3-4 ft. (*Kurz*); branches obscurely quadrangular. *Leaves* $5\frac{1}{2}$ by $2\frac{1}{2}$ in., base suddenly shortly acuminate (the uppermost and reduced floral leaves sessile cordate), crenate-serrate, subglabrous, minutely lineolate above; nerves 7-8 pair; petiole $0\frac{1}{2}$ in. *Heads* few-fl., glandular-hairy; peduncles $\frac{1}{2}$ – $\frac{3}{4}$ in.; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., obovate-oblong, caducous. *Calyx* $\frac{1}{3}$ – $\frac{1}{2}$ in., divided nearly to the base; segments linear-ligulate. *Corolla* nearly straight; cylindric base

about as long as the moderately-widened ventricose part; segments ovate. *Filaments* and *style* sparsely hairy. *Capsule* $\frac{1}{2}$ in., narrowly elliptic, pubescent upwards, 4-seeded. *Seeds* $\frac{1}{8}$ in., ovate, silky; areoles hardly any.—Kurz rightly refers this to the neighbourhood of *S. pentstemonoides*.

98. **S. discolor**, *T. Anders. in Journ. Linn. Soc.* ix. 477; leaves elliptic cuspidate-acuminate glabrous, heads cymose running into compound panicles, bracts fugacious, calyx hairy, corolla $1\frac{1}{4}$ in. nearly glabrous. *Goldfussia discolor*, *Nees in DC. Prodr.* xi. 172 (excl. West Himalayan examples).

BHOTAN, ASSAM, and KHASIA MTS.; *Griffith (Herb. Propr.* nn. 2399, 2400; *Kew Distrib.* nn. 6105, 6120).

A shrub, closely resembling *S. pentstemonoides* and *S. sessilis*; differing from the former in having the leaves more shortly petioled, less sharply toothed, the inflorescence more compound; from the latter in the leaves cuspidate acuminate. In the type examples of *Nees* the leaves are scarcely whitened beneath. *Bracts* not seen, oblong-lanceolate, *vide Nees*.

VAR. nudicalyx; leaves densely lineolate above coriaceous very white beneath, bracts $\frac{1}{2}$ in. obovate, sepals glabrate lineolate. *Goldfussia* sp. n. 25, *Herb. Ind. Or. H. f. & T.*—Khasia, alt. 4000 ft.; Mausmai Falls, *Griffith* (*Kew Distrib.* n. 6120); Cherra, *H. f. & T.*—The type examples of this collected by J. D. H. look like a very distinct species; but some of the pieces of *Griffith* have the sepals glandular hairy.

99. **S. isophyllus**, *T. Anders. in Cat. Hort. Calcutt.* 43, and in *Journ. Linn. Soc.* ix. 478; leaves linear-lanceolate attenuate at both ends glabrous, heads numerous small cymed, bracts elliptic obtuse green shorter than the calyx, bracteoles nearly as long as the bracts, corolla 1 in. nearly glabrous lavender. *Goldfussia isophylla*, *Nees in Wall. Cat.* 7162, and in *Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 176; *Bot. Mag.* t. 4363; *Maudsl. Bot.* t. 244. *Strobilanthes Goldfussia*, *Dalz. & Gibs. Bomb. Fl. Suppl.* 71, *excl. syn.*

KHASIA MTS., or adjoining parts of Silhet or Assam. All the examples are of cultivated plants.

A nearly glabrous, erect, very ramous shrub, 1-2 ft. *Leaves* 3 by $\frac{1}{2}$ – $\frac{1}{2}$ in., opposite, subequal, entire or slightly serrulate, covered with raphides on both surfaces; nerves 4-5 pair; petiole 0– $\frac{1}{4}$ in. *Heads* $\frac{1}{2}$ in. diam., 1-4-fl., terminal but appearing axillary cymed, the reduced leaves on the short axillary branches being caducous; bracteal leaves to the heads caducous; bract $\frac{1}{2}$ in., green, nearly glabrous, subsistent; bracteoles $\frac{1}{2}$ in., linear-oblong, green, nearly glabrous. *Calyx* $\frac{1}{4}$ in., divided nearly to the base, pubescent; segments sublinear. *Corolla* curved; cylindric base much shorter than the ventricose portion, lobes short round. *Stamens* and *style* hairy. *Capsule* nearly $\frac{1}{2}$ in., glabrous, 4-seeded. *Seeds* $\frac{1}{10}$ in., ovate, silky; areoles hardly any.

100. **S. anisophyllus**, *T. Anders. in Cat. Hort. Calcutt.* 43, and in *Journ. Linn. Soc.* ix. 478; leaves very unequal or pseudo-alternate lanceolate acuminate at both ends glabrous, heads small often cymed, bracts elliptic obtuse green about as long as the calyx, bracteoles rather shorter than the bracts, corolla $1\frac{1}{4}$ in. nearly glabrous lavender. *Ruellia anisophylla*, *Wall. Cat.* 2349; *Hook. Fl. Exot.* t. 191. *R. persicifolia*, *Griff. Ilin. Notes*, 70; *Bot. Reg.* t. 955. *Goldfussia anisophylla*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 176; *Bot. Mag.* t. 3404.

KHASIA MTS., alt. 1-4000 ft., common; *Wallich*, &c.

A shrub, 2-3 ft. *Leaves* $3\frac{1}{2}$ by $\frac{3}{8}$ –1 in.; the opposite leaf of each pair $1\frac{1}{4}$ by $\frac{1}{2}$ in. or obsolete.—Except in the unequal, rather broader leaves, this wholly agrees with

S. isophyllus; and as *S. isophyllus* cannot be found wild, it may prove to be a reverſionary (under cultivation) form of *S. anisophyllus*.

101. ***S. cratægifolius***, *T. Anders. in Journ. Linn. Soc.* ix. 477; leaves subsessile elliptic or obovate crenulate glabrous, heads 1-5-flid. terminal solitary on numerous short leafy lateral branches hairy, bracts and bracteoles linear-oblong about as long as the calyx, corolla $1\frac{1}{4}$ in. blue.

MOULMEIN; *Griffith, Parish.*

Branches elongate (15 in. at least), glabrous, subsimple with numerous shortened small-leaved lateral branches in opposite pairs each terminated by a flower-head. *Leaves* $2\frac{1}{4}$ by 1 in. (those on the lateral branches $\frac{1}{4}$ - $\frac{1}{2}$ in.), lineolate above, pale leathery beneath; nerves 6 pair. *Peduncles* 0- $\frac{1}{2}$ in.; bract $\frac{1}{3}$ - $\frac{1}{2}$ by $\frac{1}{4}$ in., green, prominently white-ciliate; bracteoles similar to, rather smaller. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, green, ciliate, $\frac{1}{2}$ in. in fruit. *Corolla* nearly straight, glabrous; cylindric base much shorter than the ventricose portion. *Capsule* $\frac{1}{2}$ in., broadly clavate-elliptic, minutely pubescent, 2-seeded. *Seeds* $\frac{1}{2}$ in., fulvous-shaggy; areoles very small.

**** Heads elongate mostly interrupted 'below, frequently all the flowers scattered or only a few at the tips of the spikes capitellate.**

102. ***S. lamiifolius***, *T. Anders. in Journ. Linn. Soc.* ix. 476, partly; leaves ovate acute nearly glabrous, young heads strobilate, bracts ovate acute scarcely pubescent, bracteoles oblong about as long as the calyx, corolla $1\frac{1}{4}$ - $1\frac{1}{2}$ in. nearly glabrous. *Ruellia rotundifolia*, *Don Prodr.* 120. *R. lamiifolia*, *Wall. Cat.* 2347. *Goldfussia lamiifolia*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 172.

NEPAL; *Wallich.*

Stems 15 in., flexuose, glabrous. *Leaves* 2 by $1\frac{1}{4}$ in., base rounded or shortly acuminate, serrate, minutely pubescent on the nerves beneath, lineolate on the upper surface; nerves 6-7 pair; petiole $\frac{1}{2}$ in. *Spikes* peduncled, mostly solitary, 1 in. in flower scarcely 2 in. not interrupted in fruit; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., caducous. *Calyx* $\frac{1}{2}$ in., in fruit $\frac{1}{2}$ in., divided nearly to the base; segments linear-lanceolate, pubescent. *Corolla* purple (Nees). *Capsule* $\frac{1}{2}$ in., pubescent, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, silky; areoles hardly any.

103. ***S. pauper***, *Clarke*; leaves lanceolate acuminate at both ends puberulous beneath or glabrate, heads oblong in fruit interrupted small or 1-flid., bracts obovate quadrate shorter than the calyx, corolla $1\frac{1}{2}$ in. purple. *S. lamiifolius*, *T. Anders. in Journ. Linn. Soc.* ix. 476, partly.—*Goldfussia* sp. n. 26, *Herb. Ind. Or. H. f. & T.*

KHASIA MTS., alt. 4-6000 ft.; Nunklow and Nungbree, *H. f. & T.*, &c.

A meagre shrub, 1-2 ft.; branches upwards hairy or glabrate. *Leaves* $3\frac{1}{4}$ by $\frac{3}{4}$ -1 in., minutely toothed or subentire, densely obscurely lineolate; nerves 6-7 pair; petiole $\frac{1}{2}$ -1 in. *Spikes* in fruit sometimes 2 in., usually shorter, or the flowers occasionally nearly all solitary; bracts scarcely $\frac{1}{2}$ in., tip obtusely triangular, green, subpubescent, caducous; bracteoles $\frac{1}{2}$ in., oblong, caducous. *Calyx* $\frac{1}{4}$ in., in fruit $\frac{1}{2}$ in., sub-5-partite; segments linear-spathulate, glandular-pubescent. *Corolla* nearly glabrous; narrow cylindric base nearly as long as the ventricose part. *Stamens* glabrous. *Capsule* $\frac{1}{2}$ in., pubescent, 4-seeded. *Seeds* $\frac{1}{10}$ - $\frac{1}{8}$ in., ovate, shaggy; areoles small.

104. ***S. extensus***, *Nees in DC. Prodr.* xi. 195; leaves subsessile ovate acuminate hairy base rounded or cordate, spikes long interrupted below, bracts ovate, corolla $1\frac{1}{4}$ - $1\frac{1}{2}$ in. nearly glabrous purple. *T. Anders. in Journ. Linn. Soc.* ix. 476. *Goldfussia extensa*, *Nees in Wall. Cat.* 7160, and in *Wall. Pl. As. Rar.* iii. 88.

KHASIA MTS., alt. 4-6000 ft., common; *Wallich, &c.* ASSAM; *Griffith, Mrs. Mack.*

An erect shrub, 1-2 ft.; branches hairy. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ in., upper cordate sessile, lower sometimes short-petioled, serrate; nerves 5 pair, springing near the leaf-base. *Spikes* 2-6 in., terminal, hairy, dense at the tip, usually much interrupted below; the lowest flowers often distant solitary in the axil of altogether leaf-like persistent bracts; bract proper $\frac{1}{2}$ - $\frac{3}{4}$ in., herbaceous, glandular, deciduous; bracteoles $\frac{1}{2}$ in., elliptic. *Calyx* $\frac{1}{3}$ - $\frac{1}{2}$ in. (or more in fruit), divided nearly to the base; segments linear-oblong, subobtuse, glandular-pubescent. *Corolla* curved; narrow cylindric base of the tube hardly so long as the ventricose part. *Filaments* glabrous; style thinly hairy. *Capsule* $\frac{1}{3}$ - $\frac{2}{3}$ in., glandular-pubescent, 4-seeded. *Seeds* $\frac{1}{8}$ in., ovate, hairy; areoles small.

105. **S. phyllocaulos**, *Clarke*; leaves short-petioled ovate acute hairy, spikes long dense interrupted below in fruit, bracts ovate, corolla $1\frac{1}{4}$ in. nearly glabrous purple.

KHASIA MTS., alt. 5000 ft.; Moflong, *J. D. H.*; Dingling, *Clarke*.

Stems stout, hairy; internodes not half as long as the leaves. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., without the acumination characteristic of *S. extensus*, base of the lower leaves shortly acuminate, serrations often 40-50 to the leaf (rarely 20 in *S. extensus*), upper surface softly densely adpressedly hairy, lower softly patently hairy reticulately nervose; nerves 8 pair, subequally distant (not all springing near the base of the leaf). *Inflorescence, flowers and capsule* exactly as of *S. extensus*.—So unlike *S. extensus* in its densely leafy stem that it has been sorted in the Herbarium with *Echmanthera leioperma*, which it exceedingly resembles; but it is difficult to separate it from *S. extensus* by any technical character.

106. **S. Newii**, *Beddome ms.*; leaves petioled ovate acute pubescent, spikes much interrupted panicled, bracts lanceolate, corolla $1\frac{1}{4}$ - $1\frac{1}{2}$ in. nearly glabrous purple. *S. extensus*, *Bedd. Ic. Pl. Ind. Or. t. 202, not of Nees*.

W. MYSORE; Manjeerabad, *New* (fide *Beddome*).

A small shrub; branches puberulous, glandular hairy towards the tips. *Leaves* 2 by $1\frac{1}{4}$ in., base rounded or subcordate, serrate, puberulous scabrous above pubescent beneath; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. (uppermost leaves sessile). *Panicles* 6-10 in.; flowers nearly all opposite distant. *Calyx and corolla* nearly as of *S. extensus*.—*Col. Beddome* published this as *S. extensus*, to which it is no doubt closely allied, but the leaves will not match, and the bracts are totally different, very hairy, early caducous, the bracteoles subobsolete.

107. **S. alatus**, *Nees in DC. Prodr. xi. 194*; leaves petioled ovate acute hairy, spikes early panicled, flowers all distant, bracts narrowly oblong caducous, corolla $1\frac{1}{4}$ in. nearly glabrous purple. *T. Anders. in Journ. Linn. Soc. ix. 476 (excl. Sikkim examples)*. *S. reflexus*, *Nees l. c. 194*. *S. attenuatus*, *Nees l. c. 193 (excl. syn.)*. *Ruellia urticifolia*, *Wall. Cat. 2346*.

W. TEMPERATE HIMALAYA, alt. 6-10,000 ft., common; from Kashmir to Kumaon. —DISTRIB. N.E. Cabul.

A shrub, 2-4 ft., erect, viscous-hairy. *Leaves* 5 by $2\frac{3}{4}$ in., upper sessile, lower long-petioled, base cordate rounded or attenuate, serrate; nerves 7-8 pair; petiole 1-3 in., linear or winged upwards. *Spikes* (by the early fall of the bracts) forming terminal panicles; upper flowers soon in distant pairs, not capitate; bracts narrow-lanceolate or oblong, caducous; upper hardly so long as the calyx; bracteoles $\frac{1}{2}$ in., narrowly oblong, caducous. *Calyx* $\frac{1}{4}$ - $\frac{1}{2}$ in., deeply divided; segments unequal, linear, obtuse, green, viscous-hairy. *Corolla* ventricose, mouth curved, constricted base hardly longer than the calyx, 2 hairy lines within. *Stamens* glabrous. *Ovary* glandular, style very remotely minutely hairy. *Capsule* $\frac{3}{4}$ in., narrowly elliptic, glandular-hairy,

4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, shaggy; areoles hardly any.—The lower long-petioled leaves are usually cordate, but leaves acuminate at the base occur on the same plant. The species is better distinguished by the tips of the spikes having the flowers (quite early) spicate not capitate, and all the bracts very narrow; but the leaves about the base of the panicle are cordate ovate acuminate. Nees has written this species up under 3 names in the Kew Herbarium: as *S. alatus*, which is altogether right; as *S. attenuatus*, which is erroneous so far as he doubtfully meant it for *Ruellia attenuata*, Wall. & Nees (an *Echinacanthus*); and as *S. extensus*, which is a blunder.

108. ***S. Lachenensis*, Clarke**; leaves ovate attenuated at the base laxly hairy, spikes long interrupted at the base, bracts sessile elliptic truncate at the base exceeding the calyx caducous, corolla middle-sized glabrate without.

SIKKIM HIMALAYA; Lachen, alt. 10,000 ft., *J. D. H.*

Branches elongate, with lax white patent hairs. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{2}$ in., obtuse or triangular, base (even in the uppermost) acuminate, decurrent. *Spikes* 2–5 in., solitary, simple; lower bracts $\frac{1}{2}$ by $\frac{1}{4}$ in., green, entire, exactly truncate, not at all cordate. *Corolla* (not expanded) $\frac{3}{4}$ in., with a few scattered lax hairs towards the apex without.—This has been referred as a Sikkim form to *S. alatus*, to which it is certainly allied; but no one of the numerous examples of *S. alatus* will it match even reasonably well.

109. ***S. collinus*, Nees in Wall. Pl. As. Rar. iii. 86, and in DC. Prodr. xi. 192**; leaves large elliptic acuminate glabrous, spikes forming thin terminal pubescent panicles, bracts narrowly elliptic overtopping the calyx, corolla 2 in. nearly glabrous. *T. Anders. in Journ. Linn. Soc. ix. 476.* *Ruellia collina, Wall. Cat. 2343.*

PENANG; *G. Porter.*

Branch-tips stout, glabrous; internodes elongate. *Leaves* $9\frac{1}{2}$ by $3\frac{1}{2}$ in., base cuneate, repand-crenate, bearing raphides on both surfaces; nerves 7 pair; petiole $\frac{3}{4}$ in. *Spikes* 3–4 in., with few flowers in remote opposite pairs, early running into a few-branched panicle; bracts $\frac{1}{2}$ in., concave; bracteoles 0. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., divided nearly to the base; segments linear, with weak subulate pubescent tips. *Corolla* slightly curved, cylindric base as long as the ventricose part. *Capsule* $\frac{3}{4}$ in., clavate-oblong, puberulous, 4-seeded. *Seeds* $\frac{1}{2}$ in., ovate, shortly fulvous-hairy; areoles small.—Habit and calyx much like those of the large *Asystasias*, but the capsule and seeds are of *Strobilanthes*.

110. ***S. lancifolius*, T. Anders. in Journ. Linn. Soc. ix. 480**; leaves elliptic acuminate at both ends glabrous, spikes linear interrupted hairy collected into terminal panicles, bracts oblong obtuse green shorter than the calyx deciduous, corolla $1\frac{1}{4}$ in. minutely pubescent without deep-blue.

MOULMEIN; *Parish. TENASSERIM; Beddome.*

A shrub; branches terete. *Leaves* 7 by 3 in., widest about the middle, serrate, minutely lineolate above; nerves 7–8 pair; petiole 1 in. *Spikes* ascending, straight; flowers nearly all in opposite pairs; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ in., linear-oblong, obtuse, deciduous. *Calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., subequally divided nearly to the base; segments linear-oblong, obtuse, pubescent. *Corolla* nearly straight, funnel-shaped, ventricose upwards; segments ovate, dense rows of long white hair within. Longer filaments white hairy. *Capsule* $\frac{3}{4}$ in., glabrate, 4-seeded. *Seeds* shaggy.

111. ***S. denticulatus*, T. Anders. in Journ. Linn. Soc. ix. 483**; leaves long-petioled elliptic acuminate at both ends fuscous-pubescent on the nerves beneath, spikes linear interrupted fuscous-pubescent, flowers (or many of them) in distant pairs, bracts lanceolate. *Ruellia denticulata, Wall. Cat. 2418.* *Asystasia denticulata, Nees in Wall. Pl. As. Rar. iii. 89, and in DC. Prodr. xi. 164.*

KHASIA Mts.; *Wallich.* PATKOYE Mts. (in S.E. Assam), at the river Namyoon (by error Kamyoon in Griffith's Journals); *Griffith* (Kew Distrib. n. 6112).

A shrub; branches quadrangular, scabrid puberulous upwards. *Leaves* 6 by $2\frac{1}{2}$ in., crenulate-dentate, with small raphides on both surfaces, paler beneath; nerves 12 pair; petiole $\frac{1}{2}$ –3 in. (often very unequal in the opposite pairs). *Spikes* 1–4 in., axillary, 1 or 2 together, interrupted, slender even before flower-time; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in., green, slightly pubescent; bracteoles $\frac{1}{2}$ in. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., divided nearly to the base; segments lanceolate, scarcely acute, fuscous-pubescent. *Corolla* $1\frac{1}{4}$ in., pubescent without, nearly straight; linear-cylindric part of the tube nearly as long as the ventricose part. *Filaments* very hairy (Nees). *Capsule* not seen.

112. *S. microcarpus*, *T. Anders. in Journ. Linn. Soc.* ix. 482; leaves large petioled ovate acuminate coarsely serrate hirsute on both surfaces, flowers paniced distant mostly in opposite pairs, bracts and bracteoles very small, corolla $\frac{3}{4}$ in. glabrous without.

TENASSERIM or ANDAMANS; *Helper* (Kew Distrib. n. 6113).

A shrub; branches terete, swollen at the nodes, glabrous. *Leaves* 8 by $4\frac{1}{2}$ in., base broadly rhomboid, hirsute with white hairs which are stellately clustered on the upper surface, closely minutely lineolate on both surfaces; nerves 15 pair; petiole $1\frac{1}{2}$ –2 in. *Inflorescence*, viscidly glandular-hairy; spikes proper apparently laxly few-fl., axillary and running into a terminal panicle; bracts $\frac{1}{2}$ in., linear; bracteoles similar to the bracts. *Calyx* $\frac{1}{2}$ in., divided nearly to the base, viscous; segments linear, more or less unequal. *Corolla* nearly straight, very hairy within; cylindric base much shorter than the ventricose portion; segments short. *Capsule* scarcely $\frac{1}{2}$ in., clavate, 2-seeded where examined.—*Helper's* examples are in bad condition, with the leaves (both cauline and floral) all detached; and the species very possibly is not placed here correctly.

113. *S. angustifrons*, *Clarke*; leaves elliptic acuminate at both ends nearly glabrous, spikes lateral and terminal paniculate with capitellate tips, bracts oblong acuminate caducous, corolla $1\frac{1}{2}$ in. nearly glabrous purple.—*Strobilanthes* sp. n. 29, *Herb. Ind. Or. H. f. & T., partly*. *Goldfussia Edgeworthiana*, *Nees in DC. Prodr.* xi. 173?

N.W. HIMALAYA; Deyra, alt. 2500 ft., *Thomson*; Kangra and Dhurmsala, alt. 3–6000 ft., *Clarke*.

A suberect shrub, 2–3 ft.; branches glabrous. *Leaves* $4\frac{1}{2}$ by $1\frac{3}{4}$ in., upper all attenuate at the base, serrulate, upper surface and margin minutely hairy or glabrous, raphides small on both surfaces; nerves 6 pair; petiole $\frac{1}{2}$ in. *Spikes* forming short irregular panicles, branches nearly glabrous; lower bracts leaf-like, lanceolate (base never cordate), upper shorter than the calyx; bracteoles $\frac{1}{2}$ in., linear, scarcely pubescent. *Sepals* $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, pubescent. *Corolla* nearly as of *S. alatus*, but much narrower. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., sparsely pubescent, 4-seeded. *Seeds* scarcely $\frac{1}{2}$ in., orbicular, hairy; areoles hardly any.—This differs from *S. alatus* by the slenderer corolla, capsule and seeds, and by the uppermost leaves being narrowed never cordate at the base.

114. *S. agrestis*, *Clarke*; leaves ovate acuminate at both ends sparsely hairy on both surfaces, spikes elongate paniculate with capitellate tips, bracts shorter than the calyx obovate pubescent caducous, corolla 2 in. glabrous without.

SUBTROPICAL SIKKIM and W. BHOTAN, alt. 2–5000 ft., frequent; *Clarke*.

An erect, branched undershrub, 1–2 ft.; branches upwards quadrangular, pubescent. *Leaves* 4 by 2 in., often unequal, shortly acuminate at the base, serrulate, shortly sparsely hairy above, minutely pubescent beneath, minutely lineolate on both surfaces; nerves 6 pair; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Spikes* 1–4 in., hairy, lower flowers in distant pairs; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., linear-oblong. *Corolla* slightly curved, rather narrowly tubular-ventricose, lavender colour. *Capsule* and *seeds* as of *S. angustifrons*, to which it is nearly allied.

VAR. *hemiotis*; one leaf of every pair sessile cordate less than $\frac{1}{2}$ the length of the other.—Khasia Mts., *Herb. Watt.*

115. **S. Thomsoni**, *T. Anders. in Journ. Linn. Soc.* ix. 478; leaves ovate or elliptic acuminate at both ends glabrous, spikes short cymose or fascicled axillary shorter than the leaves glabrous or viscous-hairy, bracts and bracteoles very small, corolla $1\frac{1}{2}$ in. purple.—*Strobilanthes* sp. n. 30, *Herb. Ind. Or. H. f. & T.*

SUBTROPICAL SIKKIM and W. BHOTAN, alt. 2–6000 ft., common; *J. D. H., T. Anders., &c.*

A shrub, 3–5 ft.; branches elongate, flexuose, glabrous. *Leaves* $4\frac{1}{2}$ – $6\frac{1}{2}$ by $2\frac{1}{2}$ in., serrate, with small raphides on both surfaces; nerves 6 pair; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., sometimes 0. *Spikes* 1–3 in., in nearly all the axils, densely divided from the base, the flowers nearly all in crowded but distinct opposite pairs; lower bracts resembling reduced leaves, lanceolate; upper $\frac{1}{2}$ in. spatulate, glabrous pubescent or very viscous-hairy. *Calyx* in flower often less than $\frac{1}{2}$ in., in fruit sometimes nearly $\frac{1}{2}$ in., divided nearly to the base; segments equal or unequal, glaucous or green, hairy. *Corolla* somewhat curved, minutely pubescent, ultimately glabrate. *Capsule* scarcely $\frac{1}{2}$ in., minutely pubescent, 4-seeded. *Seeds* $\frac{1}{10}$ in., orbicular, innumerable fine white hairs springing out on applying water; areoles very small.—There is a wide series of forms here collected, varying much in the size and hairiness of the calyx, but all remarkable by the fasciculate axillary inflorescence. Possibly T. Anderson also included here *S. agrestis*, which has different inflorescence, and much larger capsules.

116. **S. lævigatus**, *Clarke*; nearly glabrous, leaves elliptic acuminate at both ends serrate, flowers loosely paniced nearly all in opposite distant pairs, bracts very caducous, corolla $1\frac{3}{4}$ in. nearly glabrous.

SIKKIM; *J. D. H.*

A shrub, glabrous except a few glandular hairs occasionally on the calyx and panicle-rachis. *Leaves* 7 by $2\frac{1}{2}$ in., sharply serrate, obscurely lineolate, nerves 8 pair; petiole $\frac{3}{4}$ in. *Panicles* axillary and terminal, large, lax; bracts and bracteoles all fallen before some of the corollas have opened. *Calyx* $\frac{1}{2}$ in., divided nearly to the base; segments subequal, narrowly lanceolate, subobtusate, somewhat enlarged, membranous in fruit. *Corolla* nearly as of *S. angustifrons* & *agrestis*. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous, tip obscurely glandular.

117. **S. debilis**, *Clarke*; leaves small elliptic sparsely hairy, spikes small interrupted, flowers in opposite pairs, bracts linear-lanceolate, corolla 1 in. nearly glabrous without long white-hairy within.

PEGU; *Kurz.*

Stem creeping, rooting; flowering branches 4–8 in., erect, branching, pubescent. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ in., apex triangular, very obtuse, base cuneate, undulate or crenate, densely lineolate and with a few long multicellular hairs above, pubescent beneath; nerves 5 pair; petiole $\frac{1}{2}$ in. *Spikes* 1–2 in., weak, hairy; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, green, hairy. *Sepals* $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, subulate, very hairy. *Corolla* nearly straight; cylindric base hardly half as long as the urceolate part; segments 5, short, round, subequal. *Filaments* glabrous. *Ovary* 4-ovulate. *Capsule* not seen.—A very anomalous species; it is possible that the bracts are not caducous, and that it should not be arranged here.

118. **S. glandulosus**, *Kurz in Journ. As. Soc.* 1873, ii. 92; viscous, leaves narrowly elliptic repand-crenate, spikes very numerous, lowest bracts leaf-like subsistent, proper bracts small oblong caducous, corolla scarcely $\frac{1}{2}$ in. yellow. *Hemigraphis glandulosa*, *T. Anders. in Kurz Andaman Rep. App.* B. 13.

S. ANDAMAN ISLANDS; *Kurz.*

A branched herb (*Kurz*). *Leaves* 3 by 1 in., subobtusely cuneate at both ends nearly glabrous; nerves 6 pair; petiole $\frac{1}{2}$ in. *Inflorescence* exceedingly sticky, very compound; lower bracts persistent, or deciduous forming the spikes into compound panicles; flowers distant in opposite pairs, or in small heads; or in appearance solitary,

terminal, pedicelled. *Calyx* $\frac{1}{4}$ – $\frac{1}{3}$ in., divided nearly to the base; segments linear. *Corolla* straight, tubular-ventricose, hardly $\frac{1}{2}$ in. diam.; segments short, round. *Filaments* and *style* glabrous; ovary 4-ovulate. *Capsule* $\frac{1}{2}$ in., clavate, compressed, pubescent, 4-seeded. *Seeds* $\frac{1}{2}$ in., orbicular; when wetted the fine hairs spring out; areoles very small.—Kurz, after removing this species to *Strobilanthes*, suggests that it is allied to *Hemigraphis Griffithiana*, of which not merely the ovules, but the inflorescence, &c., are totally different.

119. **S. secundus**, *T. Anders. in Journ. Linn. Soc.* ix. 480; leaves elliptic acute at both ends nearly glabrous, spikes lax long, flowers distant in opposite pairs, bracts petioled ovate deciduous, corolla $1\frac{1}{2}$ in. minutely pubescent without yellow with a brown-purple tube.—*Strobilanthes* sp. n. 23, *Herb. Ind. Or. H. f. & T.*, partly.

MISHMEE and ASSAM; *Griffith* (Kew Distrib. n. 6122). ASSAM; *Simons*.

Leaves $6\frac{1}{2}$ by 3 in., crenate or subentire, ashy puberulous on the nerves beneath otherwise glabrous, upper surface with minute raphides; nerves 8 pair; petiole $\frac{1}{2}$ in. *Spikes* 12 in., whip-like, sparingly branched (in Griffith's type specimens), sometimes depauperated 3 in., 5-fld.; lower bracts leaf-like, upper gradually smaller, leaf-like, deciduous, uppermost only $\frac{1}{2}$ in., lanceolate; bracteoles obsolete. *Calyx* $\frac{1}{2}$ in., divided nearly to the base, glabrous, enlarged in fruit; segments unequal, narrowly lanceolate, linear-elongate, subobtuse. *Corolla* curved, cylindric base hardly so long as the calyx. *Capsule* nearly 1 in., base long barren narrow, 4-seeded. *Seeds* $\frac{1}{2}$ – $\frac{3}{4}$ in., ovate, shaggy; areoles very small.

120. **S. flaccidifolius**, *Nees in DC. Prodr.* xi. 194; glabrous, leaves elliptic acute at both ends, spikes forming somewhat dense panicles, flowers opposite many remote, bracts petioled ovate deciduous, corolla 2 in. nearly glabrous purple. *T. Anders. in Journ. Linn. Soc.* ix. 481. *S. Championi*, *T. Anders. in Benth. Fl. Hongk.* 261. *S. flaccidus*, *Mann. Assam For. Rep.* 1876-7, par. 135; *Gamble, Man. Ind. Timb.* 280; *Kurz For. Fl.* ii. 239. *Ruellia indigofera*, *Griff. Trav.* 237. *R. indigotica*, *Fortune, Resid. Chin.* 158. *Balfour, Cyclop. Ind. IV.* (*Ruellia*). *R. Cusia*, *Ham. in Wall. Cat.* 2386. *Goldfussia Cusia*, *Nees in Wall. Pl. As. Rar.* iii. 88, and in *DC. Prodr.* xi. 175. *Dipteracanthus* ? *calycinus*, *Champ. in Hook. Kew Journ.* v. 133.

N. and E. BENGAL with ASSAM, alt. 1–4000 ft. in the lower hills, often cultivated, *Hamilton, Griffith, &c.*—DISTRIB. N. Burma, S. China.

A shrub. *Leaves* and *flowers* closely resembling (when dry) those of *S. secundus*, but the inflorescence denser, the flowers rather larger. *Capsule* $\frac{3}{4}$ in., not constricted at the base; lower seeds less than $\frac{1}{4}$ in. from the base.—Except as to the capsule, this looks exceedingly like a cultivated form of *S. secundus*. Yields the dye “Room.”

Series C. *Alternifloræ*. *Bracts* persistent or caducous, large or small, in opposite pairs (sometimes unequal) one of each pair mostly barren. *Spikes* linear lax usually interrupted often flexuose, zigzag or twisted, or compound passing into much-branched panicles; spikes upwards at least generally sympodal. *Flowers* mostly distant, alternate.—(Several species in this section have some of their flowers opposite, but these are in such case often twisted much to one side; and in many cases where such occur as solitary in the axils of leaves, they are really alternate on shortened axillary branches with 2 opposite bracts, whereof one only contains a flower.)—Species of N. India and the Malay Peninsula.

121. **S. divaricatus**, *T. Anders. in Journ. Linn. Soc.* ix. 478; leaves lanceolate or elliptic acuminate at both ends glabrous, spikes axillary and terminal elongate flexuose or zigzag, flowers distant both paired and alter-

nate, bracts very small caducous, corolla $1\frac{1}{2}$ in. nearly glabrous purple. *Ruellia divaricata*, Wall. Cat. 2372. *Goldfussia divaricata*, Nees in Wall. Pl. As. Rar. iii. 89, and in DC. Prodr. xi. 176.—*Strobilanthes* sp. n. 23, Herb. Ind. Or. H. f. & T., partly.

TEMPERATE HIMALAYA, alt. 5–9000 ft., from Nepal to Bhotan, common; Wallich, &c. KHASIA MTS., alt. 3–5000 ft., frequent; H. f. & T., &c.

A shrub, 2–5 ft., nearly glabrous. Leaves $5\frac{1}{2}$ by 2 in. (in the Himalaya plant usually narrower), serrulate, obscurely setulose; nerves 7 pair; petiole $\frac{1}{2}$ in. Spikes very lax, divaricate; glabrous or (in the Khasia form) thinly hairy upwards. Bracts $\frac{5}{8}$ in., ovate, caducous; bracteoles $\frac{1}{2}$ – $\frac{1}{6}$ in., obovate-oblong, caducous. Calyx $\frac{1}{2}$ –1 in., subequally divided to the base; segments narrow elongate caudate, often glabrous in the Himalaya form, usually hairy (sometimes very hairy in fruit) in the Khasia form. Corolla curved, tubular, ventricose, subviscid dark purple, glossy in the high-level Himalaya plant. Stamens glabrous or the filaments minutely pubescent at the base. Capsule $\frac{1}{2}$ in., glabrate, 4-seeded. Seeds $\frac{1}{10}$ in., ovate, pubescent; areoles small.

122. **S. rubescens**, T. Anders. in Journ. Linn. Soc. ix. 479; lower leaves subsessile oblong acuminate subentire coriaceous hairy or glabrate, spikes curved, flowers mostly remote not opposite, bracts very small ovate, corolla nearly 2 in., seeds $\frac{1}{2}$ in.—*Goldfussia* sp., Griff. Itin. Notes, 20, n. 309. *Goldfussia* sp. n. 27, Herb. Ind. Or. H. f. & T., in great part.

KHASIA and JAINTIA MTS., alt. 3–5000 ft., common; Griffith, H. f. & T., &c.

Suberect flexuose, or lax curved, 1–2 ft., hairy or glabrous. Lower leaves $3\frac{1}{2}$ by $1\frac{1}{2}$ in. with petiole rarely $\frac{1}{6}$ in., upper cordate sessile, sparsely lined above; nerves 5 pair. Spikes 1–5 in., axillary, and forming a quasi-terminal panicle, secund, glabrous or sparingly glandular-hairy; bracts scarcely $\frac{1}{2}$ in., ovate, opposite, usually only one bearing a flower; bracteoles nearly as long as the bracts, linear. Calyx $\frac{1}{2}$ – $\frac{1}{2}$ in., divided nearly to the base; segment linear-lanceolate, somewhat enlarged in fruit. Corolla nearly straight, glabrous, purple or lilac; cylindric base $\frac{1}{2}$ in., ventricose part 1 in. Capsule $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous, 4-seeded. Seeds ovate, shaggy principally on the margin; areoles small.

VAR. ? *microsperma*; leaves more distinctly serrate lower sessile cordate, capsule scarcely $\frac{1}{2}$ in., seeds $\frac{1}{10}$ in.—Khasia Mts., alt. 4–5000 ft., H. f. & T. Darjeeling; Jor Bungalow, alt. 7500 ft., Beddome.—The small seeds appear perfectly ripe. Col. Beddome's Darjeeling plant may be a new species.

123. **S. boerhaavioides**, T. Anders. in Journ. Linn. Soc. ix. 479; lower leaves long-petioled ovate acuminate crenate glabrate, spikes curved, flowers mostly remote not opposite, bracts very small ovate, corolla $1\frac{1}{2}$ in., seeds $\frac{1}{2}$ in.—*Goldfussia* sp. n. 27, Herb. Ind. Or. H. f. & T., in part.

SIKKIM HIMALAYA; Thomson. KHASIA MTS., alt. 4–5000 ft.; Pomrang, J. D. H.

Lower leaves $6\frac{1}{2}$ by 3 in.; petiole 1– $1\frac{1}{2}$ in., winged upwards. Otherwise so closely resembling *S. rubescens* type, that the species have been thrown into one in Herb. Kew.

124. **S. Helictus**, T. Anders. in Journ. Linn. Soc. ix. 479; leaves lanceolate or elliptic acuminate at both ends glabrous, spikes elongate zigzag twisted glabrous or viscous hairy, bracts linear shorter than the calyx, corolla $1\frac{1}{2}$ in. creamy-white. *Ruellia calycina*, Wall. Cat. 2417. *Asystasia calycina*, Nees in Wall. Pl. As. Rar. iii. 90. *Echinacanthus calycinus*, Nees in DC. Prodr. xi. 168.

SIKKIM, alt. 6000 ft.; Treutler. KHASIA and JAINTIA MTS., alt. 4000 ft. frequent; Griffith, &c.

A shrub, 1–4 ft.; branches sometimes pubescent upwards. Leaves $4\frac{1}{2}$ by 1 – $1\frac{1}{2}$ in. lanceolate (in the Sikkim example $4\frac{1}{2}$ by 2 in. elliptic), serrate; upper surface lineo-

late; nerves 5-9 pair; petiole $\frac{3}{4}$ in. *Spikes* 3-8 in., axillary and terminal, but little branched; flowers all distant alternate; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., unequal, opposite, the smaller one barren; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{2}$ - $1\frac{1}{4}$ in., divided subequally nearly to the base; segments linear, glabrous or very viscous hairy, more or less enlarged in fruit. *Corolla* nearly glabrous, very ventricose from a constricted base scarce $\frac{1}{4}$ in. long; segments short, round. *Stamens* 4, filaments very hairy downwards. *Capsule* $\frac{3}{4}$ in., glabrous, 4-seeded. *Seeds* $\frac{1}{4}$ in., ovate, pubescent hair at first dense white, ultimately tawny less; areoles very small.—T. Anderson says the leaves are "softly tomentose beneath," which is a mistake.

125. **S. Griffithianus**, *T. Anders. in Journ. Linn. Soc.* ix. 481; leaves broadly lanceolate acuminate at both ends puberulous on the nerves beneath, spikes elongate zigzag viscous pubescent, flowers distant alternate, bracts lanceolate obtuse persistent, corolla $1\frac{3}{4}$ in. yellow. *Triænanthus* Griffithianus, *Nees in DC. Prodr.* xi. 169.

KHASIA MTS., alt. 2-3000 ft., *Griffith, J. D. H.*, &c., frequent on the southern face.

A spreading shrub, 3-7 ft. diam.; branches fuscous-puberulous upwards. *Leaves* 6 by $1\frac{1}{2}$ in., minutely denticulate; nerves 10 pair; petiole $\frac{3}{4}$ in. *Spikes* 3-8 in., lateral and in lax terminal panicles; bracts 1 in., opposite, more or less unequal, one of each pair supporting a flower; bracteoles $\frac{1}{4}$ in., linear-oblong. *Calyx* $\frac{1}{4}$ - $\frac{1}{2}$ in., divided subequally very nearly to the base; segments (one a little longer than the other 4) linear-oblong, green, viscous-pubescent. *Corolla* nearly straight glabrous, yellow with brown or red spots or lines; linear-cylindric base of the tube about as long as the ventricose part. *Filaments* very hairy. *Capsule* $\frac{3}{4}$ in., nearly glabrous, 4-seeded. *Seeds* $\frac{1}{8}$ - $\frac{1}{6}$ in., fulvous-hairy; areoles very small.—Nees erected this plant into a genus on the ground that the calyx was 2-lipped with one lip trifid but half-way down; an error of fact.

126. **S. paucinervius**, *T. Anders. in Herb. Kew*; glabrous, leaves elliptic acuminate, spikes linear elongated interrupted flexuose alternate-fld., bracts lanceolate persistent.

TENASSERIM OR ANDAMAN ISLANDS; *Helper* (Kew Distrib. n. 6115).

Apparently a lax shrub. *Leaves* $4\frac{1}{2}$ by $1\frac{1}{2}$ in., base rhomboid, subentire or minutely denticulate, lineolate on both surfaces; nerves 5-6 pair; petiole $\frac{1}{2}$ in. *Spikes* 2-4 in., axillary, short peduncled, 1 or 2 together; bracts $\frac{1}{2}$ in., bracteoles nearly as long, narrower, persistent. *Calyx* subequally 5-fid nearly to the base; segments linear-lanceolate acute. *Capsule* $\frac{3}{4}$ in., glabrous, 4-seeded. *Seeds* $\frac{1}{8}$ in., ovate, shaggy; areoles hardly any.

127. **S. elongatus**, *Clarke*; glabrous, leaves lanceolate acuminate, spikes very long lax, flowers alternate and opposite distant, bracts lanceolate persistent, sepals linear-lanceolate rather longer than the bracts.

ASSAM; Namroop, *Griffith* (Kew Distrib. n. 6183).

A shrub. *Leaves* $4\frac{1}{4}$ by $1\frac{1}{4}$ in., base cuneate, minutely serrate, densely lineolate above; nerves 11 pair; petiole $\frac{1}{4}$ in. *Spikes* axillary and quasi-terminal, 1 or 2 together, attaining 7 in., sparingly branched, leafless; bracts in opposite pairs, all distant, both or one or neither bearing a flower, $\frac{1}{2}$ by $\frac{1}{10}$ in.; bracteoles linear, shorter than the bracts. *Sepals* $\frac{1}{2}$ in., glabrous. *Corolla* not seen. *Capsule* $\frac{1}{4}$ - $\frac{1}{2}$ in., 4-seeded, glabrous. *Seeds* compressed, orbicular, subelastically hairy.

128. **S. farinosus**, *Clarke*; leaves elliptic acuminate at each end serrate glabrous, spikes in a pubescent panicle, flowers distant alternate, bracts very small persistent, corolla $1\frac{1}{2}$ in. nearly glabrous without.

MOULMEIN; Thoung Yun, *Lobb*.

Branch terete, glabrous. *Leaves* 5 by $1\frac{3}{4}$ in., upper surface lineolate, lower pale; nerves 7 pair; petiole $\frac{3}{4}$ in. *Spikes* axillary, and a terminal panicle 4 in. diam.;

bracts $\frac{1}{2}$ in., elliptic, pubescent, opposite one of each pair usually barren; bracteoles oblong rather longer than the bracts. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., divided subequally nearly to the base; segments linear-ligulate, softly pubescent, densely white papillose down the back. *Corolla* nearly straight, much ventricose upwards, constricted base of the tube short. *Style* glabrous. *Capsule* $\frac{1}{2}$ in., spatulate-oblong, puberous, 4-seeded. *Seeds* $\frac{1}{8}$ – $\frac{1}{4}$ in., ovate, shaggy; areoles very small.—The papillæ on the backs of the sepals (and continued also on the bracts) give this species a powdered or farinose look.

129. **S. nobilis**, *Clarke*; leaves elliptic acuminate at both ends sparsely hairy on the nerves beneath, spikes long flexuose paniced pubescent, flowers alternate, bracts lanceolate acute persistent.

JAINTA HILLS; Jarain, alt. 3500 ft., *Clarke*.

An erect gregarious shrub, 6–10 ft. *Leaves* 9 by 3 in., unequal-sided, upper sessile, serrate, thinly lineolate above; nerves 10 pair. *Spikes* 6–12 in., hardly interrupted; bracts $\frac{1}{2}$ –1 in., very acuminate, minutely hairy; bracteoles $\frac{1}{2}$ in., linear-lanceolate. *Calyx* $\frac{3}{8}$ in., divided nearly to the base equally; segments linear, minutely scabrous-pubescent. *Capsule* $\frac{1}{2}$ in., nearly glabrous, 4-seeded. *Seeds* $\frac{1}{8}$ in., ovate, shaggy; areoles very small.—*Corolla* not preserved, believed to be yellow.

130. **S. inflatus**, *T. Anders. in Journ. Linn. Soc.* ix. 476; villous, leaves elliptic or subovate acuminate, flowers alternate or some opposite in flexuose or twisted 1-sided spikes, lower bracts leaf-like upper spatulate, corolla $1\frac{1}{2}$ in. much curved pubescent without.—*Goldfussia* sp. n. 28, *Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA, alt. 5–8000 ft.; *J. D. H.*

Branches woody, flexuose, terete, fulvous-villous. *Leaves* $2\frac{1}{2}$ by $\frac{3}{4}$ – $1\frac{1}{4}$ in., serrate, hairy on both surfaces; nerves 6 pair; petiole $1\frac{1}{4}$ in. *Spikes* 1–3 in., fulvous villous, internodes zigzag or contorted almost as in *S. Helictus*; most of the bracts foliaceous; bracteoles minute linear. *Corolla* funnel-shaped, inflated, tube very much curved towards the top; segments subquadrate orbicular. *Capsule* $\frac{2}{3}$ in., narrowly elliptic, glabrous, 4-seeded. *Seeds* $\frac{1}{8}$ in., subquadrate, shaggy; areoles subobsolete.—Nearly all the bracts are leaf-like, persistent; the uppermost, entirely bracteiform ones, are deciduous.

131. **S. Wallichii**, *Nees in Wall. Pl. As. Rar.* iii. 87, and in *DC. Prodr.* xi. 193; leaves petioled elliptic acuminate nearly glabrous upper sessile cordate, spikes lax 1-sided, flowers solitary or paired, many of the lower bracts large leaf-like, sepals linear subobtuse glabrous in fruit elongate somewhat hairy at the tips, corolla $1\frac{1}{4}$ in. blue. *T. Anders. in Journ. Linn. Soc.* ix. 477. *Ruellia alata*, *Wall. Pl. As. Rar.* i. 26, t. 31, and *Cat.* 2371 a. *Goldfussia Thomsoni*, *Bot. Mag.* t. 5119, not *Strobilanthes Thomsoni*, *T. Anders.*

SUBALPINE HIMALAYA, alt. 7–11,000 ft.; from Nepal to Bhotan, common, *Wallich*, &c.

Stems 6–24 in., weak, quadrangular sometimes sharply, glabrous or pubescent on the angles. *Leaves* 3 by 1 in., crenate-serrate, puberulous or glabrate, thinly lineolate above; nerves 6 pair; petiole $\frac{3}{4}$ in. *Spikes* 1–6 in., often flexuose or zigzag, lowest flowers appearing often axillary solitary opposite; bracts (many of the middle ones) ovate or subcordate, altogether resembling the upper leaves; uppermost bracts often small, less than $\frac{1}{4}$ in., ovate or obovate, glabrate; bracteoles linear-oblong, small or 0. *Sepals* in flower $\frac{1}{2}$ in., usually quite glabrous, in fruit often more than 1 in., laxly flexuose, very narrow, usually more or less glandular hairy at least at the tips. *Corolla* nearly straight, glabrous or with minute lines of hairs within; cylindrical base about as long as the ventricose portion; segments short, round. *Filaments* and *style* glabrous. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous, 4-seeded. *Seeds* $\frac{1}{8}$ in., ovate, pubescent; areoles small.—The lowest flowers often appear axillary opposite, with 2 small ovate bracteoles each: more careful comparison shows that the axillary flower is on a

short axillary branch which has 2 opposite bracts, 1 barren, the other with a flower often supported by the two normal but minute bracteoles.

VAR. *microphylla*, Nees; leaves very thin herbaceous uppermost cuneate or rhomboid at the base, bracts lanceolate or subovate many foliaceous not cordate, sepals in fruit much broader than in *S. Wallichii* type, corolla-mouth much on one side, capsule more than $\frac{1}{2}$ in., seeds $\frac{1}{2}$ in. *Ruellia alata*, *Wall. Cat.* 2371 b.—N.W. Himalaya, alt. 7–11,000 ft.; from Kashmir to Kumaon, common, *Wallich*, &c.—Connected by intermediate forms with the Sikkim type. Leaves often large, sometimes small.

132. ***S. atropurpureus*, Nees in Wall. Pl. As. Rar.** iii. 86, and in *DC. Prodr.* xi. 195; leaves ovate acute coarsely serrate sparsely hairy, spikes lax, flowers solitary or paired, many of the lower bracts leaf-like, sepals linear subobtuse patently hairy, corolla $1\frac{1}{2}$ in. blue. *T. Anders. in Journ. Linn. Soc.* ix. 477. *Ruellia atropurpurea*, *Wall. Cat.* 2398.

SUBALPINE W. HIMALAYA, alt. 6–10,000 ft.; from Jamu to Nepal, frequent, *Wallich*, &c.

A perennial, often growing in swamps; stems 1– $1\frac{1}{2}$ foot, thick, succulent, hirsute upwards, or dwarfed 3–6 in. Lower leaves petioled or the petiole winged to the base. Corolla usually much curved, the ventricose part of the tube very broad. Otherwise as *S. Wallichii* var. *microphylla*, of which this species has been treated (perhaps correctly) at Kew as a var.

133. ***S. subnudatus*, Clarke;** leaves petioled elliptic acuminate at both ends nearly glabrous uppermost sessile cordate, spikes linear hairy interrupted, nearly all the bracts small oblong, sepals linear elongated subobtuse hairy, corolla $1\frac{1}{2}$ in. purple.—*Goldfussia* sp. n. 29, *Herb. Ind. Or. H. f. & T.*

SUBALPINE SIKKIM; Lachoong, alt. 9000 ft., *J. D. H.*

Stems 1 foot, from a woody rootstock, slender, nearly glabrous. Leaves $1\frac{1}{2}$ by $\frac{1}{2}$ in., crenate, with minute scattered bristly hairs above and on the nerves beneath, raphides obsolete; petiole $\frac{1}{2}$ in., one or two pairs of the leaves at the base of the spikes sessile cordate. Spikes $1\frac{1}{2}$ –4 in.; flowers mostly subsolitary, occasionally opposite; bracts $\frac{1}{2}$ in., oblong or elliptic (none of the flowers with large bracts similar to the uppermost sessile cordate leaves as in *S. Wallichii*); bracteoles similar to the bracts. Sepals in fruit $\frac{1}{2}$ – $\frac{3}{4}$ in., as of *S. Wallichii*.—This has been taken as a form of *S. Wallichii*; but none of the numerous forms of *S. Wallichii* have bracts and hairy spikes without foliaceous bracts like it.

134. ***S. urophyllus*, Nees in DC. Prodr.** xi. 192; leaves lanceolate acuminate at both ends glabrous, flowers scattered, lower bracts leaf-like upper small long-petioled ovate, corolla $\frac{1}{2}$ in. curved pubescent without. *T. Anders. in Journ. Linn. Soc.* ix. 477. *Ruellia urophylla*, *Wall. Cat.* 2344. *Dipteracanthus urophyllus*, *Nees in Wall. Pl. As. Rar.* iii. 82.

KHASIA MTS.; *Wallich*. JAINTIA, alt. 4000 ft.; Jarain, *Clarke*.

A small, ramous, nearly glabrous shrub. Leaves $5\frac{1}{2}$ by $1\frac{1}{2}$ in., those on the flowering branches much reduced, serrate, not (or very obscurely) lincolate; nerves 9 pair; petiole $1\frac{1}{2}$ in. Flowers scattered, alternate and subopposite on small-leaved branches; bracts $\frac{1}{2}$ in. exclusive of their $\frac{1}{2}$ in. petioles, nearly glabrous, persistent; bracteoles similar. Calyx $\frac{1}{4}$ – $\frac{1}{2}$ in., divided nearly to the base, pubescent; segments linear, enlarged more hairy in fruit. Capsule $\frac{3}{4}$ – $1\frac{1}{2}$ in., 4-seeded. Seeds $\frac{1}{2}$ in., ovate, pubescent; areoles very small.

VAR. *sikkimensis*; leaves much broader, corolla 1 in. much curved purple-blue.—Darjeeling; *Griffith* (Kew Distrib. n. 6125); alt. 6000 ft., *Treutler*.—Leaves $5\frac{1}{2}$ by $2\frac{1}{2}$ in. “Flowers faintly fragrant” (*Treutler*).

135. ***S. stenophyllus*, Clarke;** leaves narrowly lanceolate attenuate

at both ends ciliate pubescent, flowers alternate or opposite in leafy spikes, upper bracts ovate or spatulate persistent, corolla 1 in. nearly glabrous purple.

KHASIA Mts., alt. 3-5000 ft., frequent; *J. D. H.*, &c.

A small, erect, somewhat densely branched shrub. *Leaves* $2\frac{1}{2}$ by $\frac{1}{2}$ in., equal or subequal, minutely dentate undulate or subentire; nerves 5-6 pair, puberulous, beneath ciliate; petiole obscure. *Spikes* 1-3 in., numerous, axillary and terminal, nearly glabrous; lower bracts leaf-like; upper sometimes spatulate (hardly petioled as in *S. urophyllus*); bracteoles $\frac{1}{2}$ in., ovate. *Sepals* $\frac{1}{2}$ - $\frac{1}{2}$ in., subequal, linear, obtuse. *Corolla* nearly straight, hairy within; cylindric base shorter than the ventricose portion; segments short, round. *Filaments* very hairy downwards. *Ovary* glabrous; style sparsely hairy. *Capsule* $\frac{3}{4}$ in., 4-seeded. *Seeds* $\frac{1}{4}$ - $\frac{1}{2}$ in., ovate, pubescent; areoles hardly any.—This common Khasia in habit and leaves remarkably resembles *S. isophyllus*; the inflorescence, sepals, &c., are totally different.

136. **S. Panichanga**, *T. Anders. in Journ. Linn. Soc.* ix. 478; leaves broadly elliptic acuminate at both ends rusty-pubescent, panicles lax capillary pubescent, flowers scattered mostly alternate, bracts minute persistent, corolla $1\frac{1}{2}$ in. nearly glabrous. *Ruellia Panichanga*, *Wall. Cat.* 2387. *Asystasia Panichanga*, *Nees in Wall. Pl. As. Rar.* iii. 90, and in *DC. Prodr.* xi. 167.

SILHET; *Wallich.* CACHAR; *Keenan.*

A shrub; branches tetragonous, pubescent upwards. *Leaves* $6\frac{1}{2}$ by $2\frac{1}{2}$ in., serrate; nerves 10 pair; petiole $\frac{3}{4}$ in. *Peduncles* $\frac{1}{2}$ -2 in., repeatedly trichotomous; bracts and bracteoles scarcely $\frac{1}{2}$ in., linear, pubescent. *Calyx* $\frac{1}{2}$ in., deeply subequally 5-fid, closely uniformly pubescent; segments linear-lanceolate. *Corolla* nearly straight, puberulous, cylindric base longer than the calyx, gradually widening into the rather narrow cylindric portion of the tube; segments round, short, contorted in bud. *Filaments* and style with scattered white hairs. *Capsule* more than $\frac{1}{2}$ in.

137. **S. coloratus**, *T. Anders. in Journ. Linn. Soc.* ix. 481, not of *Nees*; leaves ovate or elliptic acuminate glabrous, panicles capillary very compound glabrous, bracts elliptic caducous, corolla $1\frac{1}{2}$ in. nearly glabrous pale purple. *Ruellia colorata*, *Wall. Cat.* 2388. *Goldfussia colorata*, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 176.—*Acanthacea*, *Griff. Itin. Notes*, 87, n. 1280.

EASTERN HIMALAYA; Sikkim and Bhotan, alt. 2-5000 ft., *Clarke.* ASSAM and KHASIA Mts., alt. 2-4000 ft., frequent; *Griffith, H. f. & T.*, &c.

A nearly glabrous shrub, 3-6 ft. *Leaves* 7 by $2\frac{1}{2}$ -4 in., serrate; nerves 7-8 pair; petiole $\frac{1}{4}$ - $1\frac{1}{2}$ in. *Panicle* often 1 foot in diam., leafless bractless with 200-500 flowers, sometimes denser with stouter shorter branches; bracts $\frac{1}{2}$ in. *Calyx* $\frac{1}{4}$ - $\frac{1}{2}$ in., deeply 5-fid; segments subequal, lanceolate, glabrous. *Corolla* tubular-ventricose, glabrous. *Capsule* $\frac{1}{2}$ - $\frac{3}{4}$ in., 4-seeded. *Seeds* $\frac{1}{4}$ - $\frac{1}{2}$ in., ovate, pubescent; areoles hardly any.—The flowers said by *Nees* to be capitate are mostly alternate scattered; they are capitate only at the tips of the younger panicle-branches.

VAB. *crinita*; panicle-branches minutely thinly glandular-hairy. *S. crinitus*, *T. Anders. in Journ. Linn. Soc.* ix. 481. *Goldfussia crinita*, *Nees in DC. Prodr.* xi. 176.—Bhotan, alt. 1000 ft.; *Griffith.* Assam.—Varies in the thinness of the panicle-branches just as does the type.

Series D. *Paniculata*: Flowers paniced laxly, or densely, secund, subspicate. *Bracts* conspicuous, persistent. *Capsule* elliptic, compressed, cuneate at both ends. *Seeds* shaggy, often only 2 perfected, or if 4 imbricated.—Species of Ceylon or S. Deccan Peninsula. (This series approaches in technical character, though not in habit, the section *** of the series A, *Bracteata*. Compare *S. perfoliatus* above, which Wight placed here.)

138. **S. sexennis**, *Nees in DC. Prodr.* xi. 187; leaves sessile elliptic attenuate at each end denticulate nearly glabrous, bracts sessile ovate base rounded or subcordate glandular-hairy or glabrate, corolla $1\frac{1}{2}$ in. glabrous. *T. Anders. in Journ. Linn. Soc.* ix. 483. *S. interruptus*, *Benth. in Pl. Hohenack.* n. 1432.

CEYLON; *Walker, Thwaites*, C. P. n. 2593. NILGHERY MTS.; on Dodabetta, *Hohenacker*.

A shrub, flowering at 6 or 7 years old, then dying down. Branches subquadrangular, glabrous, transversely verrucose. Leaves 3 by 1 in.; nerves 5-6 pair; petiole winged, base dilated. Bracts $\frac{1}{2}$ by $\frac{1}{4}$ - $\frac{1}{2}$ in., glabrous or hairy on the same spike; bracteoles $\frac{1}{2}$ in., oblong obtuse. Calyx divided subequally nearly to the base; segments linear-oblong, hairy at least at the tips. Corolla white (Beddome). Capsule $\frac{1}{2}$ in., glabrous, 2-seeded.—Described from *Nees'* type specimen; the specimen in leaf only which he adds has very large many-nerved leaves very woolly when young, and is a gregarious undershrub well known to Col. Beddome in Ceylon, of which the flower has not yet been observed.

VAR. *arguta*; leaves distinctly dentate sometimes slightly hairy, petiole (even in the leaves near the spikes) usually well defined sometimes 1-2 in. not dilated at the base, spikes often elongate secund sometimes dense. *S. argutus*, *Nees in DC. Prodr.* xi. 188.—Ceylon, frequent; *Gardner, Thwaites*, C. P. 66 partly, &c.—Appears a trifling variety.

VAR. *cerinthoides*; leaves sessile elliptic or oblong narrowed suddenly at the very base subentire coriaceous few-nerved. *S. cerinthoides*, *Nees in DC. Prodr.* xi. 724; *T. Anders. in Thwaites Enum.* 229. *Mackenzia sessilis*, *Nees in DC. Prodr.* xi. 308.—Ceylon; *Thwaites* (C. P. nn. 2594, 66 partly), *Mackenzie*, &c.—The type of this with nearly all the leaves subsessile rounded at the base seems to form a distinct species, but there are examples wherein the lower leaves are cuneate at the base. The flowers are noted white with much purple marking.

VAR. *hirsutissima*; stem and leaves hirsute. *S. hirsutissimus*, *Nees in DC. Prodr.* xi. 187.—Ceylon; *Walker, Thwaites* (C. P. n. 3626), &c.

139. **S. homotropus**, *Nees in DC. Prodr.* xi. 187; leaves oblong or elliptic long attenuate at the base glabrous, spikes very hairy flexuose or somewhat twisted, bracts elliptic or subovate narrowed at the base, corolla 1 in. nearly glabrous. *S. sexennis*, *Bedd. Ic. Pl. Ind. Or.* t. 206, not of *Nees*.

NILGHERY MTS., alt. 8000 ft.; *Wight*, &c.

This has been treated as a var. of *S. sexennis*, but the bracts are quite unlike.

140. **S. violaceus**, *Bedd. Ic. Pl. Ind. Or.* t. 205; leaves large petioled ovate hairy on both surfaces, bracts elliptic or oblong much shorter than the calyx, corolla $1\frac{1}{4}$ in. glabrous without deep violet.

NILGHERY MTS.; *Sisparah*, alt. 6000 ft., *Beddome*.

A large shrub, very rarely flowering (Beddome); branches quadrangular, hairy upwards. Leaves $6\frac{1}{2}$ by $3\frac{1}{4}$ in., shortly acuminate at both ends, crenulate; nerves 14 pair; petiole 1-2 in. Panicles 6-10 in., lax, hairy; bracts $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., oblong hairy. Calyx divided nearly to the base, less hairy than the bracteoles; segments $\frac{1}{4}$ in., narrowly oblong, obtuse. Corolla nearly straight, urceolate, very hairy within; constricted base short; segments short, rounded. Capsule not seen.

141. **S. gracilis**, *Bedd. in Trans. Linn. Soc.* xxv. 222, and *Ic. Pl. Ind. Or.* t. 207, not of *T. Anders.*; leaves sessile lanceolate attenuate at both ends glabrous, panicle glabrous, bracts oblong much shorter than the calyx, bracteoles 0, corolla 1 in. white lilac tinged. *S. Beddomei*, *T. Anders. in Journ. Linn. Soc.* ix. 482.

ANAMALLAY MTS., alt. 5-6000 ft.; *Beddome*.

A very large shrub (Beddome), glabrous or the sepal-tips thinly glandular-hairy; branches terete. *Leaves* 7 by $2\frac{1}{4}$ in., serrulate; nerves 10 pair. *Panicle* lax, branches long curved, flowers distant; bracts in opposite pairs, $\frac{1}{8}$ – $\frac{1}{4}$ in., sometimes both, more often one only, carrying a flower on a pedicel $0\text{--}\frac{1}{10}$ in. *Sepals* $\frac{1}{4}$ – $\frac{1}{2}$ in., linear-ligulate. *Corolla* slightly curved, nearly glabrous, constricted part of the tube short (from Beddome). *Filaments* and *style* hairy (Beddome). *Capsule* $\frac{1}{2}$ in., glabrous.

142. **S. hellicoides**, *T. Anders. in Thwaites Enum.* 229, and in *Journ. Linn. Soc.* ix. 483; leaves elliptic or obovate acuminate glabrous, panicle very compound capillary divaricate glabrous, flowers scattered mostly in appearance pedicelled, bracts much smaller than the calyx, corolla 1 in. glabrous without violet. *Bedd. Ic. Pl. Ind. Or.* t. 220. *Leptacanthus hellicoides*, *Nees in DC. Prodr.* xi. 170.

CEYLON, up to 3000 ft. alt.; *Walker, Thwaites.*

A shrub, 2–3 ft., glabrous except the sepal-tips. *Leaves* 4 by $1\frac{1}{4}$ in. (lower larger), base cuneate rounded (or the upper cordate), toothed, paler beneath; nerves 5–6 pair; petiole $0\text{--}\frac{1}{2}$ in. *Panicle* 6–12 in. diam., dense with slender divaricate recurved or zigzag branches; bracts at the forks $\frac{1}{2}$ – $\frac{1}{2}$ in., ovate; bracts below the flowers $\frac{1}{2}$ – $\frac{1}{2}$ in., linear or linear-obovate. *Sepals* $\frac{1}{4}$ in., linear, glabrous or sparsely glandular-hairy at the tips. *Corolla* nearly straight, ventricose, constricted base very short; segments short, rounded. *Capsule* $\frac{1}{2}$ in., glabrous, 2-seeded (4-seeded, *Nees*).—The flowers are in appearance solitary terminal on pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in., with 2 bracts (called bracteoles by Beddome) placed $0\text{--}\frac{1}{20}$ in. below the flower.

143. **S. rubicundus**, *T. Anders. in Journ. Linn. Soc.* ix. 483 (not of Thwaites Enum. 229); leaves lanceolate acuminate at both ends nearly glabrous, panicle compound slender glandular-pubescent, bracts at the forks ovate acuminate, flower-bracts 0, corolla $\frac{3}{4}$ in. pubescent without violet. *S. paniculatus*, *Bedd. Ic. Pl. Ind. Or.* t. 199, not of *T. Anders.* *Ruellia rubicunda*, *Heyne in Herb. Rottler; Wall. Cat.* 2337. *Leptacanthus rubicundus*, *Nees in Wall. Pl. As. Rar.* iii. 90, and in *DC. Prodr.* xi. 170.

S. DECCAN PENINSULA; Wynaad and Coorg, alt. 2–3000 ft., *Rottler, Beddome.*

A rather delicate shrub, 5–6 ft.; branches cylindric, glabrous. *Leaves* 5 by $1\frac{1}{4}$ in., unulate crenate or subentire; nerves 6–7 pair, glabrous or pubescent beneath; petiole $\frac{1}{2}$ in. *Panicle* 8 in., narrow; bracts at the forks $\frac{1}{2}$ – $\frac{1}{2}$ in., lanceolate from an ovate base; pedicels $\frac{1}{2}$ – $\frac{1}{2}$ in., mostly ebracteolate except at the base. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., divided deeply, closely pubescent; segments lanceolate-subulate, often very unequal. *Corolla* nearly straight; base funnel-shaped, hardly cylindric. *Capsule* not seen.

144. **S. paniculatus**, *T. Anders. in Journ. Linn. Soc.* ix. 483, not of *Bedd.*; leaves lanceolate acuminate at both ends nearly glabrous, panicle compound slender glandular-pubescent, bracts at the forks linear or linear-oblong, pedicels very short, flower-bracts 0, corolla nearly 1 in. glabrous without. *S. rubicundus*, *T. Anders. in Thwaites Enum.* 229, not of *Journ. Linn. Soc.* ix. 483.

CEYLON; *Thwaites* (C. P. n. 3351).

Pedicels $0\text{--}\frac{1}{10}$ in. *Calyx* $\frac{1}{8}$ – $\frac{1}{4}$ in., glandular-hairy. Otherwise as *S. rubicundus*; the leaves are in the examples a good deal longer.

145. **S. pulcherrimus**, *T. Anders. in Thwaites Enum.* 229, excl. syn., and in *Journ. Linn. Soc.* ix. 483, the Ceylon plant only; leaves elliptic acuminate at both ends hairy on the nerves beneath, panicle large very compound viscos hairy, bracts at its divisions ovate acute, flower-bracts obsolete, corolla 1 in. puberulous without violet, capsule hairy. *Leptacanthus Walkeri*, *Nees in DC. Prodr.* xi. 170, not of *Wight*.

CEYLON, alt. 4-7000 ft.; *Walker, Thwaites* (C. P. nn. 266, 301).

A large, rambling shrub (*Walker*); branches terete, glabrous. *Leaves* 6½ by 2½ in., minutely toothed; nerves 9 pair; petiole 1½ in. *Panicle* 8-14 in.; branches ascending, bracts ½-¾ in., sessile, base rounded or cordate; pedicels ⅓-½ in., mostly ebracteolate except at the base. *Calyx* ½-⅓ in., divided nearly to the base, viscidous-hairy; segments linear caudate. *Corolla* nearly straight; tube broad-cylindric from the base, very hairy within; segments short, round. *Capsule* ⅔ in., 4-seeded.

146. *S. amabilis*, *Clarke*; leaves broadly elliptic acuminate at both ends glabrous, panicle large compound viscidous hairy, bracts at its divisions linear-oblong, flower-bracts linear much shorter than the calyx, corolla 1½-1¾ in. glabrous without purplish, capsule glabrous. *Leptacanthus Walkeri*, *Wight Ic. t. 1507*, not of *Nees*, nor *Strobilanthes Walkeri, Nees*.

NILGHERY MTS., alt. 6000 ft.; *Gardner, &c., Hohenacker*, n. 1440.

Leaves 7½ by 3½ in., glabrous beneath; nerves 10-12 pair. *Calyx* ½-⅔ in., closely subtended by 2 linear bracts. *Capsule* ⅔ in. and upwards, conspicuously stipitate.—Closely allied to *S. pulcherrimus*, which it was taken for by *Wight*. *T. Anderson* overlooked the numerous points of difference above diagnosed, which are constant. A much finer species than the Ceylon one, the panicle stouter with fewer but larger flowers.

SPECIES NOT SEEN.

147. *S. NEESII*, *Kurz in Journ. As. Soc. 1873*, pt. ii. 93, and *For. Fl.* ii. 245; leaves large lanceolate minutely hairy on both surfaces, spikes sessile dense bracteate ultimately elongated interrupted below, bracts proper oblong-linear shorter than the calyx slightly serrate at the tips, corolla 1¼-1½ in. glabrous without purple.

MARTABAN; *Kurz*.

A large shrub, 10-12 ft. *Leaves* attaining 10 in., shortly acuminate, base attenuate, obsoletely repand-toothed; petiole ¼-1½ in. Lowest bracts (or floral leaves) leaf-like, caducous, ½ in., tips serrate; bracteoles 2, linear-lanceolate, glandular-hirsute, as long as the calyx. *Calyx-segments* ⅔ in. or more, linear, hoary, ciliate. *Corolla-tube* long, slender, hairy within. *Stamens* 2 only; filaments glabrous. *Style* hairy. *Capsule* a little longer than the calyx, glabrous, tip pubescent, 4-seeded. *Seeds* silky.

148. *S. REMOTUS*, *T. Anders. in Journ. Linn. Soc.* ix. 471; leaves ovate acuminate subentire glabrous, spikes axillary 1 or 2 together elongate, flowers remote solitary, bracteoles and calyx-segments smaller than the bracts, capsule elongate glabrous.

TENASSERIM; *Helper*.

Stem subterete, glabrous. *Spikes* 1½-3 in.; bracts ½ in., lanceolate, mucronate, 1-nerved, glabrous; bracteoles and calyx-segments ½ in., narrower than the bracts. *Capsule* ⅔ in.—Allied to *S. fimbriatus* and *S. polythrix*.

149. *S. HAPLANTHOIDES*, *T. Anders. in Journ. Linn. Soc.* ix. 471; leaves petioled ovate acuminate at both ends crenate or undulate glabrous or floral leaves ciliate, spikes suberect lax, bracts bracteoles and calyx-segments linear hirsute with hyaline bristles, corolla funnel-shaped pubescent without hairy within.

BRITISH BURMA; Moulmein, *Falconer* (n. 402 in *Herb. Calcutt.*), *Helper*, n. 255.

An erect herb, 1-1½ foot. *Stem* terete, swollen at the nodes, glabrous. *Leaves* 2-3½ by 1-1½ in., paler beneath; petiole ¼ in. *Spikes* 2-3 in., lax, crowded in the upper axils and subterminal, on slender hirsute peduncles; bracts ½ in.; bracteoles and calyx ½ in. *Corolla* ⅔ in., tube suddenly narrowed, segments small. *Capsule* ½ in., constricted at the base, upwards ovate, acute, glabrous.—Placed by *T. Anderson* next *S. khasyanus*.

150. *S. MASTERSI*, *T. Anders. in Journ. Linn. Soc.* ix. 481; upper leaves sessile lanceolate acute serrate subglabrous, panicles dichotomous lax erect viscidous, pedicels elongate mostly 1-fld., bracts lanceolate acute sparsely glandular deciduous, corolla funnel-shaped suberect glabrous.

ASSAM; *Masters, Simons*.

Stem erect, tetragonous, glandular, viscous. *Calyx-segments* equal, linear, glandular, viscous. *Stamens* included. *Capsule* oblanceolate, elongate, tip glandular, 4-seeded.—Placed by Anderson next *S. coloratus*.

151. *S. SPICATUS*, *T. Anders. in Journ. Linn. Soc.* ix. 484; leaves subsessile ovate or ovate-lanceolate acute base subcordate serrate tomentose above pale pubescent beneath, spikes terminal elongate, flowers solitary sessile opposite, bracts leaf-like ovate pubescent, bracteoles small herbaceous spatulate, corolla $1\frac{1}{2}$ in. funnel-shaped glabrous.

KHASIA MTS. ; above Nunklow, *Simons*.

Softly pubescent; stem tetragonous. *Leaves* 1-3 by $\frac{1}{2}$ -1 in., floral passing into bracts. *Bracts* $\frac{1}{2}$ - $\frac{3}{4}$ in.; bracteoles $\frac{1}{4}$ in. *Calyx* $\frac{1}{2}$ in.; segments linear, unequal. *Capsule* oblanceolate, glandular at the tip, 4-seeded. *Seeds* large.—Affinity uncertain, *T. Anderson*.

152. *S. LAMIOIDES*, *T. Anders. in Journ. Linn. Soc.* ix. 485; floral leaves large sessile ovate acuminate serrate tomentose beneath, heads terminal few-fl., bracts spatulate glandular-tomentose ciliate, corolla straight tomentose without and within. *Kurz For. Fl.* ii. 244.

PEGU; Mt. Taijoo, alt. 4000 ft., *Brandis*; Mts. Nattoung, *Cross*. MARTABAN HILLS, alt. 2-4000 ft.; *Kurz*.

An evergreen shrub (*Kurz*), glandular-tomentose; stem subtetragonous. Floral leaves 3-1 by 2-1 in., glabrous above. *Heads* leafy, lax, sessile or shortly peduncled; bracteoles linear, acute, subglabrous. *Calyx* 5-cleft to the middle; lobes linear, acute. *Corolla* $\frac{1}{2}$ in., like that of *Ruellia*. *Stamens* included. *Capsule* $\frac{1}{2}$ in., compressed, tip bearded. *Seeds* large.—Of doubtful affinity (*T. Anderson*). Corolla blueish-purple, seeds shortly tomentose (*Kurz*).

153. *S. VIOLEFOLIUS*, *T. Anders. in Journ. Linn. Soc.* ix. 485; leaves petioled obliquely ovate acute serrate subglabrous, spikes few-fl., flowers distant subsessile in opposite pairs, bracts linear, corolla funnel-shaped straight glabrous without and within.

SIKKIM HIMALAYA, alt. 5000 ft.; Ratong Valley, *T. Anderson*.

Stem herbaceous, weak; innovations pubescent. Lower leaves round; petiole 1 in., filiform; upper leaves sessile, $1\frac{1}{2}$ -3 $\frac{1}{2}$ by 1-1 $\frac{1}{2}$ in. *Spikes* 3-4 in., terminal on lateral branches; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., linear sometimes spatulate, herbaceous; bracteoles $\frac{1}{8}$ in., subulate. *Calyx* deeply divided; segments $\frac{1}{2}$ in., linear, acute, glabrous. *Corolla* $\frac{1}{2}$ in., pale blue; lobes equal, small.—Of doubtful affinity (*T. Anderson*).

154. *S. ? LANATUS*, *Nees in DC. Prodr.* xi. 191; leaves ovate acuminate entire glabrate above woolly-tomentose beneath, spikes axillary and terminal ternate cylindric dense, bracts oblong obtusely cuspidate woolly-tomentose beneath glabrous lanceolate above.

NILGHERRIES; *Perrottet*.

Very distinct from the stem, petioles under surface of leaves and spikes being densely softly tomentose. *Corolla-tube* 1 in., slender, throat campanulate, approaching that of *Stenosiphonium*. *Calyx* sub-5-partite; segments linear, obtuse, very villous.—Genus doubtful: referred to *Strobilanthes* from its similarity to *S. Mysurensis*, *Nees*, which is an *Asystasia*.

S. VERUCULOSUS, *Nees in DC. Prodr.* xi. 181, from "India" remains obscure; *Nees* doubts whether it may not have been a *Ruellia*.

XIX. CALACANTHUS, *T. Anders.*

A shrub. *Leaves* large, entire. *Spikes* terminal, dense or elongate, hairy; bracts prominent, elliptic; flowers large, purple. *Calyx* sub-5-partite, segments unequal. *Corolla* deeply 2-lipped; posterior lip narrow, shortly 2-fid, anterior of 3 short emarginate lobes; lobes all contorted in bud. *Stamens* 4, didynamous; anthers subequal, oblong, 2-celled, muticous. *Ovary* 4-ovulate; style long, stigma simple linear. *Capsule* ellipsoid,

compressed, acute at both ends, 2-seeded. *Seeds* compressed, exareolate, densely shortly hairy.

C. Dalzelliana, *T. Anders.*; *Benth. in Gen. Pl.* ii. 1088. *Lepidagathis grandiflora*, *Dalz. in Hook. Kew Journ.* ii. 138; *Dalz. & Gibs. Bomb. Fl.* 190; *Bedd. Ic. Pl. Ind. Or. t.* 226.

SYHADREE MTS.; near Bombay, *Dalzell*. CANARA; near the foot of the Ghats, plentiful, *Beddome*; Parwhur Ghat, *Ritchie*.

Leaves 7 by $3\frac{1}{2}$ in., acuminate at both ends, very sparsely hairy above, glabrous beneath, minutely lineolate on both surfaces; nerves 11 pair; petiole 0-1 in. *Spikes* 1-6 in., sometimes interrupted towards the base; bracts $\frac{2}{3}$ in.; bracteoles $\frac{1}{2}$ - $\frac{1}{4}$ in., oblong. *Calyx* $\frac{1}{2}$ in., hairy; one segment elliptic, two narrowly oblong, two linear-lanceolate. *Corolla* $1\frac{1}{2}$ -2 in.; cylindric base shorter than the lobes; palate bullate, yellow-hairy. *Filaments* glabrous; anther-cells hairy. *Ovary* glabrous; style hairy. *Capsule* $\frac{2}{3}$ by $\frac{1}{2}$ in. *Seeds* nearly $\frac{1}{2}$ in. diam.

XX. BLEPHARIS, *Juss.*

Herbs or undershrubs, harsh often rigid or prickly. *Leaves* opposite or 4 in a whorl, subentire toothed or prickly. *Spikes* terminal or on suppressed axillary branches, strobiliform, 4-ranked or capitate and few-fld., or many-bracteate and 1-fld., bracteate and bracteolate. *Sepals* 4, unequal, in opposite pairs, inner smaller; one of the outer pair emarginate or 2-lobed. *Corolla-tube* ovoid, horny; limb of 2 lips, upper subobsolete; lower patent, 3-lobed, blue or pinkish. *Stamens* 4, didynamous; filaments thick, rigid, anterior produced above the insertion of the anthers; anthers 1-celled, margins densely bearded, second cell small or 0. *Ovary* glabrous, 4- or 2-ovulate; style linear, very shortly 2-fld. *Capsule* oblong or ellipsoid, 2- or 4-celled. *Seeds* compressed, orbicular, echinate by thick papillæ formed of closely connected tubes spirally or annularly thickened, which when moistened usually become free at their upper ends (see *Kippist in Trans. Linn. Soc.* xix. t. 6, fig. 5).—Species 20, Indian and African.

1. **B. asperima**, *Nees in DC. Prodr.* xi. 267; leaves ovate subentire setulose, bracteoles obovate 3-toothed subglabrous green-nerved, capsule 4-seeded. *Dalz. & Gibs. Bomb. Fl.* 192; *Wight Ic.* t. 1534; *T. Anders. in Journ. Linn. Soc.* ix. 499.

W. DECCAN PENINSULA; Concan and Canara, on the Ghauts common, *Daltell*, &c.

Stems 8-24 in., herbaceous, erect, glabrous or sparsely setulose. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{2}$ in., base rounded or obtuse; petiole $\frac{1}{2}$ in. *Heads* terminal and quasi-axillary, few-fld.; outermost bracts leafy; proper bracts $\frac{1}{2}$ in. or small, obovate or subpetioled, ovate; bracteoles $\frac{1}{2}$ - $\frac{1}{2}$ in., usually with 3 lanceolate subspinescent teeth, the middle the shortest. *Calyx* green-and-white nerved, glabrous thinly ciliate or setulose; 2 outer segments $\frac{3}{4}$ -1 in., spatulate, one bilobed; 2 inner much smaller, lanceolate. *Corolla* $\frac{3}{4}$ -1 in., blue. *Capsule* $\frac{1}{2}$ in., oblong, seed-bearing from the base. *Seeds* $\frac{1}{2}$ - $\frac{1}{2}$ in., compressed, ovate, closely echinate; spines obtuse, lanceolate, many closely connected tubes containing spiral filaments, which rise elastically when moistened, but do not separate.

2. **B. boerhaaviæfolia**, *Pers. Syn.* ii. 180; leaves usually 4 in a whorl elliptic repand-toothed puberulous or glabrate, bracteoles spatulate bristle-ciliate subglabrous green-nerved, capsule 2-seeded. *Wall. Cat.* 2513; *Nees in Wall. Pl. As. Rar.* iii. 97, and in *DC. Prodr.* xi. 266; *Wight Ill.* t. 164 b, fig. 6, and *Ic.* t. 458; *Dalz. & Gibs. Bomb. Fl.* 192; *T. Anders. in*

Journ. Linn. Soc. ix. 500. *B. maderaspatensis*, *Roth Nov. Sp.* 320. *Acanthus maderaspatensis*, *Linn. Sp. Pl.* 892; *Roxb. Fl. Ind.* iii. 33. *A. ciliaris*, *Burm. Fl. Ind.* 139, t. 42, fig. 2.

DECCAN PENINSULA, from Mt. Aboo and Behar to Ceylon; common. *PERU*; *Wallich*, &c.—*DISTRIB.* Ava, Tropical Africa.

Prostrate, scabrous or puberulous. *Leaves* $1\frac{3}{4}$ by $\frac{3}{4}$ in., acute at both ends; petiole $\frac{1}{2}$ in. *Spikes* axillary or peduncled, 1- or few-fl'd.; bracts $\frac{1}{2}$ in., ovate, bristle-ciliate; bracteoles $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in.; segments 4, oblong, unequal, nerved, subglabrous, one of the outer pair minutely emarginate. *Corolla* $\frac{3}{4}$ in., pink, purple or nearly white. *Capsule* $\frac{1}{2}$ in., ellipsoid, compressed, shining glabrous. *Seeds* densely covered with obtuse spines formed of tubes free at the vertex when moistened.—*Wight* depicts the ovary 2-ovulate, and no more can be found; nor does the capsule show (as 2-seeded capsules usually do) the papillæ of the suppressed ovules; but *Nees* and *Benth.* in *Gen. Pl.* say the ovary is always 4-ovulate.

3. ***B. molluginifolia***, *Pers. Syn.* ii. 180; leaves usually 4 in a whorl oblong hairy or minutely scabrous, heads mostly 1-fl'd. many of the outer bracts barren, bracteoles elliptic or oblong subsessile, capsule 2-seeded. *Wall. Cat.* 2514; *Nees in Wall. Pl. As. Rar.* iii. 97, and in *DC. Prodr.* xi. 266; *Dalz. & Gibs. Bomb. Fl.* 192; *T. Anders. in Journ. Linn. Soc.* ix. 500. *B. repens*, *Roth Nov. Sp.* 321. *Acanthus repens*, *Vahl Symb.* ii. 76. *A. maderaspatensis*, *Linn. Herb. partly*.

DECCAN PENINSULA; common in the Carnatic, and from Delhi and Chota Nagpore to CEYLON.

A wiry perennial; branches 3-6 in., prostrate, usually roughly hairy. *Leaves* $\frac{1}{2}$ -1 in., subsessile, obtuse. *Bracts* and *bracteoles* bristle-ciliate; bracts shorter than the bracteoles. *Calyx* and *corolla* nearly as of *B. boerhaaviaefolia*, but much smaller; corolla (including the larger lip) only $\frac{1}{4}$ - $\frac{1}{2}$ in. *Capsule* and *seeds* as of *B. boerhaaviaefolia*, but the seeds appear (even when dry) shaggy, from the numerous bundles of annular tubes being connected only at the base.—As in *B. boerhaaviaefolia*, only 2-ovulate ovaries and 2-seeded capsules have been seen.

4. ***B. sindica***, *Stocks*; *T. Anders. in Journ. Linn. Soc.* ix. 500; leaves linear or narrowly oblong pubescent, heads few- or many-fl'd., bracteoles linear hairy shorter than the bracts, capsule 2-seeded. *Acanthodium grossum*, *Wight Ic.* tt. 1535, 1536, *not of Nees*.

SCINDE; *Stocks*, *Dalzell*. PUNJAB; *Stewart*, *Vicary*, *Aitchison*.

Stems 3-6 in., or very short. *Leaves* 1-2 in., toothed or subspinescent. *Heads* few- or many-fl'd., 3-4 in. in fruit, quadrifarious; bracts 1 in. or more, ovate with divaricate lanceolate tips, prickly, hairy within and without; bracteoles $\frac{1}{2}$ in. *Calyx* softly hairy; 2 outer segments $\frac{3}{4}$ in., ovate; 2 inner $\frac{1}{2}$ in. narrowly ovate. *Corolla* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Capsule* $\frac{1}{2}$ in., ellipsoid, compressed, shining brown. *Seeds* $\frac{1}{2}$ in.; appearing echinate, but the tufts of tubes (even in the dry state) have all their ends free.

5. ***B. edulis***, *Pers. Syn.* ii. 180; leaves elliptic or oblong glaucous or pubescent, heads few- or many-fl'd., bracteoles linear hairy shorter than the bracts, capsule 2-seeded. *T. Anders. in Journ. Linn. Soc.* ix. 500; *Boiss. Fl. Orient.* iv. 520. *Acanthus edulis*, *Forsk. Fl. Æg.-Arab.* 114. *A. Delillii*, *Spreng. Syst.* ii. 819. *Ruellia persica*, *Burm. Fl. Ind.* p. 135, t. 42, fig. 1. *Acanthodium spicatum*, *Delile Fl. Eg.* 97, t. 33, fig. 3; *Nees in DC. Prodr.* xi. 274.

PUNJAB and SCINDE (*T. Anderson*).—*DISTRIB.* S.W. Asia, N.E. Africa.

Stems short or 1 foot or more, branched. *Leaves* often $\frac{1}{2}$ in. broad, spinescent. *Bracts* longer and more spinous than in *B. sindica*. *Corolla* $\frac{3}{4}$ -1 in., blue.—This differs from *B. sindica* by the broader usually glabrous-glaucous leaves, and the larger flowers: no Indian specimens have been seen. *Ruellia ciliaris*, *Linn. Mant.*

89, adduced as a syn. by *Nees* and *T. Anderson*, described as from India with ciliate leaves, seems more likely to have been *Blepharis boerhaaviaefolia*, i. e. *Burmamn's ciliaris*.

XXI. ACANTHUS, Linn.

Erect or twining shrubs, or herbs. *Leaves* pinnatifid, toothed, spinous or rarely entire. *Spikes* terminal or pseudo-axillary, dense strobiliform or interrupted; bracts ovate, large spinescent, or small; bracteoles large, lanceolate, rarely 0; flowers subsessile, blue or white. *Sepals* 4, 2 outer opposite, 2 inner opposite smaller. *Corolla-tube* short, ovoid, horny; limb of 2 lips, upper obsolete, lower elongate obovate, shortly obtusely 3-lobed. *Stamens* 4, didynamous, shorter than the lip; filaments stout, narrowed curved below the anther, not excurrent near the apex; anthers oblong, 1-celled, bearded. *Disc* 0. *Ovary* 4-ovulate; style very shortly 2-fid; ovules 2 in each cell. *Capsule* ellipsoid, compressed, shining chestnut-brown, 4-seeded. *Seeds* compressed, orbicular, without hairs; testa very lax.—Species 14, in the warm and hot zones of the Old World.

1. **A. carduaceus**, *Griff. Itin. Notes*, 144, and *Ic. Pl. As. Or.* t. 427; leaves large sessile elliptic deeply pinnatifid glabrous lobes toothed spinescent, spikes long woolly, bracteoles 1 in. linear silky-woolly. *T. Anders. in Journ. Linn. Soc.* ix. 500.

BHOTAN; Oongar, *Griffith*.

A robust shrub, scandent on rocks (*Griffith*). *Leaves* 12–20 by 6 in., black-green or (*Griff. Priv. Journ.* 265) flesh-coloured; lobes lanceolate. *Spikes* 6–12 in., crowded towards the ends of the branches, and on long axillary peduncles, the leaves at the base of the sessile spike being only 2–4 in. long, strobiliform, obscurely 4-ranked; bracts $1\frac{1}{4}$ by $\frac{3}{4}$ in., ovate, hairy within and without, spinous; bracteoles lanceolate. *Calyx* silky, 2 outer lobes $\frac{3}{4}$ –1 in., lanceolate one shortly 2-toothed; 2 inner lobes $\frac{3}{4}$ in., lanceolate. *Corolla* $1\frac{1}{4}$ in., white (*Griffith*), altogether as in the genus. *Capsule* $1\frac{1}{4}$ in., ellipsoid, compressed, glabrous, shining brown, 4-seeded, much as of *A. ilicifolius*.

2. **A. leucostachyus**, *Wall. Cat.* 2512; leaves short-petioled elliptic or oblong spinous-serrate slightly hairy beneath, spikes hairy, bracteoles $\frac{3}{4}$ in. linear-lanceolate hairy. *Nees in Wall. Pl. As. Rar.* iii. 98, and in *DC. Prodr.* xi. 270; *T. Anders. in Journ. Linn. Soc.* ix. 501.

KHASIA Mts., alt. 0–3000 ft., frequent; *Wallich*, &c. Namroop in the PATKOYE Mts., *Griffith*. CACHAR; *Keenan*.

Stem 6–15 in., decumbent, viscous-woolly. *Leaves* 8 by $3\frac{1}{2}$ in., cuneate at both ends, whitened beneath; nerves beneath viscous-pubescent, prominently reticulate; petiole $\frac{3}{4}$ in., woolly. *Spikes* 3–6 in., mostly terminal, solitary; bracts $\frac{3}{4}$ –1 by $\frac{1}{2}$ in., elliptic, spinous-toothed, hairy on both sides. *Calyx* softly hairy; 2 outer lobes $\frac{3}{4}$ in., one shortly 2-toothed; 2 inner $\frac{1}{2}$ – $\frac{3}{4}$ in., sublinear. *Corolla* $\frac{3}{4}$ in., white (*Nees*). *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., ellipsoid, compressed, glabrous, shining-brown, 4-seeded.—The capsule and seeds greatly resemble *A. ilicifolius*, but are not ripe.

3. **A. longipetiolatus**, *Kurz For. Fl.* ii. 241; leaves long-petioled ovate subserrate pubescent on the nerves beneath, bracts obovate spinous-toothed softly hairy, corolla $1\frac{1}{2}$ in. nearly glabrous.

PEGU; *Brandis* (*Herb. Kurz*).

Stem 1 foot, rather stout, decumbent, rooting, then erect, simple, rusty-pubescent. *Leaves* $6\frac{1}{2}$ by $3\frac{1}{4}$ in., cuneate subacute at both ends, serratures very shallow not spinescent; petiole nearly 2 in. *Spike* solitary, simple, $5\frac{1}{2}$ by $1\frac{1}{2}$ in., continuous; peduncle $\frac{1}{2}$ in., stout, pubescent; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., teeth few, large; bracteoles 1 in., linear-subulate, hairy. *Sepals* 5, softly hairy; one $1\frac{1}{4}$ by $\frac{1}{2}$ in. oblong obtuse, two

1 by $\frac{1}{2}$ in. oblong, two $\frac{3}{4}$ by $\frac{1}{6}$ in. *Corolla* and *stamens* as in *A. ilicifolius*, the curving of the top of the filament insisted on by Kurz being the same as in the other species of *Acanthus*, and without the excurrent point of *Blepharis*. *Capsule* not seen.

4. ***A. ilicifolius***, Linn.; *Benth. Fl. Austral.* iv. 548; leaves shortly petioled oblong or elliptic toothed or pinnatifid spinous rigid glabrous, spikes elongate often interrupted, bracteoles broadly lanceolate glabrous, calyx $\frac{3}{4}$ in., corolla $1\frac{1}{2}$ in. blue. *Burm. Fl. Ind.* 138; *Blume Bijd.* 806; *Wall. Cat.* 2511; *Roxb. Fl. Ind.* iii. 32; *T. Anders. in Journ. Linn. Soc.* ix. 501; *Kurz For. Fl.* ii. 241. *A. Doloarius*, *Blanco Fl. Filip.* 487. *Dilivaria ilicifolia*, *Nees in Wall. Pl. As. Rar.* iii. 98, and in *DC. Prodr.* xi. 268; *Wight Ic.* t. 459; *Dalz. & Gibs. Bomb. Fl.* 192.—*Rheede Hort. Mal.* ii. t. 48.

Sea-coast, from MALABAR to CEYLON, and from the Soonderbund to Malacca.—**DISTRIB.** Malaya to the Philippines and Australia.

Stems 1–5 ft., in clumps, little divided, terete, glabrous. *Leaves* 6 by $2\frac{1}{2}$ in.; petiole $\frac{1}{4}$ in., base usually spinous. *Spikes* 4–16 in., terminal, commonly solitary; flowers mostly opposite; bract $\frac{1}{2}$ – $\frac{3}{4}$ in., ovate, acute, glabrous; bracteoles $\frac{1}{4}$ – $\frac{1}{2}$ in. *Sepals*, 2 outer elliptic rounded, 2 inner broadly lanceolate subacute. *Corolla* pubescent within. *Capsule* $1\frac{1}{2}$ by $\frac{3}{4}$ in. *Seeds* $\frac{1}{4}$ – $\frac{1}{2}$ in., testa white very lax.

VAB. integrifolia, *T. Anders. in Thwaites Enum.* 232; leaves lanceolate entire tip acute spinous.—Ceylon; *Thwaites*:

5. ***A. ebracteatus***, *Vahl Symb.* ii. 75, t. 40; leaves shortly petioled oblong or elliptic toothed or pinnatifid spinous rigid glabrous, spikes elongate somewhat lax, bracts caducous, bracteoles obsolete, calyx $\frac{1}{2}$ in., corolla $\frac{3}{4}$ in. white. *Blume Bijd.* 806; *T. Anders. in Journ. Linn. Soc.* ix. 501; *Kurz For. Fl.* ii. 242. *A. ilicifolius*, *Lour. Fl. Cochinch.* 375, not of Linn.; *Wall. Cat.* 2511, E and part D. *Dilivaria ebracteata*, *Pers. Syn.* ii. 179; *Nees in Wall. Pl. As. Rar.* iii. 98, and *Cat.* 7169, and in *DC. Prodr.* xi. 269.—*Rumph. Amb.* vi. t. 71, fig. 1.

MALACCA; *Griffith, Maingay*. ANDAMANS; *ex Kurz*.—**DISTRIB.** Siam, Java, Cochinchina.

Stems and leaves of *A. ilicifolius*; base of petiole spinous or not. *Bracts* $\frac{1}{2}$ in., usually caducous before the flowers expand. *Capsule* $\frac{3}{4}$ in.—Seems to differ from *A. ilicifolius* by the much smaller calyx, corolla and capsule. *Vahl* puts the difference too strongly when he says the flowers are only one quarter the size. *Bentham (Fl. Austral.* iv. 548) doubts the distinctness of the species. Herbarium examples of *A. ilicifolius* with the flowers in bud, which show neither the evanescence of the bracts nor the true size of the corolla, can only be distinguished by the presence of the bracteoles.

6. ***A. volubilis***, *Wall. Pl. As. Rar.* ii. 56, t. 172; twining, unarmed, leaves oblong or elliptic entire glabrous, spikes linear-oblong, bracteoles 0, corolla white. *T. Anders. in Journ. Linn. Soc.* ix. 501; *Kurz For. Fl.* ii. 242. *Dilivaria volubilis*, *Nees in Wall. Pl. As. Rar.* iii. 98; *Griff. Notul.* iv. 138. *D. scandens*, *Nees in DC. Prodr.* xi. 269.

Sea-shores of the MALAY PENINSULA; Soonderbund, *Wallich*, &c.; Pegu, *Kurz*; Mergui, *Griffith*.—**DISTRIB.** Siam.

Stems twining in long grass, internodes often 4–8 in. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., obtuse or subacute, base attenuated; petiole $\frac{1}{2}$ in. *Spikes* 2–3 in., hardly interrupted; flowers sub-2-seriate; bracts $\frac{3}{4}$ in., elliptic, acute. *Calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., outer segments elliptic, acute, glabrous; inner similar, much shorter. *Corolla* 1 in., white, slightly tinged yellow (*Wallich*), probably when fading; rose (*Nees*).—The syn. of *Rumphius (Herb. Amb.* vi. t. 71, fig. 2, wrongly cited as t. 72 by *Nees*) has alternate leaves and fruits quite unlike *Acanthaceæ*.

7. **A. longibracteatus**, Kurz in *Flora* 1870, 363, and in *Journ. As. Soc.* 1870, ii. 79; leaves long-petioled ovate or elliptic-oblong acute at both ends remotely toothed pubescent, spikes terminal linear-oblong, bracts lanceolate spinous-mucronate, corolla $\frac{3}{4}$ in.

PEGU; *Brandis* (fide Kurz).

Annual, 3-5 in.; stems terete, decumbent or ascending, densely puberulous. *Leaves* 2 in., membranous, setulose between the teeth, sparsely hairy above, nerves beneath pubescent. *Spikes* as in *A. leucostachyus*; rachis pilose; bracts $\frac{1}{2}$ in., pubescent, lower entire, upper with 2 or 3 spinous teeth on each side; bracteoles as long as the bracts, linear. *Calyx* $\frac{1}{2}$ in., adpressedly pubescent and nervose; lower segment deeply 2-fid, lobes lanceolate acuminate. *Corolla* 5-lobed, minutely hirsute in the throat.—Copied from Kurz. Notwithstanding the narrow bracts and small corolla, I suspect that this is Kurz's subsequently described *A. longipetiolatus*.

XXII: **BARLERIA**, Linn.

Undershrubs or herbs, spinescent or unarmed. *Leaves* opposite, entire. *Flowers* showy, purple blue yellow or white, sessile, solitary or in dense or subax spikes; bracts and bracteoles large, small or 0. *Sepals* 4, in opposite pairs, outer pair very much the larger, anterior often emarginate bifid or deeply 2-lobed. *Corolla-tube* elongate, sometimes very long, funnel-shaped upwards; lobes 5, subequal, ovate, or elliptic, imbricate in bud. *Stamens* 2 with oblong 2-celled anthers; 2 small, rudimentary, or rarely with a few grains of pollen; rudimentary 5th often present. *Disc* large, often a toothed cup half enclosing the ovary. *Ovary* 4-ovulate; style long, shortly bifid or subentire. *Capsule* ovoid or oblong, 2- or 4-seeded below the middle. *Seeds* compressed, ovate, hairs wavy silky close-adpressed non-elastic (except in *B. Gibsoni*).—Species 60, tropical, mostly Old World.

Barleria lupulina, Lindl. in Bot. Reg. t. 1483, is frequently cultivated in India, and appears as an escape.

Barleria rubra, Ham., and *B. spicata*, Roxb., are entered in Steudel's Nomenclature as Indian; but it is not known from what source obtained.

Subgenus 1. **Prionitis**. Capsule ovoid, beak solid, 2-seeded close to the base.

1. **B. Prionitis**, Linn.; *Nees* in *Wall. Pl. As. Rar.* iii. 93, and in *DC. Prodr.* xi. 237; leaves elliptic acuminate at both ends spine-tipped glabrous or sometimes tawny sericeous beneath, flowers in terminal spikes yellow, bracts large elliptic spine-tipped, bracteoles very small bristles or 0. *Burm. Fl. Ind.* 135; *Blume Bijdr.* 805; *Wall. Cat.* 2510; *Roxb. Fl. Ind.* iii. 36; *Decne. in Nouv. Ann. Mus.* iii. 388; *Wight Ic.* t. 452; *Dalz. & Gibs. Bomb. Fl.* 189; *T. Anders. in Journ. Linn. Soc.* ix. 490. *B. Hystrix*, Linn. *Mant.* 89; *Wall. Cat.* 7145; *Nees* in *Wall. Pl. As. Rar.* iii. 93, and in *DC. l. c.* 239. *B. pubiflora*, *Benth. in Flora* 1849, 558. *Prionitis Hystrix* & *pubiflora*, *Miq. Fl. Ind. Bat.* ii. 809, 810.—*Rumph. Herb. Amb.* vii. 13. *Rheede Hort. Mal.* ix. t. 41.

Tropical India; from the HIMALAYA to CEYLON and MALACCA, probably in most cases introduced.—DISTRIB. Tropical Asia and Africa.

A bush, 2-5 ft., sometimes planted for a fence; usually very prickly, rarely nearly unarmed; densely scabrid lineolate, sometimes puberulous. *Leaves* 4 by $1\frac{1}{2}$ in., entire; petioles of the lower leaves usually distinct sometimes $\frac{1}{2}$ -1 in. *Flowers* axillary, 1-3-nate, uppermost spiked; bracts $\frac{1}{2}$ -1 in., entire, the lower larger, foliaceous. *Sepals* broadly lanceolate, acuminate, 2 outer $\frac{3}{4}$ - $\frac{1}{2}$ in., 2 inner $\frac{1}{2}$ in. *Corolla* $1\frac{1}{4}$ - $1\frac{1}{2}$ in., glabrous or puberulous. *Stamens* 4, 2 minute or sterile. *Disc* annular.

Pistil glabrous. *Capsule* $\frac{3}{4}$ –1 in., 2-seeded. *Seeds* $\frac{1}{3}$ in. diam., much compressed, ovate.

2. **B. cuspidata**, Heyne; *Nees in Wall. Pl. As. Rar.* iii. 93, and in *DC. Prodr.* xi. 239; glabrous, leaves sessile narrowly oblong-lanceolate spine-tipped, flowers axillary scarcely spiked at the end of the branches, bracts lanceolate acuminate spine-tipped, bracteoles minute bristles or 0. *Wall. Cat.* 2499; *Wight Ic.* t. 451; *T. Anders. in Journ. Linn. Soc.* ix. 490.

S. DECCAN PENINSULA, alt. 0–2000 ft.; Concan, Canonic, Mysore, Coimbatore, Rottler, Wight, &c.

A lower, harsher, more prickly undershrub than *B. Prionitis*, with shorter internodes. *Leaves* $2\frac{1}{2}$ by $\frac{1}{2}$ in., occasionally 1 by $\frac{1}{2}$ in., elliptic, entire. *Flowers* nearly all axillary, distant; bracts $\frac{1}{2}$ – $\frac{3}{4}$ in., usually very narrow. *Calyx* $\frac{3}{4}$ –1 in., segments long acuminate. *Corolla* $1\frac{1}{2}$ in., yellow. *Capsule* and *seeds* as of *B. Prionitis*.—Exceedingly near *B. Prionitis*, as Heyne has noted in *Herb. Rottler*. *Nees* erroneously says the corolla is pale blue; does not allow it to have been *B. cuspidata*, Heyne, but says it is part of *B. noctiflora*, Heyne. Heyne has, however, named these two species correctly in Rottler's Herbarium.

3. **B. Hochstetteri**, *Nees in DC. Prodr.* xi. 231; pubescent, leaves elliptic or oblong entire, flowers pedicelled, bracteoles small narrow remote from the calyx, corolla $\frac{3}{4}$ –1 in. lilac. *Wight Ic.* t. 1528; *Hook. Ic. Pl.* t. 803; *T. Anders. in Journ. Linn. Soc.* ix. 494; *Boiss. Fl. Orient.* iv. 523. *Barlerites Hochstetteri*, *Oerst. in Vidensk. Meddel. Kjob.* 1854, 137.

SCINDE; *Stocks*.—DISTRIB. S.W. Asia, N.E. Africa.

A woody, harsh undershrub, scarcely 1 foot high, sometimes spinescent. *Leaves* 2 by $\frac{3}{4}$ –1 in., obtuse, base narrowed; petiole $\frac{1}{2}$ in. *Pedicels* $\frac{1}{4}$ – $\frac{1}{2}$ in., pubescent, often 3 on an apparent peduncle, the 2 leaves at their base much reduced, usually petioled, oblong or sublinear; bracteoles about the middle of the pedicel 2, 1, or 0, very small, linear (? bracts). *Calyx* green, pubescent; 2 outer lobes $\frac{1}{2}$ – $\frac{1}{2}$ in., triangular-ovate, 2 inner very small. *Stamens* 2, the 3 smaller nearly obsolete. *Disc* prominent, cup-shaped. *Ovary* hairy; stigma scarcely bifid. *Capsule* nearly $\frac{1}{2}$ in., pubescent, ovoid, rostrate, 2-seeded near the base. *Seeds* densely silky.—*Oersted* attributes to his very bad genus *Barlerites* a unilateral linear stigma and glabrous seeds, which is wholly wrong.

Subgenus 2. **Eubarleria**. *Capsule* oblong or narrowly ellipsoid, 4-rarely 2-seeded at or near the middle by the suppression of the 2 lower seeds.

* *Bract* 0, bracteoles 2 divaricate long-linear or spines, 2 outer sepals large. [Each flower on the sympodal raceme is in the axil of one of two opposite bracteoles, and the terminal flower also is apparently 2-bracteolate; by comparing such species as *B. longiflora* & *tomentosa*, it is seen that it is the bracteoles that are really aborted in this section. The next section differs in the terminal flower having 3 (or 4) bracts in place of 2.]

† *Prickly*.

4. **B. buxifolia**, *Linn.*; *Nees in Wall. Pl. As. Rar.* iii. 94, and in *DC. Prodr.* xi. 241; leaves small broadly elliptic obtuse mucronate hairy, flowers solitary pedicelled or sessile, 2 outer sepals oblong entire. *Roth Nov. Sp.* 313; *Wall. Cat.* 2504, partly; *Roxb. Fl. Ind.* iii. 37; *Wight Ic.* t. 870; *T. Anders. in Journ. Linn. Soc.* ix. 489. *Dicranacanthus buxifolia*, *Oerst. in Vidensk. Meddel. Kjob.* 1854, 136.

S. DECCAN PENINSULA, alt. 0–4000 ft.; Rottler; Courtallum, Wight; Concan, Law, &c.

A small, very prickly undershrub; branches hairy. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in.; petiole hardly any. *Bracteoles* $\frac{1}{4}$ – $\frac{3}{4}$ in., simple spines; pedicel (above the bracteoles) $\frac{1}{8}$ – $1\frac{1}{2}$ in., sometimes 0 (*B. rotundifolia*, Heyne in Herb. Rottler). *Sepals* pubescent, ciliate; 2 outer in flower $\frac{1}{2}$ by $\frac{1}{2}$ in. often lanceolate, in fruit sometimes $\frac{3}{4}$ in., oblong, obtuse, scarious, nervose, glabrate; 2 inner small. *Corolla* 1 in., purple blueish rose or white. *Capsule* $\frac{3}{4}$ in., 4-seeded.—Separable from the following by the much narrower entire outer sepals. The variation in the length of the pedicel is remarkable, but there appears to be only one species here.

5. ***B. mysorensis***, *Roth Nov. Sp.* 313; leaves broadly elliptic obtuse mucronate hairy, flowers axillary sessile, 2 outer sepals large ovate sub-spinose denticulate softly hairy. *Heyne in Herb. Rottler. B. buxifolia, Wall. Cat.* 2504, sheets A and B partly, not of Linn. *B. spina-ceylanica, Nees in DC. Prodr.* xi. 242; *T. Anders. in Journ. Linn. Soc.* ix. 490. *B. bispinosa, Nees in Wall. Pl. As. Rar.* iii. 94, and in *DC. Prodr.* xi. 241, not of Vahl. *Dicranacanthus spina-ceylanica, Oerst. in Vidensk. Meddel. Kjob.* 1854, 136.

S. DECCAN PENINSULA with CEYLON, alt. 0–4000 ft.; *Rottler, Wight, Thwaites, &c.*

A very prickly small shrub; branches hairy. *Leaves* $\frac{1}{2}$ –1 in., hairy beneath, deciduously scabrid pubescent above; petiole hardly any. *Bracteoles* simple spines. Outer *sepals* $\frac{3}{4}$ –1 by $\frac{3}{8}$ in., broadest very near the base; in fruit scarious, nerved. *Corolla* $1\frac{1}{2}$ in., purple. *Capsule* $\frac{3}{4}$ in., 4-seeded.—Nees reduced *B. mysorensis*, Heyne, to *B. noctiflora*, but both Heyne's examples and Roth's description show it to have been this.

6. ***B. noctiflora***, *Linn. f. Suppl.* 290; leaves oblong or narrowly obovate mucronate pubescent afterwards glabrate, flowers axillary solitary, 2 outer sepals large ovate acute spinous-dentate sparsely pubescent, corolla-tube elongate narrowly cylindric. *Heyne in Herb. Rottler; Wall. Cat.* 2496; *Nees in Wall. Pl. As. Rar.* iii. 93, and in *DC. Prodr.* xi. 240, excl. syn. Roth; *T. Anders. in Journ. Linn. Soc.* ix. 490 (by typog. error *B. noctifolia*). *B. cristata, Lamk. Dict.* i. 380, not of Linn. *Barleriacanthus noctiflora, Oerst. in Vidensk. Meddel. Kjob.* 1854, 136.

NILGHERRY MTS., alt. 7500 ft.; Ootacamund, *Wight. CEYLON; Rottler.*

A small, very prickly undershrub; branches pubescent upwards. *Leaves* $\frac{3}{4}$ by $\frac{1}{2}$ in., obtuse or acute, grey pubescent at first; petiole hardly any. *Bracteoles* $\frac{1}{4}$ – $\frac{3}{4}$ in., with simple spines or denticulate near the base. *Sepals* soon scarious, glabrate, nervose; 2 outer $\frac{3}{4}$ by $\frac{1}{2}$ in. *Corolla-tube* $1\frac{1}{2}$ by $\frac{1}{2}$ in., pubescent without; lobes $\frac{1}{2}$ in., round-ovate. *Capsule* $\frac{3}{4}$ in., 4-seeded.

7. ***B. acanthoides***, *Vahl Symb.* i. 47; leaves obovate or elliptic obtuse mucronate pubescent, flowers solitary or in dense 1-sided spikes, 2 outer sepals ovate subentire pubescent, corolla-tube very long sublinear. *Nees in DC. Prodr.* xi. 240; *T. Anders. in Journ. Linn. Soc.* ix. 490 (excl. syn. *B. candida*); *Boiss. Fl. Orient.* iv. 524. *Barleriacanthus acanthoides, Oerst. in Vidensk. Meddel. Kjob.* 1854, 136.

SCINDE; *Stocks. PUNJAB*; Kirana Hill, *Edgeworth.*—DISTRIB. Arabia, N.E. Africa.

A small, hoary, prickly undershrub; prickles often pinnatifid near the base. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ in., base attenuated; petiole 0– $\frac{1}{2}$ in. *Bracteoles* linear or linear-lanceolate, spine-tipped, rigid, often denticulate. *Sepals* soon scarious, glabrate, nervose; 2 outer $\frac{1}{2}$ by $\frac{1}{2}$ in., acute, mucronate, scarcely denticulate. *Corolla* white; tube $2\frac{1}{2}$ by $\frac{1}{2}$ – $\frac{1}{4}$ in., puberulous without; lobes $\frac{1}{2}$ in., ovate. *Capsule* $\frac{3}{4}$ in., 4-seeded.

†† Unarmed.

8. **B. longiflora**, Linn. f. *Suppl.* 239; pubescent, leaves petioled ovate, flowers in short dense few-fl. spikes or solitary, bracteoles very long linear laxly patent, corolla-tube very long linear pubescent without. *Vahl Symb.* i. 46, t. 16; *Gaertn. Fruct.* i. 253, t. 54; *Wall. Cat.* 2501; *Roxb. Fl. Ind.* iii. 40; *Nees in Wall. Pl. As. Rar.* iii. 93, and in *DC. Prodr.* xi. 235. *B. longifolia*, T. Anders. in *Journ. Linn. Soc.* ix. 491, by typog. error not of Linn. *Barleriosiphon longiflorus*, Oerst. in *Vidensk. Meddel. Kjob.* 1854, 136.

S. DECCAN PENINSULA; *Rottler, &c.*; Tinnevely, *Beddome*.

A shrub, 2-4 ft. *Leaves* 1½ by 1 in., subacute, base rounded, entire; petiole ½-1 in. *Spikes* mostly 1-4-fl.; bracteoles ½-1 by ⅓ in., softly pubescent. *Sepals* pubescent, afterwards scarious, glabrate, nerve; 2 outer ¾-1 by ½ in., ovate, entire. *Corolla-tube* 2-3 by ½ in.; lobes ¼-½ in., ovate. *Capsule* ¾ in., 4-seeded.

9. **B. tomentosa**, Roth Nov. Sp. 314; leaves elliptic or ovate acuminate at both ends yellow-hirsute above, bracteoles linear or linear-spathulate, sepals oblong acute young scarious coloured, corolla 2-2½ in. glabrous. *Nees in Wall. Pl. As. Rar.* iii. 92, and in *DC. Prodr.* ix. 233; T. Anders. in *Journ. Linn. Soc.* ix. 451. *B. paniculata*, Wall. Cat. 2407; *Nees in Wall. Pl. As. Rar.* iii. 92, and in *DC. Prodr.* xi. 233.

S. DECCAN PENINSULA; *Rottler, &c.*

A low shrub; branches hirsute. *Leaves* 2½ by 1 in., yellow-hirsute on the nerves beneath, more or less so on the surface; petiole ½ in. *Racemes* mostly 1-3-fl.; bracteoles ½-¾ in. *Calyx* scarious, purple-veined before the flower expands; 2 outer segments ½ in., broadly oblong, entire, 2 inner ½ in.; elongated in fruit. *Corolla* rose (Beddome); tube 2 in., linear-cylindric, upper ½ in., funnel-shaped; lobes ¾ in., elliptic. *Capsule* ¾ in., 4-seeded, occasionally the 2 lower seeds suppressed.

VAR. acuminata; leaves densely pubescent subtomentose rounded or subcordate at the base, petiole 1 in. *B. acuminata*, *Wight Ic.* t. 450; *Nees in Wall. Pl. As. Rar.* iii. 93, and in *DC. Prodr.* xi. 234. *B. tomentosa*, Wall. Cat. 2503. *B. racemosa*, Heyne in *Herb. Rottler*.—S. Deccan Peninsula; Nilgubberies, Anamallays, Madura, &c., *Rottler, Wight, &c.*—Easily distinguished from *B. tomentosa*, but differs only in the shape of the leaves and indumentum; the corolla is somewhat smaller.

10. **B. involucrata**, *Nees in Wall. Pl. As. Rar.* iii. 92, and in *DC. Prodr.* xi. 232; leaves elliptic narrow at both ends yellow-strigose on the nerves beneath, racemes few-fl. axillary, bracteoles lanceolate or linear much shorter than the sepals, sepals 1 in. elongate elliptic, corolla 2 in. blue. *Wight Ill.* t. 164; T. Anders. in *Journ. Linn. Soc.* ix. 492. *B. pentandra*, Arn.; *Nees in DC. Prodr.* xi. 232; T. Anders. in *Thwaites Enum.* 230, partly. *B. Macraei*, Arn. ms.

CEYLON, in the hills; *Macrae, Gardner, &c.* MALABAR (var. *elata*).

Herbaceous, strigose. *Leaves* 4½ by 1½ in., sparsely yellow strigillose above; petiole ½ in. *Racemes* yellow-strigose; bracteoles ½ by ⅓ in. (in *Nees' type*), ¼ by ⅓ in. (in *Arnott's B. pentandra*). *Sepals* subacute. *Corolla-tube* 1½ in.; lobes 1½ in., obovate-elliptic. *Capsule* nearly 1 in., 4-seeded.—*Nees* has confounded the Ceylon and Nilgiri varieties of this species; his description of *B. involucrata* is founded on *Wight's n.* 1958 from Ceylon, and he says the bracteoles are 4 lines long; he then places under this the Malabar specimens, which do not suit the description, and which all belong to his *B. terminalis* (see *B. strigosa*, var.). The Ceylon specimens are very uniform, drying black, and having the racemes mainly axillary. The bracteoles are in well-developed specimens much longer than in the poor pieces *Nees* and *Arnott* had, but still much shorter than in *B. elata*. *Wight's n.* 1958 has the bracteoles unusually broad and obtuse.

VAR. *elata*; leaves larger lower often a foot long, racemes stout helicoid often collected towards the ends of the branches, bracteoles often 1-1½ in., linear-lanceolate, corolla 3-3½ in. *B. elata*, Dalz. in Hook. *Kew Journ.* iii. 227; Dalz. & Gibs. *Bomb. Fl.* 183. *B. cœrulea*, Wall. *Cat.* 2509, sheet *β*, partly.—Malabar, alt. 2-5000 ft., from the Bombay Ghauts to the Pulneys and Anamallays, frequent; Gardner, &c.—Shrubby, 6 ft. high (Dalzell). In Wight's Nilgherry examples, the corolla-tube is 1½ in., the upper ⅔ whereof is considerably inflated; the lobes are 1½ by ¾ in., obovate, obtuse; the racemes form dense sub-leafless short terminal panicles.

11. *B. vestita*, T. Anders. in Thwaites *Enum.* 230, and in *Journ. Linn. Soc.* ix. 492; leaves elliptic or somewhat obovate acuminate at both ends fulvous-shaggy on both surfaces, racemes lax, bracteoles linear-lanceolate, outer sepals elliptic elongate-acuminate, corolla 3 in. *Bedd. Ic. Pl. Ind. Or. t.* 263. *B. pentandra*, Var. *β*, Nees in *DC. Prodr.* xi. 233.

CEYLON, alt. 5000 ft.; Walker, Thwaites.

Herbaceous; stems stout, hirsute. Leaves 7 by 3 in.; nerves 12-15 pair, conspicuous; petiole ¼-½ in. Racemes on peduncles 3 in., i.e. the leaves at their base ¾ in., linear-lanceolate, scarcely larger than the other bracts; lower flowers 1 in. or more apart. Calyx and corolla exactly as of *B. involucrata*, of which Nees considered it a var.

** Bracteoles 2, opposite, close to the calyx or above the bract at the base of the pedicel, narrow, much smaller than the 2 outer sepals.

12. *B. pilosa*, Wall. *Cat.* 2502; softly hairy, leaves ovate acuminate, flowers axillary solitary, outer sepals ovate or orbicular scarious dentate, corolla 1½ in. blue. Heyne in *Herb. Rottler*; Nees in Wall. *Pl. As. Rar.* iii. 93, and in *DC. Prodr.* xi. 234; T. Anders. in *Journ. Linn. Soc.* ix. 491; *Bedd. Ic. Pl. Ind. Or. t.* 256.

S. DECCAN PENINSULA, alt. 1000-1500 ft.; Courtallum, Rottler, Wight; Coimbatore; Beddome.

A small, ramous shrub. Leaves 4 by 2 in., often much smaller on the lateral flower-bearing branchlets, sometimes obscurely denticulate; petiole 2 in. Pedicels ½ in.; bracteoles ¼-½ in., linear, subdenticulate, hairy, above the base of the pedicel. Sepals hairy, ultimately glabrate, nervose; 2 outer ¼-½ in. diam., subspinosely toothed. Corolla glabrous; tube nearly 1 in.; lobes ¼-½ in., broadly elliptic. Capsule ½ in., 4-seeded; seeds shaggy, the hair finally rubbing off except near the hilum.

13. *B. Lawii*, T. Anders. in *Journ. Linn. Soc.* ix. 492; leaves elliptic acuminate at both ends lineolate above fulvous-strigose on the nerves beneath, racemes short capitate, bracts and bracteoles small linear, outer sepals 1 in. elliptic acute entire, corolla 3-3½ in. minutely pilose without. B. Beddome, *Bedd. Ic. Pl. Ind. Or. t.* 258.—*Barleria* sp. n. 33, *Herb. Ind. Or. H. f. & T.*

W. DECCAN PENINSULA, in the Ghauts; Bababoodun Hills, Law (T. Anderson).

An erect shrub; branches strigose upwards. Leaves 6 by 2½ in.; petiole ¼-½ in. Racemes fulvous-strigose; bracts ½ in., linear-spathulate; bracteoles nearly as long, linear, acute. Sepals nervose, strigose without; 2 outer ¼-½ in. broad, one of these shortly 2-toothed. Corolla white (Dalzell), beautifully veined when dry, noted blue in Wight's Herbarium; tube elongate funnel-shaped, lobes 1 in., obovate. Capsule nearly 1 in., oblong or slightly obovate, 4-seeded; fruiting-sepals somewhat enlarged.

14. *B. Arnottiana*, Nees in *DC. Prodr.* xi. 232; leaves elliptic acuminate at both ends hairy, pedicels axillary solitary, bracteoles lanceolate,

outer sepals large ovate subobtusate, corolla $2\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 492.

CEYLON, alt. 6000 ft.; *Gardner, Thwaites, &c.*

Herbaceous; stems fulvous-strigose. *Leaves* 4 by $1\frac{1}{2}$ in., with scattered yellow hairs above, obscurely lineolate, beneath yellow-strigose especially on the nerves; petiole $\frac{1}{4}$ –1 in. *Bracteoles* $\frac{1}{4}$ – $\frac{3}{4}$ in., lanceolate or elliptic spatulate or O. Outer *sepals* $1\frac{1}{4}$ by $\frac{1}{2}$ in., yellow-strigose, obtuse, one shortly bifid. *Corolla* blue; tube $1\frac{1}{2}$ in., lobes 1 in., obovate, subemarginate. *Capsule* 1 in., broadly oblong, 4-seeded; sepals enlarged, scarious, nerved in fruit.

VAR. *pentandra*; leaves thinner glabrescent conspicuously lineolate above, bracteoles $\frac{1}{2}$ in., linear-setaceous, outer sepals elliptic elongate acute nearly glabrous. *B. pentandra*, Arn.; *T. Anders. in Thwaites Enum.* 230 partly, excl. syn.—Ceylon, *Thwaites* (C. P. n. 2558).

VAR. *Beddomei*; leaves elliptic acute at both ends bristly pubescent on both surfaces, flowers solitary axillary, sepals large ovate acute nervose bristly-pubescent.—Tenasserim; Mooleyit slopes, *Beddome*.—Herbaceous; stems fulvous-pubescent or substrigose. *Leaves* 3–4 by $1\frac{1}{2}$ in., not acuminate, petiole $\frac{1}{2}$ in. *Pedical* $\frac{1}{2}$ in.; bracteoles $\frac{1}{4}$ – $\frac{1}{2}$ in., linear, rigid, bristly-pubescent. Outer *sepals* nearly 1 by $\frac{1}{2}$ in., one of them very shortly bifid at the tip. *Corolla* $2\frac{3}{4}$ in., beautifully veined when dry, altogether as of *B. Arnottiana*. *Capsule* $\frac{3}{4}$ in., narrowly ellipsoid, rigid. *Seeds* more than $\frac{1}{2}$ in. diam., obovate-truncate, compressed, rugose-silky.—Possibly a new species; close to *B. Arnottiana*.

15. **B. sepalosa**, *Clarke*; hairy, leaves elliptic acute, racemes axillary 1–3 fld., bracteoles narrowly lanceolate, outer sepals very large broadly elliptic acute.—*Barleria* sp. n. 35, *Herb. Ind. Or. H. f. & T.*

CONCAN; *Gibson*.

Shrubby; stems upward villous, subtomentose. Upper *leaves* $3\frac{1}{2}$ by $1\frac{1}{4}$ in., base shortly narrowed, covered with short yellow hairs on both surfaces, somewhat rigid, strongly reticulated beneath; petiole $\frac{1}{2}$ in. *Bracteoles* $\frac{3}{4}$ by $\frac{1}{2}$ in., rigid, acute. Outer *sepals* $1\frac{3}{4}$ by $\frac{3}{4}$ in., one bifid, base rounded, yellow-villous, subtomentose, in fruit nervose, subscarious. *Capsule* $\frac{3}{4}$ –1 in. *Corolla* not seen.

16. **B. montana**, *Nees in Wall. Pl. As. Rar.* iii. 92, and in *DC. Prodr.* xi. 232; nearly glabrous, leaves narrowly ovate acuminate at both ends, flowers axillary solitary and running into terminal spikes, outer sepals large ovate, corolla 2 in., seeds densely silky. *Dalz. & Gibs. Bomb. Fl.* 189; *T. Anders. in Journ. Linn. Soc.* ix. 493; *Bedd. Ic. Pl. Ind. Or.* t. 257. *B. purpurea*, *Lodd. Bot. Cab.* t. 344. *Ruellia?* *montana*, *Wall. Cat.* 2391.—*Barleria* sp. n. 32, *Herb. Ind. Or. H. f. & T.*

W. DECCAN PENINSULA, in the Ghauts frequent; from Jubbulpore to Travancore.

Herbaceous, erect, 2 ft. high. *Leaves* 5 by 2 in., often glaucous, margins sometimes minutely scabrous; petiole $\frac{1}{4}$ –1 in. *Bracteoles* linear, $\frac{1}{2}$ in. or in large examples 1 in. Outer *sepals* $1\frac{1}{2}$ by $\frac{3}{4}$ in. in large examples, often hardly half so large, rounded or very acute, entire, glabrous or minutely scabrous. *Corolla* blue (*Beddome*), rose (*Dalzell*); lobes $\frac{3}{4}$ in. diam., orbicular. *Capsule* 1 in., 4-seeded. *Seeds* $\frac{1}{2}$ in. diam. or more, close covered with wavy silky yellowish hair, as in many other species.

17. **B. Gibsoni**, *Dalz. in Hook. Kew Journ.* ii. 339; nearly glabrous, leaves ovate acute, flowers axillary solitary and running into terminal spikes, outer sepals large ovate, corolla 2 – $2\frac{1}{2}$ in., seeds glabrous. *Dalz. & Gibs. Bomb. Fl.* 189; *T. Anders. in Journ. Linn. Soc.* ix. 493. *B. montana*, *Wight & Nees* partly; *Herb. Ind. Or. H. f. & T.* n. 34.

W. DECCAN PENINSULA; Concan, *Stocks*; Ellora Hill, *Ralph*; Belgaum, *Ritchie*; Bombay Ghauts and Brahminwara Range, *Dalzell*; N. Canara, *Brandis*.

So exceedingly like *B. montana*, except as to the seeds, that it has been mixed

therewith from Wight's day. Lower leaves often very large and very glaucous. Terminal spike more closely imbricated than in *B. montana*; flowers rather larger, corolla-lobes often 1 in. Capsule $\frac{3}{4}$ in., 4-seeded. Seeds $\frac{1}{2}$ in. diam., when ripe nearly black; always glabrous, and so differing from all other *Barlerias*.

18. ***B. grandiflora***, Dalz. in Hook. Kew Journ. ii. 339; nearly glabrous, leaves elliptic narrowed at both ends, flowers solitary axillary, outer sepals very large broadly elliptic acute, corolla 4 in. white. Dalz. & Gibs. Bomb. Fl. 189; T. Anders. in Journ. Linn. Soc. ix. 493.

CONCAN; Stocks; Mangallee Ghaut, Dalzell.

Herbaceous; innovations shortly minutely pubescent. Leaves 5 by 2 in., often glaucous; petiole $\frac{1}{2}$ in., pubescent. Bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., linear-ligulate. Outer sepals 2 by 1 in., entire, herbaceous, pubescent within. Corolla minutely pubescent without; lobes $1\frac{1}{2}$ in. Capsule not seen.—Closely allied to *B. Gibsoni*.

19. ***B. cristata***, Linn.; Benth. Fl. Hongk. 262; leaves oblong or elliptic acute yellow-hairy beneath, spikes capitate, outer sepals ovate-acuminate or lanceolate toothed nervose, corolla $1\frac{1}{2}$ in. purple-blue or white. Burm. Fl. Ind. 136; Roxb. Fl. Ind. iii. 37; Wall. Cat. 2506; Don Prodr. 119; Roth Nov. Sp. 315; Nees in Wall. Pl. As. Rar. iii. 92, and in DC. Prodr. xi. 229; Bot. Mag. t. 1615; Wight Ic. t. 453; Dalz. & Gibs. Bomb. Fl. 188; T. Anders. in Thwaites Enum. 230, and in Journ. Linn. Soc. ix. 490. *B. dichotoma*, Roxb. Fl. Ind. iii. 39; Wall. Cat. 2508; Nees in Wall. Pl. As. Rar. iii. 91, and in DC. l. c. 227; Dalz. & Gibs. l. c. 188. *B. ciliata*, Roxb. l. c. 38; Wall. Cat. 2507; Nees in Wall. Pl. As. Rar. iii. 92, and in DC. l. c. 228. *B. napalensis* & *nuda*, Nees in Wall. Pl. As. Rar. iii. 91, 92, and in DC. l. c. 228, 229. *B. laciniata*, Wall. Cat. 7144, and Nees l. c.

SUBTROPICAL INDIA; N.W. Himalaya, Sikkim, Khasia, Burma, Central India, Nilgherries, common.—DISTRIB. Gardens of India, Malaya, China, &c.

An erect or diffuse undershrub; branches adpressedly yellow-hairy. Leaves 3–4 by 1 in., or, where burnt up, 1 by $\frac{1}{2}$ in., yellow-hairy or lineolate above; petiole $\frac{1}{2}$ – $\frac{1}{3}$ in. Spikes ovate, often compound, dense; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., linear-lanceolate, toothed. Outer sepals $\frac{3}{4}$ in., toothed, softly hairy, glabrous, subspinescent. Corolla-tube funnel-shaped in the upper half; lobes $\frac{1}{2}$ in., ovate. Capsule $\frac{3}{4}$ in., 4-seeded. Seeds orbicular, compressed, silky.—Uniform except as to habit and indumentum. The common Sikkim form has erect stems, leaves 4 in. long, glabrate lineolate above, outer sepals subspinous-ciliate; a common Khasia form is similar, but has the sepals very sparingly toothed; the West Himalaya form (*B. napalensis* var. *microphylla*, Nees) has leaves hardly an inch long and many solitary flowers; *B. salicifolia*, Heyne, has a diffuse weedy habit, linear-oblong leaves and much yellow hair; the South Indian plant, on hotter drier rocks, has often smaller more rigid very hairy leaves, and very hairy sepals. There can be, as T. Anderson states, no doubt that this plant is wild everywhere in the lower hills of N.E. and Central India; and no doubt in the Mts. of S. India also.

20. ***B. nutans***, Nees in DC. Prodr. xi. 227; leaves narrowly obovate attenuately acuminate at both ends glabrous, spikes elongate pubescent, bracts and bracteoles small lanceolate, sepals lanceolate minutely pubescent, corolla 1 in. blueish purple. T. Anders. in Thwaites Enum. 230, and in Journ. Linn. Soc. ix. 493; Bedd. Ic. Pl. Ind. Or. t. 264.

CEYLON, alt. 1–3000 ft.; Gardner, Champion, &c.

An undershrub. Leaves 8 by $1\frac{1}{2}$ in., lineolate above; petiole $\frac{1}{2}$ – $1\frac{1}{4}$ in. Spikes 1–5 in., often nodding, dense with flowers; bracts and bracteoles $\frac{1}{2}$ – $\frac{1}{4}$ in. Outer sepals nearly $\frac{1}{2}$ in., nervose, one divided $\frac{1}{2}$ the way down into 2 narrow-lanceolate teeth. Corolla nearly glabrous, deep blue-purple; tube funnel-shaped upwards; lobes $\frac{1}{2}$ in., ovate. Capsule $\frac{3}{4}$ –1 in., 4-seeded. Seeds $\frac{1}{4}$ in. diam., silky.

21. **B. courtallica**, *Nees in DC. Prodr.* xi. 226; leaves narrowly obovate or elliptic attenuately acuminate at both ends glabrous, spikes elongate pubescent, bracts and bracteoles small linear-lanceolate, sepals elliptic acuminate very pubescent, corolla $1\frac{1}{2}$ –2 in. *Dalz. & Gibs. Bomb. Fl.* 188; *Wight Ic.* t. 1529; *T. Anders. in Journ. Linn. Soc.* ix. 493. *B. inæqualis*, *Benth. in Flora* 1849, 577.

W. DECCAN PENINSULA; from the Concan to Courtallum, *Wight*, &c.

A large shrub (*Wight*). *Spikes* 1–3 in., dense; bracts $\frac{1}{4}$ in.; bracteoles $\frac{1}{4}$ – $\frac{1}{2}$ in. Outer sepals $\frac{3}{4}$ by $\frac{1}{4}$ in., nervose, subcorolloid, much more pubescent than in *B. nutans*. Corolla blue and yellow (*Dalzell*), white (*Ritchie*). Capsule and seeds as in *B. nutans*.—Closely allied to *B. nutans*, differing in the broader sepals and larger flowers.

*** *Bracteoles* 2, lanceolate or elliptic, often nearly as long as the calyx.

22. **B. conspicua**, *Nees in Wall. Pl. As. Rar.* iii. 92, and in *DC. Prodr.* xi. 226; leaves elongate-oblong acuminate at both ends, spikes linear-oblong somewhat yellow-strigose, bracteoles linear-oblong as long as the calyx, corolla 1 in. *T. Anders. in Journ. Linn. Soc.* ix. 493. *Justicia conspicua*, *Wall. Cat.* 2460.

PENANG; *Wallich*.

Leaves 8 by 2 in., lineolate above, somewhat yellow-strigose on the nerves beneath; petiole $\frac{3}{4}$ in. *Spikes* 4 in., terminal, erect, somewhat lax; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., spatulate-oblong; bracteoles $\frac{3}{4}$ by $\frac{1}{2}$ in. Outer sepals $\frac{3}{4}$ in., lanceolate, acute, yellow-hairy, one bifid at the apex. Capsule $\frac{3}{4}$ in., narrowly ellipsoid, acute at both ends, glabrate, 4-seeded. Seeds ultimately nearly glabrous except near the base.

23. **B. Stocksii**, *T. Anders. in Journ. Linn. Soc.* ix. 493; leaves subsessile elliptic acute shining nearly glabrous, flowers solitary axillary, bracteoles narrowly oblong hispid-ciliate as long as the calyx, capsule 2-seeded.

BOMBAY; Bababoodun Hills, *Stocks*.

A small undershrub; branches erect, sparsely hispid. Leaves $2\frac{1}{4}$ by 1 in., base rounded, glabrous or slightly hispid-ciliate; petiole $0\frac{1}{2}$ in. Bracteoles 1 by $\frac{1}{2}$ in., subobtusate. Sepals 1 in., subentire, hispid-ciliate, 2 outer lanceolate, one bifid $\frac{1}{2}$ the way down into narrow lanceolate segments. Corolla not seen. Capsule $\frac{3}{4}$ in., shortly obovoid compressed rostrate. Seeds nearly $\frac{1}{2}$ in. diam., silky, occupying the middle of the capsule.—*T. Anderson*, from the habit and leaves of this plant, evidently considered it allied to *B. montana*. The capsule is narrowed towards the base, or it might be arranged in the section *Prionitis*. It is really a very marked species, almost worthy a section to itself.

24. **B. strigosa**, *Willd. Sp. Pl.* iii. 379; leaves large ovate acute long-decurrent on the petiole glabrate above, spikes dense many-fl. 1-sided, bracteoles oblong or elliptic shorter than the calyx, outer sepals ovate ciliate-denticulate minutely strigose, corolla $1\frac{1}{2}$ –2 in. blue. *Heyne in Herb. Rottler. B. cærulea*, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 39; *Wall. Cat.* 2509; *Nees in Wall. Pl. As. Rar.* xi. 91, and in *DC. Prodr.* xi. 226; *T. Anders. in Journ. Linn. Soc.* ix. 491. *B. macrophylla*, *Heyne in Herb. Rottler. Pseudobarleria cærulea*, *Oerst. in Vidensk. Meddel. Kjob.* 1854, 135.

BENGAL, in the lower hills, alt. 0–4000 ft., common; ORISSA, CHOTA NAGPORE, SIKKIM, ASSAM.—DISTRIB. Much cultivated in India and Malaya.

Shrubby, 2–4 ft.; branches fulvous-strigose upwards. Leaves $5\frac{1}{2}$ by $2\frac{1}{2}$ in. (sometimes twice as large), widest towards the base, lineolate above, fulvous-strigose on the nerves beneath; petiole $\frac{1}{2}$ –1 in., or 0, i.e. subulate by the much decurrent leaf-base.

Spikes 1-3 in., very dense, often glomerate, always secund, the sepals densely imbricated, the bracteoles appearing patent or reflexed on one side; bracteoles $\frac{1}{2}$ - $\frac{3}{4}$ in., lanceolate or subovate. Outer *sepals* 1 in., sometimes more, nervous. *Corolla* funnel-shaped in the upper half of the tube; lobes $\frac{3}{4}$ in., ovate. *Capsule* $\frac{3}{4}$ in., 4-seeded; seeds silky.

VAR. polystachya; leaves very large fulvous-hirsute above somewhat glaucescent beneath, spikes densely agglomerated yellow-hirsute. *B. polystachya*, *Nees in DC. Prodr.* xi. 226.—Concan; *Stocks*.

VAR. terminalis; leaves thinly fulvous-hirsute above, spikes substrobilate not or very obscurely 1-sided, outer sepals more softly hairy often obtuse. *B. terminalis*, *Nees in DC. Prodr.* xi. 225; *Dalz & Gibs. Bomb. Fl.* 188.—Concan; *Jacquemont*, &c. Belgaum; *Ritchie*.—This may be a distinct species, as Dalzell considers; but T. Anderson does not deem it worth notice as a var.

25. *B. polytricha*, *Wall. Pl. As. Rar.* i. 72, t. 82, and *Cat.* 7143; leaves large oblong attenuate at both ends hirsute above, spikes dense many-fl. 1-sided, bracteoles oblong or elliptic somewhat shorter than the calyx, outer sepals ovate ciliate-denticulate hirsute, corolla $1\frac{1}{2}$ -2 in. blue. *Nees in Wall. Pl. As. Rar.* iii. 91, and in *DC. Prodr.* xi. 225; *T. Anders. in Journ. Linn. Soc.* ix. 491. *B. cærulea*, *Wall. Cat.* 2509, letter K only. *B. hirsuta*, *Wall. Cat.* 7142; *Nees ll. c.* *Pseudobarleria polytricha*, *Oerst. in Vidensk. Meddel. Kjob.* 1854, 135.

CHITTAGONG, PEGU and TENASSERIM; *Wallich*, &c., frequent.—DISTRIB. Ava.

Leaves 6 by $1\frac{1}{2}$ in., base gradually cuneately attenuated, hairs long on the upper surface; otherwise altogether as *B. strigosa*.

VAR. polystachya has the leaves suddenly narrowed to the subulate petiole. *B. hirsuta* is a young state, having the heads substrobiliform, not (or very obscurely) 1-sided; probably always more or less 1-sided in fruit.

26. *B. nitida*, *Nees in Wall. Pl. As. Rar.* iii. 91, and in *DC. Prodr.* xi. 224; leaves ovate or elliptic shortly acuminate at both ends lineolate nearly glabrous above, spikes dense 1-sided, bracteoles elliptic or subovate nearly as long as the calyx, outer sepals ovate strongly ciliate-denticulate shining sparsely hispidulous not strigose, corolla $1\frac{1}{2}$ in. blue. *Wight Ic.* t. 454; *T. Anders. in Journ. Linn. Soc.* ix. 491. *B. cærulea*, *Wall. Cat.* 2509, letter H only. *B. bracteata*, *Heyne in Herb. Rottler*.

Hills of S. DECCAN PENINSULA; *Rottler*; Courtallum, *Wight*; Nilghiries. *Foulkes*; Tinnevely Hills, *Beddome*.

Leaves $1\frac{1}{2}$ -2 in. Outer *sepals* shining, with scattered yellow hairs, but no strigose pubescence on the nerves without; otherwise as *B. strigosa*, from which T. Anderson admits it to be specifically distinct. The Simla plant referred to this species by Nees is *B. strigosa*, with (as usual in the N.W. Himalaya) smaller leaves than in the Sikkin Terai form.

XXIII. NEURACANTHUS, *Nees*.

Perennials; flowering stems erect, annual. *Leaves* entire. *Flowers* small, blue, spicate; spikes axillary or terminal, elongate strobilate or dense capitate; bracts ovate, membranous or coriaceous; bracteoles 0 or minute. *Calyx* 2-partite; posterior segment 3-toothed, anterior 2-toothed or 2-partite. *Corolla* tubular, upper half wide-funnel-shaped; limb subentire or obscurely lobed, plicate. *Stamens* 4, didynamous; anterior anthers 2-lobed, posterior 1-lobed (second lobe rudimentary); lobes ovoid, distinct, sometimes hairy. *Style* at the apex 2-branched, 1 branch linear-lanceolate, the other obsolete; ovary 4-ovulate. *Capsule* oblong, glabrous, 4-seeded. *Seeds* much compressed, ovate, densely inelastically silky.—Species 6, the 5 following and a tropical African one.

Lepidagathis differs by the anthers all 2-celled, the stigma subequally minutely 2-lobed, and the presence of bracteoles. *N. subuninervius*, Kurz, has been removed to *Lepidagathis*.

* *Spikes axillary, elongate, bracts sub-4-ranked.*

1. ***N. trinervius***, *Wight Ic. t. 1532*; leaves sessile elliptic cuneate at both ends nearly glabrous, bracts ovate or obovate spinous-mucronate 5-nerved, calyx-segments linear-lanceolate long-ciliate. *Dalz. & Gibs. Bomb. Fl. 190*; *T. Anders. in Journ. Linn. Soc. ix. 494*.

CONCAN; in the Ghauts, *Law, Dalzell, &c.*; Salsette, *Herb. Wight*.

Stems 1-3 ft., glabrous except at the tips. *Leaves* $4\frac{1}{2}$ by $1\frac{3}{4}$ in., lineolate above, obovate-minutely setose. *Spikes* 1-5 in., hairy; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in.; segments divided about half-way down; cilia $\frac{1}{8}$ in., rising from minute glistening tubercles. *Corolla* $\frac{1}{2}$ in., blue, nearly glabrous without, 2-lipped; segments 5, subsimilar, obtusely triangular, plicate in bud, tips tufted. *Capsule* $\frac{1}{4}$ in. *Seeds* $\frac{1}{10}$ in.

2. ***N. tetragonostachyus***, *Nees in Wall. Pl. As. Rar. iii. 97*, and *Cat. 7168*, and in *DC. Prodr. xi. 248*; leaves short-petioled elliptic or obovate-lanceolate attenuate at both ends thinly pubescent or glabrous, bracts elliptic spinous-mucronate 5-nerved, calyx-segments linear-lanceolate long-ciliate. *T. Anders. in Journ. Linn. Soc. ix. 494*.

PEGU; Prome Hills, *Wallich*; Rangoon, *M'Lelland*; Moulmein, *Parish*.

Hardly differs from *N. trinervius* except in the greater attenuation of the leaves at both ends. *Flowers* blue (*Parish*).

3. ***N. grandiflorus***, *Kurz in Journ. As. Soc. 1873, pt. ii. 95*; leaves small obovate or oblong subobtuse nearly glabrous, bracts ovate-lanceolate rigid 5-nerved, calyx-segments lanceolate long-ciliate.

PEGU; Prome, *Kurz*.

Leaves $1\frac{1}{2}$ by $\frac{3}{4}$ in., not lineolate, minute scabrid-pubescent (in Kurz's specimen); petiole obsolete. *Corolla* $\frac{1}{2}$ in., or rather more, blue.—Exceedingly near *N. tetragonostachyus*, but has much smaller leaves, and larger flowers. *Neuracanthus* sp. (*Kew Distrib. n. 6144*), collected by Griffith in Hookhoom Valley, Upper Burma, is perhaps a variety, but has the leaves closely pubescent beneath.

** *Spikes axillary, densely capitate, bracts not 4-ranked.*

4. ***N. sphærostachyus***, *Dalz. in Hook. Kew Journ. ii. 140*; leaves subsessile elliptic nearly glabrous, bracts ovate softly white-hairy, calyx-segments lanceolate or subovate subobtuse. *Dalz. & Gibs. Bomb. Fl. 190*; *Hook. Ic. Pl. t. 835*. *N. Lawii, Wight Ic. t. 1531*; *T. Anders. in Journ. Linn. Soc. ix. 494*. *Lepidagathis sphærostachya, Nees in DC. Prodr. xi. 254*.

CONCAN; *Dalzell, &c.*; common in Bombay Island.

Stems 1-2 ft. *Leaves* $4\frac{1}{2}$ by 2 in., obtuse or subacute, lineolate above; petiole scarcely $\frac{1}{2}$ in. *Spikes* 1-2 in., sometimes agglomerated into axillary globes 3-4 in. diam.; bracts $\frac{1}{2}$ in., purplish. *Calyx* $\frac{1}{2}$ in., one lobe shortly 3-toothed, the other deeply 2-fid. *Corolla* $\frac{3}{4}$ in.; limb a fine blue, obconic, subentire, plicate; lower lip of 3 very depressed triangular lobes, upper an emarginate subsimilar lobe. *Anthers* pubescent. *Capsule* $\frac{3}{4}$ in., 4-seeded. *Seeds* $\frac{1}{2}$ in. diam.—The plant appears rarely to seed, as Dalzell notes.

*** *Spikes terminal, oblong.*

5. ***N. Neesianus***, *Clarke*; hoary silky subtomentose, leaves sessile

ovate or broadly elliptic base cuneate. *Lepidagathis* Neesianus, *Wight*; *T. Anders. in Journ. Linn. Soc.* ix. 499.

MADRAS; Paloor (in Arcot) on black cotton-soil, *Wight*.

Stems 12–18 in., procumbent, terete, softly hairy. *Leaves* 2 by 1 in., obtuse, entire, silky on both surfaces, young white-tomentose beneath. *Spikes* 2 by $\frac{3}{4}$ in., dense; bracts $\frac{1}{2}$ in., ovate, acute, obscurely 4-ranked; bracteoles small, subulate. *Calyx* 2-partite; one segment 3-lobed less than half-way down, lobes lanceolate acute; the other 2-lobed nearly to the base. *Corolla* 2-lipped; upper lip ovate minutely bifid, lower 3-partite, lobes ovate mucronate. *Stamens* 4, included; the upper anthers 2 with 2 divaricate cells, lower 1-celled; connective hairy. *Capsule* $\frac{1}{2}$ in., oblong, 4-seeded. *Seeds* compressed, hairy.—Flowers or stamens described by T. Anderson, whose account of the stamens requires the species to be transferred from *Lepidagathis* to *Neuracanthus*, as does also the structure of the calyx, which is erroneously given by T. Anderson. *Wight* has written on his original ticket “Paloor, in black cotton soil,” which T. Anderson has taken to be Palamcottah (near Tinnevely), where it is believed there is no black cotton-soil.

XXIV. **CROSSANDRA**, *Salisb.*

Undershrubs. *Leaves* entire or undulate, subdentate. *Spikes* linear-oblong; bracts imbricate; bracteoles linear; flowers sessile, yellow. *Sepals* 5, ovate, acute, 2 inner much smaller. *Corolla-tube* linear, incurved; limb on one side of 5 subequal, elliptic lobes, imbricate in the bud. *Stamens* 4, didynamous; anthers 1-celled, muticous; connective mucronate. *Style* minutely 2-lobed at the tip; ovary 4-ovulate. *Capsule* oblong, acute, 4-seeded. *Seeds* compressed, orbicular, adpressedly scaly; scales of numerous hairs coalescing nearly to their tips, which are seen imperfectly free when moistened.—Species 5; 1 in India, 4 in Tropical Africa or Madagascar.

C. undulæfolia, *Salisb. Par. Lond.* t. 12; leaves ovate or lanceolate narrowed at both ends, spikes sessile or peduncled pubescent. *Bot. Reg.* t. 69; *Bot. Mag.* t. 2186. *C. axillaris*, *Nees in Wall. Pl. As. Rar.* iii. 98, and in *DC. Prodr.* xi. 281; *Wight Ill.* t. 164 b, fig. 7, and *Ic.* t. 460; *Dalz. & Gibs. Bomb. Fl.* 193. *C. infundibuliformis*, *Nees in Wall. Pl. As. Rar.* iii. 98, and in *DC. l. c.* 280; *Wight Ic.* t. 461; *T. Anders. in Journ. Linn. Soc.* ix. 494. *C. oppositifolia*, *Nees in Wall. Pl. As. Rar.* iii. 98, and in *DC. l. c.* 281. *C. coccinea*, *Dalz. & Gibs. Bomb. Fl. Suppl.* 71. *Justicia infundibuliformis*, *Linn.*; *Burm. Fl. Ind.* 7. *Harrachia speciosa*, *Jacq. Ecl.* 33, t. 21; *Blume Bijd.* 793. *Ruellia infundibuliformis*, *Roxb. Fl. Ind.* iiii. 41; *Wall. Cat.* 2364.—*Rheede Hort. Mal.* ix. t. 62.

DECCAN PENINSULA and CEYLON.—**DISTRIB.** Cult. in N. India, the Malay Peninsula and Islands.

Stems 1–3 ft., pubescent upwards. *Leaves* 4 by $1\frac{1}{2}$ in. (often much smaller), glabrous or pubescent beneath; petiole $\frac{1}{4}$ –1 in. *Peduncles* 0–5 in.; spikes 1–4 in.; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., elliptic, acute; bracteoles $\frac{1}{2}$ in. *Sepals* much imbricated, outer $\frac{1}{2}$ in., rigid, subscarious. *Corolla* glabrous; tube $\frac{3}{4}$ by $\frac{1}{16}$ in.; lobes $\frac{1}{2}$ by $\frac{1}{4}$ in. *Capsule* $\frac{1}{2}$ in., glabrous.—Wallich's and Griffith's Nepal and Sikkim specimens, treated as wild by Nees and T. Anderson, are no doubt cultivated ones.

XXV. **ASYSTASIA**, *Blume.*

Herbs or undershrubs. *Leaves* entire. *Spikes* or *racemes* lax or dense, simple or compound, 1-sided or suberect; bracts and bracteoles linear, shorter than the calyx (except in *A. Lawiana*); flowers opposite or alter-

nate, usually solitary, blue purple rose or yellow. *Sepals* narrow. *Corolla-tube* short or long, funnel-shaped ventricose or narrow; lobes 5, subequal, imbricate in bud. *Stamens* 4, all perfect, didynamous, subequal; anthers oblong, cells parallel, approximate, base minutely spurred or submucous, the points only obscurely whitened. *Ovary* 4-ovulate, very hairy; stigma minutely bifid or subcapitate. *Capsule* elliptic, 4-seeded, base contracted solid. *Seeds* compressed, orbicular or irregularly angular, rugose or tubercular, glabrous.—Species 15, Tropical Asiatic and S. African.

The species having only 2 fertile stamens are transferred to *Eranthemum*, and those with large bracts to *Lepidagathis*. It might be better to sink *Asystasia* in *Eranthemum*, for many of the species have a long narrow corolla-tube as in *Eranthemum*, and the character of the stamens appears of rather less value than in separating *Hemidelphis* from *Hygrophila*.

* *Corolla* tubular-ventricose, about $\frac{3}{4}$ – $1\frac{1}{4}$ in. long.

1. **A. intrusa**, *Blume Bijl.* 796, not of *Nees*; leaves ovate or elliptic acuminate puberulous above, calyx subsessile glabrous or minutely ciliate, corolla $\frac{3}{4}$ –1 in. tube exceedingly slender. *A. Blumei*, *Nees in DC. Prodr.* xi. 167. *A. nemorum*, *Nees in Wall. Pl. As. Rar.* iii. 90, as to descr. and Malay material.

SINGAPORE; *Schomburgk*.—DISTRIB. Java.

Stems 1 foot, dichotomous, slender, nearly glabrous. *Leaves* 2 by $\frac{3}{4}$ in., base cuneate or rhomboid, undulate, subcrenate, dotted with most minute hairs above, glabrous beneath; nerves 5–6 pair; petiole $\frac{1}{4}$ in. *Spikes* 1–2 in., slender; flowers mostly opposite; bracts scarcely $\frac{1}{10}$ in.; lowest pedicels subobsolete. *Calyx* $\frac{1}{6}$ in.; segments linear-lanceolate, glabrous on the back. *Corolla* glabrous; tube hardly $\frac{1}{12}$ in. diam.; limb hardly $\frac{1}{2}$ in. in expanse. *Stamens* 4, nearly equal. *Style* nearly glabrous; stigma subcapitate. *Capsule* $\frac{1}{2}$ in., 4-seeded, minutely hairy.—This differs from *A. coromandeliana* (and its allies) in the very slender corolla; the tube is widened only near its apex, and is there scarcely $\frac{1}{2}$ in. broad.

2. **A. coromandeliana**, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 165; grey puberulous, leaves ovate acute some rounded or suddenly narrowed at base, lower pedicels manifest, corolla 1– $1\frac{1}{4}$ in. inflated part of the tube much longer than its cylindric base. *Dalz. & Gibs. Bomb. Fl.* 186. *A. plumbaginea*, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 164. *A. gangetica*, *T. Anders. in Thwaites Enum.* 235. *A. violacea*, *Bot. Mag.* t. 5882. *Justicia Gangetica*, *Linn. Amæn. Acad.* iv. 299. *J. plumbaginea*, *Wall. Cat.* 2487. *Ruellia secunda*, *Vahl Symb.* iii. 84; *Wall. Cat.* 2401. *R. Digitalis*, *Koen.*; *Spreng. Syst.* ii. 825; *Nees l. c.* xi. 153. *R. zeylanica*, *Koen.*; *Roxb. Fl. Ind.* iii. 42. *R. Coromandeliana*, *Wall. Cat.* 2399, partly.—*Rheede Hort. Mal.* ix. t. 45.

DECCAN PENINSULA and CEYLON, common.—DISTRIB. Malaya, Africa, Arabia.

A procumbent, perennial weed, 1–2 ft., usually dusky pubescent. *Leaves* 1– $1\frac{1}{2}$ in., lower mostly subcordate, base rounded or suddenly narrowed; nerves 5–6 pair; petiole $\frac{1}{2}$ in. *Racemes* 2–5 in., lax; lower pedicels often attaining $\frac{1}{2}$ in.; bract and bracteoles at the base of the pedicel, about $\frac{1}{2}$ in. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, puberulous or pubescent on the back. *Corolla* pubescent; tube yellow, limb pink or pale purple, usually dull or lurid, sometimes yellow altogether. *Filaments* with few small hairs. *Style* glabrous except near the base. *Capsule* 1 in., pubescent; solid cylindric compressed base $\frac{1}{2}$ in. *Seeds* $\frac{1}{2}$ in. diam., much compressed, ovoid angular wrinkled or subtubercular glabrous.

3. **A. chelonoides**, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 164; leaves elliptic narrowed at both ends minutely hairy or

glabrate, racemes compound many-fld., lower pedicels longer than the pubescent calyx, corolla $\frac{2}{3}$ – $\frac{3}{4}$ in. purple. *T. Anders. in Thwaites Enum.* 286.

CEYLON; *Walker, Thwaites, &c.* TRAVANCORE and TINNEVELLY HILLS; *Beddome* (wild).—DISTRIB. Cultivated in S. India and Malabar.

Leaves $5\frac{1}{2}$ by $1\frac{3}{4}$ in., lower all cuneate or acuminate at the base, punctate or puberulous or with scattered hairs (without the dull grey pubescence of *A. coromandeliana*); nerves 6–8 pair. *Racemes* usually paniced, often peduncled, sometimes 50–60-fld.; lower pedicels $\frac{1}{2}$ – $\frac{1}{3}$ in. *Capsule* nearly of *A. coromandeliana*.—Described from Nees' type specimen marked *A. chelonoides*, Var. *a*, in Nees' hand. It is the species with numerous small purple flowers much cultivated in S. India; and Col. Beddome believes it to be wild in S. Malabar, but there are no specimens except from Ceylon.

VAR. *amœna*; more hairy, leaves hairy on both surfaces, sepals subhirsute, corolla as of *A. chelonoides*, type.—Arracan; forests near Akyab, *Kurz*.

VAR. *quadrangularis*; stem acutely quadrangular, leaves ovate or narrowly lanceolate glabrate, corolla small as of *A. chelonoides*, type. *A. coromandeliana*, Var. *variabilis*, *Nees in DC Prodr.* xi. 165. *A. nemorum*, Var. *B*, *T. Anders. in Journ. Linn. Soc.* ix. 525. *Ruellia quadrangularis*, *Heyne in Herb. Rottler*.—Wynaad; *Rottler*. Anamallays; *Bedd.* Ceylon; *Macrae, Thwaites*.—Leaves very variable; in *Macrae's* example 1 by $\frac{3}{8}$ in., in *Beddome's* 7 by 1 in., in *Thwaites' 2* by $\frac{1}{2}$ in.

4. ***A. violacea***, *Dalz. ms.*, not in *Hook. Kew Journ.* ii. 139; leaves large subovate lower narrowed at base, lower pedicels shorter than the hairy calyx, corolla $1\frac{1}{4}$ – $1\frac{1}{2}$ in. fine blue. *A. chelonoides*, *Nees in DC. Prodr.* xi. 164, Var. β only; *T. Anders. in Journ. Linn. Soc.* ix. 525, chiefly. *A. nemorum*, *Nees in Wall. Pl. As. Rar.* iii. 90, and in *DC. Prodr.* xi. 167 (except the Nilgiri material). *A. coromandeliana*, *Bot. Mag.* t. 4248. *Ruellia filiformis*, *Heyne in Herb. Rottler*. *R. coromandeliana*, *Wall. Cat.* 2399, type sheet partly.

W. DECCAN PENINSULA, alt. 2–6000 ft., frequent; *Rottler, &c.*

Leaves often $6\frac{1}{2}$ by $2\frac{3}{8}$ in., membranous, green, sparsely pubescent or glabrate. *Calyx-segments* nearly $\frac{1}{3}$ in., narrowly oblong, acute. *Capsule* 1– $1\frac{1}{4}$ in.—Described from specimens named by himself, which are identical with Wight's *Herb. Propr.* ii. 1952. In his original description Dalzell says the flowers of *A. violacea* are about half as large as those of *A. coromandeliana*, and the description appears to belong altogether to *A. chelonoides*, Nees' type; but in *Dalz. & Gibs. Bomb. Fl.* 186 the character of *A. violacea* is at once shortened and widened.

5. ***A. crispata***, *Benth. in Linnæa* 1851, 647; leaves elliptic or oblong acuminate lower narrowed into the petiole repand crispately crenulate glabrate, lower pedicels shorter than the pubescent calyx, corolla 1 in. white with rose or dark purple dots in the palate. *T. Anders. in Journ. Linn. Soc.* ix. 526. *A. nemorum*, *Nees in Wall. Pl. As. Rar.* iii. 90, and in *DC. Prodr.* xi. 167, as to the Nilgiri material; *T. Anders. in Journ. Linn. Soc.* ix. 524. *A. coromandeliana*, *Wight Ic. t.* 1506, not of *Nees*. *Ruellia chelonoides*, *Wall. Cat.* 2335 chiefly, not *Asystasia chelonoides*, *Nees*.

MTS. of S. DECCAN PENINSULA, alt. 4–8000 ft.; *Rottler, Wight, &c.*, common about Ooty.

Leaves very variable in width, nearly always crisped subcrenulate; upper often sessile, with base rounded. *Flowers* very constant in colour. *Capsule* as of *A. coromandeliana*.—This species (as also *A. chelonoides*) is so closely allied to *A. coromandeliana* that Col. Beddome says he can hardly distinguish them but by the colour of the flower. They sort out pretty well in the Herbarium, and among the large non-Indian material there is nothing like *A. chelonoides* or *crispata*.

6. ***A. travancorica***, *Bedd. Ic. Pl. Ind. Or.* t. 178; leaves elongate-

lanceolate sparingly pubescent, lower pedicels often longer than the calyx, corolla $1\frac{1}{4}$ – $1\frac{1}{2}$ in. purple-violet (or in cultivation white).

TRAVANCORE, S. TINNEVELLY and ANAMALLAYS, alt. 3000 ft.; *Beddome*.

A large shrub, 6–8 ft. high; branches pubescent upwards. *Leaves* 4–5 by $\frac{3}{4}$ – $1\frac{1}{4}$ in., base cuneate or rhomboid; nerves 7–9 pair, very oblique; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Racemes* 2–8 in., pubescent; lower pedicels sometimes $\frac{1}{2}$ in. *Capsule* 1 in., nearly as of *A. coromandeliana*.—Closely allied to *A. coromandeliana*, though the elongate oblique-nerved leaves give it a very different aspect.

7. **A. macrocarpa**, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 163; pubescent, leaves oblong or elliptic narrowed at both ends, racemes dense or elongate very pubescent, corolla $1\frac{1}{4}$ in. dull pink, cylindric base of its tube much shorter than the ventricose part. *T. Anders. in Journ. Linn. Soc.* ix. 525. *Ruellia macrocarpa*, *Wall. Cat.* 2348.—*Acanthaceæ*, *Griff. Itin. Notes*, 106, n. 92, and *Id. Pl. As.* t. 438.

SUBTROPICAL HIMALAYA, from Kumaon to Bhotan; in the Terai, alt. 1000 ft., and in the hotter valleys ascending to 4000 ft.

A diffuse, rambling undershrub, 1–4 ft. *Leaves* $4\frac{1}{2}$ by $1\frac{1}{4}$ in.; nerves 8 pair; petiole $\frac{1}{2}$ in. *Racemes* usually condensed, 1-sided; sometimes 3–4 in., erect, lax, with opposite flowers; lower pedicels $0\frac{1}{6}$ in.; bracts $\frac{1}{2}$ in. *Sepals* $\frac{1}{4}$ in., linear-lanceolate, pubescent. *Corolla* pubescent. *Stamens* 4, perfect; anther-cells distinctly spurred at the base. *Capsule* $1\frac{1}{2}$ in., pubescent; cylindric base $\frac{3}{8}$ in. *Seeds* $\frac{1}{4}$ in. diam., much compressed, tubercular, rugose, glabrous.

8. **A. lanceolata**, *T. Anders. in Journ. Linn. Soc.* ix. 524; leaves lanceolate acuminate glabrous, bracts lanceolate acute villous as long as the calyx, corolla 1 in. funnel-shaped constricted base of the tube short.

BUUMA; Baragyn, *Brandis (T. Anderson)*.

An erect, glabrous herb; stem terete, sparingly branched, internodes long. *Leaves* 4–6 by $1\frac{1}{2}$ in., undulate; petiole short. *Spikes* terminal, erect; bracts opposite, $\frac{1}{2}$ in., subherbaceous, lax, decussate, somewhat remote; flowers sessile, 1 or 2 in the axil of each bract. *Sepals* linear, equal, villous, membranous. *Corolla* villous without; lobes 5, unequal, small, erect. *Anther-cells* 2, bases mucronate.—Not seen.

VAR. ? *Beddomei*; leaves linear-lanceolate hairy on both surfaces, corolla $1\frac{1}{2}$ in. and upwards before expansion.—Tenasserim, Mooleyit, *Beddome*.—*Leaves* 8 by $\frac{3}{4}$ –1 in., caudate-acuminate, widest close to the rounded or subcordate base; petiole $0\frac{1}{10}$ in. *Spikes* compound, most of the lower bracts and calyces small without flowers; upper bracts $\frac{1}{4}$ – $\frac{1}{2}$ in., lanceolate, glabrate. *Corolla* broad, nearly straight, urn-shaped on a short cylindric base; lobes subequal, $\frac{1}{2}$ in., ovate, obtuse. *Stamens* 4, 2 conspicuously longer; anthers 2-celled, cells broadly oblong, parallel, equal, white-apiculate at base. *Pistil* as of *Asystasia*. *Capsule* not seen.

** *Corolla linear shortly funnel-shaped upwards about 2 in. long.*

9. **A. atroviridis**, *T. Anders. in Journ. Linn. Soc.* ix. 526; leaves large elliptic acuminate at both ends nearly glabrous, racemes condensed nearly glabrous, corolla 2 in. rose-pink tube very long linear. *Ruellia atroviridis*, *Wall. Cat.* 2404.—*Asystasia* sp. n. 15, *Herb. Ind. Or. H. f. & T. Verbenacearum* sp., *Nees in DC. Prodr.* xi. 155.

KHASIA MTS., alt. 0–3000 ft., frequent; *Wallich, Griffith, H. f. & T., &c.*

Stems 1–3 ft., herbaceous. *Leaves* $8\frac{1}{2}$ by $3\frac{1}{4}$ in.; nerves 10–14 pair; petiole $1\frac{1}{2}$ in. *Racemes* usually paniculate in a dense terminal subsessile head; bracts $\frac{1}{2}$ in.; pedicels $\frac{1}{2}$ in., often pubescent. *Sepals* $\frac{1}{2}$ in., sublinear, glabrous or pubescent. *Corolla* glabrous, linear portion of the tube $1\frac{1}{4}$ in., limb about 1 in. diam. *Stamens* 4, glabrous; anthers mucous, or very obscurely mucronate at the base. *Capsule*

1½ in., with the seeds nearly as of *A. macrocarpa*.—The name is very misleading; the corolla is always a fine rose. In one example the raceme is developed into a lax very compound panicle, and the plant is noted as 6 ft. high.

10. **A. Neesiana**, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 164; leaves large broadly elliptic acute sparingly pubescent, racemes elongate very lax pubescent, corolla 2 in. pink tube very long linear. *T. Anders. in Journ. Linn. Soc.* ix. 526. *Ruellia Neesiana*, *Wall. Pl. As. Rar.* i. 73, t. 83, and *Cat.* 2342.—*Asystasia* sp. n. 14, *Herb. Ind. Or. H. f. & T.*

KHASIA MTS., alt. 0–3000 ft., frequent; *Wallich, &c.* CACHAR; *Keenan*. MOULMEIN; *Parish*.

Leaves 8 by 3 in., lower long-petioled, uppermost pair usually (not always) sessile. *Raceme* often nearly a foot long, very pubescent. *Corolla*, *capsule* and *seeds* nearly as of *A. atroviridis*. *Anther-cells* minutely mucronate at the base.

DOUBTFUL SPECIES.

11. **A. ? KUNTHIANA**, *Nees in Wall. Pl. As. Rar.* iii. 89, and in *DC. Prodr.* xi. 163; leaves oblong or elliptic acuminate at both ends pubescent beneath, spikes dense few-fl'd. on very short axillary peduncles. *T. Anders. in Journ. Linn. Soc.* ix. 525. *Ruellia Kunthiana*, *Wall. Cat.* 2419.

PENANG; *Wallich*.

Stems creeping, rooting; branches 1 foot, erect, subterete, glabrous. *Leaves* 3½ by 1½ in., lineolate above; petiole scarcely ¼ in. *Peduncles* 0–½ in.; spikes ¼–½ in., glabrous, lineolate; bracts ⅙ in. *Sepals* ½ in., linear. *Capsule* ½ in., constricted for a short space at the base, 4-seeded, glabrous. *Flowers* not seen.—*T. Anderson* does not doubt this being an *Asystasia*, but it might quite as well be a *Justicia*.

12. **A. ? Eranthemum montanum**, *Bot. Mag.* t. 4031, *not of Roxb.*; leaves elliptic acuminate at both ends glabrate, racemes lax compound puberulous, sepals linear-subulate ciliate, corolla 2½ in. purple tube very long linear.

"INDIA;" cultivated formerly at Kew.—Upper *leaves* 4½ by 1½ in.; nerves 7 pair; petiole ½ in. *Peduncle* 3 in., grey puberulous; panicle lax; bracts ½–⅔ in., linear-lanceolate, much shorter than the calyx; lower pedicels 0–½ in. *Sepals* ½ in. *Corolla* glabrous. *Stamens* 4 perfect, subsimilar, glabrous; anther-cells 2, bases acute. *Stigma* minutely equally bifid.—A plant of which nothing is known, but the excellent figure cited, and the specimen from which it was taken. The description is incorrect as to the 2 stamens, of which there are 4, hardly at all didynamous. The minute bracts are as in *Asystasia*, and will not do for *Dædalacanthus*. Its true place is, in the absence of fruit, uncertain.

13. **A. LAWIANA**, *Dalz. in Hook. Kew Journ.* iv. 344; leaves elliptic acute at both ends very sparsely hairy, spikes short-oblong dense softly-hairy, bracts large imbricated, corolla 1–¾ in. white. *Dalz. & Gibs. Bomb. Fl.* 186. *A. mysurensis*, *T. Anders. in Journ. Linn. Soc.* ix. 524. *Ruellia mysurensis*, *Roth Nov. Sp.* 303; *Wall. Cat.* 2402. *Strobilanthes mysurensis*, *Nees in Wall. Pl. As. Rar.* iii. 86, and in *DC. Prodr.* xi. 192.

W. DECCAN PENINSULA; from Saugur to Kurg, frequent; *Rottler, &c.*

Stem herbaceous, erect, thinly hairy. *Leaves* 4 by 1½ in., with few distant multicellular hairs above, minutely lineolate, puberulous beneath; petiole 1½ in. *Flower-heads* 1½ by ¾ in., substrobiliform; bracts ¾–1 by ¼ in., broadly lanceolate, softly hirsute; bracteoles ¾ in., lanceolate membranous. *Sepals* ½ in., linear hairy. *Stamens* slightly didynamous, nearly glabrous; anthers 2-celled; cells ovate or subellipsoid, muticous, one slightly above the other. *Style* glabrous; stigma very minutely bifid; ovary pubescent. *Capsule* ¾ in., 4-seeded; solid cylindric base ½ in. *Seeds* compressed, angular; testa minutely laxly hexagonal, glabrous.—Very unlike the genus in the bracts, corolla, anthers, and habit, in which it more resembles *Strobilanthes micranthus*.

XXVI. **ERANTHEMUM**, Linn.

Stamens 2 fertile, 2 rudimentary or 0. *Ovary* often glabrous. Otherwise as *Asystasia*.—Species 30, tropics of both hemispheres.

E. diantherum, Roxb. *Fl. Ind.* i. 112, Wall. *Pl. As. Rar.* iii. 108, and *E. racemosum*, Roxb. *l. c.* 113, Wall. *l. c.* 107, DC. *Prodr.* xi. 455, came from the Moluccas.—*E. semperflorens*, Roth *Nov. Sp.* 2, Nees in DC. *Prodr.* xi. 458, came from Martinique, nor is there reason from Roth's account to believe it otherwise than cultivated by Heyne.—*Justicia* sp., Griff. *Ic. Pl. As.* t. 426 (Kew Distrib. n. 6177), is a fine *Eranthemum*, collected in Ava, outside the bounds of British India.

* *Corolla tubular-ventricose.*

1. ***E. indicum***, Clarke; leaves lanceolate or subovate acuminate at both ends glabrous, racemes dense puberulous or glabrate, corolla $1\frac{1}{4}$ in. white abundantly purple-veined. *Thysacanthus indicus*, Nees in DC. *Prodr.* ix. 325. *Asystasia thysacanthus*, T. Anders. in *Journ. Linn. Soc.* ix. 525.

SIKKIM and BHOTAN, alt. 1–5000 ft., frequent; *H. f. & T.*, &c. ASSAM, in the lower hills; KHASIA and JAINTIA MTS., alt. 1–4000 ft., frequent.

A diffuse undershrub, 1–4 ft. *Leaves* 7 by $2\frac{1}{2}$ in.; nerves 5–7 pair; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. *Racemes* 1–5 in.; lower pedicels 0– $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ – $\frac{1}{2}$ in., linear. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, glabrous or puberulous. *Corolla* distinctly 2-lipped, upper lip subentire emarginate galeate, lower 3-fid, middle lobe the widest. *Filaments* and *style* minutely hairy. *Capsule* $1\frac{1}{2}$ in., base long, cylindric, solid. *Seeds* $\frac{1}{4}$ in., orbicular, tubercled, rugose, glabrous.—It is difficult to give a reason why this is not a *Thysacanthus*, except that it is not American; the curved subgaleate corolla does not agree well either with *Asystasia* or *Eranthemum*.

** *Corolla-tube linear-cylindric, often very narrow.*

2. ***E. crenulatum***, Lindl. in *Bot. Reg.* t. 879, not of Nees; leaves lanceolate or elliptic acuminate at both ends, racemes slender glabrous or puberulous, flowers solitary, corolla pale purple or lilac tube $\frac{3}{4}$ in. slender narrowly funnel-shaped upwards, ovary glabrous.

KHASIA TERAI, alt. 0–2000 ft., frequent; Wallich, *H. f. & T.*, &c.

Perennial; 18 in., glabrous. *Leaves* $6\frac{1}{2}$ by 2 in., undulate-crenate; nerves 8 pair; petiole $\frac{1}{2}$ in. *Racemes* in a terminal panicle with curved drooping slender branches; bracts $\frac{1}{2}$ in., linear-lanceolate; pedicels 0– $\frac{1}{2}$ in. *Sepals* $\frac{1}{2}$ in., sublinear, glabrous or puberulous. *Corolla-limb* obscurely 2-lipped, $\frac{1}{2}$ in. diam. *Stamens* 2, subincluded. *Capsule* $\frac{3}{4}$ in.; cylindric base $\frac{1}{2}$ in. *Seeds* $\frac{1}{2}$ in., rugose, glabrous.—Lindley's picture is excellent, but shows a small example in young flower; the panicle is often 8–12 in. diam., the flowers becoming distant on the branches. The species has been quite lost sight of by Nees and T. Anderson, Hooker's examples having (probably from the short corolla) been referred to *Codonacanthus*.

3. ***E. malabaricum***, Clarke; leaves elliptic or ovate narrowed at both ends glabrous, spikes glabrous or puberulous, corolla white or yellowish tube $1-1\frac{1}{4}$ in., ovary glabrous. *E. crenulatum*, Wall. *Cat.* 2491; Dalz. & Gibs. *Bomb. Fl.* 195. T. Anders. in *Thwaites Enum.* 235, and in *Journ. Linn. Soc.* ix. 523, chiefly. *Justicia latifolia*, Vahl *Symb.* ii. 4?

W. DECCAN PENINSULA, frequent; Wight, Hohenacker. CEYLON; Thwaites (*C. P.* n. 1979).

Suffrutescent, 2 ft. high. *Leaves* 5 by $2\frac{1}{2}$ in., undulate-crenate, minutely lineolate on both surfaces; nerves 6–7 pair; petiole $\frac{1}{2}$ in. *Spikes* 4–9 in.; lowest pedicels obsolete in fruit; bracts $\frac{1}{2}$ in., linear-lanceolate. *Sepals* $\frac{1}{2}$ in., sublinear,

glabrous or puberulous. *Corolla-tube* linear, only slightly widened close to the apex; limb 1-1½ in. diam., obscurely 2-lipped. *Capsule* ½ in., cylindric base ¼ in. *Seeds* ⅙ in., rugose, subterbecled glabrous.—Vahl's description agrees pretty well with this Malabar species, and he received his examples from Koenig; but his reference to Rheede Hort. Mal. ix. t. 44 (which has extremely different flowers) throws a doubt on the identification. Nees says his *E. crenulatum* was founded entirely on material from Silhet to Malacca, and therefore it should not belong to *E. malabaricum*, even in part; but in fact a good deal of Nees' material came from Malabar.

4. ***E. palatiferum***, Nees in *Wall. Pl. As. Rar.* iii. 108, and in *DC. Prodr.* xi. 457; leaves elliptic acuminate at both ends pubescent on the midrib beneath or ultimately glabrate, racemes pubescent flowers often fascicled, corolla pale-purple tube 1¼-1½ in. linear, ovary pubescent. *T. Anders. in Journ. Linn. Soc.* ix. 524. *Justicia palatifera*, *Wall. Pl. As. Rar.* i. 80, t. 92. *J. rubicunda*, *Ham. in Wall. Cat.* 2480.

SUBTROPICAL SIKKIM and BROGAN, alt. 0-3000 ft., frequent; *Treutler, Gamble, &c.* ASSAM and KHASIA MTS., alt. 0-3000 ft., common; *Wallich, Griffith, &c.*

Perennial, 3 ft.; stems pubescent upwards. *Leaves* 7 by 2-3 in., very obscurely (or not) lineolate; nerves 8-10 pair; petiole ½ in. *Racemes* often one foot long, pubescent; bracts ⅙-⅓ in., sublinear; lower pedicels rarely attaining ½ in. *Sepals* ½ in., linear, pubescent. *Corolla-tube* linear almost to its apex; limb 1¼ in. diam., obscurely 2-lipped; purple often with a yellowish spot on the middle lobe of the lower lip. *Capsule* nearly 1 in., pubescent. *Seeds* ⅙ in. diam., reticulate-rugose, glabrous.

VAR. *levicapsa*; leaves more conspicuously lineolate on the upper surface, spikes long slender in more or less compound panicles, flowers often slenderer, capsule less pubescent usually soon glabrate. *E. crenulatum*, *Wall. Cat.* 2491, letter F.—Chittagong, alt. 0-2000 ft., frequent; *H. f. & T., &c.* Pegu, *M'Lelland.* Mergui, *Griffith.* Attran, *Wallich.*

VAR. *elata*; leaves large uppermost petioled elongate-cuneate at the base. *E. elatum*, *Kurz in Journ. Bot.* 1872, 46, and 1873, 47. *E. latifolium*, *Kurz in Flora* 1870, 363 excl. syn. ?—Pegu, Yomah, *Kurz.* Rangoon, *M'Lelland.*—*Kurz* notes that this species produces on the same plant dimorphous flowers; one kind as of *E. palatiferum* type, the other (usually the upper ones in the spike) about ½ in. long, which chiefly produce fruit. Similar dimorphic flowers occur in typical Khasian *E. palatiferum*.

5. ***E. album***, Nees in *DC. Prodr.* xi. 455; leaves elliptic acuminate puberulous on the midrib beneath or glabrate, spikes panicked minutely pubescent, corolla white tube 1½ in. linear. *T. Anders. in Journ. Linn. Soc.* ix. 523. *E. crenulatum*, *Wall. Cat.* 2491, letters D, E. *Justicia alba*, *Roxb. Fl. Ind.* i. 116, and *Id. Ined. in Herb. Kew.*

ANDAMANS; *Roxburgh, Kurz.* PEGU; *Brandis.* CHITTAGONG; *J. D. H. PENANG; Wallich.* NICOBARS; *Kurz.*

Stem woody upwards, bark whitish. Uppermost leaves very shortly petioled, base usually rounded, but in *Roxburgh's* picture (and in the Chittagong example) cuneate.—This, when dry, seems very difficult to separate from *E. palatiferum*, Nees, *Var. levicapsa*, except by the woodiness of the stems, almost to the panicle as shown in *Roxburgh's* picture and in *Kurz's* and *Hooker's* examples; the stems in *E. palatiferum* being distinctly herbaceous unless very near the base.

6. ***E. malaccense***, *Clarke*; leaves broad-lanceolate minutely pilose on the midrib beneath, spikes 1-3 subterminal puberulous or pubescent, corolla pale-purple tube 1-1½ in. linear, ovary nearly glabrous. *E. crenulatum*, Nees in *Wall. Pl. As. Rar.* iii. 107, and in *DC. Prodr.* xi. 453, chiefly; *T. Anders. in Journ. Linn. Soc.* ix. 523, partly (not of *Lindl.*). *E. palatiferum*, *Bot. Mag.* t. 5957, left-hand fig. only. *Justicia orbiculata*, *Wall. Cat.* 2489, letter b.

MALACCA; *Griffith* (*Kew Distrib.* n. 6175), *Cuming*, nn. 2357, 2389, &c.

An undershrub, 4 ft. high. *Leaves* $5\frac{1}{2}$ by $1\frac{1}{4}$ in., acuminate, base cuneate, obscurely or obsoletely lineolate; nerves 5-6 pair, much curved, usually crispedly pubescent when young; petiole $\frac{1}{2}$ in. *Spikes* 2-5 in., fuscous-puberulous, few- or little-branched, never forming a lax panicle; bracts $\frac{1}{10}$ in.; lower pedicels very short. *Flowers* and *fruits* very nearly as of *E. palatiferum*. Young *capsule* sometimes sparsely pilose, soon glabrous.—This plant seems plentiful at Malacca, and probably occurs in the Malay Isles, but does not exactly agree with any Malay species at Kew, nor with the descriptions of the Dutch botanists. It may (ex descr.) possibly be *E. punctatum*, *Nees in DC. Prodr.* xi. 455.

7. **E. Andersoni**, *Masters in Gard. Chron.* 1869; leaves large lanceolate acute at both ends glabrous, spike very long linear flower-clusters whorled below, bracts and calyces glabrous or puberulous, corolla-tube $1\frac{1}{2}$ - $1\frac{3}{4}$ in. *Bot. Mag.* t. 5771. *E. elegans*, *Masters l. c.* 1868, p. 1234, not of Br. *E. Blumei*, *Teijs.*? *Miq. Fl. Ind. Bat.* ii. 836; *T. Anders. Journ. Linn. Soc.* ix. 523; *Kurz in Flora* 1870, 363.

SINGAPORE; *T. Anderson*.—DISTRIB. Malaya.

Upper *leaves* 5 by $1\frac{1}{2}$ in.; petiole $\frac{3}{8}$ in. *Spike* (coming into flower) 10 in.; lower clusters distant, many-fl'd., upper few-fl'd., continuous; bracts $\frac{1}{2}$ in. *Calyx* $\frac{1}{4}$ in.; lobes linear-lanceolate. *Corolla* white, pubescent; lobes $\frac{3}{8}$ by $\frac{1}{4}$ in. *Capsule* not seen.—Described from *T. Anderson's* Singapore example. The name should be *E. Blumei*, but there is no authentic example of that for comparison; nor is it known whether, by recording *E. Blumei* among the Indian *Acanthaceæ*, *T. Anderson* alluded to his Singapore plant.

8. **E. cinnabarinum**, *Wall. Pl. As. Rar.* i. 20, t. 21, and *Cat.* 9088; leaves large elliptic acuminate at both ends glabrous, spikes rather short rigidly paniced fuscous-puberulous, corolla crimson tube $1\frac{1}{2}$ in. linear. *Nees in Wall. Pl. As. Rar.* iii. 108, and in *DC. Prodr.* xi. 453; *T. Anders. in Journ. Linn. Soc.* ix. 524. *E. palatiferum*, *Bot. Mag.* t. 5957, right-hand fig.

LOWER BURMA and TENASSERIM; *Wallich, Parish, Beddome*.

Leaves $8\frac{1}{2}$ by $2\frac{1}{2}$ in., undulate-crenulate; raphides sunk, obscure; nerves 8-11 pair; petiole $\frac{1}{2}$ - $1\frac{1}{2}$ in. *Panicles* compound, stout; branches short, patent or ultimately recurved; flowers subsessile, often fasciated; bracts $\frac{1}{4}$ in., linear. *Sepals* $\frac{1}{2}$ in., sublinear. *Corolla-tube* linear to the apex; limb 2-lipped, lobes of the lower lip wider than those of the upper; eye often more intensely crimson, sometimes a yellowish spot on the middle lobe of the lower lip.

VAR. *succisifolia*; flowers white. *E. succisifolium*, *Kurz in Journ. As. Soc.* 1876, pt. ii. 142.—*Nicobars*; *Kurz*.—The dried examples show no good distinction between this and *E. cinnabarinum*; the leaves have rather fewer nerves than in *Wallich's* specimen, but not than in his picture; the flowers are hardly smaller than *Wallich's*; the capsules are $\frac{3}{4}$ in., altogether as of the genus.

9. **E. Parishii**, *Clarke*; leaves elliptic acuminate at both ends glabrous, spikes puberulous or pubescent subpaniced, flowers often fasciated, corolla purplish-pink tube $1\frac{1}{2}$ in. distinctly funnel-shaped upwards. *E. crenulatum* var. *grandiflora*, *Hook. f. in Bot. Mag.* t. 5440. *Asystasia Parishii*, *T. Anders. in Journ. Linn. Soc.* ix. 526.

MOULMEIN; *Parish*. TENASSERIM; *Beddome*.

Leaves $4\frac{1}{2}$ by $1\frac{1}{4}$ - $1\frac{1}{2}$ in., very acute, variegated in all the wild examples, densely punctulate not lineolate above; nerves 6 pair; petiole $\frac{3}{8}$ in. *Spikes* 2-5 in., suberect; bracts $\frac{1}{2}$ in. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, pubescent. *Corolla-tube* linear below, upper $\frac{1}{2}$ part distinctly widened subinflated; limb $\frac{3}{4}$ in. diam., segments subequal. *Anthers* subexsert. *Ovary* glabrous or very nearly so.—In *Bot. Mag.* t. 5440, the stamens are figured 4 subequal; in the accompanying text they are said to be 2 or 4. Wild specimens have 2 perfect and 2 minute rudimentary stamens.

10. ***E. leptanthus***, Clarke; leaves elliptic acuminate at both ends glabrous, racemes elongate many-fl. subglabrous, corolla small tube $\frac{1}{4}$ – $\frac{1}{3}$ in. linear curved.

MISHMEE HILLS; *Griffith* (Kew Distrib. n. 6181).

Apparently a large herb; branches subterete, glabrous. *Leaves* $7\frac{1}{2}$ by $2\frac{1}{2}$ in., not or very obscurely lineolate; nerves 11–16 pair; petiole $1\frac{1}{4}$ in. *Racemes* 5–9 in., 1–5 subterminal, nearly simple; pedicels fascicled, unusually long, upper often $\frac{1}{2}$ in.; bracts at the base of the pedicels, minute, linear. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, glabrous, margins puberulous. *Corolla* glabrous; tube linear, slightly inflated, base gibbous; limb subequally 5-lobed. *Stamens* 2, with 2 minute linear rudiments; filaments somewhat ligulate, glabrous; anthers oblong; cells straight, parallel, muticous, on the same level exactly. *Pistil* glabrous; disc annular; ovary 4-ovulate; stigma minute, obscurely bifid. *Capsule* not seen.—A species differing widely from all others, but referred by Mr. Bentham to this genus, of which it appears to possess all the essential characters.

SPECIES IMPERFECTLY KNOWN.

11. ***E. GRACILIFLORUM***, *Nees in Wall. Pl. As. Rar.* iii. 107, and in *DC. Prodr.* xi. 454; leaves 8 by $3\frac{1}{2}$ in. elliptic acute at both ends subglabrous, nerves 7–9 pair puberulous beneath, petiole $2\frac{1}{2}$ in. puberulous, thyrses 4 in. dense-fl. and densely pubescent, pedicels $0\frac{1}{2}$ in., bracts $\frac{1}{2}$ in. linear, sepals $\frac{1}{2}$ in. pubescent, corolla-tube $1\frac{1}{2}$ in. linear for $\frac{1}{2}$ its length. *Justicia graciliflora*, *Wall. Cat.* 2427.—Penang Mts.; *Wallich* (specimens without fruit, and with only a very imperfect flower).

12. ***E. BIFARIUM***, *Nees in DC. Prodr.* xi. 458; leaves ovate attenuate at both ends glabrate, spike small puberulous, flowers solitary opposite, bracts and bracteoles linear-subulate shorter than the calyx. *Gendarussa bifaria*, *Wall. Cat.* 7173; *Nees in Wall. Pl. As. Rar.* iii. 104.—Pegu; *Pingee*, *Wallich*.—*Leaves* 7 by $3\frac{1}{4}$ in., entire, minutely lineolate on both surfaces; petiole $1\frac{1}{2}$ in., puberulous. *Spike* (one only seen) $2\frac{1}{2}$ in., puberulous; flowers $\frac{1}{2}$ in. apart. *Calyx-segments* $\frac{1}{2}$ in., linear, puberulous. *Corolla* not seen. *Capsule* $\frac{3}{4}$ –1 in., altogether of *Eranthemum*.—*Nees* founded this on the 2 opposite lines of minute crisped hairs near the tips of the branches; which may be seen in *E. album*, *malaccense* and others. The solitary example of *E. bifarium* in Herb. *Wallich* differs from the neighbouring species in its depauperated spike and long-petioled leaves, but it is impossible to say that it may not be one of them.

13. ***E. PUBESCENS***, *Roth Nov. Sp.* 1; leaves ovate obtuse, spikes terminal subdistichous, bracts imbricated obovate-oblong mucronate keeled densely pubescent, calyx unequal scarious. *Nees in DC. Prodr.* xi. 458.—India; *Heyne*.—A shrub; branches subtetragonous, ashy farinose. *Leaves* from oblong to ovate, nearly entire, nervose, paler beneath, farinose; petiole 1 in. *Spike* terminal, 3 in., enveloped at base by 4 or 5 ovate acute bracts; proper bracts $\frac{1}{2}$ in., dense clothed with capitate hairs; bracteoles 2, linear-subulate. *Calyx* 5-leaved, 2 lanceolate subulate, 1 broader 2-nerved sub-bifid, 2 smaller. *Corolla* showy, pubescent without; tube 1 in. filiform, limb of 5 subequal round lobes. *Stamens* 2 with oblong villous anthers, 2 sterile very short. *Style* long, tip semi-bifid. *Capsule* oblong-ovoid, 4-seeded. *Seeds* brown, compressed, ovate subrotund, under a lens elegantly clothed with imbricated adpressed ferruginous scales.

XXVII. CODONACANTHUS, *Nees*.

Corolla small ventricose nearly from the base.—Otherwise as *Eranthemum*.

The solitary species differs from *Eranthemum indicum* in its very small flowers; from *E. leptanthus* in its ventricose corolla.

C. pauciflorus, *Nees in DC. Prodr.* xi. 103; leaves elliptic acuminate at both ends pubescent on the nerves beneath or glabrate,

flowers $\frac{1}{2}$ in. many of them distinctly pedicelled. *T. Anders. in Journ. Linn. Soc. ix.* 524. *C. acuminatus, Nees l. c.* *Ruellia pauciflora, Wall. Cat.* 2369. *Asystasia pauciflora, Nees in Wall. Pl. As. Rar.* iii. 90.

KHASIA HILLS, alt. 0-3000 ft., and ASSAM; *Wallich, Jenkins, H. f. & T., &c.* CHITTAGONG HILLS; *Clarke.*—DISTRIB. S. China.

An erect herb. *Leaves* 5 by $1\frac{1}{2}$ –2 in.; petiole $\frac{1}{2}$ in., usually pubescent. *Racemes* in the Indian examples forming very compound, slender, terminal, lax panicles; bracts minute linear; pedicels often $\frac{1}{2}$ – $\frac{3}{4}$ in. *Sepals* $\frac{1}{2}$ in., linear-lanceolata. *Corolla* glabrous, pink or whiteish; cylindric base of the tube scarcely $\frac{1}{8}$ in.; lobes 5, ovate, subequal. *Stamens* 2, with 2 minute linear rudiments. *Capsule* $\frac{1}{2}$ in.; base cylindric, solid. *Seeds* 4 as of *Eranthemum*, but nearly smooth, scarcely rugose.—The Chinese examples all differ from the Indian in their much simpler inflorescence. Benth, in allowing the genus 2 species in the Gen. Pl., appears to think the Chinese plant distinct, but in the Flora of Hongkong he had united them.

XXVIII. ANDROGRAPHIS, Wall.

Annual herbs or very small shrubs, erect or procumbent. *Leaves* entire. *Racemes* axillary and terminal, lax, often compound subpanicled, or dense or subcapitate, sometimes reduced and 1-fl., frequently 1-sided; bracts small; bracteoles minute or 0. *Sepals* narrow. *Corolla* small, tubular, 2-lipped, white or pink with dark-purple lower lip, pubescent. *Stamens* 2; filaments ciliate or setulose; anthers exerted, 2-celled; cells oblong, parallel, muticous, subequal, base bearded. *Ovary* 6-12-ovulate, thinly hairy; style slender, tip minutely bifid. *Capsule* linear-oblong or elliptic, compressed contrary to the septum, 6-12-seeded. *Seeds* osseous, subquadrate or oblong, not compressed, rugose-pitted, glabrous.—Endemic in India; the 17 species being very closely connected, and identical as to form and colour of flower, and as to seeds.

* *Capsule linear, thrice as long as broad.*

† *Racemes elongate often loosely subpaniculate, lower flowers distant.*

1. **A. paniculata**, *Nees in Wall. Pl. As. Rar.* iii. 116, and in *DC. Prodr.* xi. 515; leaves lanceolate glabrous, racemes lax paniculate divaricate, pedicels manifest, capsule nearly glabrous. *Wight Ic.* t. 518; *Dalz. & Gibs. Bomb. Fl.* 198; *T. Anders. in Journ. Linn. Soc. ix.* 502; *Bentl. & Trim. Med. Pl.* t. 197. *Justicia paniculata, Burm. Fl. Ind.* 9; *Wall. Cat.* 2454; *Blume Bijd.* 788; *Roxb. Fl. Ind.* i. 117.—*Rheede Hort. Mal.* t. 56.

Throughout INDIA from Lucknow and Assam to Ceylon (probably introduced in some of the northern stations).—DISTRIB. Cultivated in the E. and W. Indies.

An erect annual, 1-3 ft.; stems quadrangular, base not pubescent. *Leaves* $2\frac{1}{2}$ by $\frac{1}{2}$ – $\frac{3}{4}$ in., narrowed at both ends, never spatulate, ovate at base, paler beneath; petiole $0\frac{1}{4}$ in. *Racemes* 1-4 in.; pedicels $0\frac{1}{2}$ in., distant, usually pubescent; bract $\frac{1}{8}$ in., linear; bracteoles smaller or 0; inflorescence mostly sympodal, the pedicel in the axil of one of each pair of bracts suppressed. *Sepals* $\frac{1}{2}$ in., linear-lanceolata, pubescent. *Corolla* $\frac{1}{2}$ in., 2-lipped for at least half its length, hairy; white, spotted rose-purple. *Filaments* hairy upwards. *Ovary* and base of style subglabrous or very thinly hairy. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}$ in., young slightly glandular-hairy, mature glabrous. *Seeds* subquadrate, osseous, rugose, without hairs or scales at any period, wet or dry, yellow or deep brown.—Bentley and Trimen's figure is erroneous as to the seeds being hairy. *Nees* and others have doubted this being Roxburgh's *Justicia paniculata*, because Roxburgh says the bracts are large; but Roxburgh regards the reduced leaves at the base of the racemes as bracts, and does not notice the true small bracts at the base of the pedicels.

2. **A. subspathulata**, *Clarke*; leaves subspathulate elliptic minutely scabrid-punctate on both surfaces, racemes lax divaricate, pedicels manifest, capsule nearly glabrous.

MADRAS; Kurnool at the foot of the Nellymallays, *Beddome*.

In habit resembling *A. paniculata*; stem minutely hispid near the base. *Leaves* 3 by 1 in., apex scarcely acute, base suddenly narrowed; petiole $\frac{1}{2}$ in., often winged to the base. Lower *pedicels* $\frac{1}{2}$ in. *Corolla* $\frac{3}{4}$ in., similar to that of *A. paniculata*, but rather longer.—This has been considered a var. of *A. paniculata*; but points above noted as differential are constant.

3. **A. elongata**, *T. Anders. in Journ. Linn. Soc.* ix. 502; leaves petioled ovate-lanceolate pubescent or glabrate, spikes forming straggling panicles, sepals glabrate or minutely pubescent, anthers exsert not barbate, capsule nearly glabrous. *Justicia elongata*, *Vahl Enum.* i. 130. *J. cordifolia*, *Wall. Cat.* 2482. *Cryptophragmium cordifolium*, *Nees in Wall. Pl. As. Rar.* iii. 100. *C. elongatum*, *Nees in DC. Prodr.* xi. 95.

S. DECCAN PENINSULA; Courtallum, *Wight*; Tinnevely Hills, *Beddome*.

Annual, erect, 2–3 ft.; branches divaricate, acutely quadrangular. *Leaves* 2 by 1 in., base somewhat suddenly narrowed or rarely subcordate; raphides inconspicuous; petiole often attaining $\frac{1}{2}$ in. *Panicles* often a foot each way; pedicels mostly very short. *Sepals* $\frac{1}{2}$ in., linear-lanceolate. *Corolla* $\frac{1}{2}$ in., tube curved, limb $\frac{1}{2}$ – $\frac{3}{4}$ in., obscurely 2-lipped. *Filaments* flattened, glabrous or very nearly so, a little longer than the corolla; anthers glabrous. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}$ in., compressed, at first minutely hairy, soon glabrous. *Seeds* osseous, rugose, not compressed, glabrous.

4. **A. ovata**, *Benth. in Gen. Pl.* ii. 1100; stem glandular-hirsute, leaves petioled ovate, spikes often panicled rather lax somewhat recurved, corolla $\frac{1}{2}$ in., anthers included not barbate, capsule hairy. *Gymnostachyum ovatum*, *T. Anders. ms.*; *Bedd. Ic. Pl. Ind. Or.* t. 250.

DECCAN PENINSULA; Myhendra Hills, Berhampore and Jeypur Hills (Vizagapatam), alt. 2–4000 ft., *Beddome*.

Stems 6–10 in., quadrangular, glandular-pubescent or subhirsute below. *Leaves* 2½–3 by nearly 2 in., shortly attenuated into the petiole, sparsely hairy above, pubescent on the nerves beneath. *Racemes* axillary and terminal, 2–4 in. *Corollas* as of *A. elongata*. *Filaments* much dilated, thinly minutely hairy. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}$ in., compressed. *Seeds* 8–10, subquadrate, osseous, rugose, glabrous, not compressed.—Perhaps a form only of *A. elongata*, *Nees*.

5. **A. tenuiflora**, *T. Anders. in Journ. Linn. Soc.* ix. 502; leaves ovate or lanceolate glabrous or pubescent on the nerves, spikes lax simple or compound, corolla $\frac{1}{2}$ in. obscurely 2-lipped, anthers included pubescent or slightly bearded, capsule pubescent ultimately glabrate. *Haplanthus tener*, *Nees in Wall. Pl. As. Rar.* iii. 115, and *Cat.* 7185, and in *DC. Prodr.* xi. 512. *Gymnostachyum Parishii* & *andrographioides*, *T. Anders. l. c.* 504.

EASTERN FRONTIER, alt. 500–3000 ft., from Assam to Tavoy, frequent. **ANDAMANS**; *Kurz*.—**DISTRIB.** Java, Borneo.

Stems 1–2 ft., quadrangular, pubescent, or glabrous unless at the very base. *Leaves* suddenly or cuneately narrowed at base; or the upper sessile, base rounded or subcordate. *Pedicels* rarely $\frac{1}{10}$ in.—Perhaps not distinct from *A. ovata*: it presents three leading variations, viz. (a) *tenuiflora* type, *T. Anders.*, leaves ovate, spikes long, flowers in remote clusters; (b) *Parishii*, *T. Anders.*, leaves ovate, panicles lax glabrate, flowers mostly solitary; (c) *andrographioides*, *T. Anders.*, leaves lanceolate.

VAR. recedens; nearly glabrous except the very lax compound closely glandular-pubescent panicle.—Tenasserim; Mooleeyit, alt. 2000 ft., *Beddome*.

6. **A. alata**, *Nees in DC. Prodr.* xi. 516; leaves petioled ovate upper

linear-oblong glabrous, panicle large lax branches 4-winged, sepals pubescent or subhirsute, capsule hairy. *T. Anders. in Thwaites Enum.* 232, and in *Journ. Linn. Soc.* ix. 502. *Justicia alata*, *Vahl Enum.* i. 139.

S. DECCAN PENINSULA, alt. 1-3000 ft.; Coimbatore, *Wight*, &c.; Nilgherries, *Gardner*. CEYLON; *Thwaites*.

Stems 2-4 ft., annual, erect, glabrous, 4-angular. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., somewhat suddenly attenuate into the petiole, conspicuously lineolate above; upper leaves few, distant, narrow. *Panicle* often 15 in. diam.; branches glabrous; pedicels $0\frac{1}{4}$ in., pubescent. *Sepals* $\frac{1}{2}$ - $\frac{1}{3}$ in., bristle-pointed, pubescent or very hairy. *Corolla* $\frac{1}{2}$ - $\frac{3}{4}$ in., hairy, white with pink spots; tube curved, limb obscurely 2-lipped. *Anthers* exerted; filaments subglabrous. *Capsule* 1 by $\frac{1}{2}$ in., compressed. *Seeds* osseous, glabrous, not compressed.—Perhaps only a variety of *A. elongata*. The panicle being large, the examples of the old collectors show only the panicle with the reduced narrow leaves belonging thereto; and the descriptions of *Vahl*, *Nees* and *T. Anderson* do not describe the proper cauline leaves.

7. ***A. stenophylla***, *Clarke*; glabrous, cauline leaves linear, racemes lax, flowers nearly all pedicelled, capsule glabrous.

COIMBATORE; *Wight* (*Herb. Propr.* n. 2245).

Rootstock woody; annual stems from its crown numerous, erect and diffuse, quadrangular. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ - $\frac{1}{3}$ in.; rachides 0 or obscure. *Racemes* 2-5 in., axillary and terminal, not distinctly paniced, the upper leaves being nearly similar to the cauline; pedicels mostly nearly as long as the calyx. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, glabrous or very nearly so. *Corolla* nearly as of *A. paniculata*. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}$ in., compressed.

8. ***A. Wightiana***, *Arn. ex Nees in DC. Prodr.* xi. 517; nearly glabrous, leaves subsessile lanceolate, racemes lax few-fl., pedicels sometimes as long as the calyx, corolla $\frac{3}{4}$ in. conspicuously 2-lipped, capsule glabrous. *Wight Ic.* t. 1558. *A. gracilis*, *Nees l. c.* 516; *T. Anders. in Journ. Linn. Soc.* ix. 503.—*Rheede Hort. Mal.* ix. t. 44.

S. DECCAN PENINSULA; Courtallum and Anamallay Forests, *Wight*; Mysore, *G. Thomson*; Mangalore, *Hohenacker*; Travancore and Tinnevely Ghauts, *Beddome*.

Stems elongate, diffuse, lax, quadrangular, glabrous, or thinly obscurely glandular-hairy. *Leaves* attaining 3 by 1 in., subovate, base obtuse rarely cordate, glabrous minutely lineolate above rarely obscurely scabrid puberulous; petiole $0\frac{1}{10}$ in. *Racemes* 2-4 in., weak, glabrous or rarely minutely glandular-hairy; lower pedicels sometimes $\frac{1}{2}$ in. *Sepals* $\frac{1}{2}$ in., sublinear, lineolate, glabrous. *Corolla* purplish, spotted on the lower lip; lips $\frac{1}{2}$ in. *Anthers* exerted, slightly bearded at the base; filaments setulose. *Capsule* $\frac{3}{4}$ -1 by $\frac{1}{2}$ - $\frac{1}{3}$ in.—Authentic examples only differ from *A. gracilis* in the few thin glandular hairs scattered on the upper part of the stem and panicle. That *Nees* understood the same plant as *Arnott* and *Wight* is clear from his saying that in his *A. Wightiana* the calyx was glabrous.

9. ***A. macrobotrys***, *Nees in DC. Prodr.* xi. 516; sparingly pubescent, leaves very short-petioled oblong-lanceolate, racemes elongate, sepals glandular-hairy, corolla $\frac{3}{4}$ in. conspicuously 2-lipped, capsule glabrous. *A. Wightiana*, *T. Anders. in Thwaites Enum.* 232, and in *Journ. Linn. Soc.* ix. 502, not of *Nees*.

MTS. of S. DECCAN PENINSULA; Mangalore, *Hohenacker*; Anamallays and Pulneys, *Beddome*. CEYLON; *Macrae*, &c.

Leaves 3 by $\frac{3}{4}$ in.; base cuneate or rhomboid, not rounded; nerves beneath often puberulous; petiole $0\frac{1}{4}$ in. *Racemes* 6-8 in. or more, glandular-hairy, often 1-2-branched. *Corolla* and *capsule* exactly as of *A. Wightiana*.—Very near *A. Wightiana*; but dries blacker, and has the leaves not widest at the base.

VAR. *parvifolia*; leaves 1- $1\frac{1}{2}$ in. *A. ceylanica*, *Nees l. c.* 518; *T. Anders. in Journ. Linn. Soc.* ix. 502, not of *Wight*.—Ceylon; *Walker*.

†† *Racemes dense, forming a viscous brown-hairy head or panicle.*

10. **A. viscosula**, *Nees in Wall. Pl. As. Rar.* iii. 116, and in *DC. Prodr.* xi. 517; leaves lanceolate glabrous densely lineolate above, corolla $\frac{3}{4}$ in. hairy. *Wight Ic.* t. 1559; *T. Anders. in Journ. Linn. Soc.* ix. 502. *Justicia lineata*, *Wall. Cat.* 2486, letter b.

S. DECCAN PENINSULA; Courtallum, *Wight* (Herb. Propr. n. 677); Pulney Hills, *Beddome*.

An undershrub, scarcely 1 foot; branches numerous, glabrous, 4-lineolate. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ in., narrowed at both ends; petiole $0-\frac{1}{2}$ in. *Panicles* $1-2\frac{1}{2}$ in., terminal, many-fl., viscidly brown-hairy; pedicels $0-\frac{1}{10}$ in.; bracts $\frac{1}{10}$ in., linear. *Sepals* $\frac{1}{2}-\frac{1}{3}$ in., linear-lanceolate. *Corolla* conspicuously 2-lipped; lips $\frac{1}{2}-\frac{1}{3}$ in. *Anthers* exserted, bases thinly bearded, filaments thinly bristly. *Capsule* $\frac{1}{2}-\frac{2}{3}$ by $\frac{1}{8}$ in., pubescent. *Seeds* osseous, rugose, glabrous, not compressed.

VAR. *explicata*; leaves 3 by $\frac{3}{4}-1$ in., panicle elongate 6-8 in. less dense, capsules rather larger. *A. ceylanica*, *Wight Ic.* t. 1560, not of *Nees*.—Courtallum; *Wight* (Herb. Propr. nn. 676, 2242). Concan; *Stocks*. Anamallays and Nilgheries, *Beddome*.—Wight himself, after figuring his *A. ceylanica* from n. 676, has altered the name of a portion of his n. 676 to *A. viscosula*.

11. **A. Neesiana**, *Wight Ic.* t. 1561; leaves elliptic acute at both ends sparsely minutely hairy above glabrate beneath, racemes terminal subcapitate, sepals $\frac{1}{2}$ in., corolla $\frac{3}{4}$ in. hairy. *T. Anders. in Journ. Linn. Soc.* ix. 502, excl. syn.

PULNEY MTS.; *Wight* (Herb. Propr. n. 2705). WYNAAD; *Beddome*.

Branches elongate, undivided, glabrate, obscurely quadrangular. *Leaves* $2\frac{3}{4}$ by $1\frac{1}{4}$ in.; hairs remote many-cellular, raphides 0; petiole $0-\frac{1}{4}$ in. *Racemes* forming a dense panicle 2-5 in. diam., viscidly brown-hairy. *Capsule* attaining 1 by $\frac{1}{2}$ in., compressed, minutely hairy.—Differs from *A. viscosula* in the absence of raphides from the leaves above.

VAR. *producta*; leaves elongate, heads produced into oblong sub-lax panicles. *A. ceylanica*, *Wight in Herb. Andrographis* sp. n. 13, *Herb. Ind. Or. H. f. & T.*—Shevagberry Hills; *Wight* (Herb. Propr. n. 2702). Tinnevely; *Beddome*. Malabar; *Gibson* (in Herb. Dalzell), &c.—*Leaves* $4\frac{1}{2}$ by $\frac{1}{2}$ in., subsessile. *Panicles* 5 in., pyramidal. Texture, indumentum, &c., of the leaves exactly as in *A. Neesiana* type.

VAR. *affinis*, *Nees in Wall. Pl. As. Rar.* iii. 116, and in *DC. Prodr.* xi. 517 (sp.); leaves small elliptic or oblong pubescent, panicles pyramidal or oblong viscidly brown-pubescent, corolla $\frac{1}{2}$ in. *T. Anders. in DC. Prodr.* ix. 502.—Nilgherry and Kurg Mts., frequent; *Wight*, &c.—*Leaves* 1 by $\frac{1}{2}$ in., or smaller; minutely bristly above with no raphides, pubescent beneath; nerves less impressed on the upper surface, usually fulvous-pubescent. *Capsule* very hairy.

12. **A. stellulata**, *Clarke*; hairy, leaves short-petioled elliptic narrowed at both ends, heads terminal dense, sepals exceeding $\frac{1}{4}$ in. linear-setaceous, corolla $\frac{3}{4}$ in. *A. Neesiana*, *Benth. in Pl. Hohenack.* n. 1435, not of *Wight*.

NILGHERY MTS., alt. 6000 ft., *Hohenacker*, &c.

Branches elongate, obscurely quadrangular, closely villous. *Leaves* $2\frac{1}{2}$ by 1 in., copiously sprinkled with fulvous multicellular hairs above, closely villous beneath; petiole $0-\frac{1}{2}$ in. *Heads* 1-2 in. diam., viscidly brown-hairy. *Corolla* pale pink with purple spots on the lower lip. *Filaments* somewhat flattened, hairy upwards. *Capsule* $\frac{3}{4}$ by $\frac{1}{8}$ in. (and upwards), hairy, compressed. *Seeds* osseous, rugose, glabrous, not compressed.—Much resembling *A. Neesiana* and others of this subsection, but distinguished by the long substellate sepals.

13. **A. lineata**, *Nees in Wall. Pl. As. Rar.* iii. 116, and in *DC.*

Prodr. xi. 516; leaves subsessile ovate or broadly oblong shortly acute glabrous, panicles very compound viscidly grey- or dusky-pubescent, corolla $\frac{3}{8}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 502.—*Andrographis* sp. n. 14, *Herb. Ind. Or. H. f. & T.* *Justicia lineata*, *Wall. Cat.* 2486, *letter a*.

S. DECCAN PENINSULA; Mysore and adjacent parts of the Nilghiri and Kurg Mts., *Wight, G. Thomson, Lobb*; Anamallays, *Beddome*.

Branches elongate, quadrangular, glabrous. *Leaves* $1\frac{3}{4}$ by 1 in., suddenly acute, base rounded; raphides above embedded, obscure; nerves beneath usually strongly elevated; petiole $0-\frac{1}{12}$ in. *Panicle* 2–10 in.; pedicels 0 or very short. *Sepals* $\frac{1}{2}-\frac{3}{4}$ in., linear-lanceolate acute, glandular-hairy. *Corolla* hairy. *Anthers* bearded at the base. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}-\frac{3}{8}$ in., thinly hairy.—Hardly separable from *A. viscosula* var. *explicata* by the less acuminate leaves with more strongly-marked nerves and the more densely bearded anthers.

VAR. Lawii; stem closely pubescent, leaves 3 in. sparsely pilose above pubescent beneath, panicle large open.—Bababoodun Hills; *Law. Nundidroog, Beddome*.—Referred to *A. affinis* in *Herb. Hooker*: the large strongly lineate leaves, large panicle and densely barbate anthers bring it nearer to *A. lineata* type.

14. ***A. lobelioides***, *Wight Ill. t.* 164 b, fig. 11, and *Ic. t.* 1557; leaves small sessile ovate pubescent or glabrous, racemes in a subterminal panicle, corolla $\frac{1}{2}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 503. *Justicia lobelioides*, *Wall. Cat.* 2484. *Erianthera lobelioides*, *Nees in Wall. Pl. As. Rar.* iii. 115, and in *DC. Prodr.* xi. 514.

NILGHIRI MTS., alt. 6–8000 ft., common in the open grass, *Wight, &c.*

Very rusty pubescent or nearly glabrous. *Rootstock* woody; stems 2–8 in., very numerous, procumbent. *Leaves* $\frac{1}{2}-\frac{3}{4}$ in. diam. *Panicles* 1–4 in.; lower pedicels $\frac{1}{10}-\frac{1}{4}$ in. *Sepals* $\frac{1}{2}$ in. *Anthers* much exserted, conspicuously white-barbate. *Capsule* $\frac{3}{8}$ by $\frac{1}{2}$ in.—Very variable in indumentum. Easily distinguished (without the fruit) from *A. serpyllifolia* by the absence of flowers in the lower axils.

VAR. composita; racemes elongate compound forming a terminal quasi-panicle 12 by 8 in.—Courtallum Hills and Tiunnevely; *Beddome*.

**** Capsule elliptic, 2–3 times as long as broad.**

15. ***A. echioides***, *Nees in Wall. Pl. As. Rar.* iii. 117, and in *DC. Prodr.* xi. 518; erect, hairy, leaves sessile oblong or subelliptic obtuse, racemes numerous axillary, corolla $\frac{1}{2}-\frac{3}{4}$ in. *Wight Ic. t.* 467; *Dalz. & Gibs. Bomb. Fl.* 198; *T. Anders. in Journ. Linn. Soc.* ix. 503. *Justicia echioides*, *Linn.*; *Burm. Fl. Ind.* 9; *Roxb. Fl. Ind.* i. 118; *Wall. Cat.* 2439. —*Rheede Hort. Mal.* ix. t. 46.

TROPICAL INDIA, in the drier districts from the Punjab and Chota Nagpore to Ceylon, common (absent in Bengal proper and humid Malabar).

Annual, 8–24 in., closely pubescent and with patent white hairs. *Leaves* $2\frac{1}{2}$ by 1 in., base cuneate. *Racemes* about as long as the leaves, divaricate or recurved, often one from each axil about the middle of the stem; pedicels very short. *Sepals* $\frac{1}{2}-\frac{3}{4}$ in., linear; in fruit elongated, sometimes $\frac{1}{2}$ in. *Corolla* pubescent, pink or white, lower lip dark-purple. *Anthers* much exserted, white-barbate. *Capsule* $\frac{1}{2}$ by $\frac{1}{2}$ in., acute at both ends, hairy. *Seeds* twice as long as broad, oaceous, rugose, glabrous, not compressed.

16. ***A. glandulosa***, *Nees in Wall. Pl. As. Rar.* iii. 115, and in *DC. Prodr.* xi. 518; hairy, leaves petioled oblong or subelliptic obtuse, racemes numerous axillary, lower pedicels nearly as long as the calyx. *Justicia glandulosa*, *Wall. Cat.* 2485.

MYSOORE; *Heyne* (fide *Nees*), *Wight* (*Herb. Prop.* n. 2026).

Leaves 1 by $\frac{1}{2}$ in., both in *Wight's* and *Wallich's* examples, on which *Nees*

finds his species; which both hardly differ from *A. echinoides* but by their short-petioled (not sessile) leaves and rather shorter ($\frac{1}{8}$ in.) sepals.—This is certainly *A. glandulosa*, Nees, for he has written his name on Wight's n. 2026, though this appears to be an erect annual.

17. **A. Rothii**, *Clarke*; shrubby, hairy, leaves small shortly petioled ovate or orbicular, racemes axillary lax few-fl., lower pedicels nearly as long as the calyx. *Justicia glandulosa*, *Roth Nov. Sp.* 13?; *not of Wall.*

S. DECCAN PENINSULA; *Wight* (Herb. Propr. n. 675).

Rootstock woody; branches 8–12 in., wavy, closely pubescent, and with white patent hairs, some glandular. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., base rounded or in a few of the lower very shortly attenuated; petiole 0– $\frac{1}{8}$ in. *Racemes* 2–4 in., patent or recurved, wavy, sometimes bifid, upper subpanicled; bracts $\frac{1}{2}$ in., ovate. *Sepals* $\frac{1}{6}$ – $\frac{1}{5}$ in. *Capsule* $\frac{1}{2}$ by $\frac{1}{4}$ in., subobtuse.—Found loose in Wight's Herbarium, marked simply *Erianthera*: it appears to fit very closely Roth's description of his *Justicia glandulosa*.

18. **A. serpyllifolia**, *Wight Ic. t.* 517; stems procumbent villous, leaves small sessile orbicular, racemes many 1- or few-fl. in the lower axils. *T. Anders. in Journ. Linn. Soc.* ix. 503. *Justicia serpyllifolia*, *Vahl Enum.* i. 169. *J. nummularifolia*, *Wall. Cat.* 2461. *Erianthera serpyllifolia*, *Nees in Wall. Pl. As. Rar.* iii. 115, and in *DC. Prodr.* xi. 514.

S. DECCAN PENINSULA; Mysore, Palamcotta, &c., *Shuter, Wight, &c.*

Rootstock woody; annual stems 2–12 in., closely procumbent, curved, densely leafy. *Leaves* $\frac{1}{2}$ in. diam., obtuse, more or less hairy. *Racemes* sometimes forming a small terminal quasi-panicle, but always with many 1–2-fl. in the lower axils; bracts $\frac{1}{10}$ – $\frac{1}{6}$ in., orbicular, being gradually reduced leaves. *Sepals* $\frac{1}{6}$ – $\frac{1}{4}$ in., linear; in fruit often $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ – $\frac{1}{3}$ in. *Capsule* $\frac{1}{2}$ – $\frac{1}{4}$ by $\frac{1}{4}$ – $\frac{1}{6}$ in.

19. **A. Beddomei**, *Clarke*; leaves short-petioled elliptic and obovate glabrous, racemes solitary axillary small few-fl., lower pedicels viscoso-pubescent, corolla $\frac{1}{2}$ – $\frac{3}{4}$ in. conspicuously 2-lipped, anthers exerted bases densely white-bearded.

MADRAS; Kurnool, Nallaymallays, alt. 2000 ft., *Beddome*.

Stems 4–6 in., subsimple, quadrangular. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ –2 in., subobtuse, somewhat coriaceous, base cuneate, raphides 0 or obscure; petiole 0– $\frac{1}{8}$ in. *Racemes* $\frac{1}{2}$ in., 3–5-fl., viscoso-pubescent; bracts $\frac{1}{2}$ in., oblong, subobtuse. *Calyx* $\frac{1}{4}$ in. *Corolla* and *stamens* nearly as of *A. echinoides*. *Capsule* not seen.

XXIX. HAPLANTHUS, *Nees*.

Erect herbs. *Leaves* petioled, ovate, entire. *Flowers* axillary, appearing whorled, whorls sometimes approximated into terminal spikes, surrounded by numerous barren branchlets, reduced to acicular cladodes terminated by 2–3 minute spines; proper bracts and bracteoles small. *Calyx* small; sepals sublinear. *Corolla* smallish, tubular; limb 2-lipped; lobes imbricated. *Stamens* 2; anthers 2-celled; cells ovate, equal or one sometimes much smaller, muticous; connective very hairy behind. *Ovary* 6–16-ovulate; style shortly bifid at the tip. *Capsule* narrowly oblong acute, 6–16-seeded from the base. *Seeds* ellipsoid, somewhat compressed, densely shortly hairy when moistened.—Species 3, endemic in India.

1. **H. verticillaris**, *Nees in DC. Prodr.* ix. 513; cladodes in fruit stout rigid pubescent scarcely ciliate towards the tips, calyx minutely pubescent or glabrate. *Dalz. & Gibs. Bomb. Fl.* 197; *T. Anders. in Journ. Linn. Soc.* ix. 504. *Justicia verticillata*, *Rorb. Fl. Ind.* i. 135.

W. DECCAN PENINSULA, frequent, Roxburgh, &c., extending north to Mt. Aboo, *Stocks*.

Stems 2-3 ft., pubescent or nearly glabrous. *Leaves* $3\frac{1}{2}$ by 2 in., shortly acuminate, base suddenly attenuated, pubescent or nearly glabrous; petiole 1 in. *Cladodes* often 1-1 $\frac{1}{2}$ in. in fruit, pubescent or glabrous, with or without scattered patent bristles in their lower half. *Calyx* $\frac{1}{2}$ in., glabrous or puberulous. *Corolla* $\frac{2}{3}$ in., pale lilac. *Calyx* $\frac{1}{2}$ in. and upwards, glabrous.

2. **H. tentaculatus**, *Nees in DC. Prodr.* xi. 513; cladodes in fruit slender curved glabrous or pubescent not ciliate, calyx pubescent scarcely ciliate. *Dalz. & Gibs. Bomb. Fl.* 197; *T. Anders. in Journ. Linn. Soc.* ix. 503. *Ruellia tentaculata*, *Linn. Amœn. Acad.* iv. 320; *Burm. Fl. Ind.* 134, t. 40, fig. 1. *R. aciculata*, *Roth Nov. Sp.* 301.

BOMBAY; *Dalzell*. BELGAUM; *Ritchie*. MALABAR; Yelwah Hill in Palghaut, *Beddome*. CENTRAL INDIA; Mandoo, *Edgeworth*.

Cladodes in fruit $\frac{1}{2}$ in. *Corolla* less than $\frac{1}{2}$ in., white (*Ritchie*). *Capsule* $\frac{1}{4}$ - $\frac{1}{2}$ in., glabrous; seeds much smaller than in *H. verticillaris*.—Very near *H. verticillaris*. *Dalzell* says l. c. that *H. tentaculatus* is a much stouter species than *H. verticillaris*; but his numerous examples submitted are named by him in accordance with *Nees'* naming.

VAR. *nilgherrensis*; whorls collected mostly in terminal spikes, cladodes and sepals with many patent needle-like white hairs. *H. nilgherrensis*, *Wight Ic.* t. 1556. —Mts. of Nilghiri and Kurg, frequent; *Wight*, *Hohenacker*, &c.

VAR. *plumosa*; calyx densely hispid-hairy subplumose. *H. plumosa*, *T. Anders. in Journ. Linn. Soc.* ix. 504. *Haplanthus* sp. n. 4, *Herb. Ind. Or. H. f. & T.*—Concan; *Stocks*. Belgaum; *Ritchie*.

3. **H. ? hygrophiloides**, *T. Anders. in Journ. Linn. Soc.* ix. 503; leaves petioled ovate acute tomentose on both surfaces, flowers axillary aggregated, bracts minute linear.

PEGU; *Brandis* (fide T. Anderson).

An insignificant weed; stems 4-angular furfuraceous. *Leaves* 1-1 $\frac{1}{2}$ by $\frac{1}{2}$ -1 in., minutely lineolate. *Sepals* $\frac{1}{4}$ in., subulate. *Corolla* small, pubescent. *Stamens* 2; anthers 2-celled, one cell bearded. *Capsule* linear, compressed, glandular, many-seeded.—No example seen; the foregoing copied from T. Anderson.

XXX. GYMNOSTACHYUM, *Nees*.

Herbs or undershrubs. *Leaves* cauline or subradical, entire, sinuate crenulate or toothed. *Cymes* axillary or in a terminal panicle, often spicate or racemose, sometimes small axillary; bracts and bracteoles very small, except in *G. hirsutum*; flowers subsessile or shortly pedicelled. *Calyx* small (except in *G. hirsutum*), sub-5-partite; segments equal, linear-lanceolate. *Corolla-tube* slender, cylindric; limb small, 2-lipped; lobes 5, subequal, quadrate-elliptic, imbricate. *Stamens* 2, nearly as long as the corolla; filaments usually hairy at least near the base; anthers 2-celled; cells subequal, oblong or ovate, hairy or glabrous. *Ovary* pubescent, many-ovulate; style subentire at the tip. *Capsule* linear, pubescent or nearly glabrate, 16-24-seeded. *Seeds* ovoid, compressed, hairy, hairs very shortly spreading when moistened.—Species 15, Indian, with a few Malayan.

* Panicle terminal, leafless or nearly so.

† *Leaves mostly near the base of the stem*.

1. **G. venustum**, *T. Anders. in Journ. Linn. Soc.* ix. 506; leaves large

ovate, panicle large pubescent, corolla $\frac{3}{4}$ -1 in. slender. *Justicia venusta*, *Wall. Cat.* 2470, and *Pl. As. Rar.* i. 53, t. 66; *Bot. Reg.* t. 1380. *Cryptophragmium venustum*, *Nees in Wall. Pl. As. Rar.* iii. 180, and in *DC. Prodr.* xi. 94; *Bot. Mag.* t. 3208.

KHASIA MTS., alt. 0-4000 ft., common on the southern face, *Wallich., H. f. & T., &c.*

Attaining 1-4 ft.; stem leafless or with few remote very small leaves. Radical leaves 6 by 3-4 in., or larger, acute, decurrent on the petiole, entire or undulate-crenate, nearly glabrous, or with scattered minute hairs above, nerves beneath pubescent; petiole 0-4 in. *Panicle* sometimes 8 by 12 in., or reduced to a single spike; flowers opposite, 1-3 together; bracts small, linear; bracteoles 0. *Sepals* $\frac{1}{2}$ - $\frac{3}{4}$ in., linear, hairy. *Corolla* pubescent; limb deep purple or blueish. *Anthers* oblong, glabrous. *Capsule* $\frac{1}{2}$ in.

2. **G. febrifugum**, *Benth. in Flora* 1849, 558; leaves ovate, panicle puberulous, corolla $1\frac{1}{4}$ in. upper half inflated, capsule 1 in. *G. alatum*, *Wight Ic.* t. 1525; *T. Anders. in Journ. Linn. Soc.* ix. 506.

S. DECCAN PENINSULA; Mangalore, *Hohenacker* (n. 374), *Wight*.

Nearly stemless. *Leaves* $6\frac{1}{2}$ by 3 in., decurrent on the petiole, subentire or undulate-crenulate, above lineolate nearly glabrous or minutely sparsely setulose, beneath paler glabrous or pubescent on the nerves. *Panicles* 6-12 in., in appearance radical; flowers opposite, solitary or in very small few-fld. cymes; bracts small, narrow; bracteoles 0. *Sepals* $\frac{1}{2}$ - $\frac{3}{4}$ in., glabrous or puberulous. *Corolla* glabrous. *Anthers* ovate, hairy.—*Hohenacker* observes that "a decoction of the root is a febrifuge," and *Bentham's* name *febrifugum* has one year's priority over *alatum*.

3. **G. ceylanicum**, *Arn. & Nees in DC. Prodr.* xi. 93; leaves elliptic glabrate lineolate above, panicles linear pubescent, corolla $\frac{3}{4}$ in. *T. Anders. in Thwaites Enum.* 232, and in *Journ. Linn. Soc.* ix. 506; *Bedd. Ic. Pl. Ind. Or.* t. 265.

CEYLON; *Walker, Thwaites, &c.*

Stem 1-3 in., villous. *Leaves* 3 by $1\frac{1}{4}$ in., obtuse, base acuminate, undulate-crenate, pubescent beneath especially on the nerves; petiole $1\frac{1}{2}$ in. *Peduncles* 1-6 in.; panicles 5-9 by $\frac{3}{4}$ in.; cymes small, subfascicled; bracts $\frac{1}{2}$ in., linear. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, grey-pubescent. *Corolla* nearly glabrous; tube narrow purplish; limb small greenish-yellow. *Anthers* subquadrate, glabrous. *Capsule* $\frac{3}{4}$ in.

4. **G. Thwaitesii**, *T. Anders. in Thwaites Enum.* 232; leaves elliptic hairy on both surfaces, panicles oblong pubescent, corolla $\frac{1}{2}$ in. *Bedd. Ic. Pl. Ind. Or.* t. 255.

CEYLON; Ambagamowa District, *Thwaites*.

Leaves above with many lax multicellular hairs. *Panicle* open; lateral cymes $\frac{1}{2}$ - $1\frac{1}{2}$ in. Otherwise as *G. ceylanicum*.

5. **G. polyanthum**, *Wight Ic.* t. 1494; leaves broadly ovate subglabrate base rounded or cordate, panicles linear glabrous or nearly so, corolla $\frac{3}{4}$ in.

COORG; *Jerdon, in Herb. Wight*.

Stem 1 in., grey-puberulous. *Leaves* $2\frac{1}{2}$ in. diam., shortly acute or subobtuse, nearly entire, punctulate above; nerves beneath much raised, grey-puberulous; petiole $1\frac{1}{2}$ in. *Panicles* 8 by $\frac{3}{4}$ in.; flowers in subcapitate cymes; bracts minute, linear. *Sepals* $\frac{1}{2}$ - $\frac{3}{4}$ in., linear-lanceolate, glabrous or obscurely puberulous. *Corolla* puberulous, pink (in the dried example). *Capsule* $\frac{3}{4}$ in.—Overlooked by *T. Anderson*.

†† *Stems* elongate, leafy upwards.

6. **G. paniculatum**, *T. Anders. in Thwaites Enum.* 232; leaves ovate

or elliptic acute at both ends pubescent at least on the nerves beneath, panicle subterminal pubescent branches cymose, corolla $\frac{3}{4}$ in. *Bedd. Ic. Pl. Ind. Or. t.* 252.

CEYLON, alt. 1–2000 ft.; *Walker, Thwaites.*

Erect, 2–3 ft., hairy, leafy to the panicle. *Leaves* 5 by 2 in., undulate, lineolate, glabrate or hairy above; petiole $\frac{1}{2}$ in. *Panicles* 7 by 3 in., sometimes somewhat leafy at the base; lateral branches repeatedly closely 2–3-chotomous; bracts $\frac{1}{2}$ – $\frac{3}{4}$ in., linear; pedicels 0– $\frac{1}{2}$ in., often distinct. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, pubescent. *Corolla* pubescent. *Anthers* ovate, glabrous. *Capsule* $\frac{3}{4}$ in.

7. **G. glabrum**, *T. Anders. in Journ. Linn. Soc.* ix. 506; leaves ovate or elliptic acuminate at both ends undulate-crenate pubescent on the nerves beneath, panicle terminal villous, flowers fascicled on the spikes, corolla $\frac{3}{4}$ in. *Bedd. Ic. Pl. Ind. Or. t.* 251. *Cryptophragmium glabrum*, *Dalz. in Hook. Kew Journ.* ii. 338; *Dalz. & Gibs. Bomb. Fl.* 185.

CONCAN; *Law, Dalzell.*

An undershrub (Beddome); stems nearly glabrous. *Leaves* 7 by 2 $\frac{1}{2}$ in., puberulous on both surfaces or glabrate; petiole $\frac{3}{4}$ in. *Flowers* sessile, clustered; bracts $\frac{1}{2}$ in., linear-lanceolate. *Sepals* $\frac{1}{2}$ in., sublinear, villous, often viscid glandular. *Corolla* minutely pubescent, white purple-spotted in the throat. *Anthers* ovate, glabrous. *Capsule* $\frac{3}{4}$ in.

VAR. *denticulata*; leaves distinctly toothed glabrous even when young.—Concan Ghauts; *Dalzell, Ritchie.*

8. **G. leptostachyum**, *Nees in Wall. Pl. As. Rar.* iii. 106, and *Cat.* 7178, and in *DC. Prodr.* xi. 93; leaves elliptic acuminate at both ends slightly pubescent, panicle reduced to 1 or 2 long-linear spikes hairy, corolla $\frac{3}{4}$ in.

TAVOY; *Wallich.*

Stems creeping, rooting; annual flowering branches 3–5 in., erect, simple, villous. *Leaves* 4 $\frac{1}{2}$ by 1 $\frac{1}{2}$ in., subentire, upper surface with distant multicellular lax hairs, lower pubescent on the nerves; petiole $\frac{1}{2}$ in. *Spikes* 1 or 2 terminal, 3–10 in.; flowers solitary, distant; bracts $\frac{1}{2}$ in., linear-lanceolate. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, pubescent. *Corolla* narrow, straight. *Capsule* $\frac{1}{2}$ in., very slender, 20-seeded.—Overlooked by T. Anderson.

** Inflorescence axillary, a terminal panicle sometimes added.

9. **G. canescens**, *T. Anders. in Journ. Linn. Soc.* ix. 505; leaves ovate acuminate at both ends pubescent on both surfaces, panicles axillary and terminal pubescent or villous, corolla $\frac{3}{4}$ in. *G. serrulatum*, *T. Anders. l. c.*; *Bedd. Ic. Pl. Ind. Or. t.* 254. *Cryptophragmium canescens*, *Nees in Wall. Pl. As. Rar.* iii. 100, and in *DC. Prodr.* xi. 95; *Wight Ic. t.* 1495. *C. serrulatum*, *Nees l. c.* *Justicia serrulata*, *Wall. Cat.* 2452.

W. DECCAN PENINSULA, from Bombay to Courtallum, *Wight*; Tinnevely, *Beddome.*

Apparently a shrub. *Branches* pubescent or villous. *Leaves* 8 by 3 $\frac{1}{2}$ in., undulate or minutely toothed; petiole 1 $\frac{1}{2}$ in. *Panicles* trichotomous; bracts $\frac{1}{2}$ in., lanceolate; pedicels hardly any. *Sepals* $\frac{1}{2}$ – $\frac{3}{4}$ in., linear-lanceolate, minutely pubescent. *Corolla* pubescent. *Anthers* ovate, puberulous. *Capsule* $\frac{1}{2}$ in.—Nees made 2 species out of Wallich's 4 branches; and it is not clear why T. Anderson kept them up, unless he meant to transfer Nees' name *serrulatum* to the following var.

VAR. *longifolia*; leaves 9 by 1 $\frac{1}{2}$ in. elongate lanceolate distinctly toothed. *G. longifolia*, *T. Anders. ms.*—Canara Ghauts; *Law.*

10. **G. latifolium**, *T. Anders. in Journ. Linn. Soc.* ix. 505; glabrous,

leaves large long-petioled ovate, panicles mostly lateral many-fl., corolla 1 in. *Bedd. Ic. Pl. Ind. Or.* t. 253. *Cryptophragmium latifolium*, *Dalz. in Hook. Kew Journ.* ii. 137; *Dalz. & Gibs. Bomb. Fl.* 185. *Phlogacanthus latifolius*, *Wight Ic.* t. 1537; *T. Anders. in Journ. Linn. Soc.* ix. 508.

CONCAN, CANARA, and MALABAR, *Dalzell, Wight, &c.*; Bababoodun Hills, *Wight*.

An undershrub, 3 ft. (*Dalzell*). Leaves attaining 9 by 5½ in., acute, very shortly acuminate into the petiole, subentire; petiole often 6 in. Panicles chiefly from the axils of fallen leaves, 3-5 in.; branches subspicate; flowers solitary or clustered; bracts small, linear. *Sepals* ½ in., linear. *Corolla* puberulous; limb greenish-yellow. *Anthers* ovate, minutely hairy. *Capsule* ¾ in., very narrow, glabrate, 24-seeded. *Seeds* ovoid, compressed, hairy.

11. **G. sanguinolentum**, *T. Anders. in Thwaites Enum.* 232, and in *Journ. Linn. Soc.* ix. 506; leaves elliptic narrowed at both ends nearly glabrous, cymes small axillary short-peduncled few-fl. subglobose somewhat pubescent, corolla ¾ in. *Justicia sanguinolenta*, *Vahl Symb.* ii. 10. *Cryptophragmium sanguinolentum*, *Nees in DC. Prodr.* xi. 96. *C. axillare*, *Nees l. c.*; *Wight Ic.* t. 1496.

CEYLON; *Champion, Walker, &c.*

Diffuse; branches nearly glabrous. Leaves 4 by 1½ in., entire undulate or irregularly subdentate, punctate or minutely lineolate above sometimes obscurely scaberulous; petiole ¼-½ in. *Peduncles* ¼-½ in., nearly glabrous; cymes ½-1 in. diam.; bracts ½ in., linear; pedicels 0-½ in. *Sepals* ½ in., linear, puberulous. *Corolla* pubescent. *Capsule* ¾ in.

12. **G. tomentosum**, *T. Anders. in Journ. Linn. Soc.* ix. 505; glandular-tomentose, leaves ovate hirsute on both surfaces, spikes axillary and terminal trichotomous, corolla ½ in. subcylindric pubescent.

CENTRAL INDIA; *Beddome* (fide *T. Anderson*).

A perennial, erect herb. 1-2 ft. Upper leaves 1 by ¾ in., sessile, base attenuated, undulate, whitened beneath. Spikes dense; flowers pedicelled; bracts ½ in., linear, glandular ciliate. *Sepals* ½ in., aristate ciliate. *Stamens* included; anther-cells equal. *Capsule* 1 in., linear, many-seeded; retinacula erect, acute (*T. Anderson*).—Not seen, genus very doubtful.

13. **G. hirsutum**, *T. Anders. in Thwaites Enum.* 233, and in *Journ. Linn. Soc.* ix. 505; leaves broadly elliptic acute or ovate acute at both ends hairy on both surfaces, spikes axillary and terminal dense cylindric hirsute, bracteoles ½ in. linear, corolla ¾ in. *Bedd. Ic. Pl. Ind. Or.* t. 249.

CEYLON; *Thwaites*.

Erect, 2-3 ft., glabrous except at the tip. Leaves 8 by 3½ in., entire or undulate; petiole 2 in. Spikes 1-4 by 1 in., quasi-peduncled, sometimes paniced, resembling those of the dense-fl. species of *Ebermaiera*. *Sepals* ½ in., linear, hirsute. *Corolla*, *stamens* and *pistil* as of *Gymnostachyum* (fide *Beddome*). *Capsule* ¾ in., many-seeded.

XXXI. PHLOGACANTHUS, *Nees*.

Shrubs or tall herbs. Leaves entire, or obscurely crenate. Flowers orange red or pink; thyrses or narrow panicles terminal, rarely racemes or cymes axillary; bracts small, bracteoles 0. *Calyx* deeply 5-fl.; segments very narrow. *Corolla* tubular, curved upwards; limb on one side or (not very deeply) 2-lipped; segments ovate or oblong, connivent patent or recurved, imbricate in bud. *Stamens* 2, sometimes 2 small rudiments added;

anthers 2-celled, oblong, muticous, glabrous. Ovary usually glabrous, 10-16-ovulate; style filiform, subsimple at the tip. Capsule elongate, sub-tetragonous, many-seeded from the base. Seeds lenticular, ovate in outline, glabrous or densely shortly hairy.—Species 11, endemic in India.

This genus differs from *Gymnostachyum* in the broader, curved corolla, the glabrous ovary, and the much stouter capsule. The 2 following genera *Cystacanthus* and *Diotacanthus* are with difficulty discerned by the form of the corolla.

* *Thyrse* or *dense panicles* terminal.

1. **P. curviflorus**, *Nees in Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 320; leaves large elliptic or obovate nearly glabrous, thyrse dense closely villous, calyx-teeth $\frac{1}{2}$ in., corolla $1\frac{3}{4}$ in. tubular curved scarcely widened upwards. *Bot. Mag.* t. 3783; *T. Anders. in Journ. Linn. Soc.* ix. 506; *Kurz For. Fl.* ii. 246. *Justicia curviflora*, *Wall. Cat.* 2429, and *Pl. As. Rar.* ii. 9, t. 112.

KHASIA MTS., alt. 0-4000 ft.; frequent on the southern face, *Wallich*, &c.

Stem 3-6 ft., stout, glabrous, puberulous upwards. Uppermost leaves often 12 by 4-5 in., acuminate at both ends, subentire, punctulate on both surfaces, nerves beneath sometimes puberulous; petiole $2\frac{1}{2}$ in. Thyrse 4-8 in., short-peduncled; bracts $\frac{1}{2}$ in., linear. Calyx-tube $\frac{1}{2}$ in.; teeth sublinear, closely villous. Corolla densely villous, brick-red or orange; limb small, lobes hardly patent. Stamens glabrous, 2 small rudiments present. Style thinly hairy. Capsule $1\frac{1}{2}$ by $\frac{1}{4}$ in., glabrous, 12-14-seeded. Seeds $\frac{1}{8}$ in. diam., much compressed, glabrous.—*Wallich* says the flowers are bright orange-red; it is generally a brick-red obscurely orange; it is not known wild of the colour depicted by *Wallich*, or in *Bot. Mag.*

VAR. *brevicalyx*; calyx-teeth scarcely $\frac{1}{2}$ in.—*Pegu*; *Kurz.* Moulmein; *Parish.* Tenasserim; *Beddome*.—A shrub, 15 ft. (*Beddome*). Thyrse much less densely villous than in *P. curviflorus* type. Sepals without sometimes nearly glabrous, much shorter than in *P. curviflorus* type. Flowers greenish-yellow (*Parish*).—*T. Anderson* is mistaken in supposing that this variety is cultivated in Lower Burma, and not wild.

2. **P. Wallichii**, *Clarke*; leaves large elliptic acuminate at both ends glabrous, thyrse dense closely villous, calyx-teeth $\frac{1}{2}$ in., corolla $\frac{3}{4}$ in. tubular curved scarcely widened upwards. *P. asperulus*, *Wall. Cat.* 7171 partly, not of *Nees*. *Loxanthus Gomezii*, *Nees in Wall. Cat.* 7170, and in *Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 322, partly.

KHASIA MTS.; *Gomez*. JAINTEA HILLS; Jarain, alt. 3000 ft., *Clarke*.

Leaves $10\frac{1}{2}$ by $3\frac{1}{2}$ in., subentire; petiole 1 in. Thyrse 2-4 in., short-peduncled; bracts $\frac{1}{2}$ in., linear. Calyx-tube $\frac{1}{8}$ in., teeth linear-lanceolate villous. Corolla densely villous, red; limb small, lobes subequal, scarcely patent. Stamens and style glabrous.—Resembling *P. curviflorus*, but with a smaller thyrse, and very much smaller corolla.

3. **P. tubiflorus**, *Nees in Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 321; leaves large elliptic or ovate narrowed at both ends softly pubescent beneath, panicles elongate dense somewhat pubescent, calyx-teeth $\frac{1}{2}$ in., corolla $\frac{3}{4}$ in. tubular curved scarcely widened upwards. *T. Anders. in Journ. Linn. Soc.* ix. 506, partly. *Justicia tubiflora*, *Wall. Cat.* 2428.

ASSAM PLAINS; *Hamilton, Jenkins, Masters*: and adjacent KHASIA TERAI, alt. 2000 ft.; *Borpani, H. f. & T.*

Leaves attaining 10 by 3-5 $\frac{1}{2}$ in., subentire or crenulate, densely punctulate above, almost woolly (but deciduously) pubescent beneath; petiole 1-2 in., pubescent. Panicle 2-8 in., densely closely ramosus, subthyrsoid; pedicels often $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ in., linear. Calyx-tube $\frac{1}{8}$ in.; teeth linear-lanceolate, pubescent or glabrate. Corolla nearly as of *P. Wallichii*, yellow-red (*Nees*). Capsule $1\frac{1}{2}$ by $\frac{1}{2}$ in., glabrous,

12-seeded. *Seeds* much compressed, glabrous.—Nearly allied to *P. Wallichii*, differing in the softly hairy under surface of the leaves and the much more open panicle.

4. ***P. parviflorus***, *T. Anders. in Journ. Linn. Soc.* ix. 506; leaves large broadly lanceolate glabrous, panicle terminal linear nearly glabrous, sepals $\frac{1}{2}$ in., corolla 1 in. narrowly tubular curved.

S.E. ASSAM; Namyoon in the Patkoye Mts., *Griffith* (Kew Distrib. n. 6154, n. 6155 partly).

A shrub similar in habit to *P. Wallichii*. *Leaves* 9 by $2\frac{1}{4}$ in., acuminate at both ends, subentire, obscurely puberulous above, paler and glabrous beneath; petiole 1 in. *Panicles* 4 by $\frac{3}{4}$ in., subsessile; pedicels $0-\frac{1}{2}$ in. *Calyx-tube* scarcely $\frac{1}{10}$ in.; teeth linear-lanceolate, nearly glabrous. *Corolla* very slightly pubescent, blood-red, miniate (*Griffith*); lobes small, scarcely patent. *Capsule* not seen.—*Griffith's* original ticket remains on the example authenticated by T. Anderson, and shows that the plant was not collected in Mishmee.

5. ***P. thyrsiflorus***, *Nees in Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 321; leaves large lanceolate glabrous, thyrses elongate dense villous, calyx-teeth $\frac{1}{4}-\frac{1}{2}$ in., corolla $\frac{3}{4}$ in. wide-tubular 2-lipped. *T. Anders. in Journ. Linn. Soc.* ix. 506; *Kurz For. Fl.* ii. 246. *Justicia thyrsiflora*, *Roxb. Fl. Ind.* i. 114; *Wall. Cat.* 2430.

SUBTROPICAL HIMALAYA, alt. 0-4000 ft., from Gurwhal to Bhotan, very common. KHASIA MTS. and ASSAM, alt. 0-3000 ft., common. MOULMEIN; *Parish*.—DISTRIB. Ava.

A shrub, 3-7 ft. *Leaves* 7 by $1\frac{1}{2}$ in., tapering at both ends, subentire, densely punctulate; petiole $\frac{3}{4}$ in. *Thyrses* 4-12 in., terminal, solitary or several, or quasi-axillary on lateral branches; peduncles short; bracts $\frac{1}{2}$ in., linear. *Calyx-tube* $\frac{1}{2}$ in.; teeth setaceous, densely pubescent. *Corolla* closely villous, orange; tube broad from the base, curved; upper lip suberect, lower patent. *Stamens* glabrous, or slightly hairy near the base of the filaments; 2 rudiments often discernible. *Style* glabrous. *Capsule* $1\frac{1}{4}$ by $\frac{1}{2}$ in., subquadrangular, glabrous, 12-14-seeded. *Seeds* much compressed, orbicular in outline, densely shortly hairy, hairs elastically spreading when moistened.

6. ***P. asperulus***, *Nees in Wall. Pl. As. Rar.* iii. 99, and *Cat.* 7171, and in *DC. Prodr.* xi. 321, *excl. some syn.*; leaves elliptic acuminate at both ends glabrous, panicles linear subthyrsoid somewhat pubescent, calyx-teeth $\frac{1}{2}$ in., corolla $\frac{1}{2}-\frac{3}{4}$ in. tube cylindric limb much inflated ovoid. *P. vitellinus*, *T. Anders. in Journ. Linn. Soc.* ix. 507, *excl. some syn.*; *Kurz For. Fl.* ii. 246. *Justicia vitellina*, *Roxb. Fl. Ind.* i. 115, and *Ice. Ined. in Herb. Kew.* *J. quadrangularis*, *Wall. Cat.* 2451; *Bot. Mag.* t. 2845. *J. asperula*, *Lodd. Bot. Cab.* t. 1681, *not of Wall.* *J. guttata*, *Wall. Cat.* 2431, *by mixture.* *Endopogon vitellinus*, *Nees in DC. Prodr.* xi. 723.

KHASIA MTS. and ASSAM; *Wallich, Simons*. CHITTAGONG HILLS; *Roxburgh, Clarke*.

A shrub, 3 ft., nearly glabrous. *Leaves* 5 by 2 in., undulate, scarcely puberulous or punctate; petiole $\frac{3}{4}$ in. *Panicle* 2-4 in., terminal, usually solitary, very narrow; bracts $\frac{1}{2}$ in., linear. *Calyx-tube* $\frac{1}{8}$ in.; teeth setaceous, puberulous. *Corolla* suddenly curved and inflated at the summit of the tube, pubescent, pink-purple often yellow-marked; limb ringent (*Roxburgh*), segments connivent or not widely patent. *Capsule* $\frac{3}{4}$ by $\frac{1}{2}$ in., glabrous. *Seeds* glabrous.—This is one of the many species which *Nees* named *Thyrsacanthus indicus*.

7. ***P. guttatus***, *Nees in Wall. Pl. As. Rar.* iii. 99, and in *DC. Prodr.* xi. 321; leaves large oblong or elliptic acuminate at both ends glabrous, panicles linear dense somewhat pubescent, calyx-teeth $\frac{1}{2}$ in., corolla $\frac{3}{4}-\frac{1}{2}$ in. 2-lipped, segments oblong patent subrecurved. *T. Anders. in Journ.*

Linn. Soc. ix. 507. *Justicia guttata*, *Wall. Cat.* 2431 chiefly, and *Pl. As. Rar.* i. 24, t. 28; *Bot. Reg.* t. 1334.

KHASIA MTS., alt. 2-4000 ft.; on the southern face common, *Wallich, &c.* BHOTAN (*T. Anderson*).

Leaves often 9 by 3 in.; petiole $1\frac{1}{2}$ in. *Panicles* 3-6 by 1 in., terminal or quasi-terminal, solitary or 2-3 together. *Corolla* pubescent; upper lip suberect, shortly 2-lobed, yellow; lower deeply 3-lobed, segments patent subrecurved, green with purple spots. *Capsule* $1\frac{1}{2}$ by $\frac{1}{2}$ in., 12-seeded.—Confused with *P. asperulus*, but the leaves are larger, the corolla larger and altogether a different shape and colour. *Nees* doubts whether *Bot. Reg.* t. 1334 belongs here, but it is a most faithful picture.

8. ***P. elongatus***, *T. Anders. in Journ. Linn. Soc.* ix. 508; leaves long-petioled ovate acuminate at both ends glabrous, spikes elongate slender, corolla $\frac{1}{2}$ in. tubular 2-lipped. *Kurz For. Fl.* ii. 246.

TENASSERIM; *Amberst, Falconer (T. Anderson)*.

An undershrub, 1-2 ft.; stem terete, primrose. *Leaves* including the petiole 4-6 by $2\frac{1}{2}$ in. *Spikes* nearly a foot, most terminal trichotomously branched or axillary simple; flowers distichously opposite, sessile, solitary; bracts $\frac{1}{2}$ in., ovate, acute; bracteoles subulate. *Calyx* deeply 5-partite, segments linear. *Corolla-tube* straight, pubescent, lower lip hirsute within. *Stamens* of the genus. *Capsule* $\frac{1}{2}$ in., clavate, subtetragonous, glabrous, 8-seeded (*T. Anderson*).—Not seen.

** *Cymes or short panicles axillary.*

9. ***P. pubinervius***, *T. Anders. in Journ. Linn. Soc.* ix. 508; leaves elliptic or ovate acute at both ends pubescent on the nerves beneath, cymes axillary, calyx-segments woolly within nearly glabrous on the back.—*Phlogacanthus* sp. n. 7, *Herb. Ind. Or. H.f. & T.*

SIKKIM, alt. 5-7000 ft., *J. D. H.* BHOTAN; *Griffith.* ASSAM and KHASIA MTS., alt. 3-5000 ft., frequent, *Griffith, &c.*

A much-branched shrub, 3-8 ft. diam. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., subentire, puberulous or glabrate above; petiole $\frac{3}{4}$ in. *Cymes* numerous, 1 in. diam., subsessile, nearly glabrous; pedicels often $\frac{1}{2}$ in., ebracteolate at the apex; bracts at their base minute. *Calyx-tube* $\frac{1}{8}$ in.; teeth $\frac{1}{8}$ in., linear-lanceolate, appearing woolly on the margins. *Corolla* $\frac{1}{2}$ in., mature puberulous, tubular-inflated nearly from the base, red; limb small, segments ovate subconnivent. *Stamens* 2, glabrous; anthers far-exserted. *Ovary* glabrous. *Capsule* elongate, many-seeded.—*Nees* marked this *Graptophyllum hortense*.

10. ***P. Jenkinsii***, *Clarke*; leaves elliptic acute at both ends glabrous, racemes or small panicles axillary grey pubescent, calyx-segments uniformly grey pubescent.

ASSAM; *Jenkins*.—DISTRIB. Bhamo.

Branches elongate, stout, quadrangular, glabrous, puberulous upwards. *Leaves* $6\frac{1}{2}$ by $2\frac{3}{4}$ in., subentire; petiole $1\frac{1}{2}$ in. *Racemes* 1-2 $\frac{1}{2}$ in., dense-fld., sometimes compound; pedicels 0- $\frac{1}{2}$ in., closely grey pubescent. *Calyx-tube* $\frac{1}{2}$ in., segments $\frac{1}{2}$ in., linear-lanceolate. *Corolla* nearly as of *P. pubinervius*, but rather more pubescent; appears to have been orange. *Stamens* 2, glabrous; anthers very shortly exserted. *Ovary* glabrous, 12-ovulate; style glabrous. *Capsule* not seen.—The calyx and corolla of this species are very like those of *P. pubinervius*, but the habit is more that of *P. thyrsiflorus*. *Nees* marked this *Thyrsacanthus indicus*, regardless of the 2 stamens, and 12 ovules.

XXXII. CYSTACANTHUS, *T. Anders.*

Corolla tubular, ventricose upwards; segments 5, ovate, scarcely patent.

Otherwise as *Phlogacanthus*.—Species 4, in Pegu, Tenasserim, and Cochin China.

1. **C. paniculatus**, *T. Anders. in Journ. Linn. Soc.* ix. 458; leaves elliptic acuminate at both ends puberulous on the nerves beneath, panicle terminal ovate-oblong somewhat lax hairy, calyx-segments $\frac{1}{4}$ – $\frac{1}{2}$ in.

MOULMEIN; *T. Lobb*.

Branches elongate, stout, tetragonous, glabrous. *Leaves* $5\frac{1}{2}$ by $2\frac{1}{4}$ in., undulate; petiole hardly $\frac{1}{2}$ in. *Panicle* 7 by 3 in., many-fl.; bracts at the main division 1 by $\frac{1}{2}$ in., glabrous, foliaceous, otherwise very hairy. *Sepals* linear-oblong. *Corolla* 1 in., upper half ventricose, hairy, violet (*Lobb*); segments ovate, suberect. *Anthers* included. *Capsule* $1\frac{1}{4}$ by $\frac{1}{2}$ in., very hairy, 16-seeded. *Seeds* lenticular, densely shortly hairy; hairs standing out when wetted.

2. **C. cymosus**, *T. Anders. in Journ. Linn. Soc.* ix. 458; leaves elliptic or lanceolate pubescent on both surfaces, cymes axillary few-fl. *Phlogacanthus cymosus*, *Kurz For. Fl.* ii. 246.

BURMA; *Brandis*.

A shrub; branches puberulous, internodes short. *Leaves* 3–4 by $\frac{3}{4}$ – $1\frac{1}{2}$ in., acute at both ends, softly silky beneath; petiole 1 in. *Cymes* viscous-hairy; pedicels $\frac{1}{2}$ in. *Sepals* $\frac{3}{4}$ in., linear-oblong, very hairy. *Corolla* $1\frac{1}{4}$ in., inflated upwards, viscous; lobes small, subequal. *Capsule* $1\frac{1}{4}$ by $\frac{1}{2}$ in., tomentose.—Mostly copied from *T. Anderson*, the Kew example being imperfect; but it is sufficient to show that the species is congeneric with *C. paniculatus*, which *Bentham* (*Gen. Pl.* ii. 1098) doubts.

3. **C. pulcherrimus**, *Clarke*; leaves large elongate-lanceolate glabrous, panicle terminal linear, calyx-teeth $\frac{1}{2}$ – $\frac{1}{2}$ in. *Loxanthus Gomezii*, *Nees in DC. Prodr.* xi. 322 (as to the *Mergui plant*). *Phlogacanthus pulcherrimus*, *T. Anders. in Journ. Linn. Soc.* ix. 507; *Kurz For. Fl.* ii. 246.

MERGUI; *Griffith* (*Kew Distrib. n.* 6155, partly). MOULMEIN; *Parish*. TENASSERIM; *Beddome*.

A shrub. *Leaves* 8 by 2 in., acuminate at both ends, subentire; petiole 1 in. *Panicle* 4–18 by $\frac{3}{4}$ in., nearly glabrous; proper bracts small, but foliaceous; other bracts $\frac{3}{4}$ by $\frac{1}{2}$ in. are sometimes scattered throughout the panicle; pedicels 0– $\frac{1}{2}$ in. *Calyx-tube* $\frac{1}{8}$ in., teeth linear, slightly or densely pubescent. *Corolla* 1 in., tubular-funnel-shaped, somewhat curved, nearly glabrous, appears to have been green-yellow with purple spots; lobes ovate, erect-patent. *Filaments* very hairy at the base; connective minutely hispid on the back. *Capsule* $\frac{3}{4}$ –1 in., stout, glabrous.—This was no part of the original *Loxanthus Gomezii*, *Nees* (*in Wall. Pl. As. Rar.* iii. 99).

VAR. ? *bracteosa*; panicle ashy pubescent, bracts and bracteoles numerous large oblong or linear-spathulate, corolla straight subsymmetric.—Pegu; *Brandis*. Tenasserim, Mooleyit, *Beddome*. Mergui, *Griffith* (*Herb. Propr. n.* 875).

4. **C. insignis**, *Clarke*; leaves large broadly elliptic acute at both ends glabrous, panicle terminal dense slightly pubescent, calyx-teeth $\frac{1}{2}$ in. *Phlogacanthus insignis*, *Kurz in Flora* 1870, 364, and in *Journ. As. Soc.* 1870, ii. 79, and *For. Fl.* ii. 246.

PEGU; in tropical forests up to 3000 ft., *Kurz, Brandis*.

An evergreen meagre shrub, 3–5 ft.; stem tetragonous, white. *Leaves* 9 by $4\frac{1}{4}$ in.; petiole 1 in. *Panicles* 2–4 in., sessile, compound oblong; bracts minute, linear, a few foliaceous $\frac{3}{4}$ in. sometimes interspersed. *Corolla* $1\frac{1}{4}$ in., ventricose for $\frac{3}{4}$ its length, dark violet golden villous in the throat (*Kurz*); lobes $\frac{1}{2}$ in., broadly lanceolate, subequal, nearly erect. *Filaments* and *style* glabrous. *Capsule* $1\frac{1}{2}$ by $\frac{1}{2}$ in., cylindric, glabrate, 10-seeded. *Seeds* $\frac{1}{2}$ – $\frac{1}{3}$ in. diam., compressed, orbicular, fulvous-hairy.

XXXIII. **DIOTACANTHUS**, *Benth.*

Corolla-tube short, limb large ventricose 2-lipped. Otherwise as *Phlogacanthus* or *Cystacanthus*.—Species 2, S. Malabarica.

1. **D. grandis**, *Benth. in Gen. Pl.* ii. 1101; glabrous, leaves large lanceolate or obovate-lanceolate, panicles axillary peduncled many-fl'd. mostly exceeding the leaves, corolla crimson. *Phlogacanthus grandis*, *Bedd. Ic. Pl. Ind. Or.* t. 179.

TINNEVELLY and TRAVANCORE, alt. 3–4000 ft.; *Beddome*.

A shrub, 8–12 ft. *Leaves* 7 by $2\frac{3}{4}$ in., attenuate at both ends, undulate, obscurely crenate; nerves 12 pair; petiole $\frac{3}{4}$ in. *Peduncles* 2–5 in., stout, compressed; panicles often 4–8 in.; bracts at its divisions $\frac{3}{8}$ in., linear; proper bracts $\frac{1}{8}$ in., linear. *Sepals* $\frac{1}{4}$ in., linear. *Corolla* minutely pubescent, tube $\frac{1}{8}$ in., limb $\frac{3}{4}$ in.; upper lip emarginate, lower shortly 2-lobed. *Filaments* as long as the corolla, stout, minutely scabrous. *Style* minutely pubescent, subentire. *Capsule* 1 by $\frac{1}{8}$ – $\frac{1}{4}$ in., 24-seeded. *Seeds* much compressed, orbicular in outline, minutely crisped-pubescent.

2. **D. albiflorus**, *Benth. in Gen. Pl.* ii. 1101; nearly glabrous, leaves elliptic acute at both ends, panicles axillary peduncled few-fl'd. shorter than the leaves, corolla pure white. *Phlogacanthus albiflorus*, *Bedd. Ic. Pl. Ind. Or.* t. 180.

S. TINNEVELLY, alt. 3–5000 ft., and near Courtallum, *Beddome*.

A shrub, 6–10 ft. *Leaves* 5 by $1\frac{1}{2}$ in., subentire; nerves 7 pair; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Peduncles* 1–2 in., slender; panicles 1– $1\frac{1}{2}$ in., depressed corymbiform. *Calyx*, *corolla* and *capsule* nearly as of *D. grandis*.—*Beddome* describes the filaments as "much dilated below, articulated near the apex, quite black above the articulation;" this character being remarkable in the *Acanthaceæ*, Mr. Bentham refers to (*Gen. Pl.* ii. 1101) the articulation of the filaments. But in a prolonged examination of the very filaments supplied by *Beddome* no articulation whatever has been made out by myself and Prof. Oliver.

XXXIV. **LEPIDAGATHIS**, *Willd.*

Herbs or undershrubs, with often pubescent bracts or leaves. *Leaves* entire or crenate-serrate. *Flowers* sessile, usually capitate, sometimes opposite or solitary; heads terminal or axillary, dense (rarely lax), usually 1-sided, often fascicled; bracts usually larger than the calyx-segments, rarely small; bracteoles narrower than the bracts. *Calyx* deeply 5-lobed; segments unequal, the 2 anterior more or less connate (calyx 4-partite). *Corolla* small (except in *L. longifolia*), tubular, suddenly ventricose in the middle, 2-lipped; lower lip 3-lobed, patent, usually spotted. *Stamens* 4, didynamous; anthers all 2-celled; cells oblong, mucicous, parallel, or one lower somewhat divergent. *Stigma* capitate, minutely bifid or entire. *Capsule* 2- or 4-seeded, elongate conoid or oblong. *Seeds* compressed, ovate-oblong, or orbicular, hairy.—Species 50 tropical, whereof 2 only are American.

Lepidagathis falcata & *dulcis*, *Wall. Cat.* 7166, 7167, came from Ava, outside the bounds of British India.

Sect. 1. *Capsule* 2-seeded, elongate-conic, dorsally scarious, thin, irregularly tearing, only ultimately 2-valved from the subsolid tip. *Seeds* ovate-lanceolate, with very long hair spreading elastically when wet, very mucilaginous.

* *Spikes chiefly aggregated, globose, near the base of the stem.*

1. ***L. cristata***, Willd. *Sp. Pl.* iii. 400; leaves linear or oblong nearly glabrous, bracts and bracteoles elliptic ovate or obovate suddenly spinose-acuminate, sepals elliptic or obovate suddenly spinulose in fruit thickened very hairy upwards. *Roxb. Cor. Pl.* iii. 63, t. 267, and *Fl. Ind.* iii. 53; *Wall. Cat.* 2421, chiefly; *Nees Monogr. Lepidag.* 25, and in *Wall. Pl. As. Rar.* iii. 96, and in *DC. Prodr.* xi. 256, *Var. a* only; *Wight Ill.* t. 164 b, fig. 5, and *lc.* t. 455; *Dalz. & Gibs. Bomb. Fl.* 191; *T. Anders. in Journ. Linn. Soc.* ix. 494. *L. Shuteri*, *T. Anders. l. c.*—*Lepidagathis* sp. n. 18, *Herb. Ind. Or. H. f. & T.*

COROMANDEL, in the tropical region, frequent; *Rottler, Wight* (*Herb. Propr.* n. 1971), &c.

Rootstock perennial; stems 6–18 in., branched, procumbent, quadrangular, puberulous or slightly pubescent. *Leaves* 1 by $\frac{1}{2}$ in., sessile, lineolate above, minutely scabrid-pubescent on the nerves beneath or glabrate. *Inflorescence* subradical, globose; one or two smaller heads sometimes added on the lower part of the leafy branches; bracts $\frac{1}{2}$ in., rigid in fruit; bracteoles membranous, hairy, spinescent. *Calyx* sub-4-partite, one segment bifid; segments upwards thickened, oblong obtuse with a mucro, hairy, in fruit densely hairy. *Corolla* $\frac{1}{2}$ in., densely hairy in bud, white with brown or purple spots in the palate. *Stamens* glabrous; anther-cells one slightly above the other, papillose-ciliate. *Ovary* glabrous. *Capsule* $\frac{1}{2}$ in.—*T. Anderson's* specimens of *L. Shuteri* are merely the fruiting states of *L. cristata*, with particularly glabrous leaves, &c. His description again appears drawn up chiefly from *L. mitis*. The older botanists did not separate *L. cristata* from the 2 following, and Willdenow's original description does not mention the bracts, and may belong to all of the three. So Roxburgh's picture cited shows obtuse bracts; but his description says "bracts lanceolate ciliated pointed," which may have been taken from *L. Hookeri*.

VAR. rupestris; stem pubescent, leaves elliptic pubescent on both surfaces. *L. rupestris*, *Nees in Wall. Pl. As. Rar.* iii. 96, and in *DC. Prodr.* xi. 256; *T. Anders. in Journ. Linn. Soc.* ix. 494.—Coromandel (?), *Wight* (*Herb. Propr.* n. 1970).

2. ***L. Hamiltoniana***, *Wall. Cat.* 2422; leaves linear or narrowly oblong nearly glabrous, bracts lanceolate spinescent patently ciliate upwards, calyx-lobes lanceolate spinescent not thickened upwards. *Nees Monogr. Lepidag.* 23, and in *Wall. Pl. As. Rar.* iii. 96, and in *DC. Prodr.* xi. 255. *L. Beddomei*, *T. Anders. in Journ. Linn. Soc.* ix. 499.

BEHAR, alt. 1000 ft.; R. Sone at Rotasghur, *J. D. H.*; Bhagulpore, *Hamilton*. BUNDELKUND; *Edgeworth*. JUBBULPORE; *Beddome*. CHOTA NAGPORE, alt. 1–3000 ft., plentiful.

Closely resembling *L. cristata* in habit, leaves and inflorescence. *Bracts* long-tapering upwards, with long white hairs on their margins. *Calyx-segments* tough-membranous. *Corolla* with adpressed straight white hairs, not densely furred as in *L. cristata*.—The flowers in *Beddome's* example are detached; *T. Anderson* describes them as terminal, which is certainly not the case.

3. ***L. mitis***, *Dalz. in Hook. Kew Journ.* iii. 226; leaves oblong pubescent scabrous on the nerves beneath, flower-heads not prickly, bracts softly membranous obtuse or shortly acute. *Dalz. & Gibs. Bomb. Fl.* 191.

W. DECCAN PENINSULA; Concan, Belgaum, Mangalore, *Wight, Stocks*, &c.

Closely allied to *L. cristata*. *Stems* usually acutely quadrangular, puberulous or pubescent. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ – $\frac{1}{4}$ in., broader than in the two preceding species, often distinctly scabrid-ciliate. *Bracts* chaffy, purple or yellow.—Seems well separated from *L. cristata*, but the bracts pass insensibly into the following var.

VAR. subarmata; bracts lanceolate soft or subsperouscent or rigidly spinous. *L. cristata* var. *latifolia*, *Nees in DC. Prodr.* xi. 256; *Dalz. & Gibs. Bomb. Fl.* 191. *L.*

cristata, Wall. Cat. 2421, letter C. *L. rupestris*, Bedd. Ic. Pl. Ind. Or. t. 229.—Malabar; frequent, Wight, &c.—This form differs from *L. Hamiltoniana* by its much wider usually ciliate leaves.

** *Spikes mostly axillary scattered.*

4. ***L. trinervis***, Nees Monogr. *Lepidag.* 21, and in Wall. Pl. As. Rar. iii. 96, and in DC. Prodr. xi. 254; leaves linear or linear-lanceolate entire glabrous 3-nerved, bracts ovate or obovate spinose-cuspidate glabrous or cobweb-ciliate, corolla white. *T. Anders. in Journ. Linn. Soc.* ix. 495. *Barleria*? *trinervis*, Wall. Cat. 2500.

Dry hills of CENTRAL INDIA, alt. 1–2000 ft.; from Bombay Ghauts, Dalzell, and Goojerat, Stocks, to the Kymore Hills, J. D. H., and Chota Nagpore. SIKKIM (probably base of the hills), Herb. Griffith. N.W. HIMALAYA? Herb. Falconer.

Rootstock woody; stems numerous, 5–10 in. *Leaves* $1\frac{1}{4}$ by $\frac{1}{8}$ – $\frac{1}{4}$ in., sessile, mucous, lineolate above; midrib beneath distinct, with 2 slender nerves parallel to it near the margins. *Spikes* $\frac{2}{3}$ in., ovoid, often numerous, generally near the base of the stems, sometimes all conglomerated into a subradical globe as in *L. cristata*; bracts $\frac{1}{2}$ – $\frac{3}{4}$ in., nearly half their length occupied by the subsquarrose cusp; bracteoles linear-lanceolate, softly membranous. *Calyx* non-spinescent. *Corolla* and *capsule* nearly as of *L. cristata*.

VAR. *asperima*, T. Anders. ms.; leaves $\frac{1}{2}$ by $\frac{1}{12}$ in. mucronate very scabrous. *Lepidagathis* sp. n. 21, Herb. Ind. Or. H. f. & T.—Concan; Stocks.—*Stem* 6 in., branched, stoutly lignescent; branches numerous, internodes very short.

5. ***L. lutea***, Dalz. in Hook. Kew Journ. ii. 139; leaves linear or linear-lanceolate nearly glabrous 3-nerved, outer bracts often stout elongate spinous inner much smaller, corolla yellow. Dalz. & Gibs. Bomb. Fl. 190; T. Anders. in Journ. Linn. Soc. ix. 495.

BOMBAY GHAUTS; Dalzell, Stocks, Law.

Rootstock woody; stems 6–20 in., quadrangular, pubescent or nearly glabrous. *Leaves* 2 by $\frac{1}{4}$ in., sessile, minutely hairy above, glabrous beneath. *Spikes* usually 1–3 together in many of the axils, and also a subradical congested globe, pubescent; outermost bract of each spike often 1–2 in. with a very stout bayonet-like tip; inner bracts $\frac{1}{2}$ – $\frac{1}{2}$ in., membranous, acute or shortly spinescent. *Calyx* shortly spinescent or innocuous. *Corolla* $\frac{1}{2}$ in. (fide Dalzell); but appears only $\frac{1}{2}$ in. in the dried specimens, much as of *L. cristata*.

6. ***L. spinosa***, Wight; Nees in Wall. Pl. As. Rar. iii. 97, and Monogr. *Lepidag.* 32, and in DC. Prodr. xi. 258; leaves obovate spinous-mucronate mostly entire glabrous, bracts broadly oblong acuminate spinescent. T. Anders. in Journ. Linn. Soc. ix. 495. *Barleria*? *spinosa*, Wall. Cat. 2497. *Acanthus mucronatus*, Heyne in Herb. Rottler.

CARNATIC and MYSORE; Rottler, Wight, Hamilton, &c.

A prostrate, much-branched perennial, 6–20 in. *Leaves* $\frac{1}{2}$ by $\frac{1}{4}$ – $\frac{1}{2}$ in., sessile, usually with one spine only at the tip, rarely 1–2 spines on the margins added. *Heads* $\frac{1}{2}$ – $\frac{3}{4}$ in., scattered, ovoid, few-fl'd.; outer barren bracts numerous, $\frac{2}{3}$ in. including the strong spine, rigid; inner bracts and bracteoles softer; calyx (or its inner segments at least) villous mucous. *Corolla* and *capsule* as of *L. cristata*.

7. ***L. pungens***, Nees in Wall. Pl. As. Rar. iii. 97, and in Monogr. *Lepidag.* 33, and in DC. Prodr. xi. 58; leaves ovate spinous-serrate glabrous, bracts lanceolate or ovate lanceolate spinous-mucronate. Wight Ic. t. 456; T. Anders. in Journ. Linn. Soc. ix. 495. *Barleria*? *pungens*, Wall. Cat. 2498.

S. MADRAS; Rottler, Wight, G. Thomson.

Nearly all the leaves with 2-3 strong spines on each margin; otherwise closely resembling *L. spinosa*.

8. ***L. clavata***, *Dalz. in Hook. Kew Journ.* ii. 340; leaves sessile ovate subentire spinous-mucronate glabrescent, spikes solitary terminal oblong or subclavate, bracts sub-4-ranked resembling the leaves but woolly. *Dalz. & Gibs. Bomb. Fl.* 191; *T. Anders. in Journ. Linn. Soc.* ix. 495.

BOMBAY GHATS and SYHADREE MTS.; *Dalzell, Stocks*.

Rootstock stout, woody; stems several 8-12 in., erect, undivided or rarely divided, lower leaves caducous. *Leaves* 1 in., rigid, plicate, squarrose, slightly ciliate or glabrate. *Spikes* 1-3 in., dense, harsh; lower bracts altogether as the leaves, upper smaller, becoming very woolly; bracteoles resembling the calyx-segments. *Calyx* $\frac{1}{2}$ in.; segments unequal, silky. *Corolla* $\frac{2}{3}$ in. as of *L. cristata*, but (fide *Dalzell*) rose. *Capsule* and *seeds* as of *L. cristata*.

9. ***L. prostrata***, *Dalz. in Hook. Kew Journ.* ii. 138; leaves sessile ovate subentire spinous-mucronate pubescent, spikes terminal on short lateral branches ovate or oblong, bracts resembling the leaves. *Dalz. & Gibs. Bomb. Fl.* 190; *T. Anders. in Journ. Linn. Soc.* ix. 495.

W. DECCAN PENINSULA; Concan, *Dalzell, Stocks*; Canara, *Ritchie*. SUB-TROPICAL W. HIMALAYA; Kangra, alt. 1-4000 ft., *Clarke*.

Rootstock woody; branches 6-15 in., prostrate, much branched pubescent. *Leaves* $\frac{1}{2}$ -1 in., rigid, plicate, squarrose, strongly nerved. *Spikes* $\frac{1}{2}$ -2 in., in appearance axillary, dense, varying much in length; lower bracts as the leaves, upper smaller. *Calyx* $\frac{1}{3}$ - $\frac{1}{2}$ in., villous; inner segments smaller, not spinescent. *Corolla* and *capsule* as of *L. clavata*, to which this species appears closely allied, though differing so greatly in habit.

10. ***L. diffusa***, *Clarke*; leaves sessile linear or elliptic entire mucous glabrescent, spikes ovate axillary often clustered, bracts lanceolate acuminate spinescent. *Barleria diffusa*, *Wight in Herb. Propr.*

DECCAN PENINSULA; *Wight*; Bellary, *Beddome*.

Rootstock woody; branches 3-10 in., prostrate, much-divided, nearly glabrous. *Leaves* 1 by $\frac{1}{2}$ - $\frac{3}{4}$ in., varying considerably on the same plant, sometimes acute almost mucronate. *Spikes* $\frac{1}{2}$ - $\frac{3}{4}$ in., dense, hairy, mostly towards the upper ends of the stems, really terminal on much-shortened lateral branches; bracts $\frac{1}{2}$ in. *Calyx* 4-partite, villous; 2 outer segments lanceolate undivided, inner narrower. *Corolla* $\frac{1}{2}$ in.—*Wight* doubtless referred this to *Barleria* because both the outer larger calyx-segments are undivided. The corolla, stamens and capsule are altogether as of *L. cristata*.

Sect. 2. *Capsule* 4-seeded, oblong, early 2-valved from the apex. *Seeds* ovate or orbicular, with very short hairs elastic when wetted.

* *Leaves* entire or undulate.

11. ***L. rigida***, *Dalz. in Hook. Kew Journ.* ii. 341; softly hairy, leaves linear-lanceolate mucous, spikes oblong dense terminal often appearing clustered, bracts narrowly ovate shortly spinescent. *Dalz. & Gibs. Bomb. Fl.* 191; *T. Anders. in Journ. Linn. Soc.* ix. 495.

BOMBAY GHATS; *Dalzell, Stocks, &c.* SCINDE (*T. Anderson*).

Suffruticose, 1-2 ft. (at least), erect, softly hairy. *Leaves* $3\frac{1}{2}$ by $\frac{1}{2}$ in., attenuate at both ends, glandular-pubescent on both surfaces; petiole indistinct. *Spikes* $\frac{1}{2}$ -2 $\frac{1}{2}$ in., often appearing as in terminal clusters on shortened lateral branches; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., entire, rigid. *Corolla* $\frac{1}{2}$ in., yellow-white. *Capsule* $\frac{1}{2}$ in., 4-seeded. *Seeds* $\frac{1}{12}$ in. diam.—The inflorescence, capsule and seeds approach those of *L. hyalina*.

12. **L. cuspidata**, *Nees in Wall. Pl. As. Rar.* iii. 97, and *Monogr. Lepidag.* 31, and in *DC. Prodr.* xi. 258; leaves elliptic or ovate attenuate at both ends puberulous, spikes dense or very lax pubescent, bracts ovate cuspidate 3-nerved. *T. Anders. in Journ. Linn. Soc.* ix. 495; *Bedd. Ic. Pl. Ind. Or. t.* 227. *Ruellia cuspidata*, *Wall. Cat.* 2405.

TROPICAL INDIA; extending from W. Himalaya, *Falconer, Edgeworth*, to COORG, *Rottler*, and MALABAR from the plains nearly to the top of the Ghauts.

Shrubby; stems 1-2½ ft., erect or diffuse, glabrous or pubescent towards the apex. *Leaves* of the main stem 4½ by 1½ in., mucous; petiole ¼-½ in.; on the lateral flowering branches the leaves are mostly 1 in., sessile, mucronate. *Spikes* 1 in., dense, or 6 in. lax with the flowers in distinct opposite pairs; bracts ⅔ by ½ in. *Calyx* ½ in., 5-partite. *Corolla* scarcely ½ in., whiteish with purple spots. *Capsule* 4-seeded.

13. **L. calycina**, *Hochst.*; *Nees in DC. Prodr.* xi. 252; leaves petioled oblong entire nearly glabrous, spikes numerous small ovoid sparingly scabrid puberulous, bracts obovate 3-nerved aristate not spinescent. *T. Anders. in Journ. Linn. Soc.* ix. 496; *Boiss. Fl. Orient.* iv. 525. *L. strobilifera*, *Stocks in Hook. Kew Journ.* iv. 177.

SCINDE; *Stocks*.—DISTRIB. Beloochistan, Abyssinia.

A small, erect, rigid, much-branched undershrub. *Leaves* 1½ by ½ in., lineolate, obscurely ciliate-pubescent; petiole ⅓-½ in. *Heads* ¾ in., appearing sessile often conglomerate; bracts ½ by ½ in., scarious, 3-5 nerved, scabrid-puberulous on the nerves; bracteoles ¼ in., linear, ciliate. *Calyx* 4-partite; 2 outer segments ⅓-½ in. broad, scarious, nerved, one bifid half-way down; 2 inner segments ¼-½ in., linear. *Corolla* ½ in., white, lower lip purple-spotted. *Capsule* nearly ½ in., 4-seeded.

14. **L. chlorostachya**, *Nees in DC. Prodr.* xi. 256; leaves large petioled elliptic acuminate at both ends glabrous, spikes axillary oblong dense ciliate scarcely pubescent, bracts and bracteoles narrowly lanceolate mucronate scarcely spinescent. *T. Anders. in Journ. Linn. Soc.* ix. 496.

MERGUI; *Griffith* (*Kew Distrib.* n. 6141).

Shrubby, erect. *Leaves* 6½ by 1½ in., entire membranous; petiole ½-1 in. *Spikes* 2 by ½ in., subsessile, mostly solitary in each axil sometimes 2 together, erect, 1-sided or subsymmetric; bracts ½ by ⅓ in., white ciliate, subsymmetric or in the 1-sided spikes falcate; bracteoles similar rather smaller. *Calyx* 5-partite; segments linear-lanceolate, nearly similar. *Corolla* ½ in., and *stamens* as of *L. hyalina*. *Capsule* oblong, 4-seeded.

15. **L. subuninervia**, *Clarke*; spikes linear-oblong pubescent, bracts linear-lanceolate sub-1-nerved ciliate mucronate. *Neuracanthus subuninervius*, *Kurz in Journ. As. Soc.* 1873, pt. ii. 95.

PROME HILLS; *Kurz*.

The fragment on which *Kurz* founded this species is the leafless base of a stem, whence arise 2 erect spikes, very similar to those of *L. chlorostachya*, but pubescent as well as ciliate, and the bracts rather smaller. *Stamens* 4; anthers all 2-celled, cells superposed; filaments slightly bearded at the apex. *Style* glabrous, stigma small minutely bifid.—The *stamens* and bracts are not those of a *Neuracanthus*; and the fragmentary solitary specimen is so like *L. chlorostachya* that it might be merely a burnt-down hill specimen of it.

16. **L. purpuricaulis**, *Nees in Wall. Pl. As. Rar.* iii. 96, and *Monogr. Lepidag.* 27, and in *DC. Prodr.* xi. 257; leaves lanceolate or ovate-lanceolate pubescent, spikes axillary sessile solitary or clustered oblong hairy, bracts lanceolate or ovate-lanceolate mucronate striate, calyx sub-5-partite one segment broad the other 4 very narrow. *T. Anders. in Journ. Linn. Soc.* ix.

496. *L. striata*, *Nees in Wall. Pl. As. Rar.* iii. 96, and *Monogr. Lepidag.* 26, and in *DC. Prodr.* xi. 257, and in *Wall. Cat.* 7165. *Ruellia mucronata*, *Wall. Cat.* 2366, sheets β , δ , ζ .

SUBTROPICAL W. HIMALAYA; Hooshianpur, *Aitchison*; Hurdwar, *Wallich*; Kumaon, *Strachey & Winterbottom*. CHOTA NAGPORE; Parasnath, *Edgeworth*; Rajmahl, *Watt*. PROME HILLS; *Wallich*.

Stems herbaceous, 8-24 in., suberect or diffuse, glabrous or hairy, often purple. *Leaves* 1-5 in., sometimes in unequal pairs; larger attenuate at both ends glabrate, smaller subovate more pubescent. *Spikes* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., dense; bracts $\frac{1}{3}$ by $\frac{1}{6}$ in.; bracteoles $\frac{1}{4}$ in., linear-falcate. Large *sepal* $\frac{1}{3}$ - $\frac{1}{2}$ by $\frac{1}{3}$ in.; 2 next $\frac{1}{3}$ in., linear-lanceolate, 2 inner linear. *Corolla* and *capsule* as of *L. hyalina*, from which this species differs very little.

17. ***L. dulcis***, *Nees in Wall. Pl. As. Rar.* iii. 96, and *Monogr. Lepidag.* 30, and in *DC. Prodr.* xi. 257, and in *Wall. Cat.* 7167; leaves petioled elliptic narrowed at both ends pubescent on the nerves beneath, spikes axillary ovoid or somewhat elongate hairy, bracts elliptic scarious, calyx sub-5-partite, outer segment broad. *T. Anders. in Journ. Linn. Soc.* ix. 496. *Ruellia dulcis*, *Wall. Cat.* 7167.

PROME HILLS; *Wallich*. PEGU; *Kurz*.

Annual *stems* 6-12 in., subundivided, flexuose, in appearance procumbent, somewhat pubescent. *Leaves* 3 $\frac{1}{2}$ by 1 $\frac{1}{4}$ in., undulate, soon glabrate above; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Spikes* 1 by $\frac{1}{2}$ in., mostly solitary opposite, 1-sided; bracts $\frac{1}{3}$ by $\frac{1}{6}$ in., somewhat obovate, apiculate not spinescent, nerved, scarious, ciliate; bracteoles similar, but rather smaller, subfalcate. Outer *sepal* nearly $\frac{1}{2}$ by $\frac{1}{4}$ in., obovate, nerved, scarious, ciliate; 2 next $\frac{1}{3}$ by $\frac{1}{4}$ in. falcate, 2 inner $\frac{1}{4}$ in. linear. *Corolla* $\frac{1}{2}$ in. (*Nees*). *Capsule* exceeding $\frac{1}{4}$ in., 4-seeded.

18. ***L. scariosa***, *Nees in Wall. Pl. As. Rar.* iii. 95, and *Monogr. Lepidag.* 15, and in *DC. Prodr.* xi. 251; leaves petioled ovate furfuraceous-pubescent, spikes mostly terminal ovoid dense, bracts narrowly obovate mucronate, outer calyx-segment large obovate scarious. *Wight Ic.* t. 457; *T. Anders. in Journ. Linn. Soc.* ix. 497. *L. terminalis*, *Hochst.*; *Nees in DC. Prodr.* xi. 251. *Ruellia scariosa*, *Wall. Cat.* 2354.

S. DECCAN PENINSULA; Coimbatore, *Wight*; S. Canara, *Beddome*.—DISTRIB. Abyssinia.

A small undershrub; branches numerous, much-divided, stellately woolly or glabrate. *Leaves* 2 by 1 $\frac{1}{4}$ in., hardly acute, undulate; petiole 0- $\frac{1}{2}$ in. *Spikes* 1 in. diam., solitary or 2-3, conglomerate, all at the tips of the branches; bracts $\frac{1}{3}$ in., ciliate, scariosa; bracteoles $\frac{1}{3}$ in., nearly linear. *Calyx* $\frac{1}{2}$ in., sub-5-partite; outer segment $\frac{1}{2}$ in. broad; 2 next $\frac{1}{2}$ in. broad, 2 innermost linear. *Corolla* $\frac{1}{2}$ in. and upwards. *Capsule* $\frac{1}{3}$ in., 4-seeded.—*T. Anderson*, as well as *Nees*, keeps *L. terminalis* distinct; but the only difference is that the corolla in *L. terminalis* is $\frac{3}{4}$ in., whereas in *L. scariosa* it must not exceed $\frac{2}{3}$ in.

19. ***L. simplex***, *T. Anders. in Journ. Linn. Soc.* ix. 497; leaves sessile narrowly oblong glabrous, spikes terminal solitary ovoid or ellipsoid, bracts and bracteoles narrowly obovate white-ciliate, calyx sub-5-partite, segments lanceolate submucronate.

TENASSERIM; *Helper* (*Kew Distrib.* n. 6140).

Stem simple, 4-10 in., erect, glabrous, 4-angular. *Leaves* 1 by $\frac{1}{2}$ in., rigid, obtuse, entire, shining. *Spike* $\frac{1}{2}$ -1 in., sessile, 1-sided; bracts $\frac{1}{3}$ by $\frac{1}{3}$ in., scarcely acute, scarious; bracteoles similar to the bracts, but rather smaller. *Calyx* $\frac{1}{2}$ - $\frac{1}{3}$ in., white ciliate; 2 outer segments oblong, subentire, 2 inner linear. *Corolla* not seen. *Capsule* $\frac{1}{2}$ in., oblong, 4-seeded. *Seeds* densely, elastically hairy.—This looks like a form of *L. hyalina* var. *semiherbacea*.

20. *L. hyalina*, *Nees in Wall. Pl. As. Rar.* iii. 95, and *Monogr. Lepidag.* 16, and in *DC. Prodr.* xi. 252; leaves petioled ovate or oblong minutely viscid-pubescent, spikes oblong very dense axillary and terminal often clustered ciliate often softly hairy, bracts lanceolate acuminate mucronate, calyx sub-5-partite, segments linear-lanceolate mucronate outer larger, corolla $\frac{1}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 498. *L. incurva*, *Don Prodr.* 119. *Ruellia dependens*, *Roxb. Fl. Ind.* iii. 49; *Wall. Cat.* 2365.

Throughout N. INDIA, alt. 0-4000 ft., very common; from Jamu to Upper Assam and Chittagong. BEHAR and CHOTA NAGPORE, frequent. PEGU and TENASSERIM, common.—DISTRIB. Burma, S. China.

A perennial herb, 1-2 ft. *Leaves* 3 by $1\frac{1}{2}$ in., uppermost often narrower, pendent, undulate; petiole $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ - $1\frac{1}{2}$ in., erect, 1-sided; bracts nearly $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., linear-lanceolate, mucronate. *Sepals* $\frac{1}{2}$ in., ciliate, sometimes softly hairy. *Corolla* white with brown spots in the palate. *Capsule* $\frac{1}{2}$ in., 4-seeded.—Of this plant so universal in N. India there is no plate extant; nor is there any example of the typical form at Kew collected in the Deccan. Roxburgh says his *Ruellia dependens* is native in Mysore; but the examples in his collections under that name are all the common Bengal form.

VAR. *mollis*; leaves all ovate hairy on both surfaces, heads very softly hairy.—Himalaya Terai, frequent.

VAR. *ustulata*; plant 1-5 in., leaves 1 in., spikes $\frac{1}{2}$ -1 in. ovoid, bracts rather larger than in *L. hyalina* type. *L. ustulata*, *Nees in Wall. Pl. As. Rar.* iii. 95, and *Monogr. Lepidag.* 18, and in *DC. Prodr.* xi. 253. *Ruellia mucronata*, *Wall. Cat.* 2366, letters γ , ϵ .—Kashmir and N.W. Himalaya, alt. 2-4000 ft., Thomson, *Strachey & Winterbottom*, &c. A very local and easily separable form.

VAR. *mucronata*; leaves ovate pubescent beneath, spikes and heads small or large, bracts $\frac{1}{4}$ in. *L. mucronata*, *Nees in Wall. Pl. As. Rar.* iii. 95, and *Monogr. Lepidag.* 11, and in *DC. Prodr.* xi. 250. *L. neurophylla*, *T. Anders. in Journ. Linn. Soc.* ix. 497. *Ruellia mucronata*, *Wall. Cat.* 2366, type sheet.—Concan, Canara, Nilgherries, &c., Stocks, Wight, Dalzell, &c.—Nees founded this species on Wight's plant (*Herb. Propr.* n. 1968), which has small leaves; subsequently he (in *DC. Prodr.*) added such specimens from Mergui as had small leaves: these, however, having bracts $\frac{1}{2}$ - $\frac{1}{4}$ in. are nearer *L. purpuricaulis*, though their stems are not very purple. T. Anderson's *L. neurophylla* has full-sized leaves; the bracts are nearly the same as in Var. *mucronata*.

VAR. *lophostachyoides*, *Nees in DC. Prodr.* xi. 252; leaves large, spikes $2\frac{1}{2}$ by $\frac{1}{2}$ in. 1-sided, bracts as in *L. hyalina* type.—Ceylon; Gardner, Walker, &c. Bababoodun Hills; Cleghorn.—This variety in habit and in details runs very near *L. chlorostachya*, but has the spikes rather slenderer, the bracts rather smaller.

VAR. *semiherbacea*; leaves linear-lanceolate often shining. *L. semiherbacea*, *Nees in Wall. Pl. As. Rar.* iii. 96, and *Cat.* 7164, and *Monogr. Lepidag.* 20, and in *DC. Prodr.* xi. 253; *Wall. Cat.* 7164. *L. iridescens*, *T. Anders. in Journ. Linn. Soc.* ix. 496. *Lepidagathis* sp., *Griff. Notul.* iv. 137.—From Sikkim and Assam to Burma, very common in the Terai and adjacent Tropical Valleys.—Stems often elongate, diffuse, with long nodes; the lower stem leaves (in the extreme form of the variety) 7 by $\frac{3}{4}$ in. But intermediate forms are more common, having the lower leaves ovate, the upper or uppermost oblong or linear, large or small. Some of the examples only differ from *L. simplex*, T. Anders., in having numerous heads.

VAR. *riparia*; leaves large ovate, heads large softly ciliate, bracts $\frac{1}{2}$ in. (or sometimes longer) acuminate long aristate. *L. riparia*, *Nees in DC. Prodr.* xi. 253. *L. aristata*, *Nees in Wall. Pl. As. Rar.* iii. 95, and *Monogr. Lepidag.* 19; *Wall. Cat.* 7163 (not *Ruellia aristata*, Vahl).—Rangoon; M'Lelland. Pegu Yomah; Kurz. Tenasserim; Beddome. Siamese Hills; Parish.—Kurz and Beddome have noted on their specimens that this is probably a distinct species; and it seems more distinct from *L. hyalina*, to which T. Anderson reduced it, than some usually admitted species.

21. *L. linearis*, *T. Anders. in Cat. Hort. Calc.* 43, and in *Journ.*

Linn. Soc. ix. 496; leaves subsessile linear acute at both ends scabrous pale beneath, spikes terminal or axillary tetragonal subsecund dense woolly, bracts herbaceous obliquely lanceolate mucronate ciliate 1-nerved, calyx 5-partite membranous ciliate upper segment lanceolate rounded at the tip 3-nerved.

BURMA; *R. Scott*.

Perennial; stems several, 2-3 ft., tetragonous, winged, glabrous. *Leaves* 3-6 in., scabrous. *Spikes* 1-2 in., hoary woolly. Terminal *spikes* 2-3 together, axillary solitary opposite; bracteoles membranous, concave, obovate, obtuse at both ends, ciliate. *Corolla* and *capsule* appear (ex descr.) same as of *L. hyalina* (*T. Anderson*). —Not seen.

** *Leaves crenate or crenate-serrate*. (Anther-cells more separated and more divergent at the base than in the rest of the genus.)

22. ***L. ceylanica***, *Nees Monogr. Lepidag.* 35, and in *DC. Prodr.* xi. 259; leaves petioled ovate-lanceolate nearly glabrous, bracts as long as the calyx elliptic or obovate scarious 3-nerved glabrous ciliate. *T. Anders. in Journ. Linn. Soc.* ix. 498. *L. nervosa*, *Wight Ic.* t. 1620.

CEYLON; *Walker, Thwaites*.

Stems 2-3 ft., herbaceous, diffuse, 4-angular, glabrous. *Leaves* 3 by $\frac{1}{4}$ in., acuminate at both ends, crenate-serrate, obscurely puberulous; petiole $\frac{1}{2}$ in. *Spikes* $\frac{3}{4}$ in., ovoid or obovoid, in dense panicles or clusters; bracts $\frac{1}{2}$ by $\frac{1}{4}$ in., mucronate; bracteoles $\frac{1}{2}$ by $\frac{1}{4}$ in., subfalcate, scarious, 3-nerved, ciliate. *Calyx* $\frac{1}{2}$ - $\frac{1}{4}$ in., deeply 5-fid, scarious, glabrous, ciliate; outer segment oblong or elliptic, other 4 narrow. *Corolla* $\frac{1}{2}$ in. *Capsule* $\frac{1}{2}$ in., 4-seeded.

23. ***L. Walkeriana***, *Nees in DC. Prodr.* xi. 260; leaves petioled ovate-lanceolate nearly glabrous, bracts half as long as the calyx elliptic. *Wight Ic.* t. 1530; *T. Anders. in Journ. Linn. Soc.* ix. 499. *L. ceylanica*, Var. β , *Nees Monogr. Lepidag.* 35.

CEYLON; *Walker, Macrae, &c.*

Bracts $\frac{1}{2}$ in., 3-nerved, subscarious. *Calyx* $\frac{1}{4}$ in., densely minutely glandular-hairy or glabrate ciliate. Otherwise as *L. ceylanica*, which it so greatly resembles that Wight has noted on the specimen he has figured a doubt whether it was the "true *Walkeriana*," which it certainly is.

24. ***L. fasciculata***, *Nees in Wall. Pl. As. Rar.* iii. 95, and *Monogr. Lepidag.* 10, and in *DC. Prodr.* xi. 260; leaves petioled ovate or ovate-lanceolate pubescent, bracts herbaceous as long as the calyx ovate or elliptic 3-nerved hairy. *T. Anders. in Journ. Linn. Soc.* ix. 498; *Bedd. Ic. Pl. Ind. Or.* t. 228; *Wawra Bot. It. Pr. S. Cob.* i. 88, t. 13. *L. hirta*, *Nees Monogr. Lepidag.* 37. *L. goensis*, *Dalz. in Hook. Kew Journ.* ii. 340; *Dalz. & Gibs. Bomb. Fl.* 191. *Ruellia fasciculata*, *Retz. Obs.* iv. 28; *Rorb. Fl. Ind.* iii. 48; *Wall. Cat.* 2406, and 2394 partly.

Throughout TROPICAL and SUBTROPICAL INDIA, from the base of the N.W. HIMALAYA and BENGAL to CEYLON and TENASSEERIM; mostly rare, plentiful in Malabar.

Stems 1 foot, herbaceous, diffuse, hairy. *Leaves* 2 by 1 in., crenate-serrate, pubescent at least on the nerves beneath; petiole $\frac{1}{4}$ in. *Spikes* $\frac{1}{2}$ in. diam., or often elongate, interrupted below with the lower flowers in opposite pairs; bracts $\frac{1}{2}$ - $\frac{1}{4}$ in., in fruit somewhat enlarged; bracteoles rather shorter than the bracts, falcate-oblong. *Corolla* and *capsule* nearly as of *L. hyalina*.—This plant always occurs mixed with *Hemigraphis latebrosa*, *Nees*; without counting the ovules or seeds it may be distinguished therefrom by the presence of bracteoles, the capi-

tellate sub-bifid stigma, the corolla suddenly ventricose in the middle not tubular (as in *Hemigraphis latebrosa*).

VAR. *major*; leaves larger toothed or subentire, heads larger, bracts $\frac{1}{2}$ by $\frac{1}{4}$ in. acute subspinnulose, calyx $\frac{1}{2}$ in., corolla $\frac{1}{2}$ in.—Tenasserim; Mooleyit, *Bed dome*.—Much finer than the ordinary *L. fasciculata*, of which some examples from moist valleys in Malabar (marked *L. goensis*) come so near this Tenasserim plant that it is difficult to treat the latter as a species.

DOUBTFUL SPECIES.

L. LONGIFOLIA, *Wight Ic. t.* 1564; leaves large lanceolate glabrous, spikes elongate lax terminal subpanicled, bracts large elliptic acute, flowers large, anthers minutely spurred at the base. *T. Anders. in Journ. Linn. Soc.* ix. 499.

MALACCA; *Griffith* (Kew Distrib. n. 6138), *Maingay*.

Branches terete, glabrescent. *Leaves* 9 by 2 in., acute at both ends, entire; petiole $\frac{3}{8}$ in. *Spikes* 3–7 by 1 in., clustered towards the end of the branch, lax, nodding, pubescent; bracts $\frac{3}{4}$ by $\frac{1}{4}$ in., opposite, one of each pair usually barren; bracteoles $\frac{1}{2}$ in., oblong. *Calyx* nearly $\frac{1}{2}$ in., 5-lobed nearly to the base; 3 segments broadly lanceolate, 2 linear. *Corolla* in form nearly as of *Lepidagathis* but larger, minutely hairy without, nearly glabrous; no traces of dots on the lower lip. *Stamens* 4, slightly didynamous; filaments glabrous, connective papillose; anthers oblong, cells parallel approximate each with a divaricate minute mucro at the base. *Ovary* depressed, glabrous, 4-ovulate; style patently hairy; stigma capitellate (not as in *Wight Ic.*). *Capsule* not seen.—A remarkable plant, both in habit and characters removed from *Lepidagathis*; in the absence of fruit it is advisable not to found a new genus on it. Nees marked it “Species ab Acanthaceis aliena.” In many points it approaches *Asystasia Lawiana* and *Strobilanthes*.

L. STROBILINA, *T. Anders. ms.*; *Kurz in Journ. As. Soc.* 1873, pt. ii. 96; glabrous, leaves lanceolate membranous entire, heads lax terminal largeish, corolla 1 in. funnel-shaped purple-lilac tube short.

MARTABAN; *Parish* (fide *Kurz*).

A herb, 1–2 ft., stems terete with 4 elevated lines. *Leaves* 7–8 in., acuminate at both ends, shining, petioled. *Bracts* 1 in., oblong-lanceolate acuminate thin-papery, tinged purple-lilac, 1-nerved and reticulated, glandulose-puberulous; bracteoles similar to the bracts but narrower. *Calyx* large. *Capsule* wanting.—Not seen; the foregoing translated from *Kurz l. c.* Appears ex descr. to be allied to *L. longifolia*.

XXXV. **PHIALACANTHUS**, *Benth.*

An erect, glabrous shrub. *Leaves* large, entire. *Cyme* terminal, loosely corymbose; pedicels slender; bracts minute. *Calyx* membranous, coloured, tubular-campanulate, shortly 5-toothed. *Corolla-tube* elongate, ventricose upwards; limb 2-lipped; lobes 5, subequal, imbricate in bud. *Stamens* 4; anthers all 2-celled; cells oblong, parallel, muticous. *Style* filiform; stigma minutely 2-lobed; ovules 2 in each cell. *Capsule* shortly stalked, oblong, 4-seeded. *Seeds* (unripe) compressed, orbicular in outline, retinacula stout.

P. Griffithii, *Benth. in Gen. Pl.* ii. 1102.

MISHMEE; *Griffith*.

Leaves $7\frac{1}{2}$ by $2\frac{1}{2}$ in., broad-elliptic, acuminate at both ends, bearing raphides on both surfaces; petiole $1\frac{1}{2}$ in. *Cymes* 3 in. diam., short-peduncled; lower bracts $\frac{1}{4}$ in., linear, upper minute; pedicels $\frac{1}{4}$ in. *Calyx* $\frac{1}{4}$ by $\frac{1}{8}$ in., enlarged in fruit; teeth $\frac{1}{8}$ in., triangular. *Corolla* $1\frac{1}{2}$ in., orange with yellow mouth (*Griffith*). *Stamens* glabrous; anthers minutely pubescent. *Style* glabrous. *Disc* small, cup-shaped. *Capsule* (unripe) $\frac{1}{4}$ in., glabrous.

XXXVI. **MONOTHECIUM**, *Hochst.*

Diffuse herbs. *Leaves* entire. *Spikes* small, ovate or oblong, dense;

bracts and bracteoles linear or setaceous. *Sepals* 5, equal, linear-setaceous. *Corolla* small, tubular, limb deeply 2-lipped. *Stamens* 2; anthers narrowly oblong, 1-celled, mucous, attached by the middle of the back. *Style* minutely bifid. *Capsule* oblong, on a short solid stalk, 4-seeded. *Seeds* compressed, orbicular, rugose subtubercled; retinacula stout.—Species 2, Indian and Tropical African.

M. aristatum, *T. Anders. in Thwaites Enum.* 234; leaves ovate or ovate-lanceolate pubescent on the nerves beneath, bracts $\frac{1}{4}$ – $\frac{1}{2}$ in. linear setaceous lineolate. *Bedd. Ic. Pl. Ind. Or.* t. 269. *Justicia aristata*, *Wall. Cat.* 2481; *Nees in Wall. Pl. As. Rar.* iii. 115. *Anthocometes aristatus*, *Nees in DC. Prodr.* xi. 312.

CEYLON; *Walker, Wight, &c. NILGHERY MTS.; G. Thomson.*

Stems 1 foot, procumbent, much branched, often rooting. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ in., cuneate at both ends; petiole $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ – $1\frac{1}{2}$ in., peduncled or sessile, pubescent or nearly glabrous; bracteoles 0 (barren bracts frequent). *Sepals* $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ in., white, lower lip brown-spotted. *Capsule* $\frac{1}{4}$ in.—This is so like *Justicia procumbens* that an example of it in *Herb. Kew* is marked "*Rostellularia procumbens*, Var. α or β ," by *Nees'* hand.

XXXVII. CLINACANTHUS, *Nees*.

A tall herb, minutely pubescent. *Leaves* ovate-lanceolate, entire or toothed. *Flowers* conspicuous, dull red, in small drooping cymes at the tips of the branches; bracts and bracteoles small, linear. *Sepals* 5, equal, linear-subulate. *Corolla-tube* elongate, curved at the base, widened upwards; limb 2-lipped. *Stamens* 2; anthers scarcely exerted, 1-celled, narrowly oblong, mucous, attached by the middle of the back. *Style* minutely bifid. *Capsule* oblong, on a short solid stalk, 4-seeded. *Seeds* muricate (*Nees*).

Only differs from *Hypoestes* by the small bracts.

C. Burmanni, *Nees in DC. Prodr.* xi. 511. *Justicia nutans*, *Burm. Fl. Ind.* 10, t. 5, fig. 1. *J. fulgida*, *Blume Bijd.* 784. *Beleropone?* *fulgida*, *Hassk. Cat. Hort. Bogor.* 151.

MALACCA; *Maingay*.—DISTRIB. Java, Borneo, Hainan.

Leaves $2\frac{1}{2}$ by 1 in., acuminate, base cuneate or rounded; petiole $\frac{1}{4}$ in., puberulous. *Cymes* about 5-fl.; bracts $\frac{1}{2}$ in., linear; pedicels $\frac{1}{6}$ in. *Sepals* $\frac{1}{4}$ in., rusty pubescent. *Corolla* $1\frac{1}{4}$ in., lobed $\frac{1}{3}$ – $\frac{1}{2}$ in. *Stamens* and *pistil* glabrous.

XXXVIII. JUSTICIA, *Linn.*

Herbs or shrubs. *Leaves* entire. *Flowers* sessile or nearly so, spiked or paniced (rarely solitary), small or middle-sized; bracts large or small; bracteoles narrow or 0. *Calyx* 5- or 4-partite; segments narrow. *Corolla-tube* shorter, or scarcely longer, than the 2-lipped limb; upper lip 2-lobed or subentire, lower 3-lobed, lobes imbricate in bud. *Stamens* 2, filaments often dilated, hairy near the base; anthers 2-celled; cells oblong or round, usually more or less separate, lower always with a white basal appendage. *Ovary* 4-ovulate; style filiform, shortly bifid. *Capsule* ovoid or ellipsoid, 4-seeded from the base, or with a long solid cylindric stalk 4-seeded at the apex. *Seeds* ovoid, more or less compressed, tubercular, scaly or glochidiate-subspinescent (appearing hispid), never with fine elastic hairs springing out when wetted.—Species 100, in the warm regions of both hemispheres.

Justicia bivalvis, Roxb. Fl. Ind. i. 124, came from the Moluccas, and was probably a *Dicliptera*; though Roxburgh quotes his species as the same as Linnæus' under that name, he excludes (correctly) the plate on which Linnæus founded his species.

Gendarussa virgata, Wall. Cat. 7176, was collected in Ava, outside the bounds of British India.

Justicia inconspicua, Wall. Cat. 2475, collected in Penang, is not in Wallich's Herbarium at the Linn. Soc., nor are there any data for determining its genus.

Sect. 1. **Hemichoriste.** Shrubby. *Spikes* elongate; flowers clustered; bracts herbaceous, subovate. *Corolla* and *capsule* large.

1. **J. montana**, Wall. Cat. 2471, not of Roxb.; leaves large elliptic acute at both ends glabrous, spikes near the ends of the branches subpaniculate, inflorescence subviscidly pubescent. *T. Anders. in Journ. Linn. Soc.* ix. 509; *Benth. in Gen. Pl.* ii. 1109. *J. longifolia*, Wall. Cat. 2437. *Hemichoriste montana*, Nees in Wall. Pl. As. Rar. iii. 102, and in DC. Prodr. xi. 367; *Dalz. & Gibs. Bomb. Fl.* 194; *Wight Ic.* t. 1538.

W. DECCAN PENINSULA, in the Ghats, from Mahabalaishwur (Law) to Nilgherries (Wight).

Stem erect, subtetragonous, puberulous upwards. *Leaves* 9 by $3\frac{1}{2}$ in., both surfaces punctulate; petiole 1 in. *Spikes* 6-15 in., the terminal often paniculately branched; lower clusters of flowers usually distant, upper continuous; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., lower larger; bracteoles smaller, elliptic, near the base of the pedicel; pedicels $0-\frac{1}{8}$ in. *Sepals* 5, $\frac{1}{2}$ in., sublinear, pubescent. *Corolla* 1-1 $\frac{1}{4}$ in., 2-lipped half its length, minutely pubescent, red. *Stamens* 2 (without any rudiments); lower anther-cells long-spurred. *Capsule* 1 in., clavate, pubescent, 4-seeded near the top. *Seeds* glabrous, intensely rugose, but possibly smooth when fully ripe.—Nees says "stamens 4, 2 shorter with 1-celled anthers or rudimentary;" but there is no trace of these shorter stamens in the example named by Nees' hand.

Sect. 2. **Betonica.** Shrubs or herbs. *Spikes* continuous; bracts ovate or elliptic, often 4-ranked, mostly imbricate. *Calyx-segments* 5, nearly equal.

* *Bracts* white, green-nerved.

2. **J. Betonica**, Linn.; Roxb. Fl. Ind. i. 128; tall shrubby puberulous, leaves ovate-lanceolate, bracteoles large ovate-lanceolate, corolla $\frac{1}{2}$ in. white rose-spotted. *Burm. Fl. Ind.* 8; Wall. Cat. 2433; *T. Anders. in Journ. Linn. Soc.* ix. 510; *Kurz For. Fl.* ii. 247. *J. ochroleuca*, Blume Bijdr. 786. *Adhatoda Betonica*, Nees in Wall. Pl. As. Rar. iii. 103, and in DC. Prodr. xi. 385.—*Rheede Hort. Mal.* ii. t. 21.

Throughout INDIA and CEYLON, common; often cultivated.—DISTRIB. Malaya, Tropical Africa.

Branches terete, glabrous, tips pubescent. *Leaves* 3 by $1\frac{1}{2}$ in. (lower sometimes much larger), punctulate on both surfaces, not lineolate, base shortly attenuate; petiole $\frac{1}{2}$ in. *Spikes* 1-4 by $\frac{3}{4}$ in., short-peduncled, terminal, often on short lateral branches appearing lateral; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., ovate acute, white, minutely pubescent; bracteoles $\frac{1}{2}-\frac{1}{3}$ in., similar to the bracts. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, pubescent. *Capsule* $\frac{3}{4}$ in., stoutly clavate, pubescent, 4-seeded. *Seeds* ovoid, somewhat compressed, glabrous, densely rugose in nearly all herbarium specimens, but smooth in some fully ripened.

VAR. *villosa*; stem softly hairy, leaves hairy beneath, flowers salmon-coloured. *J. Pseudo-Betonica*, Roth Nov. Sp. 17.—Central India and Chota Nagpore, alt. 1-5000 ft., common.

VAR. *ramosissima*; stems decumbent diffuse, bracts rather narrower. *J. ramosissima*, Roxb. Fl. Ind. i. 129; *T. Anders. in Journ. Linn. Soc.* ix. 510. *Adhatoda*

ramosissima, *Nees in Wall. Pl. As. Rar.* iii. 103, and in *DC. Prodr.* xi. 385; *Dalz. & Gibs. Bomb. Fl.* 193.—Throughout India, frequent.—This plant is said to have both axillary and terminal spikes, while *J. Betonica* is said to have only terminal; but there is no difference in the inflorescence between them.

3. ***J. nilgherrensis***, *Wall. Cat.* 2435; small procumbent nearly glabrous, leaves sessile oblong obtuse, spikes dense, bracteoles $\frac{1}{2}$ – $\frac{1}{3}$ by $\frac{1}{4}$ in., corolla $\frac{1}{2}$ – $\frac{3}{4}$ in. pale. *J. neilgherriensis*, *T. Anders. in Journ. Linn. Soc.* vii. 118. *Adhatoda nilgherrensis*, *Nees in Wall. Pl. As. Rar.* iii. 103. *A. nilgherrica*, *Nees in DC. Prodr.* xi. 386; *Wight Ic.* t. 1544.

NILGHERRIES, alt. 7–8000 ft.; plentiful in the grass round Ooty.

Rootstock woody. **Stems** 2–8 in., numerous. **Leaves** $1\frac{1}{2}$ by $\frac{1}{2}$ in. **Spikes** terminal, $\frac{1}{2}$ –2 in.; bracts $\frac{2}{3}$ by $\frac{1}{3}$ in., scarious-margined, very acute. **Capsule** $\frac{2}{3}$ in., stout, clavate, pubescent, 4-seeded. **Seeds** (not ripe) glabrous, subtubercular, rugose, not differing from those of some examples of *J. Betonica* at the same stage.—Seems distinct, but not allowed by T. Anderson (in *Thwaites Enum.* 233). Though the plant is so humble, the bracts, corolla and capsule are full as large as in *J. Betonica*.

4. ***J. trinervia***, *Vahl Enum.* i. 156; small, procumbent, nearly glabrous, leaves ovate or elliptic, spikes lax continuous, bracteoles $\frac{1}{2}$ in. lanceolate, corolla $\frac{1}{2}$ in. *Wall. Cat.* 2446. *J. Betonica*, *T. Anders. in Journ. Linn. Soc.* ix. 509, partly. *Adhatoda trinervia*, *Nees in Wall. Pl. As. Rar.* iii. 103, and in *DC. Prodr.* xi. 386; *Dalz. & Gibs. Bomb. Fl.* 194.

W. DECCAN PENINSULA, in the Ghauts, frequent; Concan, *Stocks*, *Dalzell*; Canara, *Ritchie*; Nilgherries, *Wight*, &c.

Rootstock woody; stems 3–8 in. **Leaves** $\frac{1}{2}$ –1 in., lower mostly short-petioled, upper sessile. **Spikes** 1–4 by $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ by $\frac{1}{3}$ in., lanceolate, white or sometimes green, not or obscurely nervose.—This plant, “a small var. of *J. Betonica*” (*T. Anders. ms.*), differs considerably in the slender spikes and narrow bracts, as well as in size and habit, nor are there intermediates in the Herbarium.

VAR. arenaria; leaves linear-oblong, spikes often small. *Adhatoda arenaria*, *Nees in DC. Prodr.* xi. 387.—W. India; Concan, Belgium, &c.

**** Bracts green, often purple-tinged, not white though sometimes scarious-margined.**

5. ***J. ventricosa***, *Wall. Pl. As. Rar.* i. 80, t. 93, and *Cat.* 2436, and 7174 in part; leaves elliptic cuneate at both ends glabrous minutely lineolate, bracts orbicular imbricated usually 3-fld., bracteoles minute, corolla $\frac{3}{4}$ in. white rose-spotted. *Bot. Mag.* t. 2766; *T. Anders. in Journ. Linn. Soc.* ix. 509; *Kurz For. Fl.* ii. 248. *Adhatoda ventricosa*, *Nees in DC. Prodr.* xi. 407. *Gendarussa ventricosa*, *Nees in Wall. Pl. As. Rar.* iii. 104.

PEGU and TENASSERIM; *Wallich*, *M'Lelland*, &c.—**DISTRIB.** Siam, China (cultivated?).

Branches stout, glabrous. **Leaves** 6 by $2\frac{1}{2}$ in.; petiole $\frac{1}{4}$ in. **Spikes** 3 by $\frac{3}{4}$ in., continuous, somewhat dense; peduncles 0–1 in., terminal, or terminal on short lateral branches; bracts $\frac{1}{2}$ – $\frac{1}{3}$ in. diam., sub-4-ranked, puberulous. **Flowers** usually 3 in the axil of each bract subsessile; bracteoles $\frac{1}{8}$ in., subulate, or 0. **Calyx** $\frac{1}{2}$ – $\frac{1}{3}$ in.; segments sublinear. **Capsule** $\frac{1}{2}$ in., hairy.

6. ***J. oreophila***, *Clarke*; leaves broadly elliptic acute at both ends pubescent beneath, bracts orbicular imbricate 1-fld., bracteoles large spatulate-oblong.

CHITTAGONG Seetakoond alt. 1000 ft., *J. D. H.*

A shrub, habit of *J. ventricosa*; innovations densely silky strigose. *Leaves* $8\frac{1}{2}$ by $3\frac{1}{2}$ in., above minutely thinly hairy, nerves reticulate impressed, beneath pubescent especially on the nerves; petiole $\frac{3}{4}$ in. *Peduncles* 1-3 in., axillary; spikes 4 by 1 in., rachis softly hairy; bracts sub-4-ranked, $\frac{1}{2}$ by $\frac{1}{2}$ in., green, puberulous, 5-nerved; bracteoles $\frac{1}{2}$ by $\frac{1}{8}$ in., green. *Calyx* $\frac{1}{8}$ in., pubescent; segments linear-lanceolate.—Differs from *J. ventricosa* in the indumentum and bracteoles.

7. ***J. punduana*, Wall. Cat.** 2453; leaves broadly elliptic acute at both ends minutely lineolate nerves beneath villous, bracts ovate scarious-margined 1-fld., bracteoles oblong acute scarious longer than the calyx, corolla $\frac{1}{2}$ in. *Rungia punduana*, *Nees in Wall. Pl. As. Rar.* iii. 110, and in *DC. Prodr.* xi. 473; *T. Anders. in Journ. Linn. Soc.* ix. 518.

E. BENGAL; Jaintea Mts., Gomez; Cachar, Keenan.

A shrub; stem rooting; annual branches 1 foot, villous-pubescent. *Leaves* 6 by 2-2 $\frac{3}{4}$ in.; petiole $\frac{1}{4}$ in. *Spikes* axillary and terminal, $1\frac{1}{2}$ by $\frac{1}{2}$ in., dense; peduncles $\frac{1}{4}$ in.; bracts closely imbricate, imperfectly 4-ranked, $\frac{1}{2}$ by $\frac{1}{3}$ in., obtuse or subacute; bracteoles $\frac{1}{4}$ in., minutely hairy. *Sepals* $\frac{1}{2}$ in., equal, linear-lanceolate, minutely hairy. *Anther-cells* minutely hairy, lower distinctly white-tailed. *Capsule* scarcely $\frac{1}{4}$ in., pubescent, clavate, 4-seeded; pedicel solid, placentæ not rising elastically from the capsule-base. *Seeds* glabrous, rugose, subtubercular.—Very few of the plants marked Pundua by Wallich were collected at or near Pundua; the present species was collected by Gomez (Wallich's trained Eurasian collector), and delivered to Wallich in his boat at Pundua. It is strange that Nees and T. Anderson should have removed this species to *Rungia*; for it is a shrub resembling *J. Atkinsoni*, &c.

8. ***J. burmanica*, Clarke**; leaves long-petioled broadly elliptic acute at both ends villous on the nerves beneath, bracts obovate or orbicular nearly glabrous 1-fld., bracteoles broadly lanceolate longer than the calyx.

BURMA; Griffith (Kew Distrib. n. 6184).

Resembling very much *J. Keenani*, but the leaves are long-petioled, the bracts herbaceous, uniformly intensely green (even when dried) without a scarious margin. *Spikes* 2-5 in., continuous but lax; bracts sometimes scarcely imbricate, subpatent. *Corolla* not seen. *Capsule* $\frac{1}{2}$ in., 4-seeded, glabrous or puberulous.

9. ***J. argyrostachya*, T. Anders. in Journ. Linn. Soc.** ix. 510; leaves large ovate minutely pubescent, bracts ovate patently softly long-hairy 1-fld., bracteoles falcate-oblong longer than the calyx, corolla $\frac{1}{2}$ in. *Adhatoda argyrostachya*, *Nees in Wall. Pl. As. Rar.* iii. 1027, and *Cat.* 7172, and in *DC. Prodr.* xi. 385.

BURMA; Prome Hills, Wallich.

An undershrub (or large herb) with the habit of the preceding species. *Leaves* 11 by 5 in., shortly attenuate at both ends; petiole $1\frac{1}{2}$ in. *Spikes* axillary, solitary and terminal, 2-5 by 1 in., continuous; peduncles short; bracts $\frac{1}{2}$ - $\frac{3}{4}$ by $\frac{1}{2}$ in., imbricate, green purple-margined; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in. *Sepals* 5, $\frac{1}{4}$ in., linear-lanceolate. *Corolla* (fide Nees) yellowish-white purple-marked. *Capsule* $\frac{1}{2}$ in., clavate, 4-seeded.—This differs from the allied species (except *J. Kurzii*) by the long soft hairs on the bracts.

10. ***J. Kurzii*, Clarke**; leaves large ovate minutely pubescent, bracts large elliptic acute softly long-hairy 1-fld., bracteoles sublinear longer than the calyx, corolla nearly 1 in.

PEGU; Kurz.

A large herb, closely resembling *J. argyrostachya* except as to the corolla. *Leaves* 7 by $4\frac{1}{2}$ in., acute, base suddenly attenuate; petiole $2\frac{1}{2}$ in. *Spikes* 3-4 in.; bracts $\frac{3}{4}$ by $\frac{1}{4}$ in., sub-4-ranked; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in., hairy. *Calyx-segments* $\frac{1}{4}$ - $\frac{1}{2}$ in., linear-

setaceous hairy. *Corolla* (dried) rose-purple, spotted; tube much inflated upwards. Lower *anther-cell* conspicuously white-tailed.—A specimen, issued by Kurz under the same number (2167), has large oblong leaves much attenuate at both ends; petiole winged to the base, and there often auriculate; capsules $\frac{1}{2}$ in., clavate, 4-seeded. From the variations of the leaves in some allied species, it is probably a form of *J. Kurzii*.

11. **J. Atkinsoni**, *T. Anders. in Journ. Linn. Soc.* ix. 509; leaves long-petioled ovate caudate-acuminate puberulous on the nerves beneath, bracts suborbicular pubescent 1-fld., bracteoles linear nearly as long as the bracts, corolla $\frac{1}{2}$ in.

SIKKIM and E. BHOTAN, alt. 2–6000 ft., from the outer hills to the northern valleys frequent, *T. Anderson, &c.*

A shrub, 2–3 ft. *Leaves* 8 by $4\frac{1}{2}$ in. (many smaller narrower), base shortly decurrent; petiole 3 in. *Spikes* terminal, solitary, 2–5 by $\frac{3}{4}$ in., continuous; peduncles $\frac{1}{2}$ –2 in.; bracts $\frac{1}{2}$ – $\frac{1}{2}$ in., green, purple-margined; bracteoles $\frac{1}{2}$ in., green. *Sepals* 5, $\frac{1}{2}$ – $\frac{1}{2}$ in., linear, puberulous. *Corolla* hairy without, yellowish-white rose-marked. *Stamens* and *pistil* glabrous; lower *anther-cell* distinctly white-tailed. *Capsule* $\frac{1}{2}$ in., clavate, 4-seeded. *Seeds* glabrous, rugose, subtubercular.

12. **J. grandifolia**, *T. Anders. in Journ. Linn. Soc.* ix. 510; leaves long-petioled large round-ovate nearly glabrous, bracts elliptic acute rusty pubescent 1-fld., bracteoles $\frac{1}{2}$ in. linear-lanceolate hairy, corolla $\frac{3}{4}$ –1 in.

MOULMEIN; *Parish*. TENASSERIM; *Beddome*.

A herb (*T. Anders.*). *Leaves* 8–5 in., attaining 14 by 7 in. (*T. Anders.*), shortly acuminate, base rounded or very shortly decurrent; petiole $3\frac{1}{2}$ in. *Spikes* axillary and terminal, 3–11 by 1 in., continuous, somewhat lax, very pubescent; peduncles 0–1 in.; bracts $\frac{3}{4}$ –1 by $\frac{1}{2}$ in. *Sepals* 5, $\frac{1}{2}$ in., linear-lanceolate, very pubescent. *Corolla* $\frac{3}{4}$ –1 in., pubescent, white purple-marked. *Anther-cells* glabrous, subparallel, lower minutely white-tailed. *Capsule* $\frac{1}{2}$ in., stoutly clavate, pubescent, 4-seeded.

13. **J. dasycarpa**, *Kurz in Journ. As. Soc.* 1873, pt. ii. 96; leaves ovate acute subglabrous, bracts ovate softly hairy, bracteoles oblong longer than the calyx, corolla $\frac{1}{2}$ in. *Neuracanthus tetragonostachyus*, *Wall. Cat.* 7168, *by admixture*.

TENASSERIM; Chappedong, *Wallich*. RANGOON; *McLelland*. KAREN HILLS, *Kurz*.

Stem $1\frac{1}{2}$ –3 ft., glabrous, pubescent upwards. *Leaves* 3 by 2 in., base obtuse, raphides conspicuous on both surfaces; petiole $\frac{1}{2}$ in., pubescent. *Spikes* axillary and terminal, $\frac{1}{2}$ –1 $\frac{1}{2}$ by $\frac{1}{2}$ in., continuous; peduncles $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ in., green; bracteoles $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in.; segments 5, linear-lanceolate, pubescent. Lower *anther-cell* shortly white-tailed. *Capsule* $\frac{1}{2}$ in., clavate, pubescent, 4-seeded.—The bracts are 1–3-fld.; where several flowers occur, some of the bracteoles are suppressed. The leaves, bracts and flowers are considerably smaller than in the preceding species.

14. **J. fragilis**, *Wall. Cat.* 7174, *type sheet only*; leaves oblong narrowed at both ends glabrous, bracts elliptic acute puberulous several-fld., bracteoles small linear or 0, corolla $\frac{2}{3}$ in.—*Justicia* sp., *Griff. Notul.* iv. 143.

TENASSERIM; Amherst, *Wallich*; Mergui, *Griffith*.

Branch elongate, glabrous. *Leaf* 5 by $1\frac{1}{4}$ in.; petiole $\frac{1}{2}$ in. *Spikes* 1–5 in., terminal and quasi-axillary on short-lateral branches, interrupted below; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., uniformly green, somewhat deciduous, upper imbricate; flowers clustered on the spikes; bracteoles 0– $\frac{1}{2}$ in. *Sepals* 5, $\frac{1}{2}$ – $\frac{1}{2}$ in., linear, puberulous. *Corolla* pubescent, altogether as of *Sect. Betonica*. *Stamens* and *pistil* very nearly glabrous; lower *anther-cell* distinctly shortly white-tailed.—The elongate spikes interrupted below

and deciduous bracts are very unlike *J. ventricosa*, with which Nees united this, and which has been distributed by Wallich under the same number.

15. **J. caloneura**, *Kurz in Journ. As. Soc.* 1873, pt. ii. 96; leaves elliptic acute at both ends minutely pubescent, bracts ovate acuminate pubescent, bracteoles broadly lanceolate exceeding the calyx, corolla $\frac{1}{2}$ – $\frac{1}{2}$ in.

TENASSEEIM; *Beddome*.

A perennial herb; stems 2–3 ft., glabrous or crisped-pubescent. *Leaves* 4 by $1\frac{1}{2}$ in., nerves conspicuously reticulate on both surfaces; petiole $0\frac{1}{2}$ in., crisped-pubescent. *Spikes* terminal, $1\frac{1}{2}$ by $\frac{1}{2}$ in., dense; peduncles $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., 4-ranked, striate, green black-tipped, ciliate; bracteoles $\frac{1}{2}$ by $\frac{1}{4}$ in., green. *Sepals* 5, $\frac{1}{2}$ in., linear, pubescent. *Corolla* minutely hairy, straw-coloured (*Kurz*). *Anther-cell* distinctly white-tailed. *Capsule* not seen.—Identified with *Kurz's J. caloneura* from description only.

16. **J. ceylanica**, *T. Anders. in Thwaites Enum.* 233, and in *Journ. Linn. Soc.* ix. 513; leaves lanceolate or ovate-lanceolate glabrous, bracts and bracteoles spatulate orbicular, corolla $\frac{1}{2}$ in. *Adhatoda ceylanica*, *Nees in DC. Prodr.* xi. 400.

CEYLON; *Walker, Gardner, &c.*

Herbaceous, 2–3 ft., branched, glabrous; whole plant, including the bracts, drying black. *Leaves* 3 by 1 in., acuminate, not or very obscurely lineolate, base cuneate, midrib beneath glabrous; petiole $\frac{1}{2}$ in. *Spikes* axillary, branched, lax, nearly glabrous; bracts $\frac{1}{2}$ in., orbicular, on a $\frac{1}{2}$ in. pedicel, patent; bracteoles similar, but rather smaller; flowers in distant opposite pairs. *Calyx-segments* 5, $\frac{1}{2}$ in., linear, nearly glabrous. *Corolla* nearly glabrous, purple (fide *Nees*); lower lip longer. *Capsule* $\frac{1}{2}$ in., clavate, puberulous, 4-seeded.

VAR. viridescens; leaves larger pubescent on the nerves beneath, bracts larger obovate, bracteoles oblong.—Ceylon; *Walker, Thwaites*, C. P. n. 2422, partly.—Whole plant drying green. *Leaves* 5 by 2 in., conspicuously lineolate on both surfaces. *Spikes* 2–4 in., much interrupted; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., green, nearly glabrous; bracteoles $\frac{1}{2}$ in. *Calyx-segments* $\frac{1}{2}$ – $\frac{1}{2}$ in., green, lineolate. *Capsule* as of type.—Very unlike *J. ceylanica*, of which both *Nees* and *T. Anderson* consider it a form.

VAR. capitata, *T. Anders. ms.*; leaves pubescent, spikes capitate globose solitary on short axillary peduncles.—Ceylon; *Thwaites*, n. 3919, and 2422 partly.—Branches pubescent. *Leaves* subhispidly pubescent on both surfaces, drying green. *Peduncles* $\frac{1}{2}$ in.; heads $\frac{3}{8}$ in. diam., rusty pubescent; bracts densely imbricate. *Calyx-segments* $\frac{1}{2}$ in., oblong-lanceolate, subscarious. *Corolla* and *stamens* as of *J. ceylanica*. *Capsule* not seen.—A very puzzling plant, not seen by *Nees*; *Mr. Benth* observes that it is “very near *Sect. Anisostachya*.”

17. **J. glauca**, *Rottler; Roem. & Sch. Syst.* i. 165; herbaceous, leaves 1–2 in. ovate puberulous or pubescent, bracts ovate or orbicular puberulous ciliate or pubescent, corolla $\frac{1}{2}$ in. *J. brachioides*, *Roth Nov. Sp.* 16. *J. orixensis*, *Roxb. Fl. Ind.* i. 132; *T. Anders. in Journ. Linn. Soc.* ix. 510, partly. *J. tranquebariensis*, *Roxb. l. c.* 130; *Wall. Cat.* 2424 (not 2462); *T. Anders. l. c.* 513, partly; not of *Linn. f.* *J. brachionoides*, *Spreng. Syst.* i. 82. *Gendarussa orixensis*, *Nees in Wall. Pl. As. Rar.* iii. 104. *Adhatoda orixensis* & *diversiformis*, *Nees in DC. Prodr.* xi. 400, 399.

DECCAN PENINSULA, alt. 0–2000 ft., frequent; *Rottler, &c.*

Stems 8–20 in., herbaceous, puberulous, diffuse; internodes long. *Leaves* pubescent on the nerves beneath, those at the main nodes acute at both ends, many smaller often rounded leaves on the lateral branches; petiole $\frac{1}{2}$ in. *Spikes* 1–5 by $\frac{1}{2}$ in., terminal, lax; solitary bractless flowers often scattered in the distant lower axils; bracts $\frac{1}{2}$ in. diam., often subpatent, very variable in indumentum; bracteoles $\frac{1}{2}$ in., obovate-oblong, or often 0. *Sepals* $\frac{1}{2}$ – $\frac{1}{2}$ in., linear, pubescent or glabrous. *Capsule* $\frac{1}{2}$ in., nearly glabrous short-stalked, 4-seeded. *Seeds* hispid with ovate acute scales.—Perhaps not

distinct from the next. T. Anderson regards the presence of scattered solitary flowers in the lower axils as of specific importance, and has deviated from the results of the older botanists accordingly.

18. **J. tranquebariensis**, *Linn. f. Suppl.* 85; very woody, leaves $\frac{1}{8}$ – $\frac{1}{2}$ in. orbicular or obovate puberulous or pubescent, bracts ovate or orbicular puberulous or pubescent, corolla $\frac{1}{2}$ in. *Wall. Cat.* 2462; *T. Anders. in Journ. Linn. Soc.* ix. 513, partly. *Gendarussa tranquebariensis*, *Nees in Wall. Pl. As. Rar.* iii. 105; *Wight Ill.* t. 164 b, fig. 8, and *Id.* t. 462. *Adhatoda tranquebariensis*, *Nees in DC. Prodr.* xi. 399.

S. MADRAS and CEYLON, especially on hot dry low hills, frequent; *Wight, &c.*

A low, intricate undershrub; nodes very short. Inflorescence, corolla, capsule and seeds as of *J. glauca*.—Wight's figure represents a more diffuse plant with leaves considerably larger than in any of the specimens; it is a form intermediate between *J. glauca* & *tranquebariensis* as here understood; Col. Beddome believes these two not specifically distinct.

19. **J. salsoloides**, *T. Anders. in Journ. Linn. Soc.* ix. 514; branches softly white-hairy, leaves small spatulate or oblong subglabrous, bracts elliptic or oblong, corolla $\frac{1}{4}$ – $\frac{1}{3}$ in. densely white-hairy.

CARNATIC and MYSORE; *Wight, G. Thomson.*

A rigid, much-branched, small undershrub; branches densely shortly hairy. *Leaves* sessile, $\frac{1}{2}$ – $\frac{3}{4}$ in., obtuse. *Spikes* terminal, few-fl., with scattered solitary, often ebracteate flowers in the axils below; bracts $\frac{1}{4}$ by $\frac{1}{2}$ in.; bracteoles similar, smaller, or often 0. *Sepals* $\frac{1}{6}$ in., linear-lanceolate, pubescent. Lower *anther-cell* tailed. *Capsule* $\frac{1}{2}$ in., clavate, densely pubescent (T. Anderson).—Easily separated from *J. trinervis* (and its Var. *arenaria*) by the white-furred branches and narrower non-marginate bracts.

Sect. 3. **Calophanoides**. *Flowers* axillary, solitary clustered or in dense cymes, without a terminal spike or panicle. *Calyx* sub-5-partite. *Corolla* small. *Seeds* subtubercular or verrucose, not hispid.

* *Bracts* obovate or spatulate (all perhaps var. of one).

20. **J. quadrifaria**, *Wall. Cat.* 2479; leaves shortly petioled elliptic acute at both ends puberulous on the nerves beneath, flowers in close axillary clusters, corolla $\frac{1}{4}$ – $\frac{1}{3}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 514, partly. *Gendarussa quadrifaria*, *Nees in Wall. Pl. As. Rar.* iii. 105. *Adhatoda quadrifaria*, *Nees in DC. Prodr.* xi. 396.

KHASIA and JAINTIA MTS., alt. 3000 ft.; *Wallich, &c.* ASSAM; *Griffith* (*Kew Distrib.* n. 6188).—DISTRIB. S. China.

Branches 2 ft., little divided, rusty-pubescent. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., drying black, not or obscurely lineolate; petiole $\frac{1}{2}$ in. *Flowers* 1–5-nate; bracts $\frac{1}{2}$ in., spatulate, orbicular or emarginate, very rusty-pubescent; bracteoles similar, smaller, or 0. *Sepals* $\frac{1}{4}$ in. and upwards, linear-lanceolate, lineolate, puberulous. *Corolla* hairy, white rose-spotted. Lower *anther-cell* white-tailed. *Capsule* $\frac{1}{4}$ in., minutely pubescent, 4-seeded; solid pedicel very short. *Seeds* tubercular, verrucose, glabrous.

21. **J. Zollingeriana**, *Clarke*; leaves shortly petioled oblong acuminate at both ends nearly glabrous, flowers in close axillary clusters, corolla $\frac{1}{4}$ – $\frac{1}{2}$ in. *J. quadrifaria*, *T. Anders. in Journ. Linn. Soc.* ix. 514, partly. *Adhatoda Zollingeriana*, *Nees in DC. Prodr.* xi. 396.

TENASSERIM; *Beddome*.—DISTRIB. JAVA.

Resembling *J. quadrifaria*, but much more glabrous. *Branches* minutely pubes-

cent. *Leaves* 4 by 1 in.; nerves conspicuous. *Bracts* $\frac{1}{2}$ in., spatulate, orbicular, subglabrous. *Corolla* subglabrous.

22. **J. salicifolia**, *T. Anders. in Journ. Linn. Soc.* ix. 514; leaves subpetioled lanceolate acuminate at both ends glabrous or pubescent, flowers in close axillary clusters, corolla $\frac{1}{2}$ in. minutely hairy.—*Adhatoda* sp. n. 20, *Herb. Ind. Or. H. f. & T.*

N. KHASIA MTS., alt. 3-5000 ft.; Borpani and Shillong, *H. f. & T.*, &c.

Leaves $2\frac{1}{2}$ by $\frac{1}{2}$ in.; petiole $\frac{1}{12}$ in. *Bracts* $\frac{1}{4}$ in., spatulate, orbicular, glabrous or sparsely pubescent.

23. **J. Neesiana**, *Wall.*; *T. Anders. in Journ. Linn. Soc.* ix. 513; leaves linear-lanceolate glabrous, flowers in close axillary clusters, corolla $\frac{1}{4}$ in. Gendarussa *Neesiana*, *Wall. Cat.* 7175; *Nees in Wall. Pl. As. Rur.* iii. 105. *Adhatoda Neesiana*, *Nees in DC. Prodr.* xi. 397.

KHASIA MTS.; *Wallich.*

A small undershrub; internodes very short. *Leaves* $1\frac{1}{2}$ by $\frac{1}{4}$ in.; petiole hardly any. *Bracts* as in the 3 preceding species, which differ from the present by their diffuse habit and elongate internodes.

**** Bracts lanceolate or linear-lanceolate.**

24. **J. flava**, *Kurz in Journ. As. Soc.* 1873, pt. ii. 97; subglabrous, leaves ovate or ovate acuminate; cymes small axillary densely subcapitate subglabrous, corolla $\frac{1}{3}$ – $\frac{1}{2}$ in. pubescent yellow.

TENASSERIM; *Beddome*; Martaban (fide *Kurz*).

A herb, 2-3 ft., erect (*Kurz*). *Leaves* 4-6 in., acuminate at both ends, nerves prominent; petiole $\frac{1}{4}$ in. *Cymes* forming axillary heads $1\frac{1}{4}$ in. diam.; bracts and bracteoles small, linear, glabrous. *Sepals* 5, $\frac{1}{4}$ – $\frac{1}{2}$ in., linear-lanceolate, caudate, glabrous. Lower *anther-cell* distinctly white-tailed. *Capsule* $\frac{1}{2}$ in., clavate, glabrous, 4-seeded; seeds minutely rugulose (*Kurz*).—No specimen of *Kurz's* plant has been seen, but his description fits very satisfactorily *Beddome's* *Herb. Prop.* n. 84.

25. **J. Brandisii**, *T. Anders. in Journ. Linn. Soc.* ix. 514; leaves ovate acute pubescent on the nerves beneath, flowers sessile or sometimes aggregated on a very short peduncle, corolla pubescent tube short.

BURMA; Mt. Toungoo, *Brandis*, and Karen Hills, *Masson* (fide *T. Anderson*).

An undershrub, 1-2 ft.; stem terete, glabrous. *Leaves* scabrous above, puberulous beneath, decurrent into the petiole; nerves prominent, approximate. *Bracts* and bracteoles small, subulate. *Sepals* 5, equal, $\frac{1}{2}$ in., subulate, hoary pubescent. Lower *anther-cell* long-tailed. *Ovary* 4-ovulate (*T. Anderson*).—Not seen. *Anderson* places it in a section with "flowers axillary solitary or 2 or 3 together," along with *J. salicifolia* & *quadrifaria*. Nevertheless it may be *J. flaccida*, *Kurz*, of the Section *Gendarussa*.

26. **J. heterocarpa**, *T. Anders. in Journ. Linn. Soc.* vii. 41; leaves petioled ovate minutely lineolate subglabrous, flowers minute in small axillary clusters, capsules of 2 kinds in nearly every axil. abnormal winged crested 1-seeded. *Harnieria dimorphocarpa*, *Solms in Schweinf. Æthiop.* 110.

WESTERN INDIA; Deesa (Goojerat) and Kurrachee (Scinde), *Stocks*; Ferozepore (Punjab), *Vicary*.—DISTRIB. Abyssinia.

A herb, 8-12 in., minutely grey-pubescent. *Leaves* 1 by $\frac{1}{2}$ in.; petiole $\frac{1}{2}$ in. *Flowers* 1-4-nate, closely axillary; bracts and bracteoles small, linear. *Calyx* sub-5-partite; segments $\frac{1}{2}$ in., linear, minutely pubescent. *Corolla* $\frac{1}{2}$ in., upper lip shortly 2-lobed, lower transversely marked shortly 3-lobed. *Anther-cells* ovate; lower white-tailed.

Normal capsule $\frac{1}{8}$ – $\frac{1}{4}$ in., ellipsoid, acute at each end, hardly stalked, pubescent, 4-seeded. *Seeds* papillose, subhispid; abnormal 1-celled, 1-seeded capsules occur $\frac{1}{2}$ in., ellipsoid with 3–6 vertical crested wings, with seed ovoid, larger than in the normal, nearly smooth, on a nearly basal retinaculum.—The examples collected far apart show the heterocarpous capsules to be characteristic, not monstrous. The species is not nearly allied to any other; but as the inflorescence is axillary and the calyx 5-merous, it has been moved here so as to fortify the characters of the section *Rostellaria*.

Sect. 4. **Gendarussa.** *Spikes* terminal and on short lateral branches (in *J. Hookeriana* axillary), interrupted; terminal often large, paniculate; bracts mostly narrow, lower rarely imbricate. *Calyx* sub-5-partite. *Flowers* small or middle-sized. *Seeds* (where known) verrucose or tubercular, glabrous, not glochidiate nor hispid.

27. **J. Gendarussa**, *Linn. f. Suppl.* 85; leaves short-petioled lanceolate glabrous, spikes puberulous or glabrous, bracts linear shorter than the calyx, corolla $\frac{1}{2}$ in. *Jacq. Ecl.* t. 11; *Burm. Fl. Ind.* 10; *Roxb. Fl. Ind.* i. 128; *Blume Bijd.* 785; *Wall. Cat.* 2442; *Bot. Reg.* t. 635; *Blanco Fl. Fil.* 14; *Dalz. & Gibs. Bomb. Fl. Suppl.* 71; *T. Anders. in Journ. Linn. Soc.* ix. 513; *Kurz For. Fl.* ii. 247. *Gendarussa vulgaris*, *Nees in Wall. Pl. As. Rar.* iii. 104, and in *DC. Prodr.* xi. 410; *Wight Ic.* t. 468; *Decne. in Nouv. Ann. Mus. d'Hist. Nat.* iii. 382.—*Rumph. Herb. Amb.* iv. t. 28. *Rheede Hort. Mal.* ix. t. 42.

Throughout INDIA, from Bengal to Ceylon and Malacca, often an escape from cultivation.—DISTRIB. Malaya and China to the Philippines (? wild).

Stems 2–4 ft., erect. *Leaves* 4 by $\frac{3}{4}$ in.; petiole $\frac{1}{2}$ in. *Spikes* 2–5 by $\frac{3}{4}$ in., terminal often forming a panicle; flowers clustered, lower clusters usually distant; bracts $\frac{1}{2}$ in. *Sepals* $\frac{1}{2}$ in. *Corolla* nearly glabrous, white or rose with purple spots. Lower anther-cell distinctly tailed. *Capsule* $\frac{1}{2}$ in., clavate, glabrous, 4-seeded.—No capsule has been seen except on an example of Wight's; and that does not suffice for a description of the seed. This commonly cultivated plant is considered by Nees and T. Anderson wild in various parts of India, but the rarity of the seeds renders this doubtful. Col. Beddome says "wild on Mooleyit in Tenasserim."

28. **J. Hookeriana**, *T. Anders. in Thwaites Enum.* 233, and in *Journ. Linn. Soc.* ix. 513; leaves short petioled lanceolate glabrous, spikes simple or compound all axillary lax nearly glabrous, bracts linear or linear-spathulate mostly shorter than the calyx, corolla $\frac{1}{3}$ – $\frac{1}{2}$ in. *Bedd. Ic. Pl. Ind. Or.* t. 268. *Adhatoda Hookeriana*, *Nees in DC. Prodr.* xi. 403. *Leptostachya zeylanica*, *Nees l. c.* 379.

CEYLON; *Macrae, Walker, &c.*

An undershrub, less erect, more branched than *J. Gendarussa*. *Leaves* as of *J. Gendarussa*. *Spikes* 2–7 in., simple or paniculate; flowers distant, solitary or opposite; bracts $\frac{1}{2}$ in., linear, rarely spatulate; bracteoles $\frac{1}{2}$ in., linear, or 0. *Flowers* nearly as of *J. Gendarussa*. *Capsule* $\frac{1}{2}$ in., clavate, 4-seeded. *Seeds* verrucose, glabrous.—Beddome figures the inflorescence terminal, but in the examples the uppermost axils are sterile, many lower axils with spikes.

29. **J. decussata**, *Roxb. Hort. Beng.* 4, and *Fl. Ind. ed. Carey & Wall.* i. 128; leaves ovate or obovate pubescent or glabrate, panicle terminal large divaricate pubescent, flowers in distant clusters, corolla $\frac{1}{3}$ – $\frac{1}{2}$ in. pubescent. *Wall. Cat.* 2476; *T. Anders. in Journ. Linn. Soc.* ix. 515. *Gendarussa decussata*, *Nees in Wall. Pl. As. Rar.* iii. 104. *Adhatoda decussata*, *Nees in DC. Prodr.* xi. 408.

PEGU and TENASSERIM, frequent; *Wallich, Griffith, &c.*

A shrub, 3-6 ft.; branches pubescent upwards. *Leaves* (upper cauline alone seen) 6-10 by 3-6 in., petioled ovate, or sessile spatulate-obovate, base auricled, punctulate, puberulous at least when young. *Panicles* 12-20 in. long and broad; branches long, subsimple, often recurved in fruit; clusters 2-8-fl., pubescent, lower often 1-3 in. apart; bracts $\frac{1}{2}$ in., linear-lanceolate, but the clusters are often supported by reduced leaves $\frac{1}{2}$ -1 in.; bracteoles $\frac{1}{2}$ in., linear, often 0. *Sepals* $\frac{1}{2}$ - $\frac{3}{4}$ in., linear-lanceolate, pubescent. Lower *anther-cell* distinctly white-tailed. *Capsule* $\frac{3}{4}$ in., long-stalked, pubescent, 4-seeded. *Seeds* verrucose, glabrous.

30. **J. Helferi**, *Clarke*; leaves petioled elliptic acute at both ends glabrous, panicle terminal of 3 erect spikes, clusters of flowers distant pubescent, corolla $\frac{1}{2}$ in. pubescent.

TENASSEM OR ANDAMANS; *Helfer* (Kew Distrib. n. 6185).

Branch woody, terete, glabrous. Upper *leaves* $5\frac{1}{2}$ by 2 in., minutely lineolate on both surfaces; petiole $\frac{1}{2}$ in. *Panicle* 3 in. diam., trichotomous, sparingly pubescent; lateral spikes curved, ascending; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., linear-lanceolate, pubescent. *Calyx* and *corolla* as of *J. decussata*, but rather smaller.—This may be a small var. of *J. decussata*, as the example is poor; but the leaves do not match, and the curved ascending spikes are very unlike the habit of *J. decussata*.

31. **J. flaccida**, *Kurz in Journ. As. Soc.* 1870, ii. 80, and in *Flora* 1870, 364; leaves large sessile spatulate-elliptic nearly glabrous, panicles terminal very lax, flowers distant rarely clustered, corolla $\frac{3}{4}$ in. nearly glabrous pale yellow or testaceous (*Kurz*).—*Adhatoda* n. 19, *Herb. Ind. Or. H. f. & T.*

PEGU; *M'Lelland, Kurz, Brandis.*

Annual, 1-2 ft., erect. *Leaves* opposite and ternate, 7-12 in., acuminate, lineolate above; petiole winged to the base, there often auriculate. *Panicle* often 12 in. long and broad, very thin flaccid, nearly glabrous; flowers opposite or alternate, lower often 1 in. apart; bracts hardly $\frac{1}{2}$ in., linear-lanceolate. *Sepals* $\frac{1}{2}$ in., linear-lanceolate, puberulous or glabrate. *Corolla* slender. Lower *anther-cell* white-tailed. *Capsule* $\frac{3}{4}$ in., long-stalked, thinly pubescent, 4-seeded.

32. **J. wynaadensis**, *Wall. Cat.* 2474; leaves petioled elliptic acuminate at both ends pubescent or glabrous, spikes simple or compound axillary and terminal pubescent interrupted, flowers solitary opposite, bracts linear-lanceolate shorter than the calyx, corolla $\frac{1}{2}$ - $\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 515. *J. lineata*, *Wall. Cat.* 2486, *second sheet*. *Gendarussa wynaadensis*, *Nees in Wall. Pl. As. Rar.* iii. 104. *Adhatoda wynaadensis*, *Nees in DC. Prodr.* xi. 406; *Dalz. & Gibs. Bomb. Fl.* 194; *Wight Ic.* t. 1545.

S. DECCAN PENINSULA, alt. 1-3000 ft.; Wynaad, Belgaum, Ooorg, &c., *Wight, Ritchie, &c.*

Branches elongate, terete, glabrescent; internodes long. *Leaves* $4\frac{1}{2}$ by 2 in., pubescent beneath or glabrous; petiole $\frac{3}{4}$ in. *Spikes* 2-4 in., somewhat dense in flower, elongate interrupted in fruit; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in.; bracteoles $\frac{1}{2}$ in., linear. *Sepals* $\frac{1}{2}$ in., linear, very pubescent. *Corolla* pubescent, purple. Lower *anther-cell* white-tailed. *Capsule* $\frac{1}{2}$ - $\frac{3}{4}$ in., very pubescent, clavate, 4-seeded. *Seeds* verrucose, glabrous.—Very variable in indumentum; *Wight's* type, from the Nilgubberies' base, has the leaves very pubescent beneath, and has been marked *Rhaphidospora* sp. by *T. Anderson*. *Dalzell's* specimens have the leaves glabrous beneath.

33. **J. vasculosa**, *Wall. Cat.* 2469; leaves ovate attenuate at both ends minutely crisped pubescent on the midrib beneath, flowers solitary opposite, corolla $\frac{1}{2}$ - $\frac{3}{4}$ in. upper lip oblong entire lower pendent. *T. Anders. in Journ. Linn. Soc.* ix. 515. *Ruellia rivinaefolia*, *Wall. Cat.* 2413. Gen-

darussa vasculosa, *Nees in Wall. Pl. As. Rar.* iii. 104. *Adhatoda vasculosa*, *Nees in DC. Prodr.* xi. 407.

E. HIMALAYA and KHASIA MTS., alt. 2-5000 ft., common; *Wallich, H. f. & T.*, &c.

Rootstock perennial; branches 8-20 in., glabrous except at the tip. *Leaves* 5 by 2 in., punctulate above; petiole $\frac{3}{4}$ in. *Spikes* 1-4 in., axillary and terminal, simple or paniculate, pubescent; bracts oblong or linear, mostly shorter than the calyx, pubescent; bracteoles similar to the bracts, but smaller. *Calyx* sub-5-partite; segments $\frac{1}{2}$ in., lanceolate. *Corolla* pubescent, yellowish slightly pink-spotted; tube cylindric; upper lip hardly broader than one of the three lobes of the lower. *Anther-cells* divaricate, lower with a minute white appendage at the base. *Ovary* glabrous; style pubescent in the lower part. *Capsule* not seen, the abundant specimens all being in flower.—T. Anderson places this in *Raphidospora*, and in the absence of the seed it is impossible to prove he is wrong; but in the Sect. *Raphidospora*, the flowers are "laxly panicled," as T. Anderson says.

VAR. ? *Parishii*; leaves glabrous, upper lip of corolla ovate $\frac{1}{2}$ in. broad lower erect-patent.—Moulmein; *Parish, n.* 417. Tenasserim, Mooleyit; *Beddome, n.* 86. —This may be specifically distinct.

VAR. *Brandisi*; bracts (even in the upper part of the spikes) exceeding $\frac{1}{4}$ in. elliptic-acuminate.—Pegu; Sitang, *Brandis*.—*Capsule* $\frac{1}{2}$ in., narrowly cylindric, clavate, very hairy. *Seeds* roughly verrucose, glabrous.

34. **J. andrographioides**, *Clarke*; leaves ovate acuminate glabrous base rhomboid or rounded, flowers solitary opposite, corolla $\frac{1}{2}$ in. both lips erect-patent.

TENASSERIM; Mooleyit, *Beddome*.

Closely resembling *J. vasculosa*, both in leaves and inflorescence, but the corolla as of *Andrographis*. *Leaves* 3 by 1 in. *Spikes* (all seen) solitary, terminal, simple, pubescent; bracts small linear, or the lower $\frac{1}{2}$ in., linear-spatulate. Lower *anther-cell* with a microscopically small white spur.

35. **J. ptychostoma**, *Wall. Cat.* 2478; leaves ovate acuminate at both ends minutely pubescent on the nerves beneath, spikes axillary linear dense nearly glabrous, bracts minute, corolla $\frac{1}{4}$ - $\frac{1}{2}$ in. *T. Anders., in Journ. Linn. Soc.* ix. 517? *Gendarussa*? *sumatrana, Mig. Fl. Ind. Bat.* ii. 832.

PENANG; *Wallich*.—DISTRIB. Sumatra.

Wallich's imperfect example is perhaps the same as *J. vasculosa* var. *Parishii* above. *Branches* slender, with long internodes, glabrous. *Leaves* 6 by 2½ in., nearly glabrous, closely lineolate above; petiole 1½ in. *Spikes* 3½ by $\frac{1}{4}$ in., those seen all axillary, but there may have been also terminal spikes; bracts $\frac{1}{20}$ in., ovate or lanceolate; bracteoles $\frac{1}{10}$ in., linear-lanceolate. *Sepals* $\frac{1}{8}$ in.—*J. ptychostoma, Nees in Wall. Pl. As. Rar.* iii. 108 (*Rhytiglossa*? *ptychostoma, Nees in DC. Prodr.* xi. 337), is founded on this *Wallichian* number, but the description of the bracts is so different from the example that there must have been some confusion.

36. **J. Maingayi**, *Clarke*; leaves ovate-lanceolate or narrowly lanceolate minutely pubescent on both surfaces, flowers solitary mostly alternate, corolla $\frac{1}{2}$ in.

PENANG; *Maingay* (*Kew Distrib. n.* 1181).

A small shrub (*Maingay*); branches elongate, slender, glabrous except at the tips. *Leaves* 4 by $\frac{1}{2}$ -1 in., very variable in breadth on the same branch, base cuneate; petiole $\frac{1}{2}$ in. *Spikes* axillary and terminal, simple or divided, 2-3 in., slender, lax, pubescent; lower flowers distant, mostly alternate; bracts $\frac{1}{8}$ in., linear-lanceolate, pubescent. *Calyx* and *corolla* nearly as of *J. vasculosa*, but upper corolla-lip ovate, broader. *Capsule* $\frac{1}{2}$ in., stalk solidified.—The line between the small *Justicias* of this section and *Dianthera* is artificial, and the present species has quite the habit of others which have been removed by Bentham (in *Herb. Kew*) to *Dianthera*. It is

retained in *Justicia* because the white tail of the lower anther-cell, though small, is yet larger than in *J. vasculosa*, a species retained by name in *Justicia* by Bentham. —These small *Justicias* (*J. vasculosa*, *Mainayi*, &c.) form with *Dianthera collina*, &c., a very natural group; but they cannot be kept together unless we pull the Acanthaceæ all to pieces, and abolish anther-tails from the generic characters (which will be done some day).

37. **J. flagelliformis**, *Clarke*; leaves ovate attenuate at both ends minutely crisped pubescent on the midrib beneath, spikes linear, bracts and bracteoles lanceolate longer than the calyx, corolla $\frac{1}{2}$ in.

TENASSERIM or ANDAMANS; *Helper* (Kew Distrib. n. 6172).

Branches elongate slender, glabrous except at the tips. *Leaves* 5 by 2 in., punctulate above; petiole $\frac{2}{3}$ in. or frequently 0. *Spikes* 1-3, terminal, 3-5 by $\frac{1}{4}$ in., wavy, subinterrupted below; bracts $\frac{1}{4}$ - $\frac{1}{2}$ by $\frac{1}{10}$ in., green, minutely pubescent; bracteoles nearly as long, narrower, subfalcate. *Calyx* sub-5-partite; segments $\frac{1}{2}$ in., linear pubescent. *Corolla* nearly as of *J. vasculosa*; upper lip ovate subentire. Lower *anther-cell* white-tailed. *Capsule* $\frac{1}{2}$ in., clavate. —The leaves closely resemble those of *J. vasculosa*, but the narrow subimbricate bracts are altogether different.

38. **J. grossa**, *Clarke*; leaves petioled large ovate glabrous, spikes terminal solitary linear pubescent, bracts elliptic or oblong often as long as the calyx, corolla $\frac{1}{2}$ in.

MERGUI; *Griffith*.

Branches glabrous, with numerous large leaves near the tips. *Leaves* 8-10 by 4 in., acute, base rhomboid or obtuse; petiole 1 in. *Spike* 5 in., subsessile, interrupted below; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., puberulous. *Sepals* $\frac{1}{2}$ in., linear-lanceolate. *Anther-cells* subparallel, slightly divaricate at the base, one somewhat lower, both white-tailed at the base. *Ovary* glabrous, 4-ovulate; style minutely hairy below; stigma minute, subsimple. *Capsule* not seen. —This plant has been named by Nees *Phlogacanthus asperulus*, together with many others which he did not recognize. Wight marked it "*Hemichoriste*?" and this is probably its true affinity, though its small flowers are opposed to it. It is nearly allied to *J. flagelliformis*.

39. **J. boerhaaviæfolia**, *T. Anders. in Journ. Linn. Soc.* ix. 517; leaves petioled ovate-lanceolate uppermost sessile cordate, spikes $\frac{1}{2}$ in. second on filiform dichotomous terminal branches, bracts subulate narrowly white-margined, corolla $\frac{1}{2}$ in. purple in the throat.

TENASSERIM; Amherst, *Falconer* (fide T. Anderson).

A weedy herb; stem diffuse, terete, glabrous. *Cauline leaves* long-petioled, 2-5 in. long (petiole included); upper and floral leaves $\frac{1}{2}$ -1 $\frac{1}{2}$ by $\frac{1}{4}$ - $\frac{1}{2}$ in.; all glabrous above, glaucous beneath. *Corolla* 2-lipped, glabrous, with 2 lines of recurved hairs in the throat. Upper *anthers* small, sterile. *Capsule* $\frac{1}{8}$ - $\frac{1}{6}$ in., compressed, sterile part very short (T. Anderson). —Anderson was seldom wrong in generic determinations, but his description suggests that this is a *Rungia*.

Sect. 5. **Rhaphidospora**. *Flowers* laxly paniced. *Bracts* small linear or linear-lanceolate. *Seeds* retrorsely hispid.

40. **J. glabra**, *Koen.; Roxb. Hort. Beng.* 4, and *Fl. Ind. ed. Carey & Wall.* i. 132; leaves petioled ovate acute puberulous on the nerves or glabrate, cymes axillary and terminal, corolla $\frac{1}{4}$ in. *Wall. Cat.* 2455; *T. Anders. in Journ. Linn. Soc.* ix. 516. *J. Careyana*, *Wall. Cat.* 2456. *Rhaphidospora glabra*, *Nees in Wall. Pl. As. Rar.* iii. 115, and in *DC. Prodr.* xi. 499; *Wight Ic.* t. 1554.

S. DECCAN PENINSULA; *Roxburgh, Wight.* CEYLON; *Walker, &c.* —DISTRIB. Java.

An erect, branched herb. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ in. (in one example $4\frac{1}{2}$ by 1 in.), base attenuate or rounded; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. Axillary *peduncles* numerous, $\frac{1}{2}$ – $1\frac{1}{2}$ in., divaricate; pedicels $0\frac{1}{4}$ in., puberulous or pubescent; bracts and bracteoles minute. *Calyx-segments* scarcely $\frac{1}{2}$ in., narrow, pubescent. *Corolla* upper lip erect, emarginate, lower pendent or reflexed. Lower *anther-cell* distinctly white-tailed. *Capsule* $\frac{1}{2}$ in.; seed-bearing part subquadrate ellipsoid suddenly narrowed into the linear-cylindric pedicel.

41. **J. pubigera**, *Wall. Cat.* 2490; leaves short-petioled ovate lanceolate hairy on both surfaces, cymes axillary trichotomous, corolla $\frac{3}{4}$ in. *J. Edgeworthii*, *T. Anders. in Journ. Linn. Soc.* ix. 516. *Peristrophe pubigera*, *Nees in Wall. Pl. As. Rar.* iii. 114, and in *DC. Prodr.* xi. 498. *Rhaphidospora ciliata*, *Nees l. c.* 500.

TEMPERATE N.W. HIMALAYA; Bhuddimath (Kumaon), *Wallich, Royle*; Simla, *Madden*; Gangotri, alt. 4500 ft., *Strachey & Winterbottom*; Mussoorie, alt. 7000 ft., *W. S. Atkinson*.

Stems herbaceous, erect, terete, hairy. *Leaves* $2\frac{3}{4}$ by $1\frac{1}{4}$ in., cuneate or rhomboid at the base; petiole $\frac{1}{2}$ in. *Cymes* axillary, 2–3 in., somewhat rigid, dense, ascending, hairy; bracts $\frac{1}{2}$ – $\frac{1}{2}$ in., linear; pedicels $0\frac{1}{2}$ in.; bracteoles 0 or minute. *Calyx* sub-5-partite; segments $\frac{1}{2}$ in., linear, pubescent. *Corolla* pubescent, purplish-red; lower lip $\frac{1}{2}$ in., pendent. Lower *anther-cell* distinctly white-tailed. *Capsule* $\frac{1}{2}$ in., linear-clavate, pubescent. *Seeds* unripe, probably glabrous, only slightly tubercular; in which case the species will not belong to Sect. *Rhaphidospora*. The inflorescence and corolla are exceedingly like *Peristrophe*; but the small bracts and distinct anther-tails do not suit.

Sect. 6. **Rostellularia** (Gen. Nees). *Spikes* terminal and axillary, cylindric or linear. *Bracts* and *bracteoles* narrowly lanceolate, usually about as long as the calyx. *Calyx* sub-4-partite (5th segment if sometimes present small), segments linear or linear-lanceolate. *Corolla* small. *Capsule* small, 4-seeded nearly from the base. *Seeds* subconcentrically tubercular or rugose or nearly smooth.—Small closely allied weeds, abundant in the tropics, all collected under 3 or 4 ill-defined species by T. Anderson. To facilitate their description it is necessary to arrange them in more species, or reduce them to vars. of one.

42. **J. micrantha**, *Wall. Cat.* 2449, partly; leaves ovate or elliptic, spikes short cylindric dense, sepals oblong scarious glabrous midrib green excurrent as a very hispid arista, seeds small concentrically rugose. *J. procumbens*, *Linn.*; *T. Anders. in Journ. Linn. Soc.* ix. 511, partly. *Rostellularia crinita*, *Nees in Wall. Pl. As. Rar.* iii. 101, and in *DC. Prodr.* xi. 373; *Dalz. & Gibs. Bomb. Fl.* 193.

DECCAN PENINSULA; *Wight*; Vingorla (S. Concan), *Dalzell*.

Stems much branched, minutely pubescent or hirsute. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ in., mature subglabrous or sparsely setose; raphides numerous sunk on both surfaces; petiole $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ – $1\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., sublinear. *Sepals* much wider than the bracteoles, nearly glabrous except the awns, hispid with many patent multicellular hairs. *Corolla* $\frac{1}{4}$ in., rose-purple. *Capsule* $\frac{1}{2}$ in., pubescent.—A strongly marked species, but it is difficult to settle the best name. *Wallich's* type sheet is mixed, and his name *micrantha* perhaps relates really to the small-fl. *J. procumbens* mixed thereon. As to the name *J. crinita*, that appears to relate chiefly to a mixture of *J. procumbens* var. *latispica* with *J. diffusa* var. *orbiculata*.

43. **J. quinqueangularis**, *Koen.*; *Roxb. Fl. Ind. ed. Carey & Wall.* i. 134; nearly glabrous, branches elongate, leaves linear or linear-lanceolate, spikes elongate $\frac{1}{2}$ in. broad, sepals linear-oblong tip obtuse herbaceous glabrous, capsule $\frac{1}{4}$ – $\frac{1}{2}$ in. stout. *Wall. Cat.* 2443, partly. *J. peploides*,

Var. **B angustifolia**, *T. Anders. in Journ. Linn. Soc. ix. 511 (excl. syn. J. Vahlil)*. *Rostellularia quinquangularis*, *Nees in Wall. Pl. As. Rar. iii. 101*, and in *DC. Prodr. xi. 375*.

CENTRAL INDIA, common; from W. Bengal and Agra to Belgaum.

Branches often 20 in., rigid, 4-5-angular, geniculate; internodes long. *Leaves* 3 by $\frac{1}{2}$ - $\frac{3}{4}$ in., glabrous, raphides obscure; petiole $0-\frac{1}{8}$ in., puberulous. *Spikes* 1-6 in.; lower flowers usually opposite solitary, calyx just reaching to the next pair; bracts $\frac{1}{4}$ in., linear-oblong, glabrous, scarious-margined; bracteoles similar, smaller. *Sepals* $\frac{1}{4}$ - $\frac{1}{2}$ in., hardly broader than the bracteoles. *Seeds* much larger than in the neighbouring species, slightly concentrically tubercular-rugose.—*J. Vahlil*, Roth, resembles this in the narrow leaves.

VAR. *peploides*; leaves oblong or ovate petiole often $\frac{1}{4}$ in., spikes shorter often subovate when young. *T. Anders. in Journ. Linn. Soc. ix. 511 (sp.)*; *Boiss. Fl. Orient. iv. 525*. *J. procumbens*, *Wall. Cat. 2441, partly*. *Rostellularia peploides*, *Nees in Wall. Pl. As. Rar. iii. 101*, and in *DC. Prodr. xi. 375*; *Dalz. & Gibs. Bomb. Fl. 193*.—Throughout the Gangetic Plain, from the Punjab to Bengal, and through Central India to the Concan. Distrib. Afghanistan.—Usually much more branched than the type, sometimes small 3-6 in. diam. This var. is very unlike the type in general aspect, and does not graduate into it; but the obtuse glabrous sepal-tips and large capsule and seeds agree closely.

44. **J. notha**, *Clarke*; stems simple glabrous, leaves sessile oblong white-setulose on the nerves beneath, bracts elliptic, sepals linear-oblong white-setulose upwards. *Rostellularia simplex*, *Wight Ic. t. 1542* (not *Justicia simplex*, D. Don).

INDIA?; *Herb. Wight*.

Stems 1 foot, slender, 4-5-angular. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ in., subobtusate at both ends, transversely lineolate glabrate above. *Spikes* 2 by $\frac{1}{2}$ in., terminal, solitary, dense; bracts $\frac{1}{4}$ by $\frac{1}{2}$ in., setulose-ciliate on margins and midrib, otherwise glabrous. *Corolla* $\frac{1}{2}$ in. *Capsule* $\frac{1}{2}$ in., ellipsoid.—*Wight* gives no locality for this; it is a well-characterized plant, and probably Malayan.

45. **J. khasiana**, *Clarke*; stems elongate hispid, leaves sessile oblong hispid on both surfaces, bracts linear-oblong hispid, sepals sublinear hispid.

KHASIA MTS., alt. 5000 ft., common; *Griffith, H. f. & T., &c.*

Stems $1\frac{1}{2}$ -3 ft., branched. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ in. *Spikes* 2-4 by $\frac{1}{2}$ in., hardly interrupted at the base, very hispid; bracts $\frac{1}{2}$ by $\frac{1}{16}$ - $\frac{1}{12}$ in. *Corolla* $\frac{1}{3}$ - $\frac{1}{2}$ in. *Capsule* $\frac{1}{2}$ in., ellipsoid. *Seeds* undulate obscurely rugose; testa minutely reticulated.—Nearly allied to *J. notha*, but differing in the indumentum and narrower bracts.

46. **J. assamica**, *Clarke*; leaves sessile narrowly obovate obtuse glabrous, bracts narrowly oblong minutely hispid, sepals narrowly lanceolate hispidulous.

ASSAM; *Griffith* (Kew Distrib. n. 6159).

Stems prostrate, copiously rooting; flowering branches 3-4 in., numerous, erect, 1-spicate. *Leaves* 1 by $\frac{1}{2}$ in., base long-cuneate; raphides sunk. *Spikes* 2 by $\frac{1}{2}$ in., continuous, somewhat dense; bracts $\frac{1}{8}$ by $\frac{1}{16}$ in., scarious-margined. *Corolla* nearly $\frac{1}{2}$ in. *Capsule* $\frac{1}{3}$ - $\frac{1}{6}$ in., ellipsoid.—In the sessile leaves, large corolla, and small capsule, this is allied to *J. notha* and *J. khasiana*.

47. **J. Royeniana**, *Clarke*; leaves subsessile linear-oblong obtuse glabrous, bracts and sepals linear-lanceolate acute glistening bristle-ciliate. *Rostellularia Royeniana*, *Nees in DC. Prodr. xi. 373*; *T. Anders. in Thwaites Enum. 234, partly*.

CEYLON; *Walker, Thwaites*.

Stems 10–15 in., procumbent, branched, glabrous. *Leaves* 2 by $\frac{1}{4}$ in., obtuse, transversely lineolate above; base long attenuate, petiole 0, or in some lower leaves short. *Spikes* $2\frac{1}{2}$ by $\frac{1}{2}$ in., subinterrupted at base, longer or shorter than the peduncle; bracts $\frac{1}{2}$ by $\frac{1}{10}$ – $\frac{1}{8}$ in., bracteoles $\frac{1}{4}$ in. *Sepals* $\frac{1}{4}$ – $\frac{1}{2}$ in., glistening ciliate on the margins and keel, otherwise glabrate. *Corolla* $\frac{1}{2}$ in. *Capsule* $\frac{1}{2}$ in.—Nearly allied to *J. notha*, differing principally in the glabrate leaves and very narrow bracts.

48. *J. diffusa*, Willd. *Sp. Pl.* i. 87; leaves petioled elliptic acuminate at both ends sparsely hairy, spikes slender sparsely hairy, bracts linear-lanceolate or linear mostly shorter than the calyx, sepals lanceolate acute minutely scabrous upwards. *Roth Nov. Sp.* 14; *Wall. Cat.* 2444; *T. Anders in Journ. Linn. Soc.* ix. 512. *J. procumbens*, Linn. partly; *Vahl Symb.* ii. 14; *Roxb. Fl. Ind.* i. 132. *Rostellularia diffusa*, Nees in *Wall. Pl. As. Rar.* iii. 100, and in *DC. Prodr.* xi. 371; *Dalz. & Gibs. Bomb. Fl.* 193 (several of these citations referring partly or mainly to plants here separately described as vars.).

KUMAON and PUNJAB TERAI; *Strachey & Winterbottom*, &c. DECCAN PENINSULA and CEYLON, plentiful; extending north to Chota Nagpore. RANGOON; *M'Lelland*.—DISTRIB. Siam.

Stems 1–2 ft., herbaceous, quadrangular, glabrous or minutely pubescent. *Leaves* (well developed) $3\frac{1}{2}$ by $1\frac{1}{4}$ in.; raphides large, sunk, on both surfaces; petiole $\frac{1}{4}$ in., pubescent. *Spikes* 1–7 by $\frac{1}{2}$ in.; lower flowers opposite, distant the length of the calyx; bracts $\frac{1}{2}$ in., narrowly or not scarious-margined, tip minutely scabrous; bracteoles $\frac{1}{10}$ – $\frac{1}{8}$ in., lanceolate. *Sepals* $\frac{1}{2}$ in., resembling the bracts. *Corolla* $\frac{1}{2}$ in. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous. *Seeds* very nearly smooth, concentric rugosities remaining as obscure tubercles.

VAR. *prostrata*, Roxb. ms.; leaves smaller often obtuse or orbicular, bracts and sepals shorter broader rather more scabrous, capsule hairy.—Deccan Peninsula and Ceylon, common.—*Stems* prostrate, intricately branched, patently hairy. *Leaves* $\frac{1}{2}$ – $\frac{1}{3}$ in. diam. *Spikes* 1–2 by $\frac{1}{2}$ in.

VAR. *Vahlia*; leaves narrowly lanceolate or linear, bracts lanceolate white-margined, sepals lanceolate subacute tips minutely scabrous. *J. Vahlia*, *Roth Nov. Sp.* 14. *J. quinqueangularis*, *Wall. Cat.* 2443, type sheet and mainly. *J. Vahliana*, *Roem. & Sch. Syst. Mant.* i. 138. *Rostellularia Vahlia*, Nees in *Wall. Pl. As. Rar.* iii. 102, and in *DC. Prodr.* xi. 376, partly.—Deccan Peninsula and Ceylon, extending to Chota Nagpore, common.—It is vain to quote extensively synonymy for this plant, as the same specimen has been named differently by the highest authorities. The narrow-leaved forms have been, both by Nees and T. Anderson, mixed with *J. quinqueangularis*, which differs in the large capsule and seeds, and in the glabrous obtuse sepal-tips. In the linear-leaved forms the spikes, bracts and sepals are often as in *J. diffusa* var. *prostrata*. Connected by imperceptible gradations with *J. diffusa*, type.

VAR. *hedyotidifolia*; woody, leaves petioled ovate, spikes shortened dense, sepal-tips lengthened sometimes very ciliate. *J. hedyotidifolia*, *Wall. Cat.* 2450. *Rostellularia hedyotidifolia*, Nees in *Wall. Pl. As. Rar.* iii. 100, and in *DC. Prodr.* xi. 370; *Wight Ic.* t. 1540.—Mts. of S. India.—The extreme forms in Wight's herbarium are very woody and glabrous, with small black leaves; but there are herbaceous examples with larger more hairy leaves, even from the Nilgherries at 8000 ft. alt., which have been marked *J. hedyotidifolia* by Mr. Benthams, and which cannot be distinguished from *J. diffusa*, type.

VAR. *orbiculata*; leaves petioled ovate hairy specially beneath. *J. orbiculata*, *Wall. Cat.* 2489; *T. Anders. in Journ. Linn. Soc.* ix. 512, partly. *Rostellularia rotundifolia*, Nees in *Wall. Pl. As. Rar.* iii. 100, and in *DC. Prodr.* xi. 370.—Deccan Peninsula, northwards to Parasnath, *T. Anderson*. Distrib. Siam.—The examples are marked by Nees (doubtless on account of the pubescent or patently hairy stem) "*Rostellularia procumbens*, Var. β and γ ," but the same thing is marked by T. Anderson "*hedyotidifolia*," which is the true affinity. Most of the examples marked *orbiculata* by Nees and T. Anderson are *J. simplex*, D. Don.

49. **J. simplex**, *Don Prodr.* 118 (not *Rostellularia simplex*, Wight); leaves petioled ovate hairy or oblong, spikes cylindric dense hairy, bracts elliptic shortly acute scarious-marginate, sepals lanceolate acute hairy nearly to their base. *J. orbiculata*, *T. Anders. in Journ. Linn. Soc.* ix. 512, partly. *J. mollissima*, *Wall. Cat.* 2445. *J. procumbens*, *Wall. Cat.* 2441, partly; *T. Anders. in Journ. Linn. Soc.* vii. 40, not of *Linn.* *Rostellularia rotundifolia* & *mollissima*, *Nees in Wall. Pl. As. Rar.* iii. 100, 101, and in *DC. Prodr.* xi. 370, 373, partly. *R. abyssinica*, *Brongn.*, and *glandulosa*, *Nees in DC. Prodr.* xi. 372, 373.

WESTERN INDIA, alt. 2-5000 ft., in the hills, common; from Kashmir, Scinde Hills (*Stocks*), Nepal (*Wallich*), to the Nilgherries. Abundant in CENTRAL INDIA and CHOTA NAGPORE.—DISTRIB. Abyssinia, Malaya to the Loochoo Isles.

Herbaceous, hairy, branched; branches sometimes long as in *Wallich's* Nepal examples, whence *D. Don* took his unfortunate name. *Spikes* much broader and more hairy than in any var. of *J. diffusa*. *Bracts* usually as long as the calyx, green-keled, very hairy with glistening many-jointed tawny or whiteish hairs.—Near *J. procumbens*, differing in its bracts; it is very uniform to its character, but the synonymy is uncertain, as the abundant examples are marked "*crinita*, *peplodes*," &c., and the Abyssinian examples have several names.

VAR. *serpyllifolia*, *Benth. ms. in Hohenack.* n. 571; very small, leaves spikes bracts and flowers smaller.—Throughout the Deccan from Chota Nagpore to S. Madras, frequent.—*Leaves* $\frac{1}{2}$ in. diam., elliptic or round, obtuse or subacute. *Spikes* 1 by $\frac{1}{2}$ in.; bracts $\frac{1}{8}$ – $\frac{1}{2}$ in., elliptic or broadly lanceolate, fulvous-hirsute.—Regarded by *Benth* as a var. of *J. procumbens*, *Linn.*

50. **J. procumbens**, *Linn. Fl. Zeyl.* 19; leaves petioled elliptic or lanceolate hairy or glabrate, spikes cylindric dense hirsute, bracts linear-lanceolate acute, sepals sublinear acute hirsute nearly their whole length. *Roxb. Fl. Ind.* i. 132, partly; *Wall. Cat.* 2441, partly; *T. Anders. in Journ. Linn. Soc.* ix. 511, partly; *Benth. Fl. Austral.* iv. 549, with *Australian syn.* *J. micrantha*, *Wall. Cat.* 2449, chiefly. *J. hirtella*, *Wall. Cat.* 2448. *Rostellularia procumbens*, *Nees in Wall. Pl. As. Rar.* iii. 101, and in *DC. Prodr.* xi. 371, partly (excl. all Himalayan examples); *Dalz. & Gibs. Bomb. Fl.* 193. *R. adenostachya*, *Nees in Wall. Pl. As. Rar.* iii. 101, and in *DC. Prodr.* xi. 373.

S. DECCAN PENINSULA with CEYLON, frequent; extending north to the S. Concan.—DISTRIB. Malaya, Australia.—Separated from *J. simplex* by the narrower bracts; a character which at all events suits the geography better than the distinctions put forward by *Nees*, and accepted by *T. Anderson*.

VAR. *latispica*, *Clarke*; stouter, spikes larger, bracts and corolla longer. *Rostellularia procumbens*, *Wight Ic.* t. 1539. *R. mollissima*, *Nees in DC. Prodr.* xi. 373, partly.—Mts. of S. India and Ceylon, common. Khasia Mts. and adjacent parts of Assam, frequent. Pegu and Tenasserim.—*Bracts* $\frac{3}{4}$ – $1\frac{1}{2}$ by $\frac{1}{20}$ in., hispid-ciliate. *Corolla* $\frac{1}{2}$ – $\frac{1}{2}$ in. *Capsule* $\frac{1}{8}$ – $\frac{1}{4}$ in.—The type of this var. is *Wight Ic.* t. 1539 (excellent), which shows the narrow bracts very correctly, and represents the common Nilgherry form: from this the Khasian and Malayan forms cannot be distinguished. In Ceylon a larger, more woody form is frequent; this is marked by *Nees R. procumbens* & *grandiflora*. The objection to calling this plant *mollissima* is that the type of *J. mollissima* (and *J. orbiculata*) was the round-leaved hairy Var. *vestita* of *J. diffusa*.

SPECIES NOT SEEN.

J. BIFLORA, *Fahl Symb.* ii. 9; leaves ovate, peduncles axillary 2-fld. as long as the leaves, bracts subulate. *Nees in DC. Prodr.* xi. 428.

INDIA; *Schumacher*.

A branched undershrub. *Leaves* 1 in., but little attenuate, base acute, very glabrous; petiole lax, lower as long as the leaves. *Peduncles* filiform; 2 petioled

bracts at the base of the unequal pedicels, oblong, acute; floral bracts 3 under each calyx, unequal; 2 subulate, the third ovate. *Calyx* 5-partite (Vahl).

J. MORETIANA, *Vahl Enum.* i. 162; leaves lanceolate, flowers solitary axillary and in a short bracteated terminal spike, calyx 5-toothed half the way down, corolla $\frac{1}{2}$ in. 2-lipped, capsule $\frac{1}{2}$ in. 4-seeded. *Nees in DC. Prodr.* xi. 428.—*Burm. Thes. Zeyl.* t. 3, fig. 1.

CEYLON; *Burm.*

Leaves $2\frac{1}{2}$ by $\frac{3}{4}$ in., acute at both ends; petiole $\frac{1}{2}$ in. Axillary flowers on peduncles $\frac{1}{4}$ in., ebracteate; spicate flowers subsessile, bracts $\frac{1}{2}$ in., oblong, acute. *Calyx* $\frac{1}{2}$ in., toothed hardly half-way down, lobes subtriangular lanceolate. *Corolla* upper lip erect, ovate, subentire, lower pendent deeply 3-lobed. *Capsule* solid below.—The good picture of the capsule and seeds renders it nearly certain that this was some *Justicia*: the inflorescence is very nearly that of *J. glauca*, but the bracts are much too narrow and acute for that species.

XXXIX. ADHATODA, *Nees*.

As *Justicia* Sect. *Betonica*, except that the anther-cells are acute, sometimes minutely apiculate, but scarcely spurred.—Species 6, Tropical; 1 Indian, 1 Cosmopolitan, 5 African or American.

Bentham (in *Gen. Plant.*) says of the anther-cells, “minime calcaratæ,” but this is an error, and the genus should be merged in *Justicia* Sect. *Betonica*, following *Nees* and *Anderson*.

1. ***A. vasica***, *Nees in Wall. Pl. As. Rar.* iii. 103, and in *DC. Prodr.* xi. 387; leaves elliptic acute at both ends entire minutely pubescent, spikes dense short, bracts ovate or obovate subacute puberulous or glabrate, corolla $1\frac{1}{4}$ in. white tube short. *Dalz. & Gibs. Bomb. Fl.* 194. *Justicia Adhatoda*, *Linn.*; *Lamk. Ill.* t. 12, fig. 1; *Roxb. Fl. Ind.* i. 126; *Blume Bijdr.* 785; *Wall. Cat.* 2434; *Bot. Mag.* t. 861; *Griff. Notul.* iv. 140; *T. Anders. in Journ. Linn. Soc.* ix. 509.—*Adhatoda* sp. *Griff. Notul.* iv. 141, and *Ic. Pl. As.* t. 424. *Rheede Hort. Mal.* ix. t. 43.

INDIA; from the Punjab and Assam to CEYLON and Singapore, common, frequently cultivated.—DISTRIB. Malaya, S.E. Asia.

A dense shrub, 4–8 ft.; sometimes arborescent, 20 ft. *Leaves* 8 by 3 in.; petiole 1 in. *Spikes* 1–3 in., terminal, often several together; bracts $\frac{3}{4}$ by $\frac{1}{4}$ in., elliptic; bracteoles $\frac{1}{2}$ by $\frac{1}{8}$ in., falcate-oblong. *Calyx* $\frac{1}{2}$ – $\frac{1}{3}$ in., deeply 5 lobed; lobes equal, lanceolate. *Corolla-tube* $\frac{1}{2}$ – $\frac{1}{3}$ in. broad; lips white, palate transversely rose-banded. *Stamens* glabrous; anther-cells acuminate at base, sometimes minutely white-tailed. *Ovary* and style-base minutely hairy. *Capsule* $\frac{3}{4}$ in., clavate, pubescent, 4-seeded. *Seeds* $\frac{1}{2}$ in. diam., glabrous, tubercular-verrucose.

2. ***A. Beddomei***, *Clarke*; leaves oblong attenuate at both ends entire minutely pubescent, spikes peduncled capitate, bracts ovate subacute puberulous or glabrate, corolla $\frac{3}{4}$ in. creamy white tube short.

S. TRAVANCORE, alt. 3000 ft.; *Beddome*.

A very large shrub (*Beddome*). *Leaves* 6 by $1\frac{1}{2}$ in.; petiole $\frac{1}{2}$ in. *Peduncles* $\frac{1}{2}$ – $\frac{3}{4}$ in., axillary, opposite, stout; heads 1 in. diam.; bracts $\frac{1}{2}$ by $\frac{1}{4}$ – $\frac{1}{2}$ in., narrowed at base; bracteoles $\frac{1}{4}$ – $\frac{1}{2}$ in., narrowly oblong. *Calyx* $\frac{1}{4}$ in., sub-5-partite; segments narrowly oblong, acute, minutely pubescent especially within. *Corolla* hairy; tube $\frac{1}{2}$ in., broadly cylindric; lips oblong, upper emarginate, lower 3-lobed nearly to the base. *Filaments* stout, glabrous except at base; anther-cells superposed, lower obscurely tailed. *Ovary* glabrous, 4-ovulate; style hairy; stigma minutely bifid. *Capsule* not known.

XL. RHINACANTHUS, Nees.

Shrubs, sometimes subscandent. *Leaves* entire. *Panicle* divaricate or dense; flowers solitary (or in minute cymes), sessile; bracts and bracteoles small, linear-lanceolate. *Calyx* small, sub-5-partite, segments linear-lanceolate. *Corolla* white, tube very long narrowly cylindric, scarcely widened at the top; limb 2-lipped, upper lip lanceolate acuminate entire or shortly 2-lobed, recurved or twisted, lower broad 3-lobed. *Stamens* 2, inserted near the top of the corolla-tube; anthers 2-celled; cells superposed, muticous. *Ovary* 4-ovulate; style filiform, minutely bifid at the tip. *Capsule* clavate, 4-seeded, stalk long solid cylindric. *Seeds* ovoid, moderately compressed, glabrous, obscurely rugose or tuberculate.—Species 4, tropical Asiatic and African.

1. ***R. communis***, Nees in Wall. *Pl. As. Rar.* iii. 109, and in DC. *Prodr.* xi. 442; leaves oblong or ovate-oblong pubescent or glabrate, panicle large spreading, calyx densely pubescent. *Wight Ill.* 164 bis, fig. 9, and *Jc.* t. 464; *Dalz. & Gibs. Bomb. Fl.* 194; *T. Anders. in Journ. Linn. Soc.* ix. 522. *Rh. Rottlerianus*, Nees in Wall. *Pl. As. Rar.* iii. 109, and in DC. *Prodr.* xi. 443. *Justicia nasuta*, Linn.; *Roxb. Fl. Ind.* i. 120; *Blume Bijdr.* 785; *Wall. Cat.* 2440; *Blanco Fl. Filip.* 14; *Bot. Mag.* t. 325; *Griff. Notul.* iv. 143. *J. Rottleriana*, Wall. *Cat.* 2477.—*Rheede Hort. Mal.* ix. t. 69.

Throughout INDIA, cultivated; perhaps wild in the Deccan Peninsula and CEYLON.—**DISTRIB.** Java, Madagascar, &c., cultivated.

Leaves 3-4 by $\frac{3}{4}$ -1 $\frac{1}{2}$ in., usually narrowed at both ends, margin undulate; petiole $\frac{1}{2}$ in. *Cymes* terminal and on short lateral branches, dusky-pubescent; flowers often clustered; bracts and bracteoles 0- $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{10}$ in. *Corolla-tube* 1 by $\frac{1}{10}$ in.; lobes $\frac{1}{2}$ in., 3 lower each twice as broad as the shortly bifid upper.

VAR. *montana*; leaves ovate softly hairy often furred beneath base frequently obtuse. *J. scandens*, Vahl *Symb.* ii. 7. *J. dichotoma*, Rottl. & Willd. in Nov. Act. Nat. Cur. iv. 221 (fide Nees). *Dianthera paniculata*, Lour. *Fl. Cochinch.* i. 26.—*Mts. of S. Deccan*, alt. 3-6000 ft., frequent.—Perhaps the wild state, of which the narrow-leaved glabrate *R. communis* is the domesticated form.

2. ***R. calcaratus***, Nees in Wall. *Pl. As. Rar.* iii. 109, and in DC. *Prodr.* xi. 444; leaves large elliptic or narrow-obovate acuminate at both ends glabrous, panicle terminal somewhat dense flowers very many. *T. Anders. in Journ. Linn. Soc.* ix. 522. *Justicia calcarata*, Wall. *Pl. As. Rar.* ii. 9, t. 113, and *Cat.* 2426.

KHASIA MTS.; Wallich, &c. **CACHAR**; Keenan.

Branches stout. *Leaves* 10 by 4 in.; petiole 1 $\frac{1}{2}$ in. *Panicle* 6 by 4 in., nearly glabrous; peduncle 1-2 in.; bracts $\frac{1}{10}$ in. *Calyx* $\frac{1}{3}$ - $\frac{1}{2}$ in., nearly glabrous; lobes linear-lanceolate. *Corolla* as of *R. communis*, but larger; tube 1 $\frac{1}{4}$ in.; lobes $\frac{1}{2}$ in.; upper lip subentire, or lobes minute setaceous, twisted. *Capsule* not seen.

XLI. DIANTHERA, Linn.

Diffuse herbs or undershrubs. *Leaves* petioled, ovate or oblong, puberulous or glabrate. *Spikes* or *panicles* terminal, axillary sometimes added; flowers, or many of the lower, distant; bracts and bracteoles small. *Calyx* sub-5-partite; segments narrow. *Corolla* small or middle-sized, white yellowish or rose-purple, 2-lipped; upper lip suberect emarginate, lower pendent, 3-lobed. *Stamens* 2, glabrous or nearly so; anther-cells 2, ellips-

oid, muticous, subopposite or superposed. *Ovary* glabrous or nearly so, 4-ovuled; style minutely hairy below, tip sub-bifid. *Capsule* clavate, 4-seeded, base subcylindric solid. *Seeds* compressed, scabrous verrucose or subhispid.—Species 80, chiefly American; about 10 in the tropics of the Old World.

The character of the genus is here narrowed to the Indian species, which differ from the small-flowered *Justicias* (*J. vasculosa*, &c.) only by having the lower anther-cell absolutely muticous.

Flowers $\frac{1}{4}$ – $\frac{1}{2}$ in., sessile or nearly so.

1. ***D. leptostachya***, *Benth. in Gen. Pl.* ii. 1114; leaves elliptic or oblong narrowed at both ends puberulous on the nerves beneath or glabrate, bracts hardly $\frac{1}{10}$ in. linear. *Ruellia leptostachya*, *Wall. Cat.* 2411. *Leptostachya Wallichii*, *Nees in Wall. Pl. As. Rar.* iii. 105, and in *DC. Prodr.* xi. 379, the *Indian plant only*; *Wight Ic.* t. 1543. *Justicia Wallichii*, *T. Anders. in Journ. Linn. Soc.* ix. 516.—*Adhatoda* sp. n. 17, *Herb. Ind. Or. H. f. & T.*

MTS. of S. DECCAN PENINSULA; Courtallum, &c., *Wight, &c.*

A herb; stem terete, puberulous. *Leaves* $4\frac{1}{2}$ by $1\frac{3}{4}$ in., punctulate on both surfaces; petiole $\frac{1}{2}$ –2 in. *Spikes* linear, slender, interrupted, mostly collected in a terminal panicle 8–10 in. diam., puberulous; flowers opposite; pedicels 0– $\frac{1}{10}$ in., or the lower developed into very small cymes. *Calyx-segments* $\frac{1}{10}$ – $\frac{1}{8}$ in., linear-lanceolate, puberulous. *Corolla* scarcely $\frac{1}{4}$ in., nearly glabrous. *Capsule* $\frac{1}{2}$ in., clavate, puberulous. *Seeds* glabrous, tubercular-verrucose.—The Philippine plant (Cuming, n. 548), combined with this species by Nees, is different, and probably not of this genus (fide Bentham).

2. ***D. virgata***, *Benth. in Gen. Pl.* ii. 1114; leaves elliptic narrowed at both ends pubescent on the nerves beneath, bracts ovate or elliptic acute as long as the calyx. *Justicia virgata*, *T. Anders. in Journ. Linn. Soc.* ix. 516, chiefly.—*Adhatoda* sp. n. 18, *Herb. Ind. Or. H. f. & T.*

SIKKIM and KHASIA MTS., alt. 1–3000 ft., frequent; *Griffith, H. f. & T., &c.*

A somewhat slender herb, 2–3 ft. *Leaves* $4\frac{1}{2}$ by $1\frac{3}{4}$ in., acuminate, punctulate on both surfaces, base attenuate or rhomboid; petiole 1 in., pubescent. *Spikes* 3–6 in., linear, slender, interrupted, terminal, 1–3 together, or sometimes panicked; bracts $\frac{1}{6}$ in.; flowers opposite, solitary, sessile. *Calyx* sub-5-partite; segments $\frac{1}{2}$ in., linear-lanceolate, minutely pubescent. *Corolla* $\frac{1}{4}$ in., white or slightly yellow-tinged. *Anther-cells* completely superposed. *Capsule* $\frac{1}{2}$ in., clavate, puberulous. *Seeds* glabrous, tubercular-verrucose.—*Leptostachya virgata*, *Nees in Wall. Pl. As. Rar.* iii. 105, and *Cat.* 7177, and in *DC. Prodr.* xi. 379, from Ava, united with this by T. Anderson, has a very large panicle, cymose flowers and linear bracts, and seems much nearer *D. leptostachya*.

3. ***D. debilis***, *Clarke*; leaves cordate-lanceolate pubescent on the nerves beneath, bracts linear or linear-oblong shorter than the calyx.

KHASIA TERAI, alt. 500 ft.; Shaila, *Clarke*.

Resembling *D. virgata*, but very weak. *Leaves* $4\frac{1}{2}$ by $1\frac{3}{4}$ in., acuminate, membranous; petiole $1\frac{1}{2}$ in. *Spikes* 1–3 in., linear, often 3 on a terminal peduncle 1–2 in.; bracts $\frac{1}{12}$ in., pubescent; flowers opposite, solitary, distant. *Calyx* sub-5-partite; segments $\frac{1}{2}$ in., linear, pubescent. *Corolla* $\frac{1}{2}$ in., yellowish-white. *Anther-cells* parallel, one very slightly higher than the other. *Ovary* glabrous; base of style hairy. Young capsule as of *D. virgata*.

4. ***D. Griffithii***, *Benth. in Gen. Pl.* ii. 1114; leaves petioled ovate acute glabrous, panicles terminal trichotomous, bracts and bracteoles

minute subulate glabrous. *Justicia Griffithii*, *T. Anders. in Journ. Linn. Soc.* ix. 516.

MISHMEE HILLS; *Griffith* (fide T. Anderson).

A glabrous herb; stem terete, base woody, upwards herbaceous tetragonous. *Leaves* 4-10 by 2-4 in.; base decurrent. *Panicles* with elongate, ascending branches; flowers remote, opposite, solitary, sessile. *Sepals* 5, linear. *Corolla* $\frac{1}{2}$ in., tube ventricose; limb 5-partite, green, lower lip spotted red. *Ovary* 4-ovulate. *Capsule* a little longer than the corolla, subclavate at the tip, acute (T. Anderson).—Not seen.

** *Flowers* $\frac{1}{2}$ in. or more, many distinctly pedicelled.

5. **D. collina**, *Clarke*; leaves ovate nearly glabrous, panicles terminal and axillary, anther-cells mucinous distant superposed. *Justicia collina*, *T. Anders. in Journ. Linn. Soc.* ix. 515.

SIKKIM and BHOTAN, alt. 5-7000 ft.; *Griffith, H. f. & T., &c.* KHASIA MTS., alt. 4000 ft.; *Griffith*.

A diffuse herb, 1-2 ft., branches puberulous. *Leaves* 3 by $1\frac{1}{2}$ in., acute, base cuneate or of the upper leaves almost rounded; petiole 1 in., or of the upper leaves sometimes 0. *Cymes* few-fl., running into an elongate terminal panicle by the gradual reduction of the leaves into bracts; proper bract hardly $\frac{1}{10}$ in., linear; pedicels 0- $\frac{1}{2}$ in.; bracteoles minute or 0. *Sepals* $\frac{1}{2}$ in., linear, green, glabrous. *Corolla* $\frac{1}{2}$ in., white, nearly glabrous; tube elongate cylindric. *Capsule* $\frac{1}{2}$ in., clavate, glabrous, 4-seeded. *Seeds* verrucose-scaly, obscurely hispidulous.

6. **D. dichotoma**, *Clarke*; leaves ovate acute nearly glabrous, panicles terminal minutely pubescent, anther-cells mucinous one superposed for half its length. *Justicia dichotoma*, *Blume Bijdr.* 783; *T. Anders. in Journ. Linn. Soc.* ix. 516. *Rhaphidospora dichotoma*, *Nees in DC. Prodr.* xi. 500. *Leptostachya dichotoma*, *Nees l. c.* 379. *Peristrophe dichotoma*, *Hassk. Cat. Hort. Bogor.* 152.

CEYLON (fide T. Anderson).—DISTRIB. Java, Philippines.

Much resembling *D. collina*, the corolla rather more ventricose and rose-purple.—There is no Ceylon example of this at Kew. We may suppose that T. Anderson had seen such at Calcutta; C. P. 2718, which he quotes, is certainly not this plant.

DOUBTFUL SPECIES.

D.? **INDICA**; leaves scarcely 1 in. rhomboid-ovate acute hairy, flowers congested into axillary and terminal decompound globose or oblong spikes, spikelets by suppression mostly 1-fl. supported by a lanceolate often empty bract. *Rhytiglossa*? *indica*, *Wawra in Oestr. Bot. Zeit.* 1881, 281, and *Bot. Reis. Pr. S. Cob.* 82, t. 9, fig. A.

GARWHAL; at Mussoorie, alt. 4000 ft., *Wawra*.

An undershrub; branches prostrate, variously twisted and incurved. Uppermost bract sterile, with the fertile valvately enclosing the single flower of the spikelet; bracteoles linear-setaceous, similar to the calyx-segments. *Corolla* ringent, rose, hairy; tube as long as the calyx; lips as long as the tube, upper ovate, emarginate; lower longer, cuneately 3-lobed. *Filaments* flattened; anther-cells superposed, ovate, mucinous. *Style* capillary, elongate after flowering, bifid. *Ovary* 4-ovulate.—Not seen. I know of no woody prostrate Acanthaceous plant at Mussoorie, and do not understand the bracts as described.

XLII. **PTYSSIGLOTTIS**, *T. Anders.*

A small, procumbent herb. *Leaves* ovate, entire. *Spikes* peduncled, few-fl.; bracts and bracteoles linear. *Calyx* sub-5-partite; segments

linear. *Corolla-tube* short, limb 2-lipped; upper lip shortly 2-fid, lower 3-lobed; lobes imbricate in bud. *Stamens* 2; anthers 2-celled; cells ellipsoid, parallel, approximate, muticous or base minutely apiculate. *Ovary* 4-ovulate; style filiform, minutely bifid. *Capsule* clavate, 4-seeded. *Seeds* compressed, orbicular, verrucose-scaly, almost muricate, not hairy.

P. radicata, *T. Anders. in Thwaites Enum.* 235, excl. syn.; *Bedd. Ic. Pl. Ind. Or.* t. 267. *Rhytiglossa radicata*, *Nees in DC. Prodr.* xi. 344.

CEYLON; Champion, *Thwaites*.

Stems 3-8 in., weak, rooting, branched, puberulous. *Leaves* $\frac{3}{4}$ by $\frac{1}{2}$ in., obtuse or subacute at either end, lineolate, nearly glabrous; petiole $\frac{1}{16}$ - $\frac{1}{8}$ in. *Peduncles* $\frac{1}{2}$ -1 in., terminal, slender; spikes $\frac{1}{2}$ - $\frac{3}{4}$ in.; bracts $\frac{1}{2}$ in. *Sepals* $\frac{1}{8}$ in. *Corolla* $\frac{1}{2}$ - $\frac{3}{4}$ in., nearly straight, pubescent. *Capsule* $\frac{1}{2}$ in., 4-seeded near the top; stalk solid, linear-cylindric.—*Rostellaria sarmentosa*, *Zoll.*, described as having the capsule 4-seeded nearly from the base, does not belong here (cf. *Benth. in Gen. Pl.* ii. 1118).

XLIII. SPHINCTACANTHUS, *Benth.*

An erect, glabrous shrub. *Leaves* large, toothed or subentire. *Spikes* interrupted, forming a terminal panicle; flowers opposite; bracts and bracteoles small. *Calyx* sub-5-partite; segments linear. *Corolla-tube* ovoid, inflated, constricted at the top; limb 2-lipped, upper emarginate, lower 3-lobed pendent; lobes imbricated in the bud. *Stamens* 2; anthers 2-celled; cells oblong, approximate, muticous. *Ovary* 4-ovulate; style linear, minutely bifid. *Capsule* unknown.

S. Griffithii, *Benth. in Gen. Pl.* ii. 1118; *Hook. Ic. Pl.* t. 1205. *Justicia orchiodes*, *Griffith ms.*

MISHMEE MTS., or PATKOYE HILLS in S.E. Assam; *Griffith* (*Kew Distrib.* n. 6161).

Leaves $7\frac{1}{2}$ by $3\frac{1}{4}$ in., acute at both ends; petiole 1 in. *Panicle* 5 by 4 in.; branches opposite; bracts $\frac{1}{10}$ in. *Calyx* $\frac{1}{10}$ in. *Corolla-tube* $\frac{1}{2}$ by $\frac{1}{2}$ in.; lobes $\frac{1}{8}$ - $\frac{1}{4}$ in., those of the lower lip subacute. *Filaments* glabrous, except near the base.

XLIV. ECBOLIUM, *Kurz.*

A small, nearly glabrous, shrub. *Leaves* entire. *Spikes* terminal, dense; bracts large, imbricate, somewhat 4-ranked; bracteoles small, narrow. *Calyx* sub-5-partite; segments equal, narrow. *Corolla-tube* long, subfiliform; limb 2-lipped; upper lip narrow shortly bifid, lower 3-lobed pendent; lobes imbricate in bud. *Stamens* 2, attached near the top of the corolla-tube; anthers 2-celled; cells oblong, parallel, approximate, muticous. *Ovary* 4-ovulate; style filiform, very shortly bifid. *Capsule* long-stalked, ovoid, compressed, 4-seeded. *Seeds* 4 or more often 2, large, compressed, orbicular, tubercular-scabrous.

E. Linneanum, *Kurz in Journ. As. Soc.* 1871, pt. ii. 75; leaves petioled ovate or lanceolate, bracts ovate obtuse entire puberulous or pubescent, corolla greenish-blue or purplish. *Boiss. Fl. Orient.* iv. 526. *Justicia Ecbolium*, *Linn.*; *Roxb. Fl. Ind.* i. 114; *Wall. Cat.* 2432; *Bot. Mag.* t. 1847; *Wight Ic.* t. 463; *Nees in Wall. Pl. As. Rar.* iii. 108, and in *DC. Prodr.* xi. 427; *Dalz. & Gibs. Bomb. Fl.* 194. *J. ligustrina*, *Vahl Enum.* i. 118. *J. emarginata*, *Nees in DC. Prodr.* xi. 427. *Eranthemum Ecbolium*, *T. Anders. in Thwaites Enum.* 235, and in *Journ. Linn. Soc.* ix. 523.—*Burm. Thes. Zeyl.* 7, t. 4, fig. 1. *Rheede Hort. Mal.* ii. t. 20.

S. DECCAN PENINSULA and CEYLON. MALACCA; *Maingay*.—DISTRIB. Arabia, Abyssinia, Madagascar.

Branches pubescent upwards. *Leaves* 4 by $1\frac{1}{2}$ in., cuneate or rhomboid at both ends, puberulous or pubescent on the nerves; petiole $\frac{1}{2}$ in. *Spikes* $2\frac{1}{2}$ by $\frac{3}{4}$ in., dense; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., sometimes softly hairy; bracteoles scarcely $\frac{1}{4}$ in., sublinear. *Calyx* $\frac{1}{4}$ in., pubescent. *Corolla* pubescent; tube $1-1\frac{1}{4}$ by $\frac{1}{16}$ in.; lobes $\frac{1}{2}$ in. *Stamens* glabrous, except the base of the filaments; anther-cells submucronate at the base. *Ovary* hairy at the tip. *Capsule-stalk* $\frac{1}{2}$ in., linear-cylindric, seed-bearing part $\frac{1}{2}$ in. diam. *Seeds* $\frac{1}{2}$ in. diam., pale-coloured.—This, the typical form, is stated by Wight to be frequent in S. Madras, but there is very little of it in the Herbarium.

VAR. *rotundifolia*; leaves sessile ovate or roundish, bracts subdentate often with a very short acumination. *Justicia rotundifolia*, *Nees* *ll. c.*—Coimbatore; *Wight*, nn. 2008, 2266.—A woody undershrub, with shortened internodes and smaller leaves; *Wight's* are the only examples at Kew.

VAR. *latevirens*; glabrescent, leaves larger petioled broadly lanceolate acute at both ends, spikes often 6–8 in. more lax, bracts $\frac{3}{4}$ by $\frac{1}{2}$ in. broadly lanceolate entire dusky-pubescent. *Justicia latevirens*, *Vahl Enum.* i. 118; *Nees in DC. Prodr.* xi. 427.—S. Deccan Peninsula and Ceylon.—This appears the common South Indian form, and when the bracts become denticulate it passes by degrees into the next.

VAR. *dentata*; glabrescent, leaves larger petioled ovate or lanceolate acute, spikes dense, bracts $\frac{3}{4}$ by $\frac{1}{2}$ in. ovate acuminate toothed. *Justicia dentata*, *Klein*; *Nees in Wall. Pl. As. Rar.* iii. 108, and in *DC. Prodr.* xi. 427. *J. livida*, *Nees in DC. Prodr.* xi. 427; *Wight Ic. t.* 1546.—Bengal, Assam and Pegu, very common. *W.* Deccan Peninsula, *Wight*, *Ritchie*.—The Bengal form has glabrate thin bracts, and a lurid or steely green-blue corolla. The Malabar form should perhaps be referred to *Var. latevirens*.

XLV. GRAPTOPHYLLUM, *Nees*.

Glabrous shrubs. *Leaves* often variegated. *Flowers* pedicelled, clustered; clusters forming terminal thyrses; bracts and bracteoles very small, narrow. *Calyx* small, sub-5-partite; segments equal, linear-lanceolate. *Corolla-tube* curved; limb 2-lipped, upper lip shortly 2-fid, lower 3-lobed. *Stamens* 2, 2 minute staminodes added; anthers oblong, 2-celled; cells parallel, muticous. *Ovary* 4-ovulate; style filiform, scarcely bifid. *Capsule* oblong, hard, contracted into a long stalk. *Seeds* usually 2, orbicular or subquadrate, compressed flat, lacunose-rugose.—Species 4, Australian or Pacific, one long time cultivated.

G. hortense, *Nees in Wall. Pl. As. Rar.* iii. 102, and in *DC. Prodr.* xi. 328; leaves petioled broadly elliptic narrowed at both ends entire, corolla $1-1\frac{1}{2}$ in. crimson. *T. Anders. in Journ. Linn. Soc.* ix. 523. *G. pictum*, *Griff. Notul.* iv. 139. *Justicia picta*, *Linn.*; *Roxb. Fl. Ind.* i. 117; *Wall. Cat.* 2438; *Blume Bijl.* 784; *Blanco Fl. Filip.* 12; *Bot. Mag.* t. 1870; *Bot. Reg.* t. 1227; *Dalz. & Gibs. Bomb. Fl. Suppl.* 71.—*Rheede Hort. Mal.* vi. t. 60. *Rumph. Herb. Amb.* iv. t. 30.

Throughout INDIA and MALAYA cultivated; where wild, uncertain.

Leaves $4\frac{1}{2}$ by $1\frac{1}{2}$ in.; petiole $\frac{1}{2}$ in. *Pedicels* often $\frac{1}{2}$ in. *Calyx* $\frac{1}{8}$ in. The description of the capsule and seeds is taken from "Gen. Plant."

XLVI. RUNGIA, *Nees*.

Diffuse or erect herbs, or shrubs. *Leaves* entire. *Spikes* dense, terminal or axillary, 1-sided; bracts 2-ranked, or 4-ranked, with 2 of the ranks often flowerless; flowering bracts often scarious-margined; bracteoles

similar to the bracts or narrow. *Calyx* small, deeply 5-lobed; segments linear-lanceolate. *Corolla* small, blueish or white; limb 2-lipped, upper lip emarginate shorter than the lower 3-lobed lip. *Stamens* 2; anthers 2-celled, cells parallel subequal, or more often superposed, lower cell muticous or white-tailed. *Ovary* 4-ovulate; style filiform, minutely bifid. *Capsule* ovoid or oblong, shortly stalked; after dehiscence the placenta with the retinacula rise elastically from the base of the capsule, scattering the seeds. *Seeds* 4, compressed, orbicular, glabrous, verrucose, sometimes minutely, sometimes very strongly, so that the seed is concentrically rugose or subcristate.—Species 20, mostly Asiatic, a few Tropical African.

I am unable to make sections of this genus; the species are described in order of their size, beginning with the largest.

1. ***R. sisparensis***, *T. Anders. in Journ. Linn. Soc.* ix. 518; leaves large elliptic acuminate at both ends glabrous, bracts dimorphic bifarious ovate subacute not acuminate glabrous, corolla $\frac{1}{2}$ – $\frac{1}{2}$ in. *Adhatoda sisparensis*, *Benth. in Pl. Hohenack.* n. 1436.

NILGHERRIES; *Sispara*, *Wight, Gardner, &c.*; *Valla Caudoo*, *Wight*; *Wynaad*, *Beddome*.

Shrubby, nearly glabrous. *Leaves* 6 by $1\frac{1}{2}$ in., obscurely lineolate; petiole 1 in. *Spikes* 2–3 by $\frac{3}{4}$ in., 1-sided, 2 series of large empty bracts on one side, 2 series of smaller flowering ones on the other; empty bracts $\frac{1}{2}$ by $\frac{1}{4}$ in., narrowed at both ends, shining green, not or very narrowly marginate, striate; flowering bracts similar but hardly half so large, subscarioso, more acute; bracteoles $\frac{1}{2}$ in., lanceolate. *Calyx* $\frac{1}{2}$ in.; segments linear-lanceolate, minutely pubescent. *Anther-cells* separated, lower white-tailed. *Capsule* $\frac{1}{4}$ – $\frac{1}{2}$ in., minutely pubescent. *Seeds* verrucose, almost tubercled.

2. ***R. Wightiana***, *Nees in Wall. Pl. As. Rar.* iii. 110, and in *DC. Prodr.* xi. 472; leaves large lanceolate or ovate-lanceolate glabrous, bracts dimorphic obscurely 2-ranked round-ovate prominently margined nearly glabrous, corolla $\frac{1}{2}$ in. *Wight Ic.* t. 1549; *T. Anders. in Journ. Linn. Soc.* ix. 518. *R. Arnottiana*, *Wight Ic.* t. 1550. *Justicia Wightiana*, *Wall. Cat.* 2472.

S. DECCAN PENINSULA; Courtallum, *Wight, G. Thomson*; Attramallay, *Beddome*.

Leaves $6\frac{1}{2}$ by 2 in., base attenuate, lineolate; petiole $1\frac{1}{2}$ in. *Spikes* 2 by $\frac{1}{2}$ in., somewhat laxly imbricate, often paniced; empty bracts $\frac{1}{4}$ in. diam., obtuse rarely minutely apiculate; flowering bracts rather narrower, somewhat obovate; bracteoles $\frac{1}{2}$ in., subovate, pubescent. *Calyx* $\frac{1}{2}$ – $\frac{1}{2}$ in.; segments linear-lanceolate, minutely pubescent. *Anther-cells* superposed, lower white-tailed. *Capsule* $\frac{1}{2}$ in., minutely pubescent. *Seeds* subtubercular verrucose.—*R. Arnottiana*, *Wigh.*, differs only in the uppermost leaves being as broad as the middle cauline.

3. ***R. læta***, *Clarke*; leaves ovate acute at both ends subglabrous, bracts large broadly elliptic acute marginate ciliate, corolla $\frac{3}{4}$ in.

S. DECCAN PENINSULA (?); *Herb. Wight*.

Leaves $2\frac{1}{2}$ by $1\frac{1}{2}$ in.; petiole $\frac{1}{2}$ in. *Peduncles* $\frac{1}{2}$ in., axillary; spikes $1\frac{1}{2}$ by $\frac{3}{4}$ in.; bracts sub-4-seriate, all fertile, $\frac{3}{4}$ by $\frac{1}{2}$ in., narrowed at base; margin prominent, scarious, purplish; bracteoles $\frac{1}{2}$ in., linear, glabrous. *Calyx* $\frac{1}{2}$ in.; segments linear-lanceolate, puberulous. *Anther-cells* oblong, contiguous, parallel, one scarcely lower than the other, slightly whitened, not tailed at the base. *Ovary* glabrous, subglandular, style hairy near the base. *Capsule* not seen.—This appears much the finest species in the genus, but there is only a branchlet in *Herb. Wight*.

4. ***R. latior***, *Nees in DC. Prodr.* xi. 472; scabrous-pubescent, leaves

petioled ovate or broad-lanceolate, spikes ovoid or oblong dense often clustered, bracts roundly obovate margined hairy, bracteoles obovate margined, corolla $\frac{1}{2}$ in. *Wight Ic. t.* 1548; *T. Anders. in Journ. Linn. Soc.* ix. 518 (except the Ceylon plant). *R. longifolia*, *T. Anders. in Thwaites Enum.* 235, *partim*.

MTS. of S. DECCAN PENINSULA; *Wight, Gardner, &c.*

Stems herbaceous, hairy. *Leaves* $2\frac{3}{4}$ by $1\frac{1}{4}$ in., cuneate at both ends; petiole $\frac{1}{2}$ in. *Spikes* 1 by $\frac{1}{2}$ in.; bracts obscurely 4-seriate (many barren more or less unlike the fertile), $\frac{1}{4}$ by $\frac{1}{2}$ in., obtuse rarely apiculate; bracteoles similar to the bracts, but smaller. *Calyx* $\frac{1}{2}$ in.; segments linear-lanceolate, softly hairy. *Anther-cells* superposed, lower white-tailed. *Capsule* $\frac{1}{6}$ in., nearly glabrous. *Seeds* small, minutely glandular-verrucose, ultimately glabrous.—This is not allied to *R. repens* as Nees supposed, but may be a var. of *R. longifolia*, as T. Anderson first supposed.

5. *R. longifolia*, *Nees & Arn. in DC. Prodr.* xi. 471, *excl. Philippine example, not of Beddome*; nearly glabrous, leaves linear-lanceolate, spikes shortly oblong, often clustered, bracts biform fertile roundly obovate marginate minutely pubescent, corolla $\frac{1}{2}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 517, *chiefly*.

CEYLON; *Walker, &c.*

Leaves 4 by $\frac{1}{2}$ in. Flowerless bracts in 2 ranks on one side of the spike, ovate-lanceolate, obscurely margined. Otherwise as *R. latior*, from which this typical form of *R. longifolia* is easily separable: not so the

VAR. *latifolia*, *Wight ms.*; leaves lanceolate or ovate-lanceolate, barren bracts few less distinctly 2-ranked less unlike the fertile. *R. latior*, *Nees & T. Anders. in herb. partim*.—Ceylon, numerous examples. S. Travancore; *Beddome*.—I follow *Wight* (in preference to *Nees* and *T. Anderson*) in regarding all the Ceylon forms as one species, of which the S. Indian is an allied species, or a variety. *T. Anderson* divided *Thwaites* n. 89 between *R. latior* and *R. longifolia*, depending upon the breadth of the leaves alone.

6. *R. crenata*, *T. Anders. in Journ. Linn. Soc.* ix. 518; leaves petioled ovate-lanceolate sparsely hairy, spikes short dense 1-sided, bracts markedly biform barren oblong acute mucronate fertile orbicular marginate, corolla $\frac{1}{2}$ in. *Rungia* sp. n. 9, *Herb. Ind. Or. H. f. & T.*

W. DECCAN PENINSULA; Canara, *Law*; Concan, *Stocks*; Belgaum, *Ritchie*.

Stem herbaceous, ramous, nearly glabrous. *Leaves* $2\frac{1}{2}$ by 1 in., base shortly acuminate, sparsely laxly hairy on both surfaces, finally scabrid lineolate glabrate; petiole $\frac{1}{2}$ in. *Spikes* 1 by $\frac{2}{3}$ in., terminal, or sessile quasi-axillary clustered; flowerless bracts in 2 regular series on one side the spike, $\frac{1}{2}$ by $\frac{1}{10}$ in., green, striate, not or very narrowly margined; flowering bracts $\frac{1}{2}$ in. diam., somewhat hairy; bracteoles $\frac{1}{2}$ in., obovate, scarious-margined. *Calyx* $\frac{1}{2}$ in.; segments linear-lanceolate, pubescent. *Capsule* scarcely $\frac{1}{2}$ in., pubescent.—Allied to *R. parviflora*, *Nees*, but with much longer flowerless bracts.

7. *R. stolonifera*, *Clarke*; leaves petioled ovate minutely scabrid-pubescent, bracts ovate minutely hairy, calyx glabrous, corolla tubular $\frac{1}{2}$ – $\frac{3}{4}$ in., anther-cells white-tailed. *Dicliptera* sp. n. 14, *Herb. Ind. Or. H. f. & T.* *Justicia* sp. (Sect. *Rostellularia*), *Benth. ms. in Herb. Kew.*

KHASIA MTS., alt. 2–5000 ft.; *H. f. & T., &c.*

Stems 18 in., procumbent, rooting, branched; many small-leaved barren branches from the lower nodes. *Leaves* 1–3 by $\frac{3}{4}$ – $1\frac{1}{2}$ in., cuneate at both ends, undulate sometimes sinuate, with few minute scattered hairs on both surfaces; petiole $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ – $1\frac{1}{2}$ in., terminal and quasi-axillary, imperfectly 2–4-farious; bracts $\frac{1}{2}$ by $\frac{1}{2}$ in., sub-obtuse, scarious-margined; bracteoles oblong, nearly as long as the bracts. *Calyx* $\frac{1}{2}$ in., deeply 5-partite; segments narrowly lanceolate, scarious. *Corolla-tube* $\frac{1}{2}$ by

$\frac{1}{2}$ in., narrowly cylindric, straight; limb $\frac{1}{8}$ in., 2-lipped; upper lip erect, subentire, lower pendent. *Capsule* $\frac{1}{8}$ – $\frac{1}{6}$ in., nearly glabrous; placentæ rising elastically from the base. *Seeds* minutely glandular-papillose, glabrate when fully ripe.

8. **R. khasiana**, *T. Anders. in Journ. Linn. Soc.* ix. 518; leaves petioled ovate or elliptic minutely scabrid-pubescent, bracts ovate acuminate somewhat pubescent, calyx minutely pubescent, corolla $\frac{1}{4}$ – $\frac{1}{3}$ in. *Rungia* sp. n. 11, *Herb. Ind. Or. H. f. & T. Acanthacea, Griff. Itin. Notes*, 36, n. 589.

KHASIA MTS., alt. 3000 ft.; *Griffith* (Kew Distrib. n. 6165), *H. f. & T.*

Much branched; branches 10 in., pubescent, or with deflexed hairs. *Leaves* $3\frac{1}{2}$ by $2\frac{1}{2}$ – $1\frac{1}{2}$ in., cuneate at both ends; petiole $\frac{1}{2}$ in. *Spikes* 1–2 in., terminal and on short lateral branches, quadrifarious; bracts $\frac{1}{2}$ – $\frac{1}{4}$ by $\frac{1}{4}$ in., acutely or long acuminate, scarious-margined, nervous; bracteoles $\frac{1}{2}$ in., linear. *Calyx* scarcely $\frac{1}{4}$ in., segments narrowly linear. *Anther-cells* superposed, mucous. *Capsule* $\frac{1}{2}$ in., pubescent, placentæ rising elastically from the base. *Seeds* minutely verrucose.

9. **R. himalayensis**, *Clarke*; leaves long-petioled ovate minutely scabrid-pubescent, spikes slenderly peduncled 4-farious secund, bracts ovate shortly acuminate somewhat pubescent, calyx minutely pubescent, corolla $\frac{1}{4}$ – $\frac{1}{3}$ in.

E. NEPAL; Tambur River, alt. 4000 ft., *J. D. H. SIKKIM*, alt. 3–4000 ft.; *Dikeeling, Clarke*.

Stems 1 foot, diffuse, weak, branched, pubescent. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ –1 in., cuneate at both ends; petiole $\frac{1}{2}$ in. *Spikes* 1 in.; peduncles $\frac{1}{2}$ –1 in.; bracts $\frac{1}{4}$ by $\frac{1}{6}$ in., scarious-margined; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{6}$ in., segments sublinear. *Anther-cells* superposed, lower mucous or whitened at base. *Ovary* nearly glabrous; style thinly hairy at base. *Capsule* less than $\frac{1}{2}$ in., minutely pubescent; young shortly glandular-verrucose. *Seeds* small, minutely verrucose, appearing punctate.—Differs from *R. repens* in the longer-petioled broader leaves and much smaller capsule and seeds; from *R. apiculata* in the longer petioled leaves, glabrous ovary, and slender peduncles (perhaps hardly sufficiently).

10. **R. linifolia**, *Nees in Wall. Pl. As. Rar.* iii. 110, and in *DC. Prodr.* xi. 469; leaves short-petioled elliptic acute nearly glabrous, spikes peduncled slender 4-farious secund, bracts lanceolate acute, corolla $\frac{1}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 517. *Justicia linifolia*, *Wall. Cat.* 2447. *J. gracilis*, *T. Anders. l. c.* 512. *Rostellularia gracilis*, *Wight Ic. t.* 1541.

W. DECCAN PENINSULA, from the Concan southwards, *Heyne, Wight, &c.*

Stems 6–12 in., slender, minutely pubescent. *Leaves* 1 by $\frac{1}{2}$ – $\frac{1}{3}$ in., from ovate to narrow-lanceolate, often apiculate, base cuneate or almost rounded, minutely scabrid or glabrous, lineolate on both surfaces; petiole usually less than $\frac{1}{6}$ in. *Spikes* 1 by $\frac{1}{4}$ in.; peduncles 0–1 in., slender; bracts $\frac{1}{2}$ – $\frac{1}{6}$ in., minutely pubescent, green or narrowly scarios-margined, obscurely striate; bracteoles $\frac{1}{2}$ in., linear-lanceolate. *Calyx* $\frac{1}{4}$ in.; segments sublinear, pubescent. One *anther-cell* lower than the other, acute hardly tailed at the base. *Ovary* pubescent, style glabrous except close to the base. *Capsule* not seen.

11. **R. apiculata**, *Bedd. Ic. Pl. Ind. Or. t.* 247; leaves petioled ovate or linear-oblong puberulous on the nerves beneath, spikes peduncled quadrifarious secund, bracts ovate-lanceolate apiculate minutely pubescent, calyx pubescent, corolla $\frac{1}{4}$ – $\frac{1}{3}$ in. *R. repens*, var., *T. Anders. in Thwaites Enum.* 235, in *Obs.*—*Rungia* sp. n. 8, *Herb. Ind. Or. H. f. & T.*

MTS. OF S. DECCAN; Tinnevely Hills, alt. 4000 ft., *Beddome*. CEYLON; *Thwaites*, *C. P.* n. 1973.

Stems 6–15 in., diffuse, branched, rooting, minutely pubescent. *Leaves* $2\frac{1}{2}$ by

$\frac{3}{4}$ –1 in., cuneate at both ends; petiole $\frac{1}{8}$ in.; leaves very variable, on one branch are seen ovate upper leaves and below them a leaf $1\frac{1}{4}$ by $\frac{1}{8}$ in. *Spikes* $1\frac{1}{2}$ in.; peduncles $\frac{1}{4}$ –1 in.; bracts $\frac{1}{4}$ in., narrowly scarious-margined, finely striate; bracteoles $\frac{1}{2}$ in., sublinear. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., segments sublinear. *Anther-cells* superposed, muticous. *Ovary* hairy, style-base glabrous; young capsule densely hairy. *Capsule* $\frac{1}{2}$ in., pubescent; seeds small, verrucose.

VAR. *compta*; leaves small short-petioled lanceolate.—S. Travancore; *Beddome*.—*Leaves* 1 by $\frac{1}{2}$ in.; petiole $\frac{1}{10}$ in.: spikes in flower, capsule not seen.

12. *R. repens*, *Nees in Wall. Pl. As. Rar.* iii. 110, and in *DC. Prodr.* xi. 472; leaves subsessile oblong-lanceolate scabrid-puberulous, bracts round apiculate nearly glabrous, corolla $\frac{1}{4}$ in., seeds $\frac{1}{16}$ in. diam. concentrically rugose. *Wight Ic.* t. 465; *Dalz. & Gibs. Bomb. Fl.* 196; *T. Anders. in Journ. Linn. Soc.* ix. 518. *Justicia repens*, *Linn.*; *Roxb. Corom. Pl.* ii. 29, t. 152, and *Fl. Ind.* i. 132; *Wall. Cat.* 2459. *Dicliptera repens*, *Ruem. & Sch. Syst.* i. 171.—*Burm. Thes. Zeyl.* t. 3, fig. 2.

Throughout INDIA, from the Punjab and Bengal to CEYLON; common. (No specimens from the Malay Peninsula.)

A procumbent, rooting, ramous weed; branches quadrangular, pubescent or nearly glabrous. *Leaves* 2 by $\frac{2}{3}$ in., or often smaller narrower; petiole rarely so much as $\frac{1}{8}$ in. *Spikes* 2 by $\frac{1}{2}$ in., appearing often peduncled, the 2 leaves close to their base usually much reduced; bracts closely regularly imbricated 4-farious, spike less 1-sided than in most species; bracts $\frac{1}{4}$ by $\frac{1}{8}$ – $\frac{1}{4}$ in., white margin broad prominent; bracteoles $\frac{1}{2}$ in., linear-lanceolate, minutely pubescent. *Calyx* $\frac{1}{2}$ in.; segments linear-lanceolate, pubescent. *Corolla* white, with rose or purple spots. *Anther-cells* superposed, lower white-tailed. *Ovary* glabrous, style thinly hairy at base. *Capsule* $\frac{1}{2}$ in. and upwards, minutely thinly hairy. *Seeds* ovoid, moderately compressed, rugose almost furrowed.

13. *R. elegans*, *Dalz. & Gibs. Bomb. Fl.* 196; stems patently white-hirsute, leaves subsessile ovate acuminate, bracts round ovate apiculate minutely hairy, corolla $\frac{1}{2}$ in. fine blue. *R. repens* var. *villosa*, *Nees in DC. Prodr.* xi. 472. *Justicia repens*, *Wall. Cat.* 2459, letter B partly.

W. DECCAN PENINSULA; Concan and Canara, *Wight, Law, Stocks, &c.*

Possibly a large form of *R. repens*. *Leaves* attaining 3 by $1\frac{1}{2}$ in., nerves beneath prominent, often patently white-hairy. *Spikes* $\frac{1}{2}$ – $\frac{3}{4}$ in. broad; bracts large, scarious margin very prominent sometimes coloured purplish. *Capsule* $\frac{1}{2}$ in., thin, very hairy; seeds concentrically furrowed, the ridges very sharp sometimes crested.

14. *R. Beddomei*, *Clarke*; leaves nearly sessile ovate acute subglabrous, spikes slenderly peduncled dense, bracts broadly ovate apiculate nearly glabrous, corolla $\frac{1}{4}$ in.

TENASSEERIM; Mooleyit and the Forest Ranges, *Beddome*.

Stems diffuse, branched, puberulous. *Leaves* 2 by $\frac{3}{4}$ –1 in., obscurely or not lineolate; petiole $\frac{1}{8}$ in. *Spikes* $1\frac{1}{2}$ by $\frac{1}{2}$ in., appearing to form lax terminal corymbs; uppermost leaves $\frac{1}{4}$ by $\frac{1}{20}$ in.; bracts nearly as of *R. repens*, more densely imbricated, 4-farious, regular. *Capsule* $\frac{1}{2}$ in. *Seeds* very small, minutely verrucose.—The spikes bear considerable resemblance to *R. repens*; but it seems more nearly allied to *R. himalayensis*, which differs in its long-petioled leaves, and slenderer spikes.

15. *R. Brandisii*, *Clarke*; leaves ovate or ovate-lanceolate acuminate at both ends nearly glabrous, bracts all fertile ovate acuminate nearly glabrous, bracteoles boat-shaped acuminate pubescent, corolla $\frac{1}{4}$ in.

TENASSEERIM; *Parish, Brandis, Beddome*.

Stems 18 in., nearly glabrous. *Leaves* $3\frac{1}{2}$ by $\frac{3}{4}$ – $1\frac{1}{2}$ in., membranous, finely lineolate; petiole 1 in. *Spikes* $1\frac{1}{2}$ by $\frac{1}{2}$ in., terminal and axillary clustered short-peduncled; bracts $\frac{1}{4}$ by $\frac{1}{8}$ in., obscurely 4-ranked, very narrowly marginate; bracteoles $\frac{1}{2}$ in.

Calyx $\frac{1}{2}$ in.; segments linear-lanceolate, pubescent. *Anther-cells* superposed, lower white-tailed. *Capsule* $\frac{1}{2}$ in., puberulous. *Seeds* small, minutely verrucose.

16. **R. parviflora**, *Nees in Wall. Pl. As. Rar.* iii. 110, and in *DC. Prodr.* xi. 469, excl. *syn.*; leaves small ovate or lanceolate nearly glabrous, bracts dimorphic barren elliptic or oblong subobtusely striate hardly margined, fertile obovate glabrous scarious-margined ciliate, bracteoles elliptic scarcely acute, corolla $\frac{1}{2}$ in. *R. repens*, *T. Anders. in Journ. Linn. Soc.* ix. 518 partly, not of *Nees*. *R. longifolia*, *Bedd. Ic. Pl. Ind. Or.* t. 266, not of *Nees*.

S. DECCAN PENINSULA; *Wight* (2011, 2285 *Herb. Propr.*). CEYLON; *Thwaites* (C. P., nn. 257, 3354).

A small, ramous weed. Lower leaves 1 by $\frac{1}{4}$ – $\frac{1}{2}$ in., petioled, ovate, upper narrow sometimes linear. *Spikes* $\frac{3}{4}$ by $\frac{1}{2}$ in., nearly all terminal, markedly 1-sided; barren bracts not cuspidate. *Capsule* $\frac{1}{2}$ in.; seeds small, minutely verrucose.—This, the typical *R. parviflora*, *Nees*, appears a very rare plant; *Nees*, however, referred numerous specimens with the fertile bracts hairy all over to *R. parviflora*, but which are *R. pectinata*, *Nees*, as far as the description goes.

VAR. pectinata; flowerless bracts mucronate often cuspidate flowering hairy. *R. pectinata*, *Nees in DC. Prodr.* xi. 470; *Wight Ic.* t. 1547; *T. Anders. in Journ. Linn. Soc.* ix. 517. *R. parviflora*, *Nees l. c. partly*; *Griff. Notul.* iv. 144; *Dalz. & Gibs. Bomb. Fl.* 195. *R. polygonoides*, *Nees in Wall. Pl. As. Rar.* iii. 110, and *Cat.* 7181, and in *DC. Prodr.* xi. 471; *Dalz. & Gibs. Bomb. Fl.* 196. *Justicia pectinata*, *Linn. Amœn. Acad.* iv. 299; *Lamk. Ill. i.* t. 12, fig. 3; *Roxb. Corom. Pl.* ii. 29, t. 153, and *Fl. Ind. i.* 133; *Wall. Cat.* 2458. *J. parviflora*, *Retz Obs.* v. 9. *J. infracta*, *Vahl Enum. i.* 155.—Throughout India, from the Himalaya to Ceylon and Pegu, a universal weed.—Usually ramous. Leaves $\frac{3}{4}$ by $\frac{1}{2}$ in.; petiole $\frac{1}{4}$ in. *Spikes* 1 by $\frac{1}{2}$ in., terminal and axillary, clustered, subsessile, distinctly 1-sided; barren bracts $\frac{1}{2}$ by $\frac{1}{12}$ in., scarcely margined; fertile $\frac{1}{10}$ in. diam., orbicular, apiculate, scarious-marginate, hairy on back as well as on margins; bracteoles $\frac{1}{10}$ in., elliptic, subacute. *Calyx* $\frac{1}{12}$ in.; segments linear-lanceolate, pubescent. *Corolla* blue or whiteish, upper lip short. *Anther-cells* superposed, lower white-tailed.—The area of this abundant plant should perhaps be extended to Java, &c., but the examples thence (*Dicliptera cœrules*, *Blume Bijl.* 791) differ considerably from all the Indian material, which is very uniform in character, the size of the heads and bracts varying a little.

VAR. muralis; spikes very dense, barren bracts ovate acute hardly longer than the fertile. *R. muralis*, *Nees in DC. Prodr.* xi. 470.—S. Deccan Peninsula; *Hohenacker*, n. 18, &c. Chittagong; *J. D. H.*, &c. *Distrib. Ava.*—Spikes sometimes $1\frac{1}{2}$ by $\frac{1}{2}$ in., densely strobiliform.

VAR. origanoides; leaves narrowly lanceolate, spikes dense narrow, barren bracts orbicular scarious-margined very hairy on the back nearly as the fertile. *R. origanoides*, *Nees in Wall. Pl. As. Rar.* iii. 110, and *Cat.* 7182, and in *DC. Prodr.* xi. 471.—Pegu; *Wallich*.

SPECIES NOT SEEN.

R. MASTERSI, *T. Anders. in Journ. Linn. Soc.* ix. 519; glabrous, leaves long-petioled ovate, spikes terminal ternate or paniced lax, bracts remote alternate spatulate-linear obtuse, corolla small.

ASSAM; banks of *R. Soonder*, *Masters*.

Herbaceous, larger than the other species of the genus. Leaves (including petiole) 5–8 by $1\frac{1}{2}$ –2 in., minutely lineolate, pale beneath. *Spikes* 3–6 in., more or less secund, glabrous or pubescent; bracts $\frac{1}{2}$ by $\frac{1}{4}$ in., mostly linear, obtuse, glabrous; bracteoles as the bracts or ovate acute glumaceous. *Corolla* $\frac{1}{2}$ in., glabrous. *Capsule* $\frac{1}{2}$ in., sparsely puberulous or pubescent (*T. Anderson*).

XLVII. DICLIPTERA, *Juss.*

Diffuse herbs. Leaves ovate, acute, entire or obscurely undulate. Inflorescence cymose, clustered or paniced; proper bracts opposite, unequal,

larger than the calyx (except in *D. parvibracteata*); flowers sessile, opposite, one of each pair usually reduced to a rudimentary calyx and bracteoles; bracteoles linear or linear-lanceolate, as long as the calyx (except in *D. parvibracteata*). *Calyx* sub-5-partite; segments equal, linear-lanceolate, more or less pubescent. *Corolla* red or rose, purple-spotted, tube slender, limb deeply 2-lipped; upper lip entire or emarginate, lower 3-lobed recurved. *Stamens* 2; anthers 2-celled; cells ovoid, superposed, muticous. *Ovary* 4-ovulate; style filiform, shortly bifid. *Capsule* clavate, stalk solid; placentæ rising elastically from their base. *Seeds* ovoid, compressed, glabrous, verrucose or glandular subpapillose.—Species 60, tropics of both Hemispheres.

Justicia chinensis, Vahl, *Roxb. Fl. Ind.* i. 124, Wall. *Cat.* 2466 (type sheet), has been long cultivated at Calcutta, having been introduced from China or Malaya; it looks like an enlarged or garden form of *D. Burmanni*, noticed below under *D. Leonotis*, Dalz.

* *Inflorescence panicled*, i. e. each pair of bracts mostly long-petioled.

1. ***D. parvibracteata***, Nees in Wall. *Pl. As. Rar.* iii. 111, and in DC. *Prodr.* xi. 488; leaves ovate acuminate nearly glabrous, bracts $\frac{1}{6}$ in. linear. *Justicia retorta*, Vahl *Enum.* i. 150 ? *J. latebrosa*, Koen.; *Roxb. Fl. Ind.* i. 125.

MADRAS; Circars, Wight (Herb. Propr. n. 51 or 2014); Vizagapatam (Jaipoor Hills), Beddome.

Stem diffuse, striate, obscurely pubescent upwards. *Leaves* 5 by $2\frac{3}{4}$ in. (or all except the lowest small, 1–2 in.), base shortly acuminate; petiole 1 in. *Panicle* 6 in., divaricate, lax, nearly glabrous; floral leaves at the bifurcations $\frac{1}{10}$ – $\frac{1}{4}$ in., linear-lanceolate; bracteoles $\frac{1}{16}$ in., linear. *Calyx* $\frac{1}{16}$ in., sub-5-partite; segments linear-lanceolate, minutely pubescent. *Corolla* $\frac{1}{2}$ in., slender, minutely pubescent. *Capsule* $\frac{1}{2}$ in., clavate, pubescent; placentæ rising elastically.—*Justicia latebrosa*, Koen., has never been satisfactorily recovered. The Ic. Ined. of this at Kew is *D. parvibracteata*; a separate imperfect drawing of a capsule added in the corner perhaps not pertaining. But Roxburgh's description does not suit in several points, of which "Flowers large" is difficult to get over. A scrap in Wallich's Herbarium, marked in old handwriting "*Justicia latebrosa*, Roxb.," is *Dicliptera cuneata*.

2. ***D. Beddomei***, Clarke; leaves ovate acuminate minutely pubescent, bracts $\frac{1}{2}$ in. linear-oblong suddenly mucronate ciliate.

N. MADRAS; Nallaymallays (in Kurnool), Beddome.

Stems diffuse, striate, glabrous except the tips. *Leaves* $5\frac{1}{2}$ by $3\frac{1}{4}$ in., pubescent beneath or nearly glabrous, base acuminate; petiole 2 in. *Panicle* 6 in., lax branches often patently white-hairy; floral leaves at the bifurcations gradually reduced, uppermost linear; bracteoles $\frac{1}{4}$ in., linear-lanceolate. *Corolla* $\frac{1}{2}$ in., minutely pubescent. *Capsule* nearly $\frac{1}{2}$ in., clavate, pubescent; placentæ rising elastically from the base. *Seeds* verrucose.

3. ***D. Kurzii***, Clarke; patently white-hairy, leaves lanceolate, bracts $\frac{1}{2}$ in. linear-lanceolate, hirsute glandular-hairy. *D. speciosa*, Var. β only, Kurz in Journ. As. Soc. 1873, pt. ii. 97.

PEGU; Kurz.

Stem stout, striate, patently white-hairy. *Leaves* 5 by $1\frac{1}{2}$ in., acuminate at both ends, thinly hairy on both surfaces; petiole $\frac{1}{4}$ in. *Panicle* 6–15 in., divaricate, lax, patently white-hairy; bracts and bracteoles with glandular hammer-headed hairs, and also white-hirsute. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., slender, minutely hairy. *Capsule* $\frac{1}{2}$ in., clavate, pubescent, placentæ rising elastically. *Seeds* verrucose.—Placed doubtfully as a var. of *D. speciosa* by Kurz; the inflorescence is different, and the corolla is considerably smaller.

4. ***D. speciosa***, Kurz in *Journ. As. Soc.* 1873, pt. ii. *Var. a. only*; leaves large lanceolate thinly hairy on both surfaces, bracts $\frac{1}{2}$ – $\frac{1}{2}$ in. spatulate-oblong obtuse hirsute glandular-hairy.

PEGU; Kurz.

Stem terete, glabrous, except towards the top. *Leaves* 8 by $2\frac{1}{2}$ in., acuminate at both ends; petiole $1\frac{1}{2}$ in. *Cymes* 1– $1\frac{1}{2}$ in., axillary, often several together, sometimes from the lower axils; mostly subsimply umbelled, rarely compound; floral leaves $\frac{1}{2}$ in., linear; proper bracts $\frac{1}{2}$ in. broad, on cinereous-pubescent peduncles $\frac{1}{2}$ in. long. *Corolla* nearly 1 in., lower lip broad. *Capsule* (immature) clavate, minutely glandulose-pubescent, 4-seeded.

5. ***D. zeylanica***, Nees in *DC. Prodr.* xi. 474; leaves ovate acuminate minutely scabrid or glabrate, bracts ovate or elliptic mucronate glabrous or minutely pubescent. *D. bivalvis*, Nees l. c. 475 (as to the Indian material); Dalz. & Gibs. *Bomb. Fl.* 196; Wight *Ill. t.* 164 b, fig. 10, and *l.c.* t. 1551; T. Anders. *Thwaites Enum.* 235, and in *Journ. Linn. Soc.* ix. 519, not of Juss.

W. DECCAN PENINSULA from the Concan southward, and CEYLON; frequent.

Stem glabrous, sometimes pubescent or densely woolly. *Leaves* attaining 5 by $2\frac{1}{2}$ in., base shortly acuminate; petiole $\frac{3}{4}$ in. *Inflorescence* variable; in the type of Wight running into terminal panicles, upper floral leaves linear, peduncles $\frac{1}{2}$ –1 in.; more often cymes axillary, abbreviated, peduncles ternate; or peduncles subobsolete, or the inflorescence reduced to one pair of bracts; bracts $\frac{1}{2}$ in. broad in the type specimen, often only $\frac{1}{4}$ in. broad, never acuminate, either cuneate or subobtusely mucronate, frequently nervose; bracteoles small, linear-lanceolate. *Corolla* $\frac{1}{2}$ in. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., clavate, pubescent. *Seeds* minutely verrucose.—*Dicliptera bivalvis*, Juss., is exactly *Justicia bivalvis*, Linn.; which, in so far as it relates to any Indian plant, is founded on Rheede *Hort. Mal.* ix. t. 43, which cannot represent the present plant (and may be *Peristrophe montana*). *D. bivalvis*, Juss., can, therefore, not even *partim* be the present *D. zeylanica*.

** *Inflorescence clustered subcapitate*, i. e. each pair of bracts, subsessile or very shortly petioled (see also 5, *D. zeylanica*).

6. ***D. cuneata***, Nees in *Wall. Pl. As. Rar.* iii. 111, and in *DC. Prodr.* xi. 481; leaves ovate acuminate glabrous, flower-clusters often long-peduncled, bracts obovate elliptic or cuneate apiculate or mucronate nearly glabrous. Wight *l.c.* t. 1552; T. Anders. in *Journ. Linn. Soc.* ix. 521. *Justicia umbellata*, Wall. *Cat.* 2467.

S. MADRAS; Wight, &c.; Tinnevely, Beddome.

Pairs of bracts on short peduncles $0\frac{1}{2}$ – $1\frac{1}{2}$ in., often 3–8 together forming a subcapitate cluster; these clusters often on a peduncle $\frac{1}{2}$ – $1\frac{1}{2}$ in., floral leaves supporting the cluster usually reduced, narrow.—Otherwise very near the glabrous forms of *D. zeylanica* with congested inflorescence: both T. Anderson and Beddome have, however, treated the species as distinct.

7. ***D. reptans***, Nees in *DC. Prodr.* xi. 483; leaves elliptic acuminate puberulous beneath, flower-clusters axillary subsessile, bracts elliptic acute mucronate softly pubescent.

MERGUI; Griffith.

Stems procumbent, rooting; branches 6–10 in., erect, puberulous. *Leaves* 3 by 1 in., base shortly acuminate; petiole $\frac{1}{4}$ in. *Peduncles* to the flower-clusters $0\frac{1}{2}$ in.; floral leaves $\frac{1}{2}$ in., linear; peduncles to the pairs of bracts $0\frac{1}{2}$ in., minutely pubescent; bracts nearly $\frac{1}{2}$ by $\frac{1}{4}$ in., 1-nerved; secondary nerves oblique, subprominent. *Corolla* $\frac{3}{4}$ in., slender.—*Capsule* not seen; and anther-cells rather long for a *Dicliptera*; it is possibly a *Peristrophe* (as Griffith marked it in the field), and greatly resembles *P. acuminata* var. *fragilis*, except that the flower is smaller.

8. **D. micranthes**, *Nees in Wall. Pl. As. Rar.* iii. 112, and in *DC. Prodr.* xi. 484, *excl. syn.*; leaves ovate acuminate nearly glabrous, flower-clusters mostly in axillary whorls, bracts oblong somewhat obovate cuspidate ciliate. *Dalz. & Gibs. Bomb. Fl.* 197; *T. Anders. in Journ. Linn. Soc.* ix. 521.

CENTRAL INDIA, alt. 1-3000 ft.; from Behar (*J. D. H.*) and Chota Nagpore to the Concan, frequent.—DISTRIB. Abyssinia.

Branches striate, puberulous or glabrate. *Leaves* 4 by $1\frac{1}{2}$ in., base shortly acuminate; petiole $1\frac{1}{2}$ in. *Bracts* $\frac{1}{2}$ by $\frac{1}{2}$ in., often nearly glabrous except the densely white ciliate margins. *Corolla* scarcely exceeding $\frac{1}{2}$ in., very slender. *Capsule* $\frac{1}{2}$ in., clavate, very shortly stalked, membranous, glabrous except the minutely hairy tip. *Seeds* very small, conspicuously verrucose.

9. **D. Leonotis**, *Dalz. ms.*; leaves elliptic acuminate glabrous, flower-clusters mostly in axillary whorls, bracts oblong-lanceolate acuminate cuspidate minutely pubescent. *D. Burmanni*, *Nees in Wall. Pl. As. Rar.* iii. 112, and in *DC. Prodr.* xi. 483 *partly, not of T. Anders.*; *Dalz. & Gibs. Bomb. Fl.* 196?. *Justicia chinensis*, *Wall. Cat.* 2466, *letter c partly.*

DECCAN PENINSULA?; *Wight* (*Herb. Propr. n.* 2016). GOOJERAT and AJMERE, *Dalzell.*

Closely allied to *D. micranthes*, but the bracts, flowers, capsules and seeds considerably larger. *Leaves* 3 by 1 in.; petiole $\frac{1}{2}$ in. *Bracts* $\frac{1}{2}$ by $\frac{1}{2}$ in., much acuminate. *Corolla* $\frac{3}{4}$ in. *Capsule* $\frac{1}{4}$ in., very hairy. *Seeds* much larger than in *D. micranthes*, minutely glandulose-papillose, scarcely verrucose.—*Nees* grounds his *D. Burmanni* on *Burmans* figure of a Java species; this is *D. Burmanni*, *T. Anders. in Journ. Linn. Soc.* ix. 520. In founding the species, *Nees* states he had only seen one specimen, viz. *Wight n.* 2016, which sheet named by *Nees*' hand is at Kew; but it is not the plant figured by *Burmans*.

10. **D. riparia**, *Nees in Wall. Pl. As. Rar.* iii. 112, and *Cat.* 7183, and in *DC. Prodr.* xi. 480; leaves ovate acuminate glabrous or pubescent, flower-clusters terminal and axillary subverticillate, bracts narrowly obovate obtuse hairy ciliate, corolla $\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 520.

PEGU and TENASSERIM; *Wallich, Griffith, McLelland, &c.*

Branches elongate. *Leaves* $4\frac{1}{2}$ by $1\frac{1}{2}$ - $2\frac{1}{2}$ in., base shortly acuminate; petiole $1\frac{1}{2}$ in. *Flowers* subsessile; bracts unequal, similar, larger $\frac{1}{2}$ by $\frac{1}{2}$ in.; bracteoles $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{2}$ in.; segments linear, nearly glabrous. *Capsule* $\frac{1}{2}$ in., clavate, nearly glabrous. *Seeds* minutely papillose, hardly verrucose.—Perhaps only a form of *D. Roxburghiana*, differing in the softly pubescent flower-clusters, and the very obtuse often emarginate bracts. The numerous examples are exactly alike, but come from one neighbourhood.

11. **D. Roxburghiana**, *Nees in Wall. Pl. As. Rar.* iii. 111, and in *DC. Prodr.* xi. 483, *excl. syn.*; leaves elliptic acute obscurely pubescent or glabrate, flower-clusters axillary and terminal sessile more rarely shortly peduncled, bracts cuneate-elliptic or obovate apiculate not acuminate. *T. Anders. in Journ. Linn. Soc.* ix. 519, *partly*; *Dalz. & Gibs. Bomb. Fl.* 196?. *Justicia chinensis*, *Wall. Cat.* 2466, *letter D*, and *part B, C.*

Plains of N. INDIA, from the Punjab to Assam, Silhet and E. Bengal, frequent. BHOTAN; *Griffith.*

Stems 1-3 ft., elongate, nearly glabrous. *Leaves* $2\frac{1}{2}$ by 1 in., base cuneate; petiole $\frac{1}{2}$ in. *Bracts* nearly $\frac{1}{2}$ by $\frac{1}{2}$ in., often 3-nerved, ciliate, thinly pubescent. *Corolla* $\frac{3}{4}$ in. *Capsule* $\frac{1}{2}$ in., clavate, puberulous or glabrous. *Seeds* conspicuously verrucose.—The whole of the plains form of *D. Roxburghiana* differs from *Var.*

bupleuroides in the broader, more or less obovate, bracts. Nees founded his species on the common Assam and E. Bengal plant, and the original ticket on his type specimen is marked Assam. Benthams, however (in Fl. Hongk. 266), says this was an error, and that this type specimen came from the Calcutta Botanic Garden; but it is not known how Benthams discovered this. Nees, however, is in error in citing Roxburgh's *Justicia chinensis*, for Roxburgh's *Ic. Ined.* proves this to have been the true plant, long cultivated at Calcutta.

VAR. *bupleuroides*, Nees in Wall. Pl. As. Rar. iii. 111, and in DC. Prodr. xi. 485, excl. syn. Roxb. (sp.); leaves ovate or elliptic acute or acuminate glabrous or somewhat pubescent, flower-clusters dense axillary and terminal mostly sessile, bracts linear or linear-oblong nearly parallel-sided acuminate cuspidate. *D. cardiocarpa*, Nees in Wall. Pl. As. Rar. iii. 111, and in DC. Prodr. xi. 480. *D. hirtula*, Nees in DC. Prodr. xi. 485. *D. Roxburghii*, T. Anders. in Journ. Linn. Soc. ix. 519, chiefly. *D. Roxburghiana*, Boiss. Fl. Orient. iv. 526, not of Nees. *D. rupestris*, Nees in DC. Prodr. xi. 486. *D. crinita*, Nees l. c. 485, as to the Indian examples so named by Nees. *Justicia chinensis*, Wall. Cat. 2466, letter B, C partly; Roxb. Fl. Ind. i. 125, Obs. only. *J. canescens*, Wall. Cat. 2423.—Throughout India in the hills, alt. 1–6000 ft., abundant in the north, becoming rare in the Malabar Ghauts; in the Himalaya from Kashmir to Upper Assam and the Chittagong Hills; Mt. Aboo, Stocks; Central India. Distrib. Afghanistan.—A large very uniform series, varying only slightly in the pubescence of the bracts. In the extreme forms the bracts are $\frac{3}{4}$ by $\frac{1}{16}$ in., glistening ciliate, and in some of Beddome's Malabar specimens they are almost subulate. Though the bracts are often broader than in these, the plant as a whole is tolerably well separable from *D. Roxburghiana*.

XLVIII. PERISTROPHE, Nees.

Erect, spreading herbs. Leaves entire. Flower-clusters axillary or terminal, often paniced by the reduction of the floral leaves; bracts 1–4 together, linear or ovate, longer (rarely shorter) than the calyx; bracteoles linear-lanceolate, shorter than the bracts. Calyx deeply 5-lobed; segments equal, linear-lanceolate. Corolla rose or purple; tube slender, limb deeply 2-lipped, upper lip subentire, lower very shortly 3-lobed. Stamens 2; filaments pubescent below; anthers 2-celled, cells linear (or in *P. bicalyculata* ovoid), mucous, one higher than the other or distant. Ovary 4-ovulate; style filiform, minutely bifid. Capsule ellipsoid, stalked, usually 4-seeded, more or less dusky pubescent. Seeds ovoid, compressed, glabrous, minutely glandular-papillose, scarcely verrucose.—Species 15, from Tropical and S. Africa to New Caledonia and S. Japan.

1. *P. bicalyculata*, Nees in Wall. Pl. As. Rar. iii. 113, and in DC. Prodr. xi. 496; thinly patently hairy, leaves ovate acuminate, panicle lax divaricate, bracts linear or linear-spathulate acute mucronate, corolla $\frac{1}{2}$ – $\frac{1}{3}$ in. Dalz. & Gibs. Bomb. Fl. 197; T. Anders. in Journ. Linn. Soc. ix. 521. *P. Kotschyana*, Nees l. c. 197. *Justicia bicalyculata*, Vahl Symb. ii. 13; Roxb. Fl. Ind. i. 126; Blume Bijdr. 783; Wall. Cat. 2457. *J. ligulata*, Lamk. Ill. t. 12, fig. 2; Cav. Ic. t. i. 52, t. 71. *Dianthera malabarica*, Linn. f. Suppl. 85. *D. bicalyculata*, Retz in Act. Holm. 1775, 297, t. 9, and Obs. i. 10. *Ruellia paniculata*, Linn. Herb.

TROPICAL and SUBTROPICAL INDIA; from the Punjab and Scinde to Assam, Pegu and Madras, very common; not known from Ceylon.—DISTRIB. Tropical Africa.

Leaves 2 by 1 in.; petiole $\frac{1}{4}$ in. Each pair of proper bracts long-petioled; bracts $\frac{1}{2}$ by $\frac{1}{16}$ in., unequal. Anther-cells ovoid, remote, resembling those of *Dicliptera*, not of other *Peristrophes*. Capsule $\frac{1}{2}$ – $\frac{1}{3}$ in. Seeds minutely glandular-papillose.

VAR. rivinoides; young inflorescence axillary very short-peduncled capitellate. *P. rivinoides*, Wall. Cat. 2488. *P. bicalyculata*, Var. *B*, Nees ms. in Wight Herb. Propr. n. 2018 c.—S. India.

2. **P. undulata**, Nees in DC. Prodr. xi. 496; puberulous, leaves lanceolate undulate, panicles small close, bracts linear-lanceolate, corolla $\frac{3}{4}$ in. *Justicia undulata*, Vahl Symb. ii. 8, excl. syn.

MALABAR (Koenig, fide Vahl). **NILGIRIS**; Beddome.

Leaves $2\frac{3}{4}$ by $\frac{3}{4}$ in., attenuate at both ends, sinuate, in Beddome's examples variegated; petiole $\frac{1}{2}$ in. Panicle 1–2 in. diam., terminal, hardly exceeding the upper leaves; bracts $\frac{1}{2}$ – $\frac{3}{4}$ by $\frac{1}{2}$ in., 2 or 3–4 together, 2–4-fld., lineolate, nearly glabrous. Corolla purple-red, tube $\frac{1}{2}$ in., limb $\frac{1}{2}$ in., lobes 2 very shortly toothed. Anther-cells linear, one placed close above the other. Capsule not seen.—This appears closely allied to *P. acuminata*, as Nees states.

3. **P. acuminata**, Nees in Wall. Pl. As. Rar. iii. 113, and in DC. Prodr. xi. 496; leaves narrowly lanceolate nearly glabrous, panicles compact, bracts $\frac{1}{2}$ by $\frac{1}{8}$ in. glabrous, corolla $\frac{3}{4}$ in. T. Anders. in Journ. Linn. Soc. ix. 521. *P. Blumeana*, Nees l. c. 495. *Justicia acuminata*, Wall. Cat. 2425, sheet B partly.

TAVOY; Wallich. **MALACCA**; Griffith.—**DISTRIB.** Java.

Leaves 3 by $\frac{3}{4}$ in., acuminate at both ends, lineate on both surfaces, minutely pubescent on the midrib beneath or glabrous; petiole $\frac{1}{2}$ in. Bracts 2–4 together, $\frac{1}{2}$ in. long or in other cymes of the same branch scarcely $\frac{1}{2}$ in. Anther-cells linear, one slightly overlapping the other, upper usually narrower curved. Capsule $\frac{1}{2}$ – $\frac{1}{2}$ in., nearly glabrous.—The plants here collected under *P. acuminata* are separated from *P. montana* by the much smaller corolla, and possibly include 2 or more species; but the material is insufficient. As noted by Nees, some of the specimens show great variation in the bracts on one branchlet; yet species have been founded on characters almost wholly drawn from them. In justification of throwing the species into one, it may be observed that the Malacca plant marked *P. acuminata* by T. Anderson is identical with the Java plant marked *P. Blumeana* by Nees; but there is no specimen from Burma (much less from Khasia) that matches this, as might be inferred from Nees and T. Anderson: and Miquel's *P. acuminata* from Java is very unlike *P. acuminata*, Nees.

VAR. fragilis; leaves larger ovate-lanceolate, bracts $\frac{3}{4}$ by $\frac{1}{2}$ in. broadly lanceolate glabrous. *P. gracilis*, Nees in Wall. Pl. As. Rar. iii. 113, and in DC. Prodr. xi. 495, and in Wall. Cat. 7184; T. Anders. in Journ. Linn. Soc. ix. 522. *Justicia acuminata*, Wall. Cat. 2425, sheet B partly.—Tavoy; Wallich. Rangoon; M'Lelland. Mergui; Griffith.—Leaves 5 by 2 in.; nerves many, pubescent; uppermost leaves linear-lanceolate.—The Tavoy example marked by Nees *fragilis* is identical with some of that marked by him *acuminata*.

VAR. khasiana, bracts all small $\frac{1}{8}$ in. fuscous-pubescent. *Justicia acuminata*, Wall. Cat. 2425, letter A right-hand fragments.—Khasia Mts.; Wallich.—This does not look like a *Peristrophe*, but the corolla and stamens are exactly as in *P. acuminata*, type.

4. **P. lanceolaria**, Nees in Wall. Pl. As. Rar. iii. 114, and in DC. Prodr. xi. 496; leaves lanceolate or ovate-lanceolate nearly glabrous, panicles densely glandular-pubescent, bracts $\frac{3}{4}$ in. linear-lanceolate, corolla $1\frac{3}{4}$ in. Bot. Mag. 5566; T. Anders. in Journ. Linn. Soc. ix. 522. *Justicia lanceolaria*, Roxb. Fl. Ind. i. 121; Wall. Cat. 2463.

SILHET and **JAINTEAPOOR**, alt. 500 ft.; Wallich, &c., frequent. **MOULMEIN**; Parish. **TENASSERIM**; Beddome.

Leaves $5\frac{1}{2}$ by 2 in., acute at both ends, pubescent on the nerves beneath or glabrate, obscurely or not lineolate; petiole $\frac{3}{4}$ in. Panicles strict, branches erect. Calyx $\frac{1}{2}$ – $\frac{1}{2}$ in.; segments sublinear. Anther-cells linear-oblong, immediately superposed.

Capsule $\frac{3}{4}$ in., viscous-pubescent.—A strongly marked species; the Moulmein plant (*P. grandiflora*, Parish ms.) has the flowers hardly larger than in some examples from Silhet.

5. **P. speciosa**, *Nees in Wall. Pl. As. Rar.* iii. 113, and in *DC. Prodr.* xi. 495; leaves ovate-lanceolate or elliptic acute nearly glabrous, floral leaves mostly large, bracts linear-oblong not acute nearly glabrous many widened upwards, corolla $1\frac{3}{4}$ in. *T. Anders. in Journ. Linn. Soc.* ix. 521. *Justicia speciosa*, *Roxb. Fl. Ind.* i. 122; *Bot. Mag.* t. 2722; *Wall. Cat.* 2464; *Lodd. Bot. Cab.* t. 1915.

SUBTROPICAL HIMALAYA, alt. 1-5000 ft., from Kumaon to Bhotan, frequent; *Wallich, &c.* SILHET STATION; *Clarke.*

Leaves 5 by 2 in., base rhomboid or acute; petiole 1 in. *Floral leaves* often 1-2 in., so that the flower-clusters often appear terminal or axillary subcapitate rather than paniced; bracts $\frac{3}{4}$ by $\frac{1}{2}$ - $\frac{1}{4}$ in., subobtusely, sometimes spatulate, tips often recurved. *Anther-cells* linear-oblong, one superposed half its length.

6. **P. montana**, *Nees in Wall. Pl. As. Rar.* iii. 113, and in *DC. Prodr.* xi. 493, partly; leaves elliptic acuminate at both ends subglabrous, bracts large elliptic glabrous nervose, corolla $2\frac{1}{4}$ in. *Wight Ic.* t. 1553; *T. Anders. in Journ. Linn. Soc.* ix. 521. *Justicia sylvestris*, *Wall. Cat.* 2468.

W. DECCAN PENINSULA from the Concan southward, and CEYLON, frequent; *Wight, &c.*

Leaves $5\frac{1}{2}$ by $1\frac{3}{4}$ in., raphides very slender on both surfaces; petiole $1\frac{1}{4}$ in. *Bracts* $\frac{3}{4}$ by $\frac{1}{2}$ - $\frac{1}{4}$ in., obtuse or minutely apiculate, not acuminate. *Filaments* pubescent; *anther-cells* linear, one half its length below the other.—Described from Wight, *Herb. Propr.* n. 2017, its type (named in Nees' hand); and includes all the S. Indian examples of Nees and T. Anderson, not their Khasi material.

7. **P. tinctoria**, *Nees in Wall. Pl. As. Rar.* iii. 113, and in *DC. Prodr.* xi. 493 P; dusky-puberulous, leaves short-petioled ovate subacute not large, bracts elliptic subacute nervose not ciliate, corolla $1\frac{1}{4}$ in. slender. *T. Anders. in Journ. Linn. Soc.* ix. 521, partly. *Justicia tinctoria*, *Roxb. Fl. Ind.* i. 123; *Wall. Cat.* 2465. *J. Roxburghiana*, *Roem. & Sch. Syst. Mant.* i. 140.

INDIA; cultivated frequently from Assam to CEYLON.—DISTRIB. Malaya, S.E. Asia; where wild not known.

Leaves 2-3 by $1-1\frac{1}{4}$ in.; lower petioles rarely exceeding $\frac{1}{4}$ in., dusky-puberulous. *Bracts* $\frac{3}{4}$ by $\frac{1}{2}$ in., somewhat nervose, dusky-puberulous. *Anther-cells* linear, one superposed for half its length. *Capsule* hardly $\frac{1}{2}$ in., shortly stalked.—A well-marked cultivated form, described from Roxburgh's and Wallich's specimens. Nees has diagnosed his *P. tinctoria* so as expressly to exclude (by the ciliate bracts, &c.) all the examples; so that the name *P. tinctoria*, Nees, can only be understood to refer to some of Nees' synonyms. The figure of *Dianthera japonica*, *Thunb. Fl. Jap.* 21, t. 4, cited by Nees for this species, is a *Dicliptera*, and with it much of Nees' synonymy falls to the ground.

8. **P. fera**, *Clarke*; leaves long-petioled ovate-lanceolate acuminate more or less pubescent, bracts elliptic often elongate nervose ciliate often hairy, corolla $1\frac{3}{4}$ in. *P. montana*, Var. β *sylvestris*, *Nees in DC. Prodr.* xi. 493 (as to the N. Indian examples). *P. tinctoria*, *Nees l. c.* as to *descr. only*; *T. Anders. in Journ. Linn. Soc.* ix. 521, chiefly. *Justicia acuminata*, *Wall. Cat.* 2425, left example on type sheet.—*Peristrophe* sp., *Griff. Itin. Notes*, 36, n. 596.

EASTERN FRONTIER Bhotan, *Griffith*. ASSAM and KHASIA Mts., alt. 1-4000 ft., common, *H. f. & T.*, &c.

Leaves $4\frac{1}{2}$ by $1\frac{3}{4}$ in.; raphides obscure or 0; petiole (of the middle cauline leaves) often exceeding 1 in. *Bracts* $\frac{3}{4}$ by $\frac{1}{4}$ in., often obtusely rennminate. *Corolla* much broader than in *P. tinctoria*.—Possibly the wild form of *P. tinctoria*. Nees, after diagnosing his *P. montana* as having non-ciliate bracts, has thus named examples of *P. fera* with intensely ciliate bracts.

VAR. intermedia; bracts more hairy, flowers smaller.—Chittagong, alt. 1000 ft.; *H. f.* & *T.* Pegu; *Kurz*. Tenasserim; *Beddome*.—This has been named *P. jalap-pafolia*, Nees, but the corolla is much smaller than in the Malay examples of that species. It is suspiciously intermediate between the *P. acuminata* var. *fragilis* and *P. fera*; and both plants were collected by Beddome on the slopes of Mooleyit in Tenasserim; the corolla is the same size in both, and the only difference between them is that in *Var. intermedia* the bracts are $\frac{1}{4}$ in. broad and hairy, but in *P. acuminata* var. *fragilis* $\frac{1}{2}$ in. broad and glabrous.

XLIX. HYPOESTES, *R. Br.*

Herbs or shrubs. *Leaves* entire or toothed. *Flower-clusters* spiked, capitellate or rarely solitary; bracts 2-4 together, free or united at base, enclosing 1-4 flowers, of which all but 1 are usually reduced or obsolete; bracteoles shorter than the bracts, narrow. *Calyx* very small (or in *H. lanata* nearly equalling the bracteoles), deeply 5-lobed, scarious or membranous; segments linear-lanceolate. *Corolla* pink purple or white (in the Indian species); tube slender, limb 2-partite; upper lip subentire, lower very shortly 3-lobed. *Stamens* 2; anthers 1-celled, mucous. *Ovary* 4-celled?; style filiform, scarcely bifid at the tip. *Capsule* ellipsoid, stalked, usually 4-seeded. *Seeds* ovoid, compressed, glabrous, in the Indian species verrucose.—Species, 70, from Tropical and S. Africa, the Himalaya, China and Australia.

Hypoestes purpurea, *R. Br.*, *Nees in Wall. Pl. As. Rar.* iii. 114 (*Justicia purpurea*, *Wall. Cat.* 2473), is a Malay Archipelago plant, cultivated from long ago in Bengal.

1. ***H. lanata***, *Dalz. in Hook. Kew Journ.* ii. 343; leaves elliptic acuminate entire nearly glabrous, spikes elongate interrupted softly hairy axillary and running into large terminal panicles, bracts distinct linear, corolla 1 in. *Dalz. & Gibs. Bomb. Fl.* 197; *T. Anders. in Journ. Linn. Soc.* ix. 522.

CONCAN GHATS; *Law, Dalzell*.

An undershrub. *Leaves* 5 by $1\frac{3}{4}$ in., minutely lineolate on both surfaces; petiole $\frac{3}{4}$ in., sometimes winged. *Spikes* 6 in. and upwards; flowers mostly in opposite distant clusters, each cluster consisting of 1-3 bracts and 1 (with 1 or 2 reduced) flower; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., very hairy. *Calyx* $\frac{1}{2}$ in., hairy. *Capsule* nearly $\frac{3}{4}$ in., stalked, pubescent. *Seeds* verrucose.—Habit very remote from *Hypoestes*, superficially resembling *Strobilanthes perfoliatus*, but the corolla and stamens are typical *Hypoestes*.

2. ***H. triflora***, *Roem. & Sch. Syst.* i. 88; leaves ovate somewhat hairy on both surfaces, flower-clusters capitellate axillary and terminal, bracts narrowly obovate subobtus, corolla scarcely $\frac{1}{2}$ in. *Nees in DC. Prodr.* xi. 506; *T. Anders. in Journ. Linn. Soc.* ix. 522. *H. Wallichii*, *Nees in Wall. Pl. As. Rar.* iii. 114. *Justicia chinensis*, *Wall. Cat.* 2466, letter E.

NEPAL; *Wallich*; Tambur River, alt. 1-3000 ft., *J. D. H.* SIKKIM and BHOTAN, alt. 4-7000 ft., *Clarke, Griffith*.—DISTRIB. Abyssinia.

Herbaceous, ramous. *Leaves* attaining $3\frac{1}{2}$ by 2 in., mostly much smaller, crenate or denticulate, sparsely hairy above, pubescent beneath; petiole $1\frac{1}{2}$ in. *Flower-clusters* 1-5 (often 3) together, subsessile; bracts opposite, paired, flower in one of each pair nearly always 0 or much reduced; bracteoles $\frac{1}{4}$ - $\frac{1}{2}$ in., linear-lanceolate.

nearly as long as the bracts. *Calyx* $\frac{1}{8}$ in. *Corolla* pink or white. *Capsule* $\frac{1}{2}$ in., nearly glabrous. *Seeds* verrucose.—The placentae tend to rise elastically, and the inflorescence also draws this plant very close to *Dicliptera*.

3. **H. malaccensis**, *Wight Ic. t.* 1555; leaves elliptic acuminate pubescent beneath, flower-clusters numerous capitate, bracts lanceolate acute connate at base, corolla $\frac{3}{4}$ in. slender. *T. Anders. in Journ. Linn. Soc.* ix. 522. *H. Decaisneana & laxiflora*, *Nees in DC. Prodr.* xi. 508.

MALACCA; *Griffith, Capt. A. C. Wight, Maingay.*

Branches herbaceous, diffuse, minutely pubescent. *Leaves* $2\frac{1}{2}$ by 1 in., petiole $\frac{1}{2}$ in. *Inflorescence* dense, minutely ashy-pubescent; bracts $\frac{1}{2}$ – $\frac{3}{8}$ in., several connate into a tube, enclosing 1–4 flowers, of which all but 1 are usually rudimentary; bracteoles $\frac{1}{4}$ in., linear, scarious. *Calyx* scarcely $\frac{1}{6}$ in., membranous. *Capsule* nearly $\frac{1}{2}$ in.—This extends, with slight variation in size of corolla and degree of union of the bracts, throughout the Malay Archipelago to the Philippines.

ORDER CX. SELAGINÆ. (By J. D. Hooker.)

Herbs or shrubs. *Leaves* alternate or the lower opposite, entire or toothed. *Flowers* small, solitary or spicate, irregular, 2-sexual. *Calyx* inferior, spathaceous or tubular and 2–5-fid or -partite, imbricate in bud. *Corolla* monopetalous; tube entire or split, limb 2-lipped or 4–5-lobed, imbricate in bud. *Stamens* inserted on the corolla-throat or -lobes, 2, or 4 with a rudimentary 5th, filaments filiform; anther-cells confluent. *Ovary* free, 2-celled; style simple, terminal, stigma subcapitate or 2-lobed; ovules 1 pendulous from the top of each cell, anatropous. *Fruit* small, 2-celled, indehiscent or of 2 cocci, one often imperfect. *Seeds* pendulous; embryo straight in the axis of fleshy albumen; cotyledons $\frac{1}{2}$ -cylindric, radicle superior.—DISTRIB. Species 140, all S. African, except the European genus *Globularia* and the following.

LAGOTIS, Gaertn. (GYMNANDRA, Pall.)

Perennial fleshy herbs. *Leaves* radical and cauline, entire crenate or incised. *Flowering branches* scape-like, ascending, leafy above. *Flowers* spicate or capitate, bracteate, blue or purple, ebracteolate; bracts usually broad, imbricating, as long or longer than the flowers. *Calyx* spathaceous or of 2 sepals. *Corolla-tube* curved; limb 2-lipped, lower lip 2–4-lobed. *Stamens* 2, inserted on the corolla-throat; anthers very large, reniform. *Ovary* 2-celled; style slender, jointed at the base, stigma capitate or 2-fid. *Drupe* small, 2-celled, 1–2-seeded, sometimes separable into 2 indehiscent cocci.—DISTRIB. Species 4 or 5, Arctic Regions and Mts. of N. Asia and N.W. America.

L. stolonifera, Koch (Gymnandra), a species found from Armenia to Afghanistan, has been collected in Wazuristan, alt. 5–7000 ft., by Stewart, close to the British frontier. It may be known by its small size, narrow leaves, and long stolons.

* *Calyx* of 2 oblong sepals.

1. **L. globosa**, *Kurz in Journ. As. Soc.* xxxix. 2, 80, t. 7, f. 1 (Gymnandra); leaves long-petioled oblong pinnatifid, scape almost naked, bracts much larger than and concealing the flowers suborbicular densely imbricate forming a globose head.

WESTERN TIBET; Therichan Pass, alt. 15–16,000 ft., *Heyde*; Gilgit, *Col. Turner (fid. C. B. Clarke)*.

Rootstock slender. *Leaves* few, cut to the midrib; lobes linear-oblong, widened towards their obtuse or notched tips; petiole 2-3 in. *Scape* slender, shorter than the leaves, with a few leafy bracts at the tip. *Heads* 1-1½ in. diam., like a double rose; outer bracts ½ in., orbicular-obovate, concave (when dry membranous), inner narrower. *Flowers* ¼ the length of the bract. *Sepals* obovate-oblong, one obtuse, the other 2-toothed. *Filaments* slender, as long as the upper lip; anthers small for the genus. *Style* included, stigma notched. *Fruit* ½ in. long, ellipsoid.

2. **L. decumbens**, Ruprecht Sert. Thianschan, 64; leaves long-petioled ovate or oblong coarsely crenate, scape few-leaved, bracts much larger than and concealing the flowers broadly ovate densely imbricate forming an oblong head.

WESTERN TIBET; Karakorum, alt. 16-18,000 ft., Thomson, Henderson; Karakash Mts., Stewart.—DISTRIB. Thianschan Mts.

Rootstock small. *Leaves* 1-1½ in., obtuse, base cuneate; petiole 2-4 in., tapering downwards. *Flowering stems* ascending, longer than the leaves, with a few leafy bracts near the top. *Spike* 1½-2 in.; bracts ½ in. long, entire, obtuse, membranous. *Flowers* ½ in. long. *Sepals* as in *L. globosa*. *Lower corolla-lip* 3- or 4-cleft. *Anthers* subsessile. *Style* short, included, stigma notched. *Fruit* narrowly oblong.

** *Calyx* very large, spathaceous, hooded, concealing the corolla, acute, nerves meeting in the tip.

3. **L. Clarkei**, Hook. f.; stem ascending leafy, leaves elliptic-ovate acute irregularly toothed, spike elongate, calyx longer than the bract.

SIKKIM HIMALAYA; Yakla, alt. 16,000 ft., Clarke.

Stems or *branches* 6-8 in., stout, flexuous. *Leaves*, radical long-petioled; cauline 2-3 in., sessile; nerves many, strong, reticulate. *Spike* recurved; bracts ¼ in., toothed. *Calyx* twice as long, ovate-lanceolate, complicate, open by a narrow slit in front nearly to the base, veined. *Corolla* half as long, lips very short, subequal, recurved, upper dilated at the hooded tip, lower obtusely 3-lobed? *Filaments* adnate to the margins of the upper lip. *Ovary* slender; style exserted, stigma 2-fid.—A very remarkable plant, more caulescent than its congeners. The specimens are very bad, and the description of the corolla may want correction. I found at Tungu (in N. Sikkim) what I take to be young plants of this, judging from the reticulate nervation of the leaves.

*** *Calyx* spathaceous, dorsally plane, 2-nerved; nerves ending apart in the terminal lobes or teeth.

4. **L. glauca**, Gaertn. in Nov. Comm. Petrop. xiv. 533, t. 18, f. 2; stolons 0, leaves oblong ovate or obovate toothed or crenate petiole very stout, cauline obtuse, spike elongate, bracts obovate or elliptic equalling or longer or shorter than the flowers. Maximovicz in Bull. Imp. Acad. St. Petersb. xxvii. (1881) 523, excl. syn. *L. decumbens*. Gymnandra Stelleri, Herb. Ind. Or. H. f. & T.

ALPINE HIMALAYA, alt. 11-15,000 ft., Royle, &c.—DISTRIB. Mts. of Central and N. Asia, and Arctic Asia and America.

Rootstock stout, with thick fleshy root-fibres. *Leaves* fleshy, radical 2-3 in., variable in breadth and toothing, narrowed into the very stout petiole; cauline ½ to 1½ in., ½-amplexicaul, often quite entire. *Flowering stems* several, 3-10 in. high, decumbent below, stout, leafy above. *Spike* 2-5 in.; bracts ½-¾ in. *Calyx* nearly as long as the corolla-tube or shorter; lobes minutely fimbriate. *Corolla-tube* rather slender, tips very variable.

VAR. *cashmeriana*; radical leaves elliptic or oblong obtuse, bracts ovate toothed rather longer than the calyx, corolla deep blue much longer than the calyx, lower lip 2-cleft, or 3-cleft with the mid-lobe narrowest, filaments from half as long to as

long as the upper lip adnate below to its margins, style far exserted, stigma minute. *Gymnandra cashmeriana*, *Royle in Benth. Scroph. Ind.* 47, and *Ill. Himal. Pl.* 291, t. 73, f. 3; *Chois. in DC. Prodr.* xii. 25.—Western Himalaya, from Chumba to Kashmir, alt. 11–15,000 ft.

VAR. kunawurensis; radical leaves ovate or oblong-lanceolate, obtuse crenate-toothed, cauline sessile ovate subacute, bracts broadly ovate rather longer than the calyx, corolla purplish tube about equalling the calyx, lower lip usually 3-cleft, anthers subsessile, style shortly exserted 2-fid, fruit ovoid rugose. *Gymnandra kunawurensis*, *Royle & Chois. ll. cc.*—Western Himalaya; Kunawur, alt. 12–15,000 ft.; Rajhoti, N. of Kumaon, alt. 15,000 ft., *Strachey & Winterbottom*.—A stouter plant than *Var. cashmeriana*.

VAR. sikkimensis; habit of *Var. kunawurensis*, but flowers larger, corolla-lobes longer, lower lip cleft into 2 narrow lobes.—Sikkim Himalaya, alt. 16–17,000 ft., *J. D. H.*

I follow Maximovicz in referring all the Himalayan plants to *L. glauca*, except *L. decumbens* (the calyx of which is widely different, as are the habit and bracts). That author further refers *Gymnandra borealis*, *Pallasii*, and *Stelleri* to the same species, and I suppose with good reason. The two principal Himalayan forms, *kunawurensis* and *cashmeriana*, are however readily distinguishable, if I mistake not, by size, colour of flower, length of filaments, and stigma; and possibly by fruit, if, as I suspect (judging from unripe ones), that of *cashmeriana* is much the smaller, narrower, and smother.

5. ***L. spectabilis***, *Kurz in Journ. As. Soc.* xxxix. 2, 80 (*Gymnandra*); tall, very robust, stem leafy, cauline leaves sessile orbicular-obovate cuspidate quite entire, spike long, bracts ovate acute toothed rather longer than the calyx, anthers subsessile, style included, stigma capitate.

SIKKIM HIMALAYA; Phalloot, alt. 13,000 ft., *Kurz*.

Rootstock and radical leaves not seen. *Stem* 18 in., $\frac{1}{2}$ in. diam., tapering downwards, naked below the middle. *Leaves* 2–3 in. long, $\frac{1}{2}$ -amplexicaul, decumbent; nerves very slender, nearly parallel to the margin, finely reticulate. *Spike* 4 in.; bracts $\frac{1}{2}$ in. *Calyx-teeth* fimbriate. *Corolla-tube* equalling the calyx; upper lip short, lower of 2 long linear lobes.—Probably a very large state of *L. glauca* var. *sikkimensis*; I have seen but one specimen, without root-leaves.

ORDER CXI. VERBENACEÆ. (By C. B. Clarke.)

Herbs, shrubs, or trees. *Leaves* opposite or whorled, apparently scattered in *Geunsia*, simple or digitate (in *Peronema* pinnate); stipules 0. *Inflorescence* cymose, racemose or spicate; cymes often compound or paniced; bracts various. *Calyx* gamosepalous, persistent, 5-4- (rarely 6-8-) toothed. *Corolla* gamopetalous; tube often cylindric, limb 2-lipped or subequal 5- (rarely many-) lobed. *Stamens* 4, didynamous, rarely 2, 5-6. *Ovary* superior, 2-carpellary (except in *Geunsia*), 2-4-celled, or sub-1-celled, 4-ovuled (in *Phryma* 1-celled 1-ovuled), entire or 4-lobed; style terminal; ovules variously attached. *Fruit* a drupe or almost capsular, 4-2-1-celled (with many pyrenes in *Geunsia*), cells 1-seeded. *Seeds* erect or pendulous, albumen 0 (in the Indian genera); radicle inferior (except in *Phryma*).—Species 700, chiefly tropical.

Duranta, a large American bush, is much cultivated in India; it differs from all the Indian genera in its 8-celled ovary, drupe with 4 2-seeded pyrenes.

Tribe 1. PHRYMEÆ. *Ovary* 1-celled, 1-ovuled.

Herb. Spike slender, interrupted 1. PHRYMA.

Tribe 2. VERBENEÆ. *Inflorescence* spicate, centripetal.

* *Pyrenes* of the fruit 2-1, 1-seeded.

- Shrubs. Calyx small. Fruit a drupe 2. LANTANA.
 Small shrubs. Calyx small. Fruit capsular 3. LIPPIA.
 Small shrubs. Calyx narrowly cylindric, 5-ribbed. Stamens 4 4. BOUCHEA.
 Herb. Calyx narrowly cylindric, 5-ribbed. Stamens 4 5. STACHYTARPHETA.

**** Pyrenes of the fruit 2, 2-seeded.**

- Herb. Calyx accrescent, enclosing the fruit 6. PRIVA.

***** Pyrenes of the fruit 4, 1-seeded.**

- Herb. Calyx tubular, not accrescent 7. VERBENA.

Tribe 3. VITICÆ. *Inflorescence* cymose, centrifugal; cymes paniced.
Drupe with 4 (in *Geunsia* many) pyrenes.—Trees or shrubs.

*** Corolla regular, stamens isomerous, equal.** (Leaves entire.)

- Flowers 5-merous. Leaves scattered. Drupe with 5-2 pyrenes 8. GEUNZIA.
 Flowers 4-merous. Drupe with 4 pyrenes 9. CALLICARPA.
 Flowers 4-6-merous. Drupe with 1 4-celled pyrene, included
 in the accrescent calyx 10. TECTONA.

**** Corolla 2-lipped, stamens didynamous.**

† Drupe with 1 pyrene.

- Leaves entire or toothed. Flowers small 11. PREMNA.
 Leaves entire or toothed. Corolla 1 inch 12. GMELENA.
 Leaves digitate (in 1 species unifoliate) 13. VITEX.

†† Drupe with 4 pyrenes. (Leaves simple.)

- Calyx in flower campanulate 14. CLERODENDRON.
 Calyx in flower large, patelliform 15. HOLMSKIOLDIA.

Tribe 4. CARYOPTERIDÆ. *Inflorescence* cymose, centrifugal; cymes paniced. *Fruit* dividing into 4 pyrenes.—Trees or shrubs.

- Leaves simple. Cymes axillary dense or thyrsoid 16. CARYOPTERIS.
 Leaves entire. Cymes in a dense corymbose panicle 17. GLOSSOCARYA.
 Leaves entire. Panicle pyramidal, lax 18. HYMENOPYRAMIS.
 Leaves large, impari-pinnate 19. PERONEMA.

Tribe 5. SYMPHOREMÆ. *Cymes* 3-9-flowered, capitate; bracts of the flower-head 6 or 3-4, usually large, involucriform. *Fruit* nearly dry, small. —Large climbers.

- Bracts 6. Corolla 6-16-merous. Anthers long exsert 20. SYMPHOREMA.
 Bracts 6. Corolla 5-6-merous. Anthers included or shortly
 exsert 21. SPHENODESMA.
 Bracts 3-4. Corolla 2-lipped 22. CONGEA.

Tribe 6. AVICENNIEÆ. *Cymes* densely capitate. *Calyx* 5-partite; segments concave, much imbricate. *Fruit* capsular, somewhat fleshy, dehiscent.
 Shrubs. Leaves entire. Flowers small 23. AVICENNIA.

I. PHRYMA, Linn.

An erect herb. *Leaves* petioled, membranous, toothed. *Spikes* long, slender; bracts linear, small; bracteoles minute. *Calyx* tubular; teeth 3, linear, hooked. *Corolla* small, tubular, 2-lipped; lower lip larger, of 3

rounded patent lobes. *Stamens* 4, didynamous; anthers round. *Ovary* oblong, oblique; ovule 1, erect, attached on one side near the base; style linear; stigma shortly unequally 2-lobed. *Utricle* membranous, enclosed in the reflexed calyx; radicle superior, cotyledons convolute.

P. leptostachya, Linn.; Schauer in DC. Prodr. xi. 520; leaves ovate or ovate-lanceolate thinly pubescent, peduncles terminal and from the upper axils. Gaertn. Fruct. i. 363, t. 75, fig. 10; Lamk. Ill. t. 516; Wall. Cat. 2088; Schnizl. Ic. Fum. Nat. t. 150 a; Walp. Rep. iv. 36.

W. HIMALAYA, alt. 3-7000 ft.; from Kashmir to Nepal frequent, Wallich, Royle, &c. KHASIA MTS., alt. 4-6000 ft., H. f. & T., &c.—DISTRIB. Amurland and Japan, Temp. N. America.

Height 1-2 ft. Leaves 2-4 in.; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. Spikes 6-15 in.; flowers alternate. Calyx-tube $\frac{1}{4}$ in.; nerves 15, in 5 groups of 3; teeth $\frac{1}{10}$ in. with purplish hooks. Corolla $\frac{1}{4}$ - $\frac{1}{2}$ in., pink or pale purple. Calyx in fruit deflexed and appressed to the rachis. Utricle $\frac{1}{2}$ in., oblong.

II. LANTANA, Linn.

Rambling shrubs, pubescent or scabrous; branches tetragonous, sometimes prickly. Leaves simple, petioled, crenate, often rugose. Spikes peduncled, capitate, ovoid or cylindric; bracts conspicuous, exceeding the calyx; bracteoles 0. Calyx small, membranous, truncate or sinuate-toothed. Corolla-tube slender, cylindric; lobes 4-5, spreading. Stamens 4, didynamous, included; anthers broadly oblong. Ovary 2-celled, 2-ovuled; style short, stigma oblique subcapitate. Drupe fleshy or nearly dry, containing 2 bony, 1-celled pyrenes. Seed without albumen; radicle inferior.—Species 40, tropical or subtropical, mostly American.

L. Camara, Linn. (Schauer in DC. Prodr. xi. 598; *L. aculeata*, Linn.; Roxb. Hort. Beng. 46. ? *L. mixta*, Linn. in Thwaites Enum. 242), an American plant, has run wild in India, especially in the W. Deccan Peninsula and Ceylon. It is readily recognized by the numerous recurved prickles on the branches.

1. **L. indica**, Roxb. Hort. Beng. 46, and Fl. Ind. iii. 89; leaves ovate or lanceolate softly hairy above, bracts ovate or elliptic acuminate softly loosely hairy. Wall. Cat. 1823, type sheet a, b; Wight Ill. t. 173 b, fig. 3, and Ic. t. 1464. *L. latifolia*, Tausch in Flora 1836, 391. *L. dubia*, Wall. Cat. 1821, 2 and C not 1; Royle Ill. 300, t. 73, fig. 2. *L. collina*, Decne. in Jacquem. Voy. Bot. 136, t. 141. *L. alba*, Schauer in DC. Prodr. xi. 606; Dalz. & Gibs. Bomb. Fl. 198; Brandis For. Fl. 369; Kurz For. Fl. ii. 253; Boiss. Fl. Orient. iv. 532, not of Miller, Decne., nor Link.

Throughout INDIA and CEYLON in the warmer parts, common; on the riverbanks of Bengal one of the commonest weeds.—DISTRIB. Beloochistan, Trop. Africa.

A shrub, 3-8 ft. high; branches long, rambling, appressedly scabrid-pubescent, or towards the tips patently densely fulvous-hairy. Leaves 1-3 in., opposite or ternate, tip not rounded, rugose, above softly hairy, beneath more densely often woolly sometimes white-woolly; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., sometimes in fruit 2-3 in. long, cylindric; bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., upper smaller, ovate or even cordate in the typical form, but varying to lanceolate. Calyx less than $\frac{1}{10}$ in., hairy. Corolla $\frac{1}{2}$ in., hairy, mouth $\frac{1}{4}$ in. diam., usually pink, the tube yellowish, varying from dull purple to white. Drupe $\frac{1}{2}$ - $\frac{1}{3}$ in. diam., purple.

VAR. *albiflora*, Wight ms.; leaves small obtuse, outer bracts ovate minutely closely pubescent. *L. Wightiana*, Wall. Cat. 2655. *Lantana* n. 1, Herb. Ind. Or. H. f. & T.—S. Madras, in or near the hills; Pulney Mts. and Courtallum, Wight, &c.—Leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. Corolla $\frac{1}{2}$ in. diam. Drupe $\frac{1}{2}$ in. diam.

2. **L. crenulata**, *Otto & Dietr. in Berlin Gartenzeit.* ix. 363; leaves ovate-lanceolate very scabrous above, bracts narrowly oblong or subspathulate scabrid-pubescent. *Schauer in DC. Prodr.* xii. 598. *L. indica* var. *salvifolia* only, *Wall. Cat.* 1823. *L. annua*, *Hort. Calc.*, not *Linn.*

N.W. INDIA, *Royle, Falconer*; Moradabad (cultivated), *Thomson*. MADRAS; Vola Charnce, *Thomson*.

Resembling *L. indica*. Leaves finely crenated, very scabrid above. Outermost bracts $\frac{1}{4}$ by $\frac{1}{16}$ in. Corolla from yellow to orange.—This plant may not be wild in India, but it is not known where it is so.

3. **L. trifolia**, *Linn.*; *Bot. Mag.* t. 1449; branches patently hairy, leaves often ternate ovate-lanceolate hairy somewhat scabrous above, outer bracts lanceolate much acuminate hairs not closely appressed. *Schauer in DC. Prodr.* xi. 607. *L. indica*, *Wall. Cat.* 1823, sheet B, letters a, d. *L. dubia*, *Wall. Cat.* 1821, n. 1 only.

Throughout INDIA, naturalized from the N.W., *Royle*, to CEYLON, *Wight*. BENGAL; Dacca, Burisal, Chittagong, *J. D. H.*, &c.—DISTRIB. Trop. America.

Resembling *L. indica*; so much so that ternate-leaved examples of *L. indica* are generally marked *L. trifolia*. Perhaps only a denizen in British India.

DOUBTFUL SPECIES.

L. SCABRA, *Wall. Cat.* 1822, is not to be found in Wallich's Herbarium.

III. LIPPIA, *Linn.*

Fruit dry, separating into 2 1-seeded pyrenes. Otherwise as *Lantana*.—Species 90, mostly American.

The genus *Lippia* can hardly be distinguished from *Lantana*, but the present species is easily recognized by its creeping habit and alternate peduncles. *Rheede Hort. Mal.* x. t. 93, sometimes quoted for this plant, has large bracts to the heads, nor does it represent the creeping habit. Roxburgh, by some slip, has omitted the genus *Verbena* in *Fl. Ind.*, though he has it in *Hort. Beng.*

1. **L. nodiflora**, *Rich. in Michx. Fl. Bor. Amer.* ii. 15; annual, creeping, minutely strigose, leaves cuneate-spathulate serrate, peduncles axillary rarely opposite, bracts obovate shortly acuminate as long as the corolla-tube. *Schauer in DC. Prodr.* xi. 585; *Wight Ill.* t. 173 b, fig. 2, and *Id.* t. 1463; *Dalz. & Gibs. Bomb. Fl.* 198; *Boiss. Fl. Orient.* iv. 532. *Verbena nodiflora*, *Linn.*; *Burm. Fl. Ind.* 12, t. 6, fig. 1; *Roxb. Hort. Beng.* 4; *Sibth. Fl. Gr.* t. 553. *V. capitata*, *Forsk. Fl. Æg.-Arab.* 10. *Blairia nodiflora*, *Gaertn. Fruct.* i. 266, t. 56. *Zapania nodiflora*, *Lamk. Ill.* t. 17; *Wall. Cat.* 1824. *L. repens*, *Bert. Rar. Ital. Pl.* iii. 27. *Lantana sarmentosa* & *repens*, *Spreng. Syst.* ii. 752. *Phyla chinensis*, *Lour. Fl. Cochinch.* 66.

Throughout INDIA and CEYLON, in wet grass; abundant.—DISTRIB. All tropical and warm-temperate regions.

Extending 6–30 in., much branched, often rooting from the nodes. Leaves subsessile, 1 by $\frac{1}{4}$ in., sharply toothed, base attenuate entire. Peduncle 1–3 in., with very rarely another from the opposite axil; heads $\frac{1}{2}$ by $\frac{1}{4}$ in., ovoid or cylindric; bracts $\frac{1}{16}$ in., ovate, shortly acute, outermost not much larger than the others. Calyx minute, 2-fid, hairy. Corolla $\frac{1}{20}$ – $\frac{1}{8}$ in., tube slender, mouth 2-lipped, lower lip rather longer, pinkish-purple to white. Fruit hardly $\frac{1}{12}$ in. diam., nearly dry.

2. **L. geminata**, *H. B. K. Nov. Gen. & Sp. Pl.* ii. 266; shrubby, leaves ovate-oblong crenate softly strigose, peduncles mostly opposite, bracts ovate acuminate softly hairy. *Schauer in DC. Prodr.* xi. 582, with syn.

Lantana sp. n. 5, *Herb. Ind. Or. H. f. & T.* *Lantana canescens*, *Hort. Calc.*, not *Linn.*

BENGAL, frequent; below Dacca, *J. D. H.*, &c.—DISTRIB. Trop. America, a widely dispersed weed.

So closely resembling *Lantana indica* that without fruit it is difficult to distinguish. *Leaves* and *peduncles* opposite or ternate. *Peduncles* rarely exceeding $\frac{1}{2}$ –1 in.; outer bracts rarely exceeding $\frac{1}{2}$ in. *Fruit* $\frac{1}{8}$ – $\frac{1}{2}$ in. diam.

IV. **BOUCHEA**, Cham.

Herbs or undershrubs. *Leaves* petioled, ovate or oblong, toothed. *Spikes* terminal, linear, elongate; bracts much shorter than the calyx. *Calyx* narrowly cylindric, strongly 5-ribbed, very shortly 5-toothed, in fruit slightly enlarged, split to the base on the outer side (in the Indian species). *Corolla-tube* very narrowly cylindric; limb patent, 5-lobed. *Stamens* included, didynamous; anthers ovate, cells 2 parallel. *Ovary* 2-celled, cells 1–2-ovuled; style short, linear; stigma 1-sided, toothed. *Fruit* dry, included in the calyx, of 2 elongate-oblong 1-seeded pyrenes.—Species 16, in the warmer parts of America and Africa, 2 extending to India.

1. **B. marrubifolia**, Schauer in *DC. Prodr.* xi. 558; hoary-pubescent, leaves ovate, corolla-tube $\frac{1}{3}$ – $\frac{1}{2}$ in., mouth scarcely $\frac{1}{2}$ in. diam. *Wight Ic.* t. 1461.

SCINDE; *Stocks, Dalzell*.—DISTRIB. Arabia, Egypt, Abyssinia, Central Africa.

Woody, much branched. *Leaves* 1 by $\frac{1}{2}$ in., coarsely toothed, hoary-pubescent on both surfaces; petiole $\frac{1}{2}$ in. *Spikes* 2–5 in., nearly continuous; flowers alternate; bracts $\frac{1}{2}$ in., lanceolate. *Calyx* $\frac{1}{4}$ in., subtruncate, inflated in fruit. *Corolla-tube* scarcely $\frac{3}{10}$ in. diam. *Pyrenes* $\frac{1}{8}$ – $\frac{1}{6}$ in., linear-oblong, black.

2. **B. hyderabadensis**, Walp. *Rep.* iv. 12; leaves ovate-oblong glabrescent, corolla-tube $\frac{1}{2}$ – $\frac{2}{3}$ in. mouth $\frac{1}{2}$ in. diam. *Wight Ill.* t. 173 b, fig. 1, and *Ic.* t. 1462; Schauer in *DC. Prodr.* xi. 559; *Thwaites Enum.* 241. *Verbena hyderabadensis*, Heyne in *Herb. Rottler*; *Wall. Cat.* 6318.

DECCAN PENINSULA and CEYLON; *Rottler, Wight, Thwaites*, &c.

Branches woody, elongate little divided upwards, nearly glabrous. *Leaves* 3–4 by $1\frac{1}{2}$ in., serrate, nerves beneath minutely pubescent; petiole $\frac{2}{3}$ in. *Spikes* 2–6 in., dense; bracts $\frac{1}{6}$ in., lanceolate. *Calyx* $\frac{1}{2}$ in., nearly glabrous; teeth $\frac{1}{8}$ in., linear. *Corolla-tube* funnel-shaped upwards; limb pink-purple. *Pyrenes* exceeding $\frac{1}{4}$ in., linear-oblong, slightly wider upwards, margined, straw-coloured, smooth on the inner face (the thickened inner layer of tissue becoming white and flaking off).

V. **STACHYTARPHETA**, Vahl.

Herbs or shrubs. *Leaves* toothed. *Spikes* terminal, long, slender (in the Indian species); bracts long or short; bracteoles 0. *Calyx* narrowly cylindric, shortly 4–5-toothed. *Corolla-tube* cylindric; limb oblique, patent, 5-lobed. *Stamens* 2 fertile, included; anther-cells ovate, vertically divaricate. *Ovary* and *fruit* nearly as of *Bouchea*.—Species 40, in warm America.

S. indica, Vahl *Enum.* i. 206; leaves elliptic serrate nearly glabrous, flowers ultimately somewhat sunk in the thickened rachis, bracts lanceolate as long as the oblique 4-toothed calyx. *Thwaites Enum.* 241. *S. jamaicensis*, Vahl l. c.; *Bot. Mag.* t. 1860. *S. urticifolia*, Dalz. & Gibs. *Bomb. Fl. Suppl.* 68. *Stachytarpha indica* & *jamaicensis*, Schauer in *DC. Prodr.* xi.

564. *S. villosa*, Turcz. in Bull. Soc. Imp. Nat. Mosc. 1863, ii. 197. *Verbena indica*, Linn.; Wall. Cat. 2656. *V. jamaicensis*, Linn.; Roxb. Hort. Beng. 4.

TROPICAL INDIA from the Punjab and Silhet to Travancore and Singapore; Ceylon, plentiful.—DISTRIB. Trop. Asia and America.

A herb, 1–2 ft., nearly glabrous; branches quadrangular. *Leaves* 1–4 in., sub-obtuse, base decurrent. *Spikes* 3–12 in., nearly continuous. *Calyx* $\frac{1}{2}$ in., 4-nerved. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., deep-blue. *Pyrenes* $\frac{1}{8}$ in.—Probably naturalized in Asia; the examples from extra-tropical India are almost surely escapes.

VI. **PRIVA**, Adans.

Erect herbs. *Leaves* toothed. *Spikes* slender; bracts small, narrow. *Calyx* tubular, shortly 5-toothed; in fruit enlarged, ovoid with a very small mouth. *Corolla-tube* narrowly cylindric; limb oblique, patent, 5-lobed. *Stamens* 4, didynamous, included; anther-cells parallel. *Ovary* 2-celled, cells 2-ovuled; style linear, stigma on one side. *Fruit* dry, separating into 2 2-seeded pyrenes.—Species 9, chiefly tropical American.

P. leptostachya, Juss. in Ann. Mus. vii. 70; leaves petioled ovate, spikes long interrupted, calyx with hooked hairs, fruit obcordate muricate. Walp. Rep. iv. 35; Schauer in DC. Prodr. xi. 533; Datz. & Gibs. Bomb. Fl. 198. *P. abyssinica* & *P. Forskalii*, Meyer; Jaub. & Spach. Ill. Pl. Or. tt. 453–455. *Tortula aspera*, Roxb.; Willd. Sp. Pl. iii. 359; Roth Nov. Sp. 299. *Streptium asperum*, Roxb. Cor. Pl. ii. 25, t. 146, and Fl. Ind. iii. 90; Wall. Cat. 2657; Wight in Hook. Journ. Bot. i. 230, t. 130.

DECCAN PENINSULA; Roxburgh, Wight, &c.—DISTRIB. Africa.

Stem 6–18 in. *Leaves* $1\frac{1}{2}$ by $\frac{1}{2}$ in., crenate-serrate, thinly somewhat softly hairy in all the examples, but (ex Roxburgh) covered with stiff hooked hairs; petiole 1 in. *Spikes* 6–12 in., lower flowers distant. *Calyx* $\frac{1}{2}$ by $\frac{1}{2}$ in. in flower; in fruit $\frac{1}{2}$ in. broad, hispid with 1-celled white hooked hairs. *Corolla* $\frac{1}{2}$ in., white. *Pyrenes* obcordate, with 2 rows of hooked small spines on the back, each presenting a large cavity towards the axis.

VII. **VERBENA**, Linn.

Pubescent herbs or undershrubs. *Leaves* opposite or ternately whorled, toothed or pinnatifid. *Spikes* terminal, simple or corymbose; bracts and flowers small. *Calyx* tubular, shortly 5-toothed. *Corolla* tubular; limb more or less oblique, sub-2-lipped, 5-lobed. *Stamens* 4, didynamous, included; anthers ovate, 2-celled, cells sub-parallel. *Ovary* 1-celled, more or less 4-lobed (sometimes even at flower-time 4-celled), 4-ovuled; style short, obscurely 2-lobed; ovules attached laterally near the base of the cell. *Fruit* included in the calyx; pyrenes 4 or fewer, oblong.—Species 80; all except 2 American.

V. bonariensis, Linn. (Roxb. Hort. Beng. 4; Schauer in DC. Prodr. xi. 541), a native of Brazil, is naturalized in the Himalaya, the Nilgherries, and elsewhere in the Old World. It has sessile, oblong, sharply serrate leaves, and short spikes in dense corymbs or heads.

V. officinalis, Linn.; Schauer in DC. Prodr. xi. 547; herbaceous, leaves oblong or ovate pinnatifid or coarsely toothed, spikes paniced slender ultimately interrupted below. Lour. Fl. Cochinch. 27; Roxb. Hort. Beng. 4; Wall. Cat. 1825; Hayne Pl. Off. 5, t. 42; Boiss. Fl. Orient. iv. 534.

V. spuria, Linn. *Sp. Pl.* 29. *V. sororia*, Don *Prodr.* 104; *Sweet Brit. Fl. Gard.* iii. t. 202.

HIMALAYA, alt. 1-6000 ft., from Kashmir to Bhotan, frequent. BENGAL PLAIN to the Sunderbunds, frequent.—DISTRIB. Temperate and subtropical regions.

Stems 1-2 ft., decumbent, then erect, quadrangular, puberulous. *Leaves* 2-4 in., variously lobed, base narrowed, lower petioled, more or less pubescent, usually hoary on the nerves beneath. *Spikes* at first dense, in fruit 3-10 in. *Calyx* $\frac{1}{8}$ - $\frac{1}{2}$ in., apparently of 4 oblong and 1 linear segments united into a tube by their scarious margins; teeth most minute. *Corolla* $\frac{1}{4}$ in., blue; lobes subquadrate, throat hairy. *Pyrenes* $\frac{3}{16}$ - $\frac{1}{8}$ in., oblong, 3-ribbed, smooth dorsally, their inner faces with minute white flaking cells similar to those of *Bouchea hyderabadensis*.—T. Thomson collected at Kusoor, and Clarke at Chumba, a monstrous form with proliferous spikes, forming densely branched panicles, the lower flowers all pedicelled, variously altered and infertile.

VIII. GEUNSLA, Blume.

Trees or large shrubs, stellately tomentose. *Leaves* opposite, every alternate pair usually widely separated so that there appear to be 2 alternate leaves on each internode, petioled, nearly entire. *Cymes* peduncled, axillary, many-flowered; bracts linear, small. *Calyx* campanulate, shortly 5-6-toothed. *Corolla* tubular; limb equally 5-6-toothed. *Stamens* 5; anthers exserted; cells oblong, parallel. *Ovary* imperfectly 5-3-celled; cells 2-ovuled; style exserted, stigma dilated 5-3-lobed. *Drupe* small; pyrenes 5-2, 1-seeded.—Species 4, Malayan.

G. farinosa, Blume *Bijd.* 819; leaves broadly oblong acuminate minutely toothed stellate-tomentose beneath, flowers 5-merous. *Callicarpa pentandra*, Roxb. *Fl. Ind.* i. 395; *Wall. Cat.* 1835; *Schauer in DC. Prodr.* xi. 646. *C. acuminatissima*, Teijs. & Binn. in *Batav. Nat. Tijdschr.* xxv. 316.

SINGAPORE; Wallich.—DISTRIB. Malaya.

A lofty tree. *Leaves* 8 by 3 in., base cuneate or rounded, mature glabrate above; petiole 1 in. *Peduncles* 1-2 in.; cymes 2-3 in. diam., densely stellate-tomentose. *Corolla* $\frac{1}{2}$ in., lilac, occasionally 6-merous, fide Teijs. & Binnend. *Drupe* $\frac{1}{8}$ in. diam.—Resembling the arborescent *Callicarpas*; readily distinguished by the mixture of both opposite and alternate leaves, and by the 5-merous flowers. *C. hexandra*, Teijs. & Binn. *l. c.*, is *C. Cumingiana*, Schauer *l. c.* 644, or very nearly so, and perhaps neither is distinct from *Geunsia farinosa*; but Cuming's n. 1773, reduced to *G. farinosa* by Schauer, is probably, as stated in Gen. Pl. 2, p. 1150, a good species.

IX. CALLICARPA, Linn.

Shrubs or trees; innovations stellately hairy. *Leaves* opposite, rarely ternately, whorled toothed or subentire (in *C. lobata* lobed). *Cymes* axillary, shorter than the leaves; bracts linear, inconspicuous. *Calyx* very small (less than $\frac{1}{2}$ in.), campanulate, limb minutely 4-lobed, unaltered in fruit. *Corolla* small (about $\frac{1}{4}$ in.), tubular, subsymmetric, purple or red; lobes 4, subquadrate-oblong, patent. *Stamens* 4; anthers exserted, 2-celled, glandular. *Ovary* imperfectly 2-celled, cells 2-ovuled; style linear, stigma dilated obscurely bifid. *Drupe* small (less than $\frac{1}{2}$ in.), globose; pyrenes 4, or by suppression fewer, 1-seeded. *Seeds* shortly oblong, exalbuminous.—Species 30, mostly E. Asian, Malayan and N. Australian; a few Polynesian, Columbian and W. Indian.

1. **C. lobata**, Clarke; leaves very long-petioled ample cordate-ovate

3-5-lobed mature nearly glabrate, cymes dense stellately tomentose shorter than the petiole. *Callicarpa* sp. n. 27, *Herb. Ind. Or. H. f. & T.*

ALPINE N.E. NEPAL; Yalloong, alt. 10-11,000 ft., *J. D. H.*

A deciduous tree, 16 ft.; branches thick, stellately tomentose, crowded with leaves at the tips. *Leaves* 12-15 in. diam., palmately 5-7-nerved, membranous; lobes ovate, acuminate, denticulate, stellately hairy on both surfaces when young, mature with some stellate hair along the nerves beneath; hairs stalked, often with 2 whorls of secondary hairs; glands scattered; petiole 4-8 in. *Peduncles* 2½ in., often 2 superposed in each opposite axil; leaves fallen from the flower-bearing axils in the specimens; cymes 2-4 in. diam., resembling those of *C. arborea*. *Calyx* ⅓ in., funnel-shaped, subtruncate, stellately hairy. *Corolla* ⅓ in., tubular, nearly glabrous in flower; lobes 4, short, ovate. *Stamens* 4. *Fruit* not seen.

2. *C. arborea*, *Roxb. Hort. Beng.* 10, and *Fl. Ind.* i. 390; arboreous, leaves ovate to narrowly oblong acute entire or nearly so closely tomentose beneath, peduncles as long as the petioles closely tomentose, fruit purple ultimately black. *Wall. Cat.* 1826, chiefly; *Schauer in DC. Prodr.* xi. 641; *Brand. For. Fl.* 368; *Kurz For. Fl.* ii. 274. *C. tectonaefolia*, *Wall. Cat.* 1827. *C. villosa*, *Roxb. Hort. Beng. l. c.* *C. farinosa*, *Roxb. mss.*

N. INDIA, in the lower hills, alt. 0-4000 ft., from Kumaon to Assam, common in the Sikkim Terai; Rajmahl. E. PENINSULA, from the Khasia Terai and Muneypoor to Singapore.—DISTRIB. Ava, Sumatra.

A tree, often 40 ft., with a thick trunk and round head. *Leaves* usually 6-8 in., base rhomboid, leathery, mature glabrate above; stellate hairs beneath very close, sessile, persistent, covering the numerous glands; petiole 1-2 in. *Calyx* ⅓ in., subtruncate, stellately pubescent. *Corolla* ⅓ in., puberulous, lavender or pale purple. *Berry* ⅓ in. diam.—Generally to be recognized by the entire leaves with very close persistent hard tomentum beneath; but the leaves are toothed in Khasian examples collected at Nunklow, and the tomentum is spreading and very woolly on some from the Malay Peninsula. Leaves usually cuneate at base, but rounded in the form *C. villosa*, *Roxb.* *C. villosa*, *Vahl*, is a doubtfully Indian plant.

3. *C. vestita*, *Wall. ms.*; arboreous, leaves ovate acute subentire silkily white-tomentose beneath, peduncles as long as the petioles stellately tomentose. *C. lanata*, *Gamble Darjeeling List* 60, not of *Linn.* *C. arborea*, *Wall. Cat.* 1826, partly.—*Callicarpa* sp. n. 3 & 4, *Herb. Ind. Or. H. f. & T.*

NEPAL; Noakote, *Wallich.* SIKKIM, alt. 1-4000 ft., in the outer valleys and Terai, frequent; *Herb. Griffith, J. D. H.* (*Kew Distrib.* n. 6042), &c.

A tree, 30 ft.; resembling *C. arborea*. *Leaves* 4-10 in., base rounded or cuneate; tomentum beneath of stellate hairs having the secondary hairs fine, long and white. *Inflorescence* stellately white or tawny tomentose. *Calyx* at flower-time nearly glabrous.—Otherwise resembling *C. arborea*.

4. *C. lanata*, *Linn. Mant.* 331, not of *Schauer*, nor of *Griff.*; arboreous, leaves ovate or ovate-lanceolate subentire stellately tomentose beneath, peduncles shorter than the petioles furred. *Vahl Symb.* iii. 13; *Roxb. Fl. Ind.* i. 391; *Ham. in Trans. Linn.* xvii. 251; *Wall. Cat.* 1831; *Grah. Cat. Pl. Bomb.* 156; *Brand. For. Fl.* 368; *Bedd. For. Man.* 173, and *Anal. Pl.* 21, fig. 6. *C. Tomex*, *Poir. Suppl.* ii. 32. *C. cana*, *Dalz. & Gibs. Bomb. Fl.* 200, not of *Linn.* *C. Wallichiana*, *Walp. Rep.* iv. 125; *Schauer in DC. Prodr.* xi. 641; *Wight Ill.* t. 173 b, fig. 5, and *l. c.* t. 1480. *C. arborea*, *Miq. in Pl. Hohenack.* n. 152, not of *Roxb.* *Tomex tomentosa*, *Linn. Fl. Zeyl.* 24. *Cornutia corymbosa*, *Lamk. Dict.* i. 54.

Throughout the DECCAN PENINSULA and CEYLON, common; ascending to 4000 ft.

A tree, 20-40 ft.; tips of branches cinnamoneous, shaggy and woolly. *Leaves*

4-8 in., base cuneate rounded or subcordate; tomentum beneath of stalked hairs often with several whorls of secondary hairs, usually dense, in a few examples from Cochin thin but of similar structure. *Calyx* at flower-time stellately hairy.—Otherwise much resembling *C. arborea* and *Hookeri*. The leaves vary from subcordate orbicular cuspidate to oblong and acuminate at both ends. The nature of the hairs appears absolutely constant. *C. lanata*, *Griff. Notul.* iv. 173, and *l.c. Pl. Asiat.* t. 447 from Bhamo, has 5 stamens.

5. ***C. macrophylla***, *Vahl Symb.* iii. 13, t. 53; shrubby, leaves ovate or ovate-lanceolate closely crenate densely persistently stellate-tomentose beneath, peduncles short, berry white. *Roxb. Fl. Ind.* i. 393; *Wall. Cat.* 1832; *Schauer in DC. Prodr.* xi. 644; *Benth. Fl. Hongk.* 270; *Brandis For. Fl.* 368; *Kurz For. Fl.* ii. 274. *C. incana*, *Roxb. l.c.* *C. Roxburghii*, *Wall. Cat.* 1833, partly. *C. cana*, *Gamble Darjeeling List* 60, and *Indian Timbers* 283, not of *Linn.*—*Callicarpus* sp., *Jones in As. Research.* iv. 233.

Throughout N. and E. INDIA, ascending to 6000 ft. in the W. Himalaya; from Kashmir to Assam and Pegu; abundant in Bengal Plain. ? DECCAN PENINSULA.

A shrub, 3-8 ft.; trunk hardly any, branches wand-like, usually shaggy as well as tomentose at the tips. *Leaves* 4-7 in., acuminate, base rounded or cuneate, mature glabrate above, tomentose with compound stellate hairs beneath; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Peduncles* usually shorter than the petioles; cymes 1-3 in. diam., globose. *Calyx* scarcely $\frac{3}{16}$ in. long, stellately hairy at flower-time, lobes small triangular or hardly any. *Anthers* small, ovate.—There is only one example of this from the Deccan, marked as communicated by W. Barclay from Malabar. From Wight and Beddome's silence it may be doubted if it is wild there. *Rheede Hort. Mal.* 4, t. 60, usually quoted as *C. macrophylla*, looks as like *C. lanata*, but may not be a *Callicarpa* at all. *Wall. Cat.* 1833 type sheet is the true *C. Roxburghii* (*Schauer l.c.* 640), a non-Indian plant. The typical *C. macrophylla*, *Vahl*, has ovate leaves, somewhat obtuse at base, thickly white-tomentose beneath. This is common in and near the hills. *Roxburgh's C. incana* is the less showy form, common in Bengal Plain (as he truly says), with the leaf-base often cuneate.

VAR. *Griffithii*; much branched, leaves smaller fuscous-woolly obscurely stellate beneath ultimately glabrate.—Bhojan; *Griffith* (*Kew Distrib.* n. 6041).—Differs a good deal in habit from *C. macrophylla*, but connected by *E. Nepal* specimens collected by Sir J. D. H.

VAR. *sinensis*; leaves oblong-lanceolate closely denticulate, peduncles longer than the petioles, anthers oblong larger.—Canara; *Gibson*. *Caleutta*; cult. *Distrib. China*.—Branches upwards dense with leaves. Teeth of the leaves with minute black glandular points. *Calyx* in flower stellately tomentose, soon nearly glabrate; teeth triangular, in fruit sometimes longer than the tube. Probably a cultivated plant: it seems as near to *C. Reevesii* as to *C. macrophylla*.

6. ***C. Reevesii***, *Wall. Cat.* 1830; shrubby, leaves elliptic-lanceolate closely crenate mature glabrate above densely stellate-tomentose beneath, peduncles longer than the petioles, cymes somewhat lax stellately tomentose, calyx at flower-time nearly glabrous. *Schauer in DC. Prodr.* xi. 641; *Benth. Fl. Hongk.* 270. *C. nudiflora*, *Hook. et Arn. Bot. Beech. Voy.* p. 206, t. 46.

TENASSERIM (?); *Falconer*. SINGAPORE; *Murton*.—DISTRIB. S. China.

May be a cultivated plant; it is very near *C. macrophylla*. The leaves are very handsome, dark above, white tomentose beneath; the anthers are nearly as of *C. macrophylla* var. *sinensis*.

7. ***C. cana***, *Linn. Mant.* 198; shrubby, leaves broadly elliptic shortly acuminate at both ends sharply crenate-serrate mature glabrate above densely stellate-tomentose beneath, peduncles very short, calyx in fruit stellate-tomentose. *Vahl Symb.* iii. 12; *Roxb. Fl. Ind.* i. 392; *Wall. Cat.*

1834, *type sheet*; *Blume Bijd.* 817; *Dcne. in Nouv. Ann. Mus.* iii. 401; *Schauer in DC. Prodr.* xi. 643; *Benth. Fl. Austral.* v. 56. *C. tomentosa*, *Lamk. Dict.* i. 562. *C. americana*, *Lour. Fl. Cochinch.* 70, *not of Linn.* *C. adenantha*, *Br. Prodr.* 513. *C. Heynei*, *Roth Nov. Sp.* 82; *Blume Bijd.* 819. *C. bicolor*, *Juss. in Ann. Mus.* vii. 77; *Schauer l. c.* 642. *C. sumatrana*, *Miq. Fl. Ind. Bat.* ii. 886. *C. dentata*, *Herb. Roxb., Wall. Cat.* 1834 *by admixture, not of Roth.*

PENANG; *Wallich.* MALACCA; *Griffith, Maingay.*—DISTRIB. Malaya and Philippine Islands, N. Australia.

Leaves $4\frac{1}{2}$ by $2\frac{1}{2}$ in., suddenly cuneate and narrowed into the petiole, often almost spatulate, mature shining above, usually very white beneath; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. *Peduncles* usually $\frac{3}{8}$ – $\frac{1}{2}$ in.; cyme 1–2 in. diam., globose. *Fruit* deep-purple, finally black.—Widely cultivated for the strong contrast between the upper and lower surface of the leaves. The figure in *Bot. Mag.* (t. 2107) is doubted by *Bentham l. c.*, and with reason.

8. *C. pedunculata*, *Br. Prodr.* 513; shrubby, leaves broadly elliptic acuminate base rounded closely serrulate mature puberulous above thinly stellate-flocculose beneath, peduncles often as long as the petiole. *Benth. Fl. Austral.* v. 57. *C. cuspidata*, *Roxb. Fl. Ind.* i. 394. *C. dentata*, *Roth Nov. Sp.* 81; *Blume Bijd.* 818; *Wall. Cat.* 6319. *C. cana*, *Wall. Cat.* 1834, n. 2. *C. lanata*, *Schauer in DC. Prodr.* xi. 644, *not of Linn., nor of Vahl.* *C. tiliaefolia*, *Teijsm. & Binnend. fide Kurz ms.*

PENANG; *Wallich.*—DISTRIB. Malaya, Trop. Australia.

Leaves 5 by $2\frac{1}{4}$ in., membranous, stellate tomentum somewhat deciduous; petiole $\frac{1}{4}$ in., stellate-woolly. *Cymes* 1–2 in. diam., globose, dense, stellately woolly; peduncles $\frac{1}{4}$ – $\frac{1}{2}$ in. *Fruit.* $\frac{1}{10}$ in. diam., dark purple.—Easily distinguished from *C. cana* by the nearly concolorous surfaces of the leaf.

9. *C. rubella*, *Lindl. Bot. Reg.* t. 883; arborescent, leaves very short-petioled cordate-oblong acuminate crenate-serrate mature softly pubescent above tomentose beneath, peduncles short, calyx in flower stellately tomentose. *Schauer in DC. Prodr.* xi. 645; *Benth. Fl. Hongk.* 271. *C. sessilifolia*, *Wall. Cat.* 1837; *Walp. Rep.* iv. 130. *C. tenuiflora*, *Champ. in Hook. Kew Journ.* v. 135.

SIKKIM, alt. 2000 ft.; *Clarke.* KHASIA and JAINTIA Mts., alt. 2–4000 ft., frequent; *Wallich, H. f. & T., &c.*—DISTRIB. China.

An erect, single-stemmed shrub, 10–20 ft., with horizontal branches and complanate foliage. *Leaves* 5 by $1\frac{1}{4}$ in., parallel-sided or slightly obovate, closely covered with short simple hairs above, concolorous beneath; petiole $\frac{1}{10}$ – $\frac{1}{4}$ in. *Peduncles* $\frac{1}{4}$ – $\frac{1}{2}$ in.; cymes 1–2 in. diam., stellately tomentose. *Calyx* not membranous, nor glabrate in fruit. *Corolla* pink. *Fruit* $\frac{1}{8}$ – $\frac{1}{6}$ in. diam., fine purple.—*Lindley's* figure represents correctly the Chinese form of this species having the leaves “crossing each other” subsessile, mature nearly glabrate above very thinly stellate-hairy beneath. The description of *Schauer l. c.* is taken from the Indian form, *C. sessilifolia*, *Wall.*, which, however, has the petioles longer than the Chinese.

10. *P. psilocalyx*, *Clarke*; arborescent, leaves elliptic acuminate denticulate mature nearly glabrous, cymes small short-peduncled stellately villous, calyx membranous in flower glandular scarcely hairy.

KHASIA Mts., alt. 4–5000 ft.; *Wallich, J. D. H., &c.*

A small tree; branchlets densely stellate-tomentose. *Leaves* 8 by $2\frac{3}{4}$ in., or $2\frac{1}{2}$ by 1 in., base rounded or cuneate thinly membranous, mature with scattered stellate hairs on the midrib beneath, tertiary venation close prominent, glands minute scattered; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Peduncles* mostly very short; cymes usually few-fl.; pedicels sometimes pink. *Calyx* $\frac{3}{4}$ in., minutely 4-toothed, greenish or pinkish,

minutely gland-dotted, with a few scattered hairs when young, whiteish or membranous in fruit. *Corolla* pink. *Fruit* scarcely $\frac{1}{2}$ in. diam.—*C. longitolia*, *Benth. Fl. Hongk.* 270 (not of *Lamk.*), in the glabrous calyx, inflorescence, and structure of leaves comes very near this; but in that the leaves are linear-lanceolate, and the fruit very much larger.

11. *C. longifolia*, *Lamk. Ill.* i. 563, and *Ill.* t. 69; shrubby, leaves petioled broadly lanceolate acuminate at both ends serrulate mature thinly stellate-hairy beneath, cymes short-peduncled dense, calyx stellately white-tomentose. *Bot. Reg.* t. 864; *Roxb. Fl. Ind.* i. 394; *Brand. For. Fl.* 369; *Kurz For. Fl.* 275; *Schauer in DC. Prodr.* xi. 645, *Var. β only*; *Benth. Fl. Austral.* v. 57, not *Fl. Hongk.* 270. *C. Roxburghiana*, *Roem. & Sch. Syst.* iii. *Mant.* 54. *C. attenuata*, *Wall. Cat.* 1835. *C. cana*, *Wall. Cat.* 1834, partly. *C. dentata*, *Wall. Cat.* 6319, partly.

MALAY PENINSULA; Penang, *Wallich, Roxburgh*; Malacca, *Griffith* (*Kew Distrib.* n. 6039), &c. NICOBAES; *Kurz.*—DISTRIB. W. Malaya to N. Australia.

Branchlets densely stellate-tomentose. *Leaves* 5 by 2 in., base much attenuate, mature nearly glabrous above, beneath so closely fulvous stellate-villous that few of the largeish glands can be seen; petiole $\frac{1}{2}$ in. *Cyme* in flower $1\frac{1}{2}$ in. diam., densely stellate-tomentose; peduncle $\frac{1}{2}$ in. *Calyx* $\frac{1}{8}$ – $\frac{1}{2}$ in. *Corolla* purple or pink, or sometimes white (fide *Benth.*). *Berry* $\frac{1}{10}$ in. diam., white.—The details of this description are from the Penang plant. *C. longifolia*, *Hook. Fl. Exot.* ii. t. 133, is *C. longifolia* var. *brevipes*, *Benth. Fl. Hongk.* 270, which has sessile obtuse-based linear-lanceolate leaves, glabrous calyx, &c.

VAR: lanceolaria; leaves narrower thinner mature beneath glabrate densely minutely glandular-dotted. *C. lanceolaria*, *Roxb. Fl. Ind.* i. 395; *Wall. Cat.* 1829. *C. lanceolaria*, *Var. α subglabrata*. *Schauer l. c. excl. syn.*—E. Bengal; in the plains, common; also in the Khasia, Chittagong Hills up to 3000 ft., plentiful. (W. Malaya.)—Cymes laxer, flowers and fruits smaller, than in the type. The abundant material for this common plant is very uniform; except that, while the leaves are generally regularly serrulate, a form with them subentire appears in Chittagong, and is common in the Malay Peninsula and islands.

12. *C. acuminata*, *Roxb. Fl. Ind.* i. 394; shrubby, innovations stellately white-tomentose, leaves broadly lanceolate acuminate denticulate, panicles axillary long-peduncled dichotomous shorter than the leaves.

SILHET; *Roxburgh*.

Leaves 4–5 by 2 in., mature glabrate reticulate above, hairy beneath. *Peduncles* longer than in the other species.—Not seen; the foregoing copied from *Roxburgh*. *Schauer* reduces this to *C. longifolia*; but there is no form of that known with the peduncles longer than in the other species described by him. His description points altogether to *C. Reevesii*, for which the locality does not suit. Possibly *Roxburgh's* specimen was a cultivated one, as *C. Reevesii* has been long cultivated.

X. TECTONA, *Linn. f.*

Trees, stellately tomentose. *Leaves* opposite or whorled, large, petioled, entire. *Cymes* dichotomous, many-fl., in large terminal panicles; bracts small, narrow. *Calyx* campanulate, shortly 5–6-lobed, in fruit enlarged ovoid or urceolate. *Corolla* small, tube short; limb equally 5–6-lobed, spreading. *Stamens* as many as corolla-lobes, on the corolla-tube; anthers exerted, oblong. *Ovary* 4-celled, cells 1-ovuled; style linear, tip shortly bifid. *Drupe* enclosed in the calyx, 4-celled; endocarp bony. *Seeds* erect, oblong.—Species 3, the following and a Philippine Island one.

1. *T. grandis*, *Linn. f. Suppl.* 151; leaves opposite ovate mature

scabrous or subglabrate above, calyx in fruit 1 in. diam. ovoid membranous. *Gaertn. Fruct.* i. 275, t. 57; *Roxb. Cor. Pl.* i. 10, t. 6, and *Fl. Ind.* i. 600; *Wall. Cat.* 772; *Graham Cat. Pl. Bomb.* 158; *Schauer in DC. Prodr.* xi. 629; *Dalz. & Gibs. Bomb. Fl.* 199; *Bocq. Rev. Verb.* 99, t. 10; *Bedd. Fl. Sylv.* t. 250 (two); *Brand. For. Fl.* 354, t. 44; *Kurz For. Fl.* ii. 259; *Gamble Indian Timbers*, 283.—*Theka, Juss. Gen.* 108; *Lamk. Ill.* t. 136.—*Rumph. Herb. Amb.* iii. t. 18; *Rheede Horæ. Mal.* iv. t. 27.

W. DECCAN PENINSULA, alt. 500–4000 ft., common; from CENTRAL INDIA to ORISSA. MALAY PENINSULA, alt. 500–4000 ft.; from Burma (common) to Malacca. —DISTRIB. Sumatra, Java.

A tree, 80–150 ft.; branchlets quadrangular, stellately tomentose. *Leaves* 12 by 8 in. (of seedlings sometimes 3 ft.), cuneate at both ends, mature with hard close tomentum beneath; petiole 1 in. *Panicles* 18 in. diam., and more; flowers very numerous, but only a few fertile; bracts $\frac{1}{2}$ by $\frac{1}{10}$ in., deciduous, with also usually some reduced leaves at the forks. *Calyx* (in flower) $\frac{1}{8}$ – $\frac{1}{6}$ in., lobed less than half-way down, stellately white-tomentose. *Corolla* scarcely $\frac{1}{4}$ in. long, white, glabrous in the throat. *Drupe* $\frac{3}{8}$ in. diam.; cells 4 with a central cavity, densely hirsute; calyx in fruit ovoid or subpyramidal, membranous, often reticulately-nerved nearly glabrous, mbuth very small.—Teak.

2. **T. Hamiltoniana**, *Wall. Pl. As. Rar.* iii. 68, t. 294, and *Cat.* 773; leaves mostly ternate whorled, ovate mature scabrid above, calyx in fruit $\frac{1}{2}$ in. diam. narrowly urceolate densely woolly. *Walp. Rep.* iv. 99; *Schauer in DC. Prodr.* xi. 629 (excl. the Philippine Island plant); *Kurz For. Fl.* ii. 259; *Gamble Indian Timbers*, 293. *Theka ternifolia*, *Ham. in Trans. Linn. Soc.* xvii. 185.

BURMA, at Prome; *Wallich, Kurz.*—DISTRIB. Ava.

A small tree, 30–40 ft.; branchlets 6–8-angular. *Leaves* sometimes opposite or 4-nate, 8 by 5 in., base rhomboid or obtuse, white tomentose beneath or ultimately softly hairy; petiole $\frac{3}{8}$ in. *Panicle* 6–12 in., stellately woolly; branches ascending. *Calyx* (in flower) $\frac{1}{8}$ in., lobed scarcely half-way down. *Corolla* $\frac{1}{2}$ in. long, throat very hairy; lobes pale blue. *Drupe* $\frac{1}{2}$ by $\frac{1}{2}$ in., glabrous or with some soft wool, 4-celled without a central cavity; calyx in fruit $\frac{1}{2}$ by $\frac{1}{2}$ in., narrower upwards.—This tree flowers before the leaves are fully developed.

XI. PREMNA, Linn.

Trees or shrubs, sometimes climbing. *Leaves* opposite, entire or toothed. *Cymes* corymbose or paniced, sometimes thyrsoid, pubescent; bracts small, narrow. *Flowers* often polygamous, greenish or yellowish white, small (in *P. cordifolia* and *P. corymbosa* rather larger, then scarcely $\frac{1}{4}$ in. long). *Calyx* small, cup-shaped, subentire or minutely 2–5-toothed, subequal or 2-lipped. *Corolla* tubular, throat hairy; limb 2-lipped, 5-lobed, or subequally 4-lobed. *Stamens* 4, didynamous. *Ovary* 2- or 4-celled, 4-ovuled; style linear, shortly bifid. *Drupe* small, surrounded below by the calyx, globose or oblong-obovoid; endocarp hard undivided 1–4-celled 1–4-seeded. *Seeds* oblong.—Species 40, chiefly Indian.

* *Calyx* 2-lipped or subtruncate, lips subentire.

† *Cymes* forming an elongate interrupted thyrses.

1. **P. racemosa**, *Wall. Cat.* 1777; leaves petioled ovate or obovate acuminate, spikes simple densely shortly villous, calyx minutely hairy or glabrate. *Schauer in DC. Prodr.* xi. 633; *Brand. For. Fl.* 367; *Kurz For. Fl.* ii. 263.

KHASIA MTS., alt. 3-5000 ft.; *Wallich, Griffith* (Kew Distrib. n. 6023); *H. f. & T.*, &c. TENASSERIM (*Kur*).

A small tree, 10-30 ft.; innovations minutely fulvous-villous. *Leaves* 3 by $1\frac{1}{2}$ in., obscurely crenate, mature nearly glabrous, nerves 4-5 pair; petiole $\frac{1}{4}$ in. *Spikes* 2-5 in.; bracts $\frac{1}{3}$ in., elliptic, nerved, whitened, deciduous, or much smaller inconspicuous. *Calyx* $\frac{1}{8}$ in., usually whitened upwards, glabrate, lobed half-way down into 2 rounded lips, or subtruncate and very shallowly lobed. *Corolla* $\frac{1}{8}$ - $\frac{1}{4}$ in., greenish-white, mouth subequally 4-lobed, throat very hairy. *Ovary* nearly glabrous at the tip. *Drupe* $\frac{1}{8}$ in., mostly 1-seeded, narrowly obovoid.

2. **P. interrupta**, *Wall. Cat.* 1778; leaves subsessile ovate or obovate very shortly acuminate, spikes simple densely shortly villous, calyx puberulous or glabrate. *Schauer in DC. Prodr.* xi. 633; *Brand. For. Fl.* 367.

TEMPERATE HIMALAYA, frequent, alt. 5-8000 ft., from Kumaon, *Strachey & Winterbottom*, to Sikkim, *J. D. H.*

A small tree, 10-30 ft., resembling *P. racemosa* very closely, except in the larger subsessile leaves. *Leaves*, those next the spikes 9 by $4\frac{1}{4}$ in., sometimes 6 by 3 in.; petiole $\frac{1}{8}$ - $\frac{1}{4}$ in., broadly channelled. *Spikes* as of *P. racemosa*, but rather larger; bracts $\frac{1}{2}$ in., whitened, nervose, or inconspicuous. *Corolla* hairy in the throat. *Drupe* (the few examined) 1-seeded, rather shorter and broader than in *P. racemosa*.—Gamble (*Darjeeling List*, 61, and *Indian Timbers*, 293) says that this and the next are large climbers, and it is very probable that they are so sometimes. But Gamble's plants being published with imperfect diagnoses, and some being wrongly identified, the information regarding others is doubtful.

3. **P. bracteata**, *Wall. Cat.* 1772; leaves short-petioled elliptic or obovate acuminate at both ends, spikes panicle and calyx densely puberulous. *P. racemosa*, *Gamble Darjeeling List*, 61?, not of *Wall. Labiata?* *Griff. Itin. Notes* 199, n. 1138.

SUBTROPICAL SIKKIM, alt. 2-3000 ft.; *J. D. H.*, &c. BHOTAN; *Griffith* (Kew Distrib. n. 6022). KHASIA MTS., alt. 4000 ft.; *Wallich, Griffith, H. f. & T.*

A tree, 40 ft.; innovations densely cinereous pubescent. *Leaves* 9 by $3\frac{1}{2}$ in., subentire, mature glabrate, nerves 8 pair; petiole $\frac{1}{4}$ in., somewhat winged, or 0. *Panicles* 7 by 4 in.; bracts $\frac{1}{2}$ in., broadly lanceolate, acute, or 0; cymes mostly in distant capitate whorls on the panicle branches. *Calyx* $\frac{1}{20}$ in.; lips entire shallow, or sometimes one minutely 2-toothed, the other still more obscurely 3-toothed. *Corolla* $\frac{1}{8}$ in., white, as of *P. interrupta* but smaller, hardly hairy in the throat. *Drupe* not seen.

†† *Cymes in compound corymbs.*

4. **P. cordifolia**, *Roxb. Fl. Ind.* iii. 78; leaves subcordate-ovate acuminate, corymb dense, pedicels very short hairy, corolla $\frac{1}{4}$ in. tube cylindric densely hairy nearly to the base. *Walp. Rep.* iv. 94; *Schauer in DC. Prodr.* xi. 632 partly, not of *Wight or Beddome*.

PENANG; *Roxburgh*. SINGAPORE; *Lobb*.

A shrub, 6-8 ft. *Leaves* 6 by 3 in., subentire, drying red, mature nearly glabrous, nerves 5-6 pair; petiole 1 in., fulvous-puberulous. *Corymb* 3-5 in. diam., many-fl.; bracts $\frac{1}{8}$ in., lanceolate, acute; branches thick, shortly yellow-hirsute. *Calyx* $\frac{1}{16}$ in., scabridly puberulous, 2-lipped; lips broad, rounded. *Corolla-tube* twice as long as the calyx, densely filled with hair within in the lower part; limb 2-lipped. *Ovary* glabrous at the tip. *Drupe* $\frac{1}{4}$ in. diam., subglobose, usually 3-4-seeded.—*Schauer's* diagnosis is taken from *Roxburgh*; his description mainly from *P. Perrottetii*. *P. cordifolia*, *Wall. Cat.* 2467, is not in *Wallich's Herbarium*; but, as it came from *Gongachora*, it is very unlikely to have been *P. cordifolia*, *Roxb.*

5. **P. corymbosa**, *Rottl. & Willd. in Gesell. Nat. Freunde Neue Schr.* iv. (1803) 187, 188; leaves subcordate-ovate acuminate undulate, panicles dense branches dichotomous slender glabrate coloured, corolla $\frac{1}{2}$ in. tube cylindric hairy near the top. *P. densiflora*, *Wall. Cat.* 1773. *P. cordifolia*, *Wight Ic.* t. 1483; *Bedd. For. Man.* 172; *Schauer in DC. Prodr.* xi. 632, partly; *Dalz. & Gibs. Bomb. Fl.* 199?, not of *Roxb.* *P. truncata*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 215, ex. descr. *Cornutia corymbosa*, *Burm. Fl. Ind.* 133, t. 41, fig. 1, not of *Lamk.*

CARNATIC; *Wight, Shuter*; Cuddapah Hills, *Beddome*. CEYLON; *Burmans, Thwaites*, C. P. n. 193.

Leaves $3\frac{1}{2}$ by $1\frac{1}{2}$ in., young sometimes woolly, mature nearly glabrous, upper surface impressed reticulate; petiole 1 in., pubescent. *Panicles* small, pyramidal, very dense, brachiately, patently deciduously pubescent with simple hairs; bracts narrowly lanceolate. *Calyx* $\frac{1}{10}$ in., early glabrate; in fruit enlarged, 2-lipped, membranous or whitened. *Corolla* tubular, limb subequally 4-lobed. *Drupe* $\frac{1}{2}$ in., obovoid, 3-4-seeded.

6. **P. coriacea**, *Clarke*; leaves cordate ovate or orbicular shortly acuminate mature coriaceous glabrous, corymbs large compound, corolla $\frac{1}{2}$ in. *P. cordifolia*, *Grah. Cat. Pl. Bomb.* 155, not of *Roxb.* *P. scandens*, *Dalz. & Gibs. Bomb. Fl.* 199, not of *Roxb.*

W. DECCAN PENINSULA, in the Ghauts, from Bombay to Cochin, common; *Wight, Graham, Hohenacker*, &c.

A large climber (*Ritchie*) or a tree (*Graham*). *Leaves* 5 by $3\frac{1}{2}$ in., entire, mature very shining smooth, nerves 4-5 pair; petiole 1 in. *Corymb* 8 in. diam., 3 in. high, closely shortly hairy; bracts $\frac{1}{2}$ in., lanceolate, scattered. *Calyx* $\frac{1}{2}$ in., cup-shaped, truncate, hardly 2-lipped, minutely pubescent. *Corolla* greenish-yellow, throat hairy. *Drupe* $\frac{1}{2}$ in., 1-seeded, narrowly obovoid.

VAR. oblonga; leaves elliptic or oblong often caudate. *P. scandens*, *Wall. Cat.* 1774, partly. *Premna* n. 23, *Herb. Ind. Or. H. f. & T.*—Khasia Terai; *H. f. & T.* Nathpur; *Hamilton*. Sikkim Terai; *Clarke*.—A tree, 20-40 ft.

VAR. cuneata; leaves oblong base cuneate often caudate. *Premna* n. 23, *Herb. Ind. Or. H. f. & T.*—Khasia Terai; Silhet and Pundua, *H. f. & T.*

7. **P. villosa**, *Clarke*; leaves cordate-ovate shortly acuminate mature densely villous beneath, corymbs large compound closely pubescent, corolla $\frac{1}{2}$ in.—*Premna* n. 25, *Herb. Ind. Or. H. f. & T.*

DECCAN PENINSULA; Mts. of Kurg, *Wight, G. Thomson*; Wynaad, alt. 3000 ft., *Beddome*.

A tree (or a large climber, *Beddome*), closely resembling *P. coriacea* except as to the indumentum. *Leaves* (mature) densely villous with simple straight hairs beneath, most copiously on the nerves, glabrate above; petiole 2 in. *Corymb*, *calyx*, *corolla*, and young *drupe* as of *P. coriacea*, of which this may be a var., as *Beddome* suspects.

8. **P. scandens**, *Roxb. Fl. Ind.* iii. 82; leaves petioled elliptic and acuminate or lanceolate entire membranous glabrous, corymbs large compound lax puberulous many-fld., calyx subentire membranous in fruit, corolla scarcely $\frac{1}{2}$ in. *Schauer in DC. Prodr.* xi. 632; *Kurz For. Fl.* ii. 263. *P. ramosa*, *Wall. Cat.* 1774.—*Premna* n. 24, *Herb. Ind. Or. H. f. & T.*

TERAI of N. and E. BENGAL, frequent; SIKKIM, *J. D. H.*, &c.; BHOTAN and ASSAM, *Griffith* (*Kew Distrib.* n. 6034). SILHET; *Roxburgh, Wallich*; CACHAR, *Keenan*. MARTABAN; *Kurz*.

A tree, 20-40 ft., or (side *Roxburgh*) a large climber. *Leaves* 11 by 4 in., base rounded or cuneate, nerves 6 pair; petiole $1\frac{1}{2}$ in., glabrous. *Corymbs* 4-10 in. diam.

Calyx $\frac{1}{8}$ in., cup-shaped, nearly glabrous at flower-time. *Corolla* bearded in the throat. *Drupe* (fide Roxburgh) size of a pea, globose, tubercled.—The immature drupes appear narrowly obovoid, and the plant hardly to differ from *P. coriacea* var. *oblonga*, except in the thinner texture. Roxburgh says the petioles are sometimes hairy; from which it may be doubted whether he did not erroneously refer other things to this species. I cannot satisfactorily identify from the descriptions the *P. scandens* & *cordifolia* of Brandis For. Flora.

9. ***P. purpurascens***, *Thwaites Enum.* 242; leaves broadly oblong suddenly shortly acuminate entire glabrous, corymbs large closely pubescent, calyx small truncate cinereous-pubescent.

CEYLON; Ambagamowa District, *Thwaites*.

A large climber. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{4}$ in., suddenly subobtusely acuminate, base obtuse or subcordate, mature fulvous-puberulous on the nerves beneath or glabrate; nerves 8 pair; petiole 1 in. *Corymbs* 6 in., straggling, with many small flowers clustered at the ends of the branches. *Calyx* $\frac{3}{8}$ in., obscurely 2-lipped. *Corolla* $\frac{1}{2}$ in., subequally 4-lobed, pale-purple, *Thwaites*. *Drupe* not seen.

VAR. ? *paucinervis*; nerves 3–4 pair, not inarching except very close to the margin. —Anamallays, alt. 3000 ft., *Beddome*.—A gigantic climber with the purple colour of *Thwaites' P. purpurascens* by *Beddome*, and referred doubtfully thereto by him. *Beddome's* specimen is very immature, but the nervation of the leaves is unlike that of *P. purpurascens*, and may indicate a new species.

** *Calyx* 2-lipped, one lip 2-toothed, the other subentire.

10. ***P. integrifolia***, *Linn. Mant.* 252 (excl. syn. Burm.); leaves broadly oblong or ovate subobtusely undulate or coarsely toothed mature glabrous, corymbs dense minutely hairy, calyx sparsely minutely pubescent or scabrid puberulous. *Wight Ic. t.* 1469; *Brand. For. Fl.* 366. *P. serratifolia*, *Linn. l. c.* 253; *Wall. Cat.* 1767; *Schauer in DC. Prodr.* xi. 632; *Bedd. For. Man.* 172; *Kurz For. Fl.* ii. 263. *P. spinosa*, *Roxb. Fl. Ind.* iii. 77. *P. sambucina*, *Wall. Cat.* 1775; *Schauer l. c.* 631; *Kurz l. c.* 261. *P. viburnoides*, *Wall. Cat.* 2646, letter C. *P. subcordata*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 216. *P. ovalifolia*, *Wall. Cat.* 1782.—*Gumira littorea*, *Rumph. Herb. Amb.* iii. 209, t. 134. *G. integrifolia*, *Hassk. Hort. Bogor.* 135.

INDIA, near the sea from Bombay to Malacca. SILHET; *Wallich*. CEYLON. ANDAMANS; and NICOBARS, *Kurz*.—DISTRIB. Malaya.

A small tree, or shrub; trunk and large branches often spinous, branchlets unarmed. *Leaves* 4 by $2\frac{1}{4}$ in. (sometimes 1 by $\frac{1}{2}$ in.), subobtusely very shortly acuminate or obtuse, sometimes obovate, entire sinuate or in the upper half with a few coarse teeth, mature glabrous or minutely hairy on the nerves above or beside the nerves beneath; nerves 4–5 pair; petiole $\frac{3}{4}$ in., usually somewhat pubescent. *Corymbs* 2–4 in. diam., short-peduncled, minutely cinereous-pubescent, and often with some fulvous deciduous hair; bracts $\frac{1}{16}$ in., lanceolate, pubescent. *Calyx* $\frac{1}{8}$ in., 3-toothed. *Corolla* $\frac{1}{2}$ in., greenish-white, throat hairy, subequally 4-lobed. *Drupe* $\frac{1}{2}$ in. diam., globose, 3–4-seeded.—Some of the synonyms cited above are uncertain; specimens with the calyx at all distinctly 5-toothed (rather than 3-toothed) must be referred to *P. latifolia*, *Roxb.*: it may be doubted whether any of the examples said to have come (*Brandis l. c.*) from Oudh and Gurwhal belong here. *Gamble*, however, says (*Darjeeling List*, 60, and *Indian Timbers*, 295) that the tree is found in the Sikkim Terai; and as he describes the tree as thorny, it would appear that he identified it correctly.

VAR. *angustior*; leaves elliptic narrowed at both ends obtuse, corymbs small.—Malacca; *Griffith* (*Kew Distrib. n.* 6030).—*Leaves* $2\frac{1}{2}$ by $\frac{3}{4}$ in., widest about the middle. *Corymbs* numerous, 1–2 in. diam.

11. ***P. parasitica***, *Blume Bijl.* 816; leaves ovate or obovate very

shortly acuminate entire glabrous, corymbs nearly glabrous, flowers mostly sessile, calyx nearly glabrous. *Schauer in DC. Prodr.* xi. 633. *P. trichostoma*, *Miq. Fl. Ind. Bat.* ii. 892.

MALACCA; *Griffith* (Kew Distrib. n. 6019). TENASSERIM; *Helper*. SINGAPORE; *G. Thomson*.—DISTRIB. Java, Borneo.

A large climber. *Leaves* $5\frac{1}{2}$ by 3 in., base obtuse or cordate, nerves 5 pair; petiole $\frac{3}{8}$ in. *Corymbs* 3-4 in. diam., puberulous, hardly pubescent; branches somewhat thick, bracts deciduous. *Calyx* $\frac{1}{16}$ in., 2-lipped, usually membranous, glabrous after flowering; one lip shortly 2-fid, the other subentire. *Drupe* not seen.

12. *P. divaricata*, *Wall. Cat.* 1781; leaves ovate acuminate entire mature nearly glabrous, corymbs compound many-fld. pubescent, calyx subtruncate with 2 minute teeth. *Schauer in DC. Prodr.* xi. 633. *P. lucidula*, *Kurz For. Fl.* ii. 263 (? of *Miquel*).—*Premna* n. 33, *Herb. Ind. Or. H. f. & T.*

MERGUI; *Griffith*. MALACCA; *Maingay* (Kew Distrib. n. 1198, 1199). ANDAMANS (*Kurz*).—DISTRIB. Java.

A climber. *Leaves* 5 by $2\frac{1}{2}$ in., nerves 5-6 pair, usually puberulous above, beneath most obscurely dotted and sometimes pubescent; petiole $\frac{1}{2}$ - $2\frac{1}{2}$ in. *Corymbs* 3 in. diam.; bracts $\frac{1}{8}$ in., lanceolate; flowers shortly pedicelled or sessile. *Calyx* $\frac{1}{4}$ in., broadly cup-shaped; upper lip in flower of 2 minute acute teeth, lower subentire. *Corolla* $\frac{1}{4}$ in., throat hairy. *Drupe* $\frac{1}{2}$ in. diam., globose, 3-4-seeded.—An authentic Javan example from *Miquel* of his *lucidula* has the corymbs stouter, the calyx larger, more distinctly toothed, the corolla fully $\frac{1}{2}$ in.

13. *P. punctulata*, *Clarke*; leaves broadly elliptic suddenly shortly acuminate entire mature glabrate punctulate beneath, corymbs large pubescent, calyx closely pubescent 2-lipped, lips subequal one 2-toothed the other subentire.

MALACCA; *Maingay* (Kew Distrib. n. 1200).

Leaves $5\frac{1}{2}$ by 3 in., base obtuse or rounded, nerves 4 pair; petiole 1 in. *Corymbs* 4-5 in. diam.; lower bracts $\frac{1}{2}$ in., linear-oblong; flowers sessile or shortly pedicelled. *Calyx* $\frac{1}{8}$ in., closely minutely grey-pubescent; after flowering somewhat deeply 2-lipped. *Drupe* not seen.—This may be *P. ceramensis* (*Miq. Fl. Ind. Bat.* ii. 893), of which no authentic specimen is at Kew.

14. *P. khasiana*, *Clarke*; leaves large ovate caudate-acuminate entire glabrous nerves pubescent above, corymbs large lax pubescent, calyx 2-lipped sub-5-toothed.

KHASIA MTS., alt. 4300 ft.; Jasper Hill near Cherra, *H. f. & T.*

Subscandent (*Hooker*). *Leaves* 7 by $4\frac{1}{2}$ in., base obtuse, shining, subcoriaceous, young scarcely pubescent beneath, nerves 7 pair; petiole $1\frac{1}{2}$ in., pubescent. *Corymbs* 6 in. diam., straggling, closely pubescent with simple hairs and minute scales; bracts $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{8}$ - $\frac{1}{2}$ in., pubescent; one lip distinctly 2-toothed, the other more shortly 3-toothed or subentire. *Corolla* $\frac{1}{2}$ in., subequally 4-lobed, glabrous without, throat somewhat hairy. *Drupe* not seen.—From the subcoriaceous, shining, much acuminate large leaves and scandent habit, the true affinity of this may be near *P. coriacea*; but the artificial sectional character taken from the calyx does not allow it to stand there.

15. *P. longifolia*, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 79, not of *Wall. nor of Schauer*; leaves large long-petioled ovate acute entire mature glabrate, corymbs compound pubescent, calyx 2-lipped lower lip shorter subentire or obscurely 3-toothed. *Walp. Rep.* iv. 93.

BENGAL; *Roxburgh*.

A tree. *Leaves* 9 by $4\frac{1}{2}$ in., base obtuse or subcordate, mature glabrate epunctate,

a little yellow hair clinging to the sides of the midrib beneath; nerves 6 pair, secondary reticulating nerves conspicuous; petiole $2\frac{1}{2}$ in. *Corymbs* terminal, short-peduncled, 3-4 in. diam., closely pubescent and with some deciduous fulvous hairs, exceedingly like *P. integrifolia*, but rather larger. *Calyx* $\frac{1}{10}$ in., in fruit 3-toothed, closely scabrid-puberulous. *Corolla* $\frac{1}{8}$ in., greenish-white, hairy in the throat. *Drupe* $\frac{1}{2}$ in. diam., globose, 4-seeded (Roxburgh).—The two examples of Roxburgh, one named by himself, agree exactly with his Ic. Ined. at Kew, and with his description; and are very unlike the *P. longifolia* of Wallich, accepted as Roxburgh's by Schauer. It seems very near *P. integrifolia*, Linn.

*** *Calyx* 5-4-toothed, subequally or obscurely 2-lipped.

† *Leaves entire or nearly so.*

16. ***P. milleflora*, Clarke**; leaves large long-petioled ovate acute entire mature minutely crisped-pubescent on the nerves, corymb large very many-fl'd., calyx minutely 5-toothed.—*Premna* n. 30, *Herb. Ind. Or. H. f. & T.*

ASSAM; *Griffith* (Kew Distrib. n. 6028); Upper Assam, *Jenkins*.

Generally resembling *P. longifolia*, Roxb., but with a very large dense corymb of very small flowers. *Leaves* 7 by 4 in., base rhomboid, mature minutely pubescent on the nerves (primary and secondary) beneath, nerves 8 pair; petiole $2\frac{1}{2}$ in. *Corymb* a foot diam., about 2000-flowered (in *Griffith's* n. 320), and *calyx* ($\frac{1}{4}$ in.), minutely pubescent. *Corolla* $\frac{1}{12}$ in., throat hairy. *Drupe* $\frac{1}{2}$ in., globose.

17. ***P. tomentosa*, Willd. Sp. Pl. iii. 314**; leaves ovate acuminate entire mature stellate-woolly beneath, corymbs paniced densely stellate-woolly, calyx shortly 5-fl'd., ovary upwards very hairy. *Roxb. Fl. Ind. iii. 76*; *Wall. Cat. 1769*; *Schauer in DC. Prodr. xi. 634*; *Wight Ic. t. 1468*; *Bedd. Fl. Sylv. t. 251*; *Brand. For. Fl. 367*. *P. flavescens*, *Juss. in Ann. Mus. d'Hist. Nat. vii. 77*, not of *Wall.* *Cornutia corymbosa*, *Lamk. Dict. i. 54*, not of *Burm.*

DECCAN PENINSULA and Ceylon, frequent; from the Circars and Central Provinces southward.

A tree, often 50 ft.; branchlets densely stellate-woolly. *Leaves* 6 by $3\frac{1}{2}$ in., base rounded or subcordate, coriaceous, minutely glandular scabrous above, nerves 7 pair; petiole 1 in. *Corymbs* $\frac{3}{4}$ in. diam., often sessile, upper branches (or nearly all) alternate; bracts $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{10}$ in., stellately woolly. *Corolla* $\frac{1}{8}$ in., 2-lipped, hairy in the throat, greenish-yellow. *Drupe* $\frac{1}{2}$ in. diam., deciduously hairy, ovoid, 3-1-seeded.—This is certainly *P. tomentosa* of Roxb., but whether of Willd. may be questioned. Willdenow founds his plant as a syn. of *Cornutia corymbosa*, Lamk. Lamarck does not say whether it was the same as *Cornutia corymbosa*, Burm. If it was the same, which from the description seems not improbable, then *Premna tomentosa*, Willd., is a mere syn. of *P. corymbosa*.

VAR. *detergibilis*; mature leaves with most of the wool rubbed off. *P. latifolia*, *Thwaites Enum. 242*, not of *Roxb.*—Ceylon; Thwaites, C. P. n. 2893.

18. ***P. pyramidata*, Wall. Cat. 1779**; leaves large ovate very shortly acuminate subentire mature glabrous above hairy and somewhat woolly beneath, panicles pyramidal many-fl'd. stellately villous. *Schauer in DC. Prodr. xi. 633*. *P. tomentosa*, *Kurz For. Fl. ii. 260*; *Gamble Indian Timbers*, 294.

TAVOY and AMHERST; *Wallich*.—DISTRIB. Java?

A large tree (*Wallich*). *Leaves* 8 by 5 in., from ovate to orbicular, base obtuse sometimes subcordate, nerves 7 pair; petiole $1\frac{1}{2}$ in., stellately villous. *Panicles* 6 in. diam.; branches opposite, ascending, peduncles $1\frac{1}{2}$ in., flowers crowded at the ends of the branches; bracts $\frac{1}{2}$ in., linear, numerous. *Calyx* $\frac{1}{2}$ in., distinctly 5-toothed at flower-time, stellately villous. *Corolla* $\frac{1}{4}$ in., or rather more, stellately villous with-

out. *Drupe* $\frac{1}{2}$ in. diam., globose, glabrous.—Brandis and Kurz consider this the same as *P. tomentosa*; but the rounded shoulders of the leaves, and the brachiate panicles give it a very different aspect; and the drupe marks it a distinct species. The Javan *P. tomentosa*, Blume (Bijd. 816), is nearly allied to this.

19. **P. bengalensis**, Clarke; leaves ovate or narrowly elliptic acuminate entire mature stellately pubescent on the nerves, corymbs spreading stellately pubescent or tomentose, calyx shortly 5-toothed. *C. longifolia*, Wall. Cat. 1771; Schauer in DC. Prodr. xi. 634.

Throughout BENGAL PLAIN, alt. 0-1000 ft., common; extending to the SIKKIM TERAI, ASSAM and CACHAR; Wallich, Griffith (Kew Distrib. n. 6029), &c.

A large shrub, or a tree, 30 ft.; shoots stellately tomentose. Leaves 8 by $3\frac{1}{2}$ in., ovate, or 5 by 2 in. obovate-oblong, mature with minute scattered stellate hair on the surface beneath or glabrous except the 7-8 pair of nerves; petiole 1 in. *Corymb* 4-8 in. diam., closely stellate-tomentose without any patent hairs; bracts $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ - $\frac{1}{3}$ in., 2-lipped; yellowish or greenish white, throat hairy. *Drupe* $\frac{1}{2}$ - $\frac{1}{3}$ in., globose or somewhat obovoid.—This has been supposed to be *P. pubescens*, Blume, in which the leaves are described as repand-toothed, and the pubescence of the corymb as simple.

20. **P. punduana**, Wall. Cat. 2651; leaves elliptic acuminate entire nerves stellately tomentose, panicle-branches elongate raceme-like, calyx minutely 5-toothed stellately tomentose. Schauer in DC. Prodr. xi. 637. —Premna n. 26, Herb. Ind. Or. H. f. & T.

KHASIA Mts.; below Churra, Wallich, Griffith, H. f. & T., &c.

A large shrub; shoots stellately tomentose. Leaves 8 by 3 in., base cuneate, mature punctulate glabrate on both surfaces, nerves 7 pair; petiole $1\frac{1}{2}$ in. *Panicles* 6-8 in., pyramidal, densely stellate-tomentose; branches mostly opposite, often 3 by $\frac{1}{2}$ in.; bracts $\frac{1}{2}$ - $\frac{1}{3}$ in., linear-lanceolate, numerous, persistent, conspicuous. *Calyx* $\frac{1}{2}$ in., obscurely 2-lipped, the 3 teeth of the lower lip wider apart (at flower-time) than those of the upper, but hardly shorter. *Corolla* $\frac{1}{2}$ - $\frac{1}{3}$ in., 2-lipped; lobes stellately tomentose without. *Drupe* $\frac{1}{2}$ - $\frac{1}{3}$ in., globose.

21. **P. integerrima**, Wight Ic. t. 1484; leaves large oblong acuminate entire glabrous, corymbs large minutely closely pubescent, calyx very shortly 5-toothed minutely pubescent. Bedd. For. Man. 172.

S. DECCAN PENINSULA; Courtallum, Wight; Mts. of Kurg, G. Thomson; Tinnevely Mts., Beddome.

A shrub, 6 ft. Leaves 7 by $2\frac{1}{2}$ in., base obtuse or cuneate, entire or (sides Beddome) sometimes serrate, nerves 5 pair; petiole $\frac{1}{2}$ in. *Corymbs* 5 in. diam.; bracts $\frac{1}{2}$ in.; broad-lanceolate. *Calyx* $\frac{1}{2}$ - $\frac{1}{3}$ in.; lobes very small, obtuse or broadly triangular. *Corolla* $\frac{1}{2}$ - $\frac{1}{3}$ in., 2-lipped. *Drupe* not seen.

22. **P. latifolia**, Roxb. Hort. Beng. 46, and Fl. Ind. iii. 76; leaves cordate-ovate shortly acuminate undulate young softly minutely hairy on both surfaces, corymbs closely simply villous, calyx strigose shortly 5-toothed much enlarged in fruit. Schauer in DC. Prodr. xi. 635.

Lower hills of the COROMANDEL COAST and BENGAL; from Rajmahl to the Southern Circars; Roxburgh, &c.

A small, poor tree, attaining 25 ft. Leaves 4 by $2\frac{1}{2}$ in., usually smaller, base (in the type form) shallowly cordate but then usually with a small cuneate decurrence on the petiole, entire, rarely serrate, dusky pubescent, drying blackish above cinereous beneath, mature usually pubescent at least on the nerves; nerves 7 pair, reticulations distinct; petiole $\frac{1}{2}$ in. *Corymbs* 2-3 in. diam., hard y brachiate; bracts small, deciduous. *Calyx* $\frac{1}{2}$ in., in fruit often nearly $\frac{1}{2}$ in. diam. *Corolla* $\frac{1}{2}$ - $\frac{1}{3}$ in., 2-lipped, densely hairy in the throat. *Drupe* $\frac{1}{2}$ in. diam., globose, hardly verrucose.—

Roxburgh grounds his species on the cordate base of the leaves: this form appears confined to the Coromandel Hills.

VAR. cuneata; leaf-base rhomboid or cuneate, calyx strigose. *P. viburnoides*, *Kurz For. Fl.* ii. 261.—Pegu; *Kurz*. Burma; *Griffith* (Kew Distrib. n. 6035).—A small tree of the dusky sombre colour of *P. latifolia* Roxb. type, the leaves drying blue-black above, ashy beneath, often very pubescent when young.

VAR. mollissima; leaves small base obtuse or rhomboid, corymbs $1\frac{1}{2}$ in. diam. *P. mollissima*, *Roth Nov. Sp.* 287; *Schauer in DC. Prodr.* xi. 638. *P. viburnoides*, *Wall. Cat.* 2646, *letter a only*; *Schauer l. c.* 635, *chiefly*.—Madras; *Wight*.—This looks like a burnt-up form of *Var. cuneata*, than which it is not more hairy, but has smaller calyx and corolla.

VAR. mucronata; leaves cuneate at both ends mature minutely pubescent on the midrib beneath, corymbs somewhat broad rusty-pubescent, calyx subpatently pubescent. *P. mucronata*, *Roxb. Fl. Ind.* iii. 635; *Wall. Cat.* 1766; *Schauer in DC. Prodr.* xi. 635; *Brand. For. Fl.* 366.—N. India from Kumaon to Bhotan and the Khasia Mts., ascending to 5000 ft., and spreading into Bengal Plain, common, *Wallich, H. f. & T., &c.*—This could not be distinguished from *P. latifolia* by Wallich or Brandis, and seems to be a state of *P. latifolia* grown in a moister soil. The leaves are often 6 in. long, the drupes larger and more verrucose.

VAR. viburnoides, *Wall. Cat.* 2646, *letter b only*; leaves ovate base rhomboid glabrate drying green surfaces concolorous. *Schauer in DC. Prodr.* xi. 635, *in small part*. *P. latifolia*, *Wight Ic. t.* 869.—S. Deccan Peninsula; Cochin and Gingee Hills, *Wight*; near Madras, *G. Thomson*.—Leaves broad, not cordate, nearly glabrous even when young.—This may be a distinct species; the green colour easily separates it from all the preceding forms of *P. latifolia*.

23. ***P. flavescens*, Ham.; Wall. Cat.** 2649; leaves ovate or obovate acuminate entire mature setulose above villous beneath, corymbs large densely pubescent, calyx closely pubescent shortly 5-toothed.

E. BENGAL; Goalpara, *Hamilton*; Dacca, *Clarke*.

A shrub or a small tree; shoots villous or woolly. Leaves 6 by $2\frac{1}{2}$ in., base obtuse or subcordate, upper surface with minute scattered hairs erect from the reticulating nerves; nerves 7 pair; petiole 1 in. Corymbs 4–7 in. diam., usually rusty-villous; bracts $\frac{1}{4}$ in., linear. Calyx $\frac{1}{12}$ in. Corolla $\frac{1}{8}$ – $\frac{1}{6}$ in., 2-lipped, very hairy below within. Drupe $\frac{1}{8}$ in.

VAR. glabrior; leaves setulose above sparingly pubescent or glabrate beneath green. *Premna* n. 24, *Herb. Ind. Or. H. f. & T.*—Subtropical Sikkim, alt. 3000 ft., *Clarke*. Silhet; *H. f. & T.*

VAR. rubens; leaves setulose above glabrate beneath drying usually reddish. *Premna* n. 32, *Herb. Ind. Or. H. f. & T.*—Malacca; *Griffith* (Kew Distrib. n. 6020). (Java).—Possibly a distinct species; but, except as to the colour of the leaves, no diagnostic mark has been found to separate it from *Var. glabrior*.

24. ***P. micrantha*, Schauer in DC. Prodr.** xi. 635; leaves ovate acuminate entire mature setulose above somewhat pubescent beneath, corymbs compound minutely pubescent, calyx very small minutely 5-toothed. *P. scandens*, *Wall. Cat.* 1774, *in small part*.

SILHET; *Wallich*.

Leaves $3\frac{1}{2}$ by $1\frac{1}{4}$ in., base rounded. Calyx $\frac{1}{24}$ – $\frac{1}{18}$ in. when the flower is expanded.—This very closely resembles *P. flavescens*, Ham., and may be a form of it; it differs in the very small calyx. The bristliness of the upper surface of the leaves is peculiar to *P. flavescens* and *P. micrantha* among *Premnas*.

25. ***P. Wightiana*, Schauer in DC. Prodr.** xi. 635; leaves ovate shortly acuminate subentire mature sparsely pubescent above, panicles narrow subthyrsoid in fruit minutely thinly scabrid-pubescent, calyx-teeth 5, subequal ovate or triangular. *P. thyrsiflora*, *Heyne; Wall. Cat.* 1770.

S. DECCAN PENINSULA; *Heyne*; Sira Mullee, *Wight*; Anamallay Mts., *Beddome*.

Appears a large rambling or subcaudex shrub. *Leaves* 3 by 2 in. (mostly smaller), membranous, base obtuse or subcordate, undulate, rarely shallowly crenate, mature nearly glabrous beneath; nerves 5 pair, secondary distinct; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Panicle* $1\frac{1}{2}$ in., pyramidal; in fruit often 2–3 in., oblong; bracts $\frac{1}{10}$ in., lanceolate, persistent, nearly glabrous. *Calyx* $\frac{1}{7}$ in., minutely scabrid, hardly pubescent. *Corolla* $\frac{1}{8}$ in., glabrate without, subequally 4-fid. *Drupe* $\frac{1}{8}$ in., obovoid, dry tubercular-rugose.

26. **P. Thwaitesii**, *Clarke*; leaves ovate acuminate entire or remotely crenate softly hairy beneath, panicles subthyrsoid densely shortly villous, calyx shortly subequally 5-toothed. *P. micrantha*, *Thwaites Enum.* 242, *not of Schauer*.

CEYLON; *Thwaites*.

A tree, 8–10 ft. (*Thwaites*). *Leaves* 3 by $1\frac{1}{2}$ in., base cuneate, minutely hairy above, densely deciduously simply hairy beneath, nerves 5 pair; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in., villous. *Panicle* $1\frac{1}{2}$ by 1 in., densely branched; bracts $\frac{1}{8}$ in., linear, villous, persistent. *Calyx* $\frac{1}{18}$ – $\frac{1}{12}$ in., minutely appressedly hairy. *Corolla* $\frac{1}{8}$ – $\frac{1}{6}$ in., yellowish. *Drupe* $\frac{1}{2}$ in. diam., globose, smooth.—Possibly a var. of *P. Wightiana*, but not at all like *P. micrantha*, Schauer.

†† *Leaves (mature) toothed* (teeth sometimes very few in *P. barbata*).

27. **P. thyrsoides**, *Wight Ic.* t. 1485; leaves ovate shortly acuminate serrate mature glabrate, panicle thyrsoid villous or woolly, calyx pubescent or villous shortly subequally 5-toothed.

TRAVANCORE and COURTALLUM; *Wight*.

A small tree or large shrub (*Wight*). *Leaves* $3\frac{1}{2}$ by 2 in., base rhomboid or subcordate, mature minutely pubescent on the nerves or glabrous; nerves 5 pair, secondary distinct; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Panicle* (in flower) 4 by 2 in., densely branched; bracts subpersistent. *Calyx* $\frac{1}{10}$ in. *Corolla* $\frac{1}{8}$ – $\frac{1}{6}$ in., glabrous without; lobes 4, subequal. *Drupe* $\frac{1}{2}$ in., globose, verrucose-tubercular.—*Wight* subsequently reduced this species to *P. Wightiana*, Schauer, remarking that the thyrses were much larger. This may be so, but in addition to the differences noted by *Wight*, the leaves are always serrate, and the indumentum differs. *Beddome's* description of *P. Wightiana* (*For. Man.* 173) is designed to include the two.

28. **P. barbata**, *Wall. Cat.* 1768; leaves oblong or ovate acuminate more or less toothed mature minutely pubescent beneath, corymbs villous with small simple hairs, calyx subequally 4-toothed glabrate or pubescent. *Schauer in DC. Prodr.* xi. 636; *Brand. For. Fl.* 366. *P. cana*, *Wall. Cat.* 1783.

SUBTROPICAL HIMALAYA, alt. 500–5000 ft., from Kumaon to Bhotan, frequent; *Wallich, H. f. & T.*, &c.

A small tree or a shrub. *Leaves* 6 by $1\frac{3}{4}$ – $2\frac{1}{2}$ in., base obtuse sometimes subcordate, usually distinctly toothed, sometimes with only a few teeth towards the tip, young softly minutely pubescent on both surfaces, mature nearly glabrous above, nerves 6 pair; petiole 1 in. *Corymbs* 1– $2\frac{1}{2}$ in. diam., somewhat dense, in fruit sometimes subglabrate; bracts small, linear, deciduous. *Calyx* $\frac{1}{12}$ in.; teeth oblong, obtuse. *Corolla* $\frac{1}{8}$ – $\frac{1}{6}$ in., 2-lipped, hairy in the throat. *Drupe* $\frac{1}{8}$ in., globose or somewhat obovoid, glabrous obscurely verrucose.

VAR. *anodon*; leaves very sparingly toothed, often nearly glabrous when young.—Sikkim and Bhotan, frequent; *Clarke*.

29. **P. pinguis**, *Clarke*; leaves ovate acuminate serrate mature pubescent on the nerves, corymbs dense subsessile, calyx subequally 5-toothed glandular scarcely pubescent. *Premna* n. 22, *Herb. Ind. Or. H. f. & T.*

ASSAM; *Griffith* (Kew Distrib. n. 6025). KHASIA TERRAI; *H. f. & T.*—DISTRIB. Ava.

An undershrub; stems 1–1½ foot (*Griffith*), thick, patently hairy. *Leaves* 6½ by 4½ in., somewhat coriaceous, base rounded often cordate, serrate nearly to the base, sparsely pubescent on both surfaces when young, nerves 5 pair; petiole 1 in., pubescent or woolly. *Corymb* (in flower) 1½ in diam., in fruit 2½ in.; branches hairy. *Calyx* ½ in., green. *Corolla* ⅓–½ in., white. *Drupe* ½ in., obovoid, smooth, purple.

30. ***P. esculenta***, *Rowb. Hort. Beng.* 46, and *Fl. Ind.* iii. 80; leaves short-petioled obovate or elliptic acuminate sharply serrate, corymbs compact nearly glabrous, calyx minutely 5-toothed, corolla ⅓ in. *Wall. Cat.* 1761; *Schauer in DC. Prodr.* xi. 636; *Kurz For. Fl.* ii. 261.

ASSAM (without name of collector). CHITTAGONG; fide *Roxburgh*.—Cultivated in the Calcutta Botanic Garden.

A branching shrub, 6–8 ft., trunk hardly any. *Leaves* 6½ by 3 in., base entire cuneate suddenly narrowed sometimes very shortly cordate, mature glabrate, nerves 5 pair; petiole ¼ in., obscurely puberulous. *Corymb* 2½ in. diam., short-peduncled, globose, many-fl., bracts ⅛ in., linear. *Calyx* ⅛ in., cup-shaped, obscurely puberulous; somewhat enlarged, more distinctly toothed, in fruit. *Corolla* yellowish-white, 2-lipped, throat hairy. *Drupe* ⅓ in., globose or somewhat obovoid, usually 3–4-seeded. —All the examples seen of this appear to be cultivated; and the native habitat is uncertain.

31. ***P. amplexans***, *Wall. Cat.* 1762; leaves sessile narrowly obovate acuminate serrate, corymbs compact nearly glabrous, calyx minutely 5-toothed, corolla ⅓ in. *Schauer in DC. Prodr.* xi. 636; *Kurz For. Fl.* ii. 262. *P. angustata*, *Wall. Cat.* 1763.—*Clerodendron* n. 33, *Herb. H. f. & T.*

RANGOON; *Wallich, M'Lelland*. PEGU, MARTABAN and UPPER TENASSERIM, common, *Kurz*.

An undershrub (*Kurz*), throwing up flower-shoots 1–2 ft. high after the jungle fires. *Leaves* whitened underneath; sessile cordate, or petiole sometimes ⅛ in. (*Kurz*). —This agrees so closely with *P. esculenta* except in the want of petioles, that it may be the wild state of it. *P. angustata*, *Wall.*, is the same, the leaves being 10 by 4 in.

32. ***P. macrophylla***, *Wall. Cat.* 1765; leaves sessile elongate-obovate remotely shallowly toothed, corymbs compact patently softly pubescent, calyx 5-toothed enlarged in fruit. *Schauer in DC. Prodr.* xi. 636; *Kurz For. Fl.* ii. 262.

PROME HILLS; *Wallich*. MARTABAN and PEGU; common (*Kurz*).

A low undershrub, sending up flower-shoots 1–2 ft. after the jungle fires; all the young parts softly pubescent. *Leaves* 12 by 4 in., base attenuate cuneate, whitened beneath, mature glabrous. *Corymbs* 2 in. diam., dense, softly hairy even in fruit; bracts ½ in., narrowly lanceolate, hairy, persistent. *Calyx* in fruit ½ in., deeply 2-lipped, striate. *Drupe* ⅓ in., tubercular-rugose (in the dried state), usually 2-seeded (*Kurz*). —Perhaps a var. of *P. amplexans*, of which the drupe when dried appears nearly smooth (as in *P. esculenta*).

33. ***P. procumbens***, *Moon; Wall. Cat.* 1780; leaves cordate-oblong acute serrate mature glabrescent, corymbs small subsessile globose pubescent, calyx shortly 5-toothed. *Schauer in DC. Prodr.* xi. 636.

CEYLON, fide *Wallich*; not uncommon in the hotter parts of the island, *Thwaites*.

Branches minutely strigose-pubescent. *Leaves* 3½ by 1½ in., base abrupt or cordate, sparsely pubescent above when young, nerves 5 pair; petiole ½ in. *Corymbs* 1 in. diam.; in fruit 1½–2 in., pyramidal or subthyrsoid. *Calyx* ⅛ in., minutely pubescent or scabrid. *Corolla* ⅓ in. *Drupe* ½ in., obovoid, tuberculate. —All the specimens seen are from the Calcutta Botanic Garden, cultivated.

34. **P. herbacea**, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 80; stem hardly any, leaves sessile obovate coarsely serrate mature pubescent on the nerves, corymbs small, calyx subequally 5-toothed. *Schauer in DC. Prodr.* xi. 637; *Griff. Itin. Notes*, p. 96, n. 1422, and *Ic. t.* 447, lower fig.; *Brand. For. Fl.* 368. *P. pygmæa*, *Wall. Cat.* 1776.

SUBTROPICAL HIMALAYA, alt. 500–3000 ft., from Kumaon to Bhotan, frequent in the Terai, *Wallich*, &c. S. DECCAN PENINSULA; Mudumallay, *Beddome*.

A small undershrub; flowering branches 1–4 in., springing up after the jungle fires. *Leaves* 4 by 2–3 in., obtuse, mature microscopically dotted above, minutely deciduously pubescent beneath, nerves 5 pair. *Corymbs* $1\frac{1}{2}$ in. diam., pubescent, somewhat dense; peduncle 0– $1\frac{1}{2}$ in. *Calyx* $\frac{1}{10}$ in., closely pubescent; lobes ovate, obtuse. *Corolla* $\frac{1}{2}$ in., greenish-white, hairy in the throat, 4-lobed obscurely 2-lipped. *Drupe* $\frac{1}{4}$ in. diam., globose.

IMPERFECTLY KNOWN SPECIES.

35. **P. GROSSA**, *Wall. Cat.* 1764, *type sheet*; leaves short-petioled narrowly obovate or elliptic coarsely obtusely toothed mature glabrate, petiole stellately fulvous-tomentose. *Schauer in DC. Prodr.* xi. 638; partly.—Burma; *Pingee, Wallich*.

Wallich's example is a branch with leaves only, in habit exceedingly like *P. esculenta*, except as to the points mentioned in the diagnosis. *Leaves* $5\frac{1}{2}$ by 2 in., mature glabrate. *Schauer's* description appears compounded out of *Wallich's* two sheets of 1764, the second of which may very possibly not be of the same genus or order.

VAR. ? orbiculata; leaves suborbicular base shortly cuneate coarsely toothed soft with simple hairs on both surfaces. *P. grossa*, *Wall. Cat.* 1764, second sheet only.—*Prome; Wallich*.

PREMNA ROXBURGHIANA, *Wall. Cat.* 2648, is not in the *Wallichian Herbarium*.

PREMNA ? *Wall. Cat.* 9077, is *Viburnum sambucinum*, *Reinw.*

XII. GMELINA, Linn.

Trees or shrubs, shoots tomentose, unarmed or spinous. *Leaves* opposite, entire toothed or lobed. *Cymes* paniced or small; bracts narrow, except in *G. Hystrica*. *Flowers* large, yellow or brownish, tomentose at least when young. *Calyx* campanulate, shortly 5-toothed or subentire. *Corolla-tube* slender below, ventricose upwards; limb oblique, 5- (or 4-) lobed. *Stamens* 4, didynamous, subexserted; anther-cells oblong, pendulous, subseparate. *Ovary* 4-celled, 4-ovuled; style slender, shortly bifid. *Drupe* succulent; endocarp bony, undivided, 4–2-celled; calyx persistent, unaltered. *Seeds* oblong.—Species 8, E. Asiatic and N. Australian.

1. **G. arborea**, *Linn.; Roxb. Cor. Pl.* iii. 41, t. 246, and *Fl. Ind.* iii. 84; arboreous, leaves large cordate-ovate acute beneath and panicles fulvous-tomentose, bracts linear-lanceolate, corolla $1\frac{1}{2}$ in. *Wall. Cat.* 1817; *Schauer in DC. Prodr.* xi. 680; *Dalz. & Gibs. Bomb. Fl.* 201; *Wight Ic. t.* 1470; *Griff. Notul.* iv. 179, and *Ic. Pl. Asiat.* t. 443; *Bocq. Rev. Verben.* t. 14, fig. 1–11; *Bedd. Fl. Sylv.* t. 253; *Brand. For. Fl.* 364; *Kurz For. Fl.* ii. 264; *Gamble Indian Timbers*, 295. *G. Rheedii*, *Hook. Bot. Mag.* t. 4395; *Thwaites Enum.* 244. *Premna arborea*, *Roth Nov. Sp.* 287. *P. tomentosa*, *Miq. in Pl. Hohenack.* n. 554, not *Willd.*—*Rheede Hort. Mal.* i. t. 41.

Throughout the DECCAN PENINSULA and CEYLON, frequent, extending to the foot of the N.W. HIMALAYA. CHITTAGONG.—DISTRIB. Malayan and Philippine Islands.

An unarmed tree, sometimes attaining 60 ft., deciduous, flowering with the young leaves. *Leaves* 9 by 6 in., more or less acuminate, entire, mature glabrate above, stellately hairy beneath; petiole 3 in., top glandular. *Panicles* often 1 foot, terminal; bracts $\frac{1}{2}$ in.; flowers numerous. *Calyx* $\frac{1}{2}$ in., teeth very small or obsolete. *Corolla* brown-yellow, upper lip shortly bifid, longer than the lower. *Drupe* $\frac{3}{4}$ in., ovoid, usually 2–1-seeded.

VAR. *glaucescens*; leaves glaucous beneath mature often nearly glabrous, calyx-teeth larger triangular.—Subtropical Himalaya and Khasia Mts., alt. 0-2000 ft.; *J. D. H.*, &c. Burma and Tenasserim, *Kurz*.—Probably only the form of *G. arborea* from moist places; some N.W. Himalayan examples are intermediate between it and the type.

2. ***G. villosa***, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 86; arboreous, leaves ovate or elliptic mature beneath and small racemose cymes fulvous-tomentose, bracts broadly lanceolate acuminate, corolla $1\frac{1}{2}$ in. *Jack in Malay Misc.* i. 17, and in *Hook. Bot. Misc.* i. 284; *Wall. Cat.* 1816; *Schauer in DC. Prodr.* xi. 679. *G. asiatica*, *Wall. Cat.* 1818, partly; *Kurz For. Fl.* ii. 265, not of *Linn.*—Gmelina sp. n. 2, *Griff. Notul.* iv. 179. *Rumph. Herb. Amb.* ii. t. 39.

PENANG; *Wallich.* MALACCA; *Griffith, Maingay.* SINGAPORE; *G. Thomson.* NICOBARS; *Kurz*.—DISTRIB. Malaya.

Spinous (Roxburgh); branchlets unarmed. *Leaves* 3 by 2 in., obtuse or cuneate at both ends, subtentire or coarsely toothed, mature glabrate above; petiole $\frac{3}{4}$ in. *Racemes* terminal, 1-2 in.; bracts $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ - $\frac{1}{3}$ in., tomentose with several large glabrous glands; teeth small. *Corolla* yellow; tube very narrow below; upper lip of the limb larger than the lower, subtentire. *Drupe* $\frac{3}{4}$ in., ovoid or obovoid, 2-1-seeded.

3. ***G. asiatica***, *Linn.*; *Roxb. Fl. Ind.* iii. 87; shrubby, leaves small ovate or obovate entire or lobed mature glabrous, racemes terminal fulvous-tomentose, bracts small caducous, corolla $1\frac{1}{2}$ in. *Lamk. Ill.* t. 542; *Wall. Cat.* 1818, partly; *Schauer in DC. Prodr.* xi. 679; *Wight Ill.* t. 174; *Bedd. For. Man.* 172; *Brand. For. Fl.* 365. *G. coromandeliana*, *Burm. Fl. Ind.* 132. *G. lobata*, *Gaertn. Fruct.* i. 268, t. 56, excl. syn. *Rumph.* *G. parvifolia*, *Roxb. Cor. Pl.* ii. 32, t. 162; *Wall. Cat.* 2654; *Schauer l. c.* *G. parviflora*, *Roxb. l. c.* *G. inermis*, *Blanco Fl. Filip.* 493. *Michelia spinosa*, *Amman. in Act. Petrop.* viii. 218, t. 18.

DECCAN PENINSULA and CEYLON, frequent; *Roxburgh*, &c.—BENGAL; cultivated.

Spinescent, or unarmed. *Leaves* $\frac{1}{2}$ - $1\frac{1}{2}$ in., entire or coarsely lobed, mature beneath glabrous glaucescent from a close coat of minute round glands; petiole $\frac{1}{4}$ in. *Racemes* 1-2 in.; bracts $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in., tomentose, but with large bare glands, as in *G. villosa*, as is the corolla. *Drupe* also as of *G. villosa*, with which this species has been confounded by *Kurz* and others.

4. ***G. Hystrix***, *Kurz in Journ. As. Soc.* 1870, ii. 81, and *For. Fl.* ii. 265; leaves elliptic cuneate or rhomboid at both ends mature glabrous, cymes subcapitate, bracts very large nervose coloured, corolla 2 in. *Benth. in Gen. Pl.* ii. 1154. *G. Finlaysoniana*, *Wall. Cat.* 6317.

TENASSERIM; fide *Kurz*.—DISTRIB Siam, Philippines.

A large, spinous, scandent shrub. *Leaves* 3 by $1\frac{1}{2}$ in., entire, beneath glaucous with scattered round glands; petiole 1 in. *Cymes* 2 in.; bracts $1\frac{1}{4}$ by 1 in., ovate, 5-nerved. *Corolla* yellow, much as of *G. villosa*, but less tomentose without; dried exceeding 2 in., 1 in. (*Kurz*). *Drupe* $\frac{1}{2}$ in., obovoid, 2-seeded.

5. ***G. oblongifolia***, *Roxb. Fl. Ind.* iii. 83; arboreous. leaves ovate or oblong entire somewhat rough, panicles terminal brachiate brown-farinose, bracts small caducous, corolla large rosy. *Schauer in DC. Prodr.* xi. 679.

E. BENGAL (*Roxburgh*).

A tall timber tree. *Leaves* 6-12 by 3-8 in.; petiole 2 in., with several glands close to the apex. *Calyx* cyathiform, entire, farinose, a few glands on the outside. *Corolla-tube* short; limb 5-partite, lower lip longer with a deep yellow mark in the centre of its base. *Anthers* bipartite. *Drupe* oblong, somewhat 4-cornered and

obtuse, size of a large olive, smooth, ripe bright crimson, 1-celled; endocarp clavate, 4-cornered, 4-celled, perforated from the base up the centre. *Seed* solitary, lanceolate. —The foregoing is extracted from Roxburgh, and indicates a remarkable tree that no one else has seen. There is at Kew an unpublished drawing of Roxburgh's of this tree, agreeing exactly with the description.

EXCLUDED SPECIES.

G. SPECIOSISSIMA, *Don Prodr.* 104, *Schauer in DC. Prodr.* xi. 680, is *Wightia gigantea*, *Wall.*

XIII. VITEX, *Linn.*

Trees or shrubs; shoots hairy or tomentose. *Leaves* opposite, digitately 3-5-foliolate (in *V. simplicifolia* 1-foliolate). *Inflorescence* terminal and axillary, or wholly axillary; cymes peduncled or sessile, forming large or small panicles or corymbs; bracts small or longer than the calyx. *Calyx* campanulate, truncate or shortly 5-toothed (in *V. gamosepala* 3-toothed). *Corolla* small, tubular; limb 2-lipped, 5-toothed; central lobe of the lower lip usually much larger than the others. *Stamens* 4, didynamous, usually exserted; anther-cells at first parallel pendulous, afterwards divaricate, often twisting so that their lower ends are suberect. *Ovary* 2-4-celled, 4-ovuled; style filiform, shortly bifid. *Drupe* globose or obovoid, supported by the more or less enlarged calyx; endocarp bony 4-, or by suppression 3-1-celled. *Seeds* obovate or oblong.—Species 60; in all tropical and warm temperate regions.

Subgenus 1. **Euagnus**, *Schauer*. *Calyx* cup-shaped, shortly subequally 5-toothed or truncate.

* *Panicles* terminal, penultimate axillary peduncles often added.

1. **V. trifolia**, *Linn. f. Suppl.* 293; leaves simple and 3-foliolate, leaflets sessile obovate or obovate-oblong entire glabrate above beneath and panicles closely white-tomentose, corolla $\frac{1}{2}$ – $\frac{1}{2}$ in., drupe $\frac{1}{2}$ in. diam. black. *Roxb. Fl. Ind.* iii. 69; *Wall. Cat.* 1743; *Bot. Mag.* t. 2187; *Schauer in DC. Prodr.* xi. 683; *Bedd. For. Man.* 172; *Brand. For. Fl.* 370. *V. ovata*, *Thunb. Fl. Jap.* 257; *Hook. & Arn. Bot. Beech. Voy.* 206, t. 47. *V. repens*, *Blanco Fl. Filip.* 513. *V. incisa*, *Wall. Cat.* 1746 partly, not of *Lamk.* *V. Agnus castus*, var. *Kurz For. Fl.* ii. 269.—*Rumph. Herb. Amb.* iv. t. 18. *Rheede Hort. Mal.* ii. t. 11.

Scattered throughout INDIA, in the tropical and subtropical region, from the foot of the Himalaya to Ceylon and Malacca, nowhere common.—DISTRIB. S. E. Asia to Japan, the Philippines and N. Australia.

A shrub or small tree. *Leaflets* 1-3 in., subobtusely, tomentum beneath of matted scarcely stellate hairs, so close as with difficulty to be scraped off; petiole 1 in. *Panicles* 1-4 in., oblong, often leafy at the base; bracts minute. *Calyx* $\frac{1}{2}$ – $\frac{1}{2}$ in., minutely 5-toothed. *Corolla* tomentose, lavender to blue. *Filaments* hairy at the base.—Perhaps commoner than supposed, being frequently unnoticed from its close general resemblance to the universal *V. Negundo*.

2. **V. Negundo**, *Linn.*; *Roxb. Fl. Ind.* iii. 70; leaves 3-5-foliolate, leaflets petioluled lanceolate entire or crenate glabrate above beneath and panicles closely white-tomentose, corolla $\frac{1}{4}$ – $\frac{1}{2}$ in., drupe $\frac{1}{2}$ in. diam. black. *Wall. Cat.* 1744; *Schauer in DC. Prodr.* xi. 684; *Wight Ic.* t. 519; *Bedd. For. Man.* 171; *Brant. For. Fl.* 369; *Kurz For. Fl.* ii. 269; *Boiss. Fl. Orient.* iv. 535. *V. bicolor*, *Willd. Enum. Hort. Berol.* 660; *Schauer l. c.* 683; *Dalz. & Gibs. Bomb. Fl.* 201. *V. arborea*, *Desf. Cat. Hort. Paris.* 391.

V. paniculata, *Lamk. Dict.* ii. 612; *Roxb. l. c.* 71.—*Rumph. Herb. Amb.* iv. t. 19. *Rheede Hort. Mal.* ii. t. 12.

Throughout INDIA and CEYLON, in the warmer zone a universal plant. NICOBARS; *Kurz.*—DISTRIB. Cabul, E. Asia to the Philippines.

A shrub or small tree, hardly distinguishable from *V. trifolia* but by the points mentioned in the diagnosis. The leaflets are frequently 5, the centre one at least usually distinctly petioluled, the flowers rather smaller.

VAR. *incisa*; leaflets crenate-serrate or subpinnatifid. *V. incisa*, *Lamk. Dict.* ii. 611, and *Ill.* t. 541, fig. 2; *Bot. Mag.* t. 364; *Roxb. l. c.* 72; *Wall. Cat.* 1746, partly; *Schauer l. c.* 684.—Throughout India. Distrib. E. Asia.—The extreme pinnatifid form of this var. is Chinese; the wild Indian examples are crenate-serrate, i.e. intermediate.

3. *V. altissima*, *Linn. f. Suppl.* 294; leaves 3-foliolate, leaflets subsessile lanceolate subentire mature glabrate above thinly pubescent beneath, panicles compound fulvous-villous, corolla scarcely $\frac{1}{4}$ in., drupe $\frac{1}{2}$ in. diam. *Roxb. Fl. Ind.* iii. 71; *Wall. Cat.* 1755; *Schauer in DC. Prodr.* xi. 685; *Dalz. & Gibs. Bomb. Fl.* 201; *Wight Ic.* t. 1466; *Bedd. Fl. Sylv.* t. 252; *Brand. For. Fl.* 370.

DECCAN PENINSULA, especially the west side, up to 4000 ft., common; *Heyne*, *Wight*, &c.

A very large tree; shoots tawny-villous or woolly. *Leaves* 3-foliolate, occasionally 5-foliolate (*Beddome*); leaflets $5\frac{1}{2}$ by $1\frac{3}{4}$ in., mature glabrous above except the midrib, beneath closely distinctly reticulate and with scattered round yellow glands; petiole $2\frac{1}{2}$ in., sometimes somewhat winged upwards. *Panicles* 3-8 in. diam.; branches elongate, interrupted, cymes clustered; bracts $\frac{1}{2}$ – $\frac{1}{6}$ in., elliptic. *Calyx* $\frac{1}{2}$ in., fulvous-villous, teeth short, triangular. *Corolla* woolly. *Ovary* and young fruit fulvous-villous at the apex.

VAR. *zeylanica*; mature leaves glabrate beneath. *V. zeylanica*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 223. *V. altissima* (forma subglabra), *Thwaites Enum.* 244.—Ceylon; *Walker*, *Thwaites*.—Leaves beneath reticulate, the depressions microscopically tomentose, as in *V. altissima* after all the hair is rubbed off.

4. *V. alata*, *Heyne*; *Roth Nov. Sp.* 316; leaves 3-foliolate, leaflets subsessile broadly lanceolate subentire mature glabrate above thinly pubescent beneath, wing of the petiole broad cordate at base, panicles terminal compound fulvous-villous, corolla scarcely $\frac{1}{4}$ in., drupe $\frac{1}{2}$ in. diam. *Dalz. & Gibs. Bomb. Fl.* 201, not of *Schauer*, nor of *Kurz*. *V. appendiculata*, *Rottler in Herb. Wall.*—*Rheede Hort. Mal.* v. t. 1.

MADRAS; *Van Royen*; *Tuichecoonum*, *Rottler*. MYSORE; *Cleghorn*.

Scarcely differs from *V. altissima* but by the wing of the petiole, which is $\frac{1}{2}$ – $\frac{2}{3}$ in. wide, continuous, dilated, cordate and subamplexicaul at the base; leaflets $2\frac{1}{2}$ in. wide.—Some branches, apparently of this, collected by *Shuter*, *Law*, and *Stocks*, have some of the leaves 5-foliolate.

5. *V. limonifolia*, *Wall. Cat.* 1754; leaves 3-foliolate, leaflets sessile ovate entire mature pubescent beneath, petiole broadly winged, panicles long-branched, cymes clustered distant, bracts prominent persistent. *Kurz For. Fl.* ii. 271. *V. alata*, *Schauer in DC. Prodr.* xi. 685, not of *Heyne*.

PEGU and TENASSERIM; *Wallich*, &c.—DISTRIB. Ava, Siam.

A tree; shoots fulvous-hairy or woolly. *Leaflets* 7 by $2\frac{3}{4}$ in., acute at both ends, mature nearly glabrate above, minutely densely fulvous-pubescent beneath; petiole 3-4 by $\frac{1}{2}$ – $\frac{3}{4}$ in. *Panicles* 18 by 6 in., fulvous-hairy; branches interruptedly spicate; bracts $\frac{1}{2}$ – $\frac{1}{4}$ in., lanceolate, often imbricate. *Calyx* $\frac{1}{2}$ in., very shortly toothed, closely fulvous-strigillose. *Corolla* $\frac{1}{2}$ in., fulvous-villous. *Drupe* $\frac{1}{2}$ in. diam., globose, smooth.—The leaves are exceedingly like those of *V. pubescens*, except that the petiole is winged; the elongated interrupted panicle-branches are quite different.

6. **V. pubescens**, *Vahl Symb.* iii. 85; leaves 3-4-foliolate, leaflets sessile ovate or oblong entire pubescent, corymbs dense fulvous-tomentose, bracts ovate persistent prominent, corolla $\frac{1}{2}$ - $\frac{1}{2}$ in., drupe $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. *Schauer in DC. Prodr.* xi. 686; *Blume Bijdr.* 812; *Decne. in Nouv. Ann. Mus. d'Hist. Nat.* iii. 401; *Bedd. For. Man.* 171; *Kurz For. Fl.* ii. 271. *V. arborea*, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 73; *Jack in Mal. Misc.* i. 18, and in *Hook. Bot. Misc.* i. 285; *Wall. Cat.* 1747; *Wight Ic.* t. 1465. *V. inæquifolia*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 223. *Pistacia Vitex*, *Linn. Fl. Zeyl.* 195. *Wallrothia articulata*, *Roth Nov. Sp.* 317.

S. DECCAN PENINSULA and CEYLON, frequent. E. BENGAL and MALAY PENINSULA, from the Khasia Terai, *H. f. & T.*, to Singapore; frequent from Pegu southwards.—DISTRIB. Throughout Malaya.

A tree, 30-50 ft. Leaves 3-foliolate, one or two smaller leaflets occasionally added; leaflets attaining 8 by 3 in., cuneate or scarcely acuminate, base cuneate rhomboid or of the lateral leaflets unequal rounded on one side, minutely pubescent on both surfaces, more strongly on the nerves; petiole 2-3 in., not winged. Corymbs 3-5 in. diam., depressed-pyramidal; bracts $\frac{1}{2}$ - $\frac{1}{2}$ in. Calyx $\frac{1}{2}$ in., densely fulvous-tomentose. Corolla tomentose, blue, upper lip ochroleucous. Drupe glabrous at the apex.

7. **V. diversifolia**, *Kurz Andam. Rep. App.* A 45 and B 14; leaves simple and 3-foliolate glabrate, leaflets sessile oblong cuneate at both ends entire, panicles terminal fulvous-strigose, bracts ovate prominent, corolla $\frac{1}{2}$ in.

ANDAMAN ISLANDS; *Kurz*.

Branchlets and shoots fulvous-strigose, or subtomentose. Leaflets attaining 5 by $1\frac{1}{2}$ in., above with minute thinly-scattered white glands, beneath finely reticulated, microscopically white-tomentose in the depressions, obscurely puberulous on the midrib; nerves 6-8 pair; petiole $1\frac{1}{2}$ in. Panicles 2-3 in., upper leaves graduating into bracts; upper bracts $\frac{1}{2}$ in. Calyx $\frac{1}{2}$ in., campanulate, subtruncate, fulvous-strigose. Corolla fulvous-villous, subtomentose. Drupe not seen.

8. **V. heterophylla**, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 75; leaves 5-foliolate glabrate, leaflets petioluled elliptic or oblong much acuminate entire, panicles compound thinly cinereous-tomentose branches elongate, calyx $\frac{1}{10}$ in. cup-shaped, corolla tomentose. *Wall. Pl. As. Rar.* iii. 15, t. 226, and *Cat.* 1745; *Schauer in DC. Prodr.* xi. 686, partly.

ASSAM; *Jenkins*. E. BENGAL; Tipperah (*Roxburgh*).

A large tree, *Wallich*. Upper leaves generally 5-foliolate; leaflets 7 by $2\frac{1}{2}$ in., with scattered white glands above and yellow glands beneath, petiolule of the central leaflet usually $\frac{1}{4}$ - $\frac{1}{2}$ in.; petiole 2 in., glabrate. Panicles 8 by 6 in., cymes dense-fld., clustered along the branches; bracts $\frac{1}{2}$ in., linear, deciduous. Calyx truncate. Corolla $\frac{1}{4}$ in., ochroleucous, lower lip blue. Drupe scarcely $\frac{1}{2}$ in. diam., glabrous at the apex.

VAR. *undulata*; leaves smaller all the upper 3-foliolate, leaflets shining undulate. *V. undulata*, *Wall. Cat.* 1756. *V. heterophylla*, *Kurz For Fl.* ii. 270. *Stereosperma* n. 7, *Herb. H. f. & T.*—Pegu; *M'Lelland*. Rangoon; *Wallich*. Tenasserim; *Helfer* (Kew Distrib. n. 6068). Distrib. Java.—*Branchlets* sharply quadrangular. *Drupe* small.

9. **V. urceolata**, *Clarke*; leaves 3-foliolate glabrate, leaflets petioluled obovate shortly suddenly acuminate entire, panicles compound thinly cinereous-tomentose branches elongate, calyx $\frac{1}{8}$ - $\frac{1}{6}$ in. oblong or suburceolate, corolla tomentose. *V. heterophylla*, *Schauer in DC. Prodr.* xi. 686, partly. *V. Loureirii*, *Herb. Wight, not of Hook. & Arn.* *Vitex* n. 12, *Herb. Ind. Or. H. f. & T.*

MALACCA; *Griffith* (Kew Distrib. n. 6064), *Maingay* (Kew Distrib. nn. 1205, 1207).—DISTRIB. S. E. Asia, Malaya.

A medium-sized tree (Maingay). *Leaves* (all the upper) 3-foliolate, a small leaflet rarely added; leaflets 5 by $2\frac{1}{4}$ in., obtuse, tip usually less than $\frac{1}{4}$ in., with scattered white glands above and yellow beneath, petiolule of the middle leaflet often $\frac{1}{2}$ in.; petiole 1-2 in., not winged. *Panicles* 8 by 5 in., terminal, penultimate sometimes added; cymes densely flowered clustered along the branches; bracts $\frac{1}{8}$ in., linear, deciduous. *Calyx* minutely toothed at flower-time, much enlarged, $\frac{1}{2}$ in. diam., roundly 5-lobed in fruit. *Corolla* $\frac{1}{4}$ - $\frac{1}{3}$ in. *Drupe* $\frac{1}{3}$ - $\frac{1}{2}$ in., apiculate.—This species differs from all the preceding by (inter alia) the large drupe. The inflorescence, calyx, corolla and drupe are so like those of *V. sumatrana* (Miq. Fl. Ind. Bat. Suppl. 567), that it may be a var. of it; but in *V. sumatrana* the leaves are mostly 5-foliolate and pubescent beneath.

10. **V. coriacea**, *Clarke*; leaves 3-foliolate coriaceous glabrous, leaflets petioluled oblong entire, panicles terminal fulvous-pubescent, flowers clustered on the elongate branches, calyx $\frac{1}{10}$ in. 5-toothed. *Vitex* n. 13, *Herb. Ind. Or. H. f. & T.*

MALACCA; *Griffith* (Kew Distrib. n. 6065), *Maingay* (Kew Distrib. n. 1203).

Branchlets round, tips puberulous. *Leaflets* 4 by $1\frac{3}{4}$ in., obtuse or acute, beneath minutely glandular and with thick elevated nerves, petiolule of the central leaflet $\frac{1}{4}$ - $\frac{1}{2}$ in., petiole 1-2 in., not winged. *Panicles* 6 by 3 in., strict, branches elongate ascending; bracts $\frac{1}{8}$ in., oblong, fulvous-pubescent, deciduous; cymes condensed almost to clusters. *Calyx* fulvous-pubescent, wide funnel-shaped, in flower conspicuously 5-toothed; in fruit enlarged, cup-shaped, subtruncate. *Corolla* $\frac{1}{4}$ in., fulvous-pubescent, as are the pistil and filaments. *Drupe* $\frac{1}{2}$ by $\frac{1}{4}$ in., teretely ellipsoid, very smooth.

11. **V. canescens**, *Kurz in Journ. As. Soc.* 1873, ii. 101, and *For. Fl.* ii. 270; leaves 3-foliolate, leaflets petioluled ovate or elliptic entire young fulvous-villous, panicles compound fulvous-pubescent branches elongate pedicels whorled.

ASSAM; *Griffith* (Kew Distrib. n. 6066), *Masters*. PEGU; *McLelland*, *Kurz*.—DISTRIB. Ava.

A tree, 20-30 ft., or a shrub (*Griffith*); innovations fulvous- or dusky-pubescent. *Leaves* (upper alone seen) 3-foliolate, or (*Kurz*) 5-foliolate; leaflets $4\frac{1}{2}$ by 2 in., mature scabrid or glabrate fulvous-pubescent on the nerves; petiolule of the middle leaflet $\frac{1}{2}$ in.; petiole 2 in., fulvous-pubescent, not winged. *Panicles* 12 by 6 in., with numerous elongate spreading branches; bracts very small, deciduous; pedicels $\frac{1}{12}$ - $\frac{1}{8}$ in. *Calyx* $\frac{1}{10}$ in., pubescent, very shortly toothed. *Corolla* $\frac{1}{4}$ in., fulvous-tomentose. *Drupe* $\frac{1}{2}$ - $\frac{1}{3}$ in. diam., globose, smooth.—*Vitex canescens*, *Wall. Cat.* 1757, is not in *Wallich's Herbarium*; *Kurz* does not state whether he intended or guessed his own *V. canescens* to be the same as *Wallich's* or no.

12. **V. Wimberleyi**, *Kurz For. Fl.* ii. 271; leaves 5-3-foliolate glabrous, leaflets petioluled elliptically oblong or lanceolate coarsely crenate-serrate, panicles terminal and penultimate puberulous.

ANDAMAN ISLANDS; *Kurz*.

A small evergreen tree, much resembling *V. sumatrana*. *Petioles* 2-3 in., slender, glabrous. *Flowers* small, clustered or cymulose; bracts caducous, lower leaf-like, upper linear-oblong as long as the calyces. *Calyx* $\frac{1}{2}$ in., subtruncate, velvety. *Corolla* pubescent; tube wide, short; lobes obtuse, lowest much produced.—Not seen; the foregoing is copied from *Kurz*. Imperfect specimens of a plant collected by me in the Chittagong Hills show similar coarsely crenate-serrate leaflets, but have the petioles winged; it may be the young state of this species.

13. **V. simplicifolia**, *Clarke*; leaves 1-foliolate coriaceous glabrous, leaflet lanceolate entire, panicles terminal branches elongate, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. fulvous-hairy pedicelled. *Vitex* nn. 14 and 11, *Herb. Ind. Or. H. f. & T.*

MALACCA; *Griffith*.—DISTRIB. Borneo.

A small tree; branchlets round, puberulous or glabrate. *Leaflet* $7\frac{1}{2}$ by $2\frac{1}{4}$ in., punctulate beneath, sessile, articulate on a petiole $\frac{1}{2}$ in. *Panicle* a foot, one branch 15 by $1\frac{1}{2}$ in. in *Griffith's* example, rusty-pubescent; cymes distant; bracts small, caducous; pedicels 12 – 16 in., thickened in fruit. *Calyx* shortly but distinctly toothed, enlarged in fruit. *Corolla* nearly $\frac{1}{2}$ in., tomentose, ochroleucous, the middle lobe of the lower lip purple-lilac (*Griffith*). *Drupe* $\frac{1}{2}$ in. or more, ovoid; apex depressed. —*Wight* supposed this to be *Vitez macrophylla*, R. Br. (now removed to *Gmelina* by *Bentham*); and it is so very like it, except in having narrow leaves, that it appears unnatural to refer the two plants to different genera.

** *Peduncles all axillary, sometimes subobsolete.*

14. **V. vestita**, *Wall. Cat.* 1750; leaves 3-foliolate, leaflets petioluled ovate-lanceolate entire mature softly pubescent beneath, cymes axillary mostly shorter than the petioles. *Schauer in DC. Prodr.* xi. 692; *Kurz For. Fl.* ii. 272. *V. Finlaysoniana*, *Wall. Cat.* 6314.

PENANG; *Wallich*. MALACCA; *Griffith* (*Kew Distrib.* n. 6063), *Cuming*.—DISTRIB. Ava, Sumatra, Java, Borneo.

A tree; shoots softly hairy or almost woolly. *Leaflets* 6 by $2\frac{3}{4}$ in., acuminate at both ends; petiolule of the middle leaflet often $\frac{3}{4}$ in.; petiole 2–3 in., not winged. *Cymes* sessile, small, few-fl'd., fulvous-pubescent; bracts $\frac{1}{2}$ in., linear; pedicels 0– $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in., subtruncate, fulvous-pubescent. *Corolla* $\frac{1}{2}$ in.; tube narrow, glabrate, densely yellow-glandular; lobes small. *Anther-cells* not very unequal, divaricate. *Drupe* $\frac{1}{4}$ in. diam.; fruit-calyx saucer-shaped.

15. **V. peduncularis**, *Wall. Cat.* 1753; leaves 3-foliolate, leaflets petioluled lanceolate entire mature glabrate, panicles long-peduncled elongate many-fl'd. cinereous-farinos. *Schauer in DC. Prodr.* xi. 687.

From ASSAM and BENGAL to TENASSERIM, frequent; *Roxburgh, Wallich, &c.*

A tree, 20–40 ft.; shoots cinereous-pubescent. *Leaflets* $4\frac{1}{2}$ by 1 in., acuminate, mature densely covered by minute yellow glands beneath, midrib sometimes puberulous; petiolule of the middle leaflet $\frac{1}{2}$ – $\frac{3}{4}$ in.; petiole 2–4 in., slender or sometimes slightly winged. *Peduncles* 3–4 in., from the penultimate axils; panicles often 6–8 by 2 in., open; bracts $\frac{1}{2}$ in., linear. *Calyx* $\frac{1}{10}$ in., grey-pubescent, subtruncate. *Corolla* $\frac{1}{2}$ in., grey-pubescent. *Drupe* $\frac{1}{2}$ in. diam., cuboid-globose.

VAR. *Roxburghiana*; less grey-pubescent, petioles winged, panicles lax few-fl'd. *V. alata*, *Roxb. Fl. Ind.* iii. 72; *Wall. Cat.* 1752; *Kurz For. Fl.* ii. 272, not of *Heyne* nor of *Schauer*.—Behar, at Parasnath, *Edgeworth*. E. Bengal and Khasia Terai; *H. f. & T. Pegu*; *Kurz*.—*Roxburgh* quotes (for his Chittagong *V. alata*) *Rheede Hort. Mal.* v. t. 1, which has leaves that might do, but a totally different inflorescence, and is *Heyne's V. alata*.

16. **V. leucoxydon**, *Linn. f. Suppl.* 293; leaves 5-foliolate, leaflets petioluled oblong entire mature woolly along the midrib beneath otherwise glabrate, corymbs divaricate lax, drupe $\frac{2}{3}$ in. *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 74; *Wall. Cat.* 1748; *Schauer in DC. Prodr.* xi. 692, partly; *Dalz. & Gibs. Bomb. Fl.* 201; *Bedd. For. Man.* 171; *Brand. For. Fl.* 370 partly, not of *Kurz*. *V. saligna*, *Roxb. Fl. Ind.* iii. 75; *Wall. Cat.* 6313; *Schauer l. c.* *Vitez l. c.* 18, *Herb. Ind. Or. H. f. & T.* *Wallrothia leucoxydon*, *Roth Nov. Sp.* 319; *Wight Ic.* t. 1467.—*Rheede Hort. Mal.* iv. t. 36.

S. DECCAN PENINSULA and CEYLON, up to 3000 ft., *Roxburgh, Rottler, &c.*

A small tree. *Leaflets* 5 by 1 in., obtuse or obtusely acuminate, when young sparsely hairy, mature with patent yellowish hairs along each side of the midrib beneath; petiolules $\frac{1}{4}$ – $\frac{3}{4}$ in.; petiole 1–3 in., not winged. *Corymbs* nearly glabrous; bracts $\frac{1}{2}$ in., lanceolate, scarious, marcescent; flowers sessile in each dichotomy. *Calyx*

$\frac{1}{2}$ in., minutely toothed, tomentose or nearly glabrous. *Corolla* $\frac{1}{2}$ in., woolly without. *Drupe* obovoid, succulent.—In the typical form the leaflets are coriaceous, shining, yellowish beneath, nervation obscure: in *V. saligna*, Roxb., they are more membranous, the reticulated nervation distinct on both surfaces. A very handsome form with broader leaflets is marked *Wallrothia tomentosa* by Wight; but the extreme membranous narrow-leaved *V. saligna* (Roxburgh's specimen) shows similar hair on each side the midrib beneath.

17. **V. glabrata**, Br. *Prodr.* 512; leaves 5-3-foliolate, leaflets ovate or oblong subentire mature sparsely strigillose beneath, corymbs divaricate, drupe $\frac{1}{2}$ in. *Schauer in DC. Prodr.* xi. 695; *Benth. Fl. Austral.* v. 68. *V. Cunninghamii*, *Schauer l. c.* 690. *V. leucoxylon*, *Schauer l. c.* 692, *partly*; *Blume Bijl.* 813; *Kurz For. Fl.* ii. 273; *Gamble Indian Timbers*, 298. *V. bombacifolia*, *Wall. Cat.* 1749; *Walp. Rep.* iv. 86. *V. pallida*, *Wall. Cat.* 1751.—*Vitex* nn. 10 and 18, *Herb. Ind. Or. H. f. & T.*

From S. ASSAM and CACHAR to MALACCA, frequent.—DISTRIB. Siam, Cochin China, Malaya. N. Australia.

A small tree; shoots fulvous-tomentose or woolly. *Leaves* mostly 5-foliolate (in the Indian tree); leaflets 5 by $2\frac{1}{2}$ in., acute or cuneate at both ends, entire rarely toothed, young very softly hairy or subtomtose, mature with scattered appressed minute hairs beneath; petiolules $\frac{1}{2}$ in.; petiole 1-4 in., not winged. *Peduncles* long or more often short; flowers somewhat numerous, mostly shortly pedicelled; bracts inconspicuous. *Calyx* $\frac{1}{10}$ in., minutely toothed. *Corolla* $\frac{1}{2}$ in., tomentose, ochroleucous; lowest segment much the largest, hairy, blue-purple. *Filaments* minutely hairy. *Pistil* glabrous. *Drupe* obovoid, succulent.—The typical *V. glabrata*, R. Br., has leaves usually 3-foliolate and rounder more glabrate leaflets and fewer-fl. corymbs than the Indian tree; but some of the examples of *V. Cunninghamii* appear identical with Sihet specimens. The typical *V. bombacifolia*, Wallich (*Vitex* n. 18, *Herb. Ind. Or. H. f. & T.*), has the leaflets mostly 5, large and broad; *V. pallida*, Wallich (*Vitex* n. 10, *Herb. Ind. Or. H. f. & T.*), has smaller, more hairy leaflets, and short peduncles.

Subgenus 2. **Glossocalyx**. Calyx unequally 2-lipped, deeply 3-toothed.

18. **V. gamosepala**, *Griff Notul.* iv. 178, and *l.c. Pl. Asiat.* t. 448, fig. 2; leaves 3-foliolate, leaflets petioluled ovate or lanceolate entire glabrate except the nerves beneath, cymes axillary sessile short. *Benth. in Gen. Pl.* ii. 1154.—*Vitex* nn. 15, 16, *Herb. Ind. Or. H. f. & T.*

MALACCA; *Griffith* (Kew Distrib. n. 6065), *Maingay* (Kew Distrib. n. 1202).

A middle-sized tree; shoots fulvous-hairy. *Leaflets* 4 by $1\frac{1}{2}$ in., somewhat coriaceous, petiolule of the middle leaflet $\frac{1}{2}$ in.; petiole 1-2 in., not winged. *Cymes* 1-3 in. diam., globose, repeatedly 2-3-tomous, sparingly fulvous-hairy; bracts caducous. *Calyx* $\frac{1}{2}$ in.; tube shorter than the lip, ovoid; upper lip of two oblong segments, lower twice as long, elliptic, entire. *Corolla* nearly $\frac{1}{2}$ in.; tube narrow, glabrate, with many yellow glands, limb small. *Anther-cells* divaricate as in *Vitex* type (*Griffith's* drawing shows them very young). *Drupe* $\frac{1}{2}$ in., ovoid, glabrous.—The corolla as well as the inflorescence shows the affinity to *V. vestita*.

UNKNOWN SPECIES.

VITEX? AXILLARIS, *Wall. Cat.* 1760, from Tavoy, is not in Wallich's Herbarium.

VITEX HAYNGA, *Roxb. Hort. Beng.* 46, from Chittagong (name only), is probably one of the species described in *Fl. Ind.*, under which Roxburgh has omitted to record the earlier name.

VITEX SCABEA, *Wall. Cat.* 1758, from Ava (*Schauer in DC. Prodr.* xi. 695), is represented by a branchlet and leaves only in Wallich's Herbarium.

XIV. **CLERODENDRON**, Linn.

Trees or shrubs, sometimes rambling. *Leaves* opposite, rarely 3-4-nate, simple, occasionally lobed. *Cymes* axillary or in terminal panicles, often leafy below; bracts prominent or small. *Calyx* campanulate, truncate or 5-toothed, or sub-5-partite, persistent often accrescent or coloured. *Corolla-tube* slender, cylindric, usually long filiform; limb 5-fid. spreading, more or less oblique. *Stamens* 4; anthers long-exserted, cells parallel. *Ovary* imperfectly 4-celled, 4-ovuled; style filiform, shortly bifid. *Drupe* globose, succulent, more rarely nearly dry, 4-grooved, separating into 4 pyrenes of which 1-3 are often suppressed. *Seeds* oblong.—Species 70, in the warmer regions of both Hemispheres, chiefly in the Eastern.

Clerodendron aculeatum, Linn. (under *Volkameria*), a native of America, is cultivated in Indian gardens; it is allied to *C. inerme*, but has axillary spines. *C. fragrans*, Vent., a Chinese species, is extensively cultivated, particularly the double-flowered variety; it is allied to *C. bracteatum*. *C. canescens*, Wall., also Chinese, and closely allied to the last, is occasionally cultivated.

Subgenus 1. **Euclerodendron**. Corolla-tube less than $1\frac{1}{2}$ in.

* *Peduncles mainly axillary, or panicle lax leafy below.*

1. **C. inerme**, Gaertn. *Fruct.* i. 271, t. 57, fig. 1; leaves obovate or elliptic subobtusate entire glabrate, calyx $\frac{1}{2}$ – $\frac{1}{3}$ in. minutely toothed, in fruit somewhat enlarged subtruncate closely embracing the base of the obovoid drupe. *Roxb. Fl. Ind.* iii. 58; *Wall. Cat.* 1788, chiefly. *Schauer in DC. Prodr.* xi. 660; *Dalz. & Gibs. Bomb. Fl.* 200; *Bedd. For. Man.* 174; *Brand. For. Fl.* 363; *Kurz For. Fl.* ii. 266. *Volkameria*, Linn. *Fl. Zeyl.* 231.—*Rheede Hort. Mal.* v. t. 49.

INDIA and CEYLON near the sea, from Bombay to Tenasserim.

A straggling shrub, 3–7 ft.; shoots grey-pubescent. *Leaves* opposite, rarely ternate, $\frac{3}{4}$ – $1\frac{1}{2}$ in., young somewhat grey-pubescent, base cuneate; petiole $\frac{1}{4}$ in. *Peduncles* $\frac{1}{2}$ – $1\frac{1}{2}$ in., all axillary, 3–7-fid.; bracts $\frac{1}{16}$ in., linear; pedicels $\frac{1}{2}$ – $\frac{1}{3}$ in. *Calyx* grey-puberulous or glabrate. *Corolla* white; tube $\frac{3}{4}$ in., glabrate; lobes $\frac{1}{2}$ in., oblong. *Drupe* $\frac{1}{2}$ by $\frac{1}{3}$ in., spongy, hardly succulent, smooth hardly sulcate, separating into 4 woody pyrenes.

2. **C. neriifolium**, Wall. *Cat.* 1789; leaves elliptic acute or linear-oblong entire glabrate, calyx $\frac{1}{2}$ in. shortly toothed, in fruit enlarged subpatent striate distinctly toothed or lobed. *Schauer in DC. Prodr.* xi. 660. *C. inerme*, Benth. *Fl. Hongk.* 271, and *Fl. Austral.* v. 61; *Schauer l. c.*, in great part; *Wall. Cat.* 1788, type sheet. *C. inerme* var. *neriifolia*, Kurz *For. Fl.* ii. 266. *Volkameria neriifolia*, *Roxb. Fl. Ind.* iii. 64.—*Rumph. Herb. Amb.* v. t. 46 (drupe very immature).

MALAY PENINSULA near the sea, from Chittagong to Malacca, frequent.—

DISTRIB. Malaya, China, Australia, Polynesia.

Leaves mostly ternate, $3\frac{1}{2}$ by $1\frac{1}{4}$ in.; or in the extreme type form of Roxburgh, sublinear, $4\frac{1}{4}$ by $\frac{1}{3}$ in. *Cymes* and drupe rather larger than in *C. inerme*. *Calyx* often $\frac{1}{2}$ in. diam. in fruit.—Otherwise as *C. inerme*, of which this may be a var., as Benthham and Kurz have treated it.

VAR. *macrocarpa*, Wall. ms.; drupe $1\frac{1}{4}$ by $\frac{3}{4}$ in.—Martaban; Wallich. Rangoon; M'Lelland.

3. **C. disparifolium**, Blume *Bijd.* 809; leaves oblong or elliptic acuminate subentire glabrate, calyx $\frac{1}{2}$ in. deeply 5-lobed nearly glabrous. *Schauer in DC. Prodr.* xi. 672; *Hassk. Relzia*, i. 57. *C. acuminatum*, Wall.

Cat. 1792; *Schauer l. c.* 664. *C. Jackianum*, *Wall. Cat.* 1794, and in *Bot. Mag.* t. 3049, in note; *Schauer l. c.*

MALACCA and SINGAPORE, frequent; *Wallich, Griffith, &c.*—DISTRIB. Throughout Malaya.

A shrub; branchlets puberulous. *Leaves* opposite, unequal or equal, 4 by $1\frac{3}{4}$ in., base obtuse, undulate or obscurely toothed, young scarcely pubescent; petiole 1–2 in. *Peduncles* numerous, axillary, or penultimate forming a terminal panicle; bracts $\frac{1}{4}$ in., linear; cymes 10–20-fl., puberulous; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx* divided nearly to the base, often purplish, minutely puberulous; segments broad-lanceolate acuminate. *Corolla* pale yellow (Blume); tube nearly 1 in., glabrous; lobes $\frac{1}{2}$ in., narrowly obovate. *Drupe* $\frac{1}{4}$ in. diam., globose, succulent; calyx-lobes in fruit $\frac{1}{2}$ in., pendent. —Wallich's specimens exactly agree with those from Java; but the one species has been made into two because Blume describes the panicle as terminal, which Schauer regarded as axillary.

4. **C. Griffithianum**, *Clarke*; leaves oblong acuminate minutely toothed pubescent beneath at least on the midrib, inflorescence subterminal very lax, calyx $\frac{1}{3}$ – $\frac{1}{2}$ in. deeply 5-lobed.

ASSAM; *Griffith* (*Kew Distrib.* n. 6054).—DISTRIB. Ava.

A small tree (*Griffith*); in habit resembling *C. disparifolium*, but the branches viscous-pubescent. *Leaves* 6 by $1\frac{1}{2}$ in., base rounded or cuneate, mature glabrate above, pubescent (usually minutely) on the lamina beneath; petiole 1 in., viscidly pubescent. *Peduncles* penultimate from petioled leaf-like bracts, and running into completely terminal panicles; bracts $\frac{1}{2}$ in., filiform; cymes lax, viscidly pubescent; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx* minutely pubescent; tube short, distinctly campanulate; lobes lanceolate, acuminate, more or less reddish. *Corolla* glabrate, white (*Griffith*); tube 1 in.; lobes $\frac{1}{2}$ in., oblong. *Drupe* $\frac{1}{2}$ by $\frac{1}{2}$ in., ovoid; calyx-tube much enlarged, almost enclosing the drupe; segments $\frac{1}{2}$ in., triangular, thickened, erect, overtopping the drupe.

5. **C. Lobbii**, *Clarke*; leaves ovate entire minutely pubescent beneath, peduncles axillary long, calyx $\frac{1}{2}$ in. deeply lobed.

PENANG; *Lobb*.

Apparently a rambling shrub; branchlets minutely pubescent. *Leaves* 3 by $2\frac{1}{4}$ in., obtuse, base rounded, glabrate above; petiole probably short. *Peduncles* numerous, 3–4 in.; bracts $\frac{1}{2}$ in., linear; cymes minutely grey-pubescent, 12-fl.; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx* obovoid, minutely grey-pubescent, enclosing the corolla, with scattered round glands; segments $\frac{1}{4}$ in., ovate-triangular, valvate in bud. *Corolla* (not fully expanded) glabrate, probably $\frac{2}{3}$ in. long, altogether of *Clerodendron*, as are the stamens and pistil.

6. **C. phlomoides**, *Linn. f. Suppl.* 292; leaves ovate sinuate or serrate mature puberulous or pubescent beneath, calyx lobed half-way down lobes triangular caudate-acuminate. *Rorb. Fl. Ind.* iii. 57; *Wall. Cat.* 1787; *Schauer in DC. Prodr.* xi. 663; *Dalz. & Gibs. Bomb. Fl.* 200; *Wight Ic.* t. 1473; *Bedd. For. Man.* 174; *Brand. For. Fl.* 363. *Volkameria multiflora*, *Burm. Fl. Ind.* 137, t. 45, fig. 1.

From the N.W. HIMALAYA TERRAI to Ceylon, general in the drier climates, extending to BEHAR and ORISSA (not to Bengal).

A large bush, sometimes 30 ft.; shoots pubescent. *Leaves* $1\frac{3}{4}$ by $1\frac{1}{4}$ in., obtuse or acute, often sub-rhomboid, usually sinuate-crenate sometimes entire, rarely crenate-dentate; petiole $\frac{3}{4}$ in., pubescent. *Peduncles* 1 in., axillary, or panicle sometimes truly terminal; cymes 12-fl., lax, pubescent; bracts $\frac{2}{3}$ in., obovate-lanceolate; pedicels $\frac{1}{8}$ – $\frac{1}{2}$ in. *Calyx* $\frac{3}{4}$ – $\frac{1}{2}$ in., puberulous; in fruit slightly enlarged, more rigid, glabrescent. *Corolla* puberulous, white; tube nearly 1 in., filiform; segments $\frac{1}{2}$ in., elliptic. *Drupe* $\frac{1}{2}$ – $\frac{1}{4}$ in., obovoid, slightly succulent, separating into 4 pyrenes much as in *C. inerme*.

7. **C. calamitosum**, *Linn. Mant.* 90; leaves broadly elliptic coarsely toothed mature nearly glabrous, calyx lobed nearly to the base lobes narrowly oblong cuneately acute. *Schauer in DC. Prodr.* xi. 663; *Bot. Mag.* t. 5294. *Volkameria alternifolia*, *Burm. Fl. Ind.* 137, t. 44.

MALACCA; *Maingay*.—DISTRIB. Java.

A shrub; branches minutely pubescent. *Leaves* 4 by 2 in., opposite rarely alternate, obtuse, base rhomboid; petiole 1 in. *Peduncles* axillary and in a terminal panicle, puberulous; bracts $\frac{1}{2}$ in., linear; cymes 6-fld.; pedicels $\frac{1}{8}$ – $\frac{1}{4}$ in. *Calyx* exceeding $\frac{1}{2}$ in., minutely pubescent. *Corolla* puberulous, white; tube 1 in.; lobes $\frac{1}{4}$ – $\frac{1}{2}$ in., narrowly obovoid. *Drupe* not seen.—Appears closely allied to *C. phlomoides*.

** *Panicles terminal, elongate, lax, often pendulous.*

8. **C. nutans**, *Wall. in Bot. Mag.* t. 3049, and *Cat.* 1793; glabrous, leaves short-petioled narrowly obvate or lanceolate subentire, calyx divided nearly to the broad base segments ovate-lanceolate. *Don Prodr.* 103; *Schauer in DC. Prodr.* xi. 663; *Griff. Itin. Notes*, 24, n. 375; *Kurz For. Fl.* ii. 268.

From SIKKIM and ASSAM to CHITTAGONG, alt. 0–3000 ft.; *Wallich, &c.*—DISTRIB. Ava.

A shrub, commonly 6 ft. *Leaves* 8 by $1\frac{1}{2}$ in., or 6 by 2 in., much acuminate, base attenuate, entire or occasionally slightly toothed; petiole $\frac{1}{2}$ in. *Panicles* 3–12 by 2–3 in., very lax, few-fld., brachiate; bracts $\frac{1}{4}$ in., filiform; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx* $\frac{1}{2}$ in.; in fruit stellate red, more or less enlarged, in one example $1\frac{3}{4}$ in. diam. *Corolla* white; tube $\frac{1}{2}$ in.; lobes $\frac{1}{2}$ in., obovate. *Drupe* $\frac{1}{2}$ in. diam., succulent, dark-purple, pyrenes 1–4.

9. **C. penduliflorum**, *Wall. Cat.* 1795, and in *Bot. Mag.* t. 3049, *in note*; leaves distinctly petioled lanceolate or oblong acuminate subentire mature glabrate, panicle minutely pubescent, calyx divided nearly to the base segments oblong cuneately acute minutely pubescent. *Schauer in DC. Prodr.* xi. 664.

MALAY PENINSULA, from Akyab, *Kurz*, to Tenasserim, *Helfer* (Kew Distrib. n. 6047). NICOBAR ISLES.

A shrub, resembling *C. nutans* except as to the calyx. *Leaves* from 8 by 1 in. to 5 by $2\frac{1}{4}$ in., or sometimes 9 by 4 in.; base cuneate or frequently obtuse, usually entire, sometimes distinctly toothed. *Panicle* puberulous in the typical form, but (as the corolla) very nearly glabrous in some Moulmein examples. *Calyx* $\frac{1}{2}$ to $\frac{3}{4}$ in., segments scarcely wider at the base. *Drupe* $\frac{1}{4}$ – $\frac{1}{2}$ in. diam., globose, succulent, pyrenes 4; sepals in fruit slightly enlarged, reflexed, reddish.

10. **C. macrostachyum**, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 220; leaves long-petioled cordate-ovate toothed sparsely pubescent, calyx very small subtruncate. *Clerodendron* n. 34, *Herb. Ind. Or. H. f. & T.*—Verbenacea, *Wall. Cat.* 6316.

KHASIA Mts., alt. 2000 ft.; on limestone rocks above Chela, *Wallich, H. f. & T.*; Upper Kala Pani, alt. 5000 ft., *Clarke*. MOULMEIN; on limestone rocks, *Parish, Cobb.*

A membranous herb. *Leaves* attaining 9 by $6\frac{1}{2}$ in., subacute, deeply cordate, very membranous, whitened beneath; petiole $6\frac{1}{2}$ in. *Panicles* 5–12 in., terminal, sometimes compound, branches long, narrow, many-fld., pubescent somewhat glandular or glabrate; bracts $\frac{1}{6}$ in., ovate, or smaller oblong; pedicels slender, $\frac{1}{2}$ in. *Calyx* $\frac{1}{6}$ – $\frac{1}{4}$ in., cup-shaped, limb shallowly toothed, glabrate or obscurely pubescent or with red glands; unaltered or slightly inflated in fruit. *Corolla* glabrous, delicate, pale blue (Hooker); tube $\frac{1}{2}$ in., linear; lobes $\frac{1}{2}$ in., obovate. *Stamens* long-exserted. *Ovary* 2- (imperfectly 4-) celled, 4-ovuled, with large red glands, style subterminal. *Drupe* $\frac{1}{10}$ in., obovoid, nearly dry, covered with red glands, dividing into 4 pyrenes.—Not allied to any other

Clerodendron. The Moulmein material has smaller, less toothed, leaves, and has more pubescence and glands than the Chela plants.

*** *Panicles terminal, elongate, conspicuously bracteate; calyx sub-truncate.*

11. *C. serratum*, *Spreng. Syst.* ii. 758; shrubby, leaves subsessile oblong or elliptic acuminate serrate, pedicels densely pubescent. *Don Prodr.* 103; *Wall. Cat.* 1809; *Ham. in Trans. Linn. Soc.* xvii. 187; *Schauer in DC. Prodr.* xi. 664; *Dalz. & Gibs. Bomb. Fl.* 200; *Wight Ic.* t. 1472; *Brand. For. Fl.* 364; *Kurz For. Fl.* ii. 267. *C. ternifolium*, *Don Prodr.* 103. *C. macrophyllum*, *Bot. Mag.* t. 2536; *Reich. Fl. Erot.* t. 209; *Schauer l. c.* 674. *C. ornatum*, *Wall. Cat.* 1811; *Schauer l. c.* 675. *C. herbaceum*, *Wall. Cat.* 1815; *Schauer l. c.* 675. *C. cuneatum*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 221. *Volkameria serrata*, *Linn. Mant.* 90; *Roxb. Fl. Ind.* iii. 62. *V. herbacea*, *Roxb. Hort. Beng.* 46.

From the HIMALAYA, east of the Sutlej, to CEYLON and TENASSERIM, alt. 0-4000 ft., frequent; very common in Bengal.

Stems usually 2-8 ft., simple, hardly woody, being burnt annually in the jungle fires; when more than a year old becoming branched, more or less hairy or glabrate. *Leaves* usually some of them ternate, commonly 6 by 2 in., narrowly obovate-oblong or subelliptic, base cuneate, mature glabrate puberulous pubescent or (in some S. Indian examples) closely villous on the lamina beneath; petiole $0\frac{1}{4}$ in. *Panicle* 6 by 1 in., sublinear, or 10 by 5 in. subpyramidal, pubescent often villous, branches and pedicels patently shortly hairy; bracts $\frac{3}{4}$ -1 $\frac{1}{2}$ in., from obovate to lanceolate, pubescent, subsistent, often coloured; pedicels $0\frac{1}{4}$ in. *Calyx* $\frac{1}{2}$ in., cup-shaped, pubescent or puberulous, limb very shortly 5-lobed, slightly enlarged in fruit. *Corolla* nearly glabrous without, hairy at the base of the stamens, from purplish-blue and white to nearly white; tube $\frac{3}{4}$ -1 in., narrow-cylindric; mouth oblique, 2-lipped; lobes $\frac{1}{2}$ -1 in., oblong or elliptic. *Drupe* $\frac{1}{4}$ by $\frac{1}{8}$ - $\frac{1}{4}$ in., succulent, purple-black, 4-1-pyrened. —In the form *C. herbaceum*, *Wall.*, the panicle is cylindric dense subspicate; in *C. ornatum*, *Wall.* (only seen from Pegu), the panicle is diffuse, slender, unusually glabrous.

VAR. Wallichii; leaves large often shortly petioled, panicle large pyramidal open pubescent, bracteoles prominent lanceolate, calyx truncate or very nearly so. *C. farinosum*, *Wall. Cat.* 1810 (not *Volkameria farinosa*, *Roxb.*). *C. divaricatum*, *Jack in Mal. Misc.* i. 2, and in *Hook. Bot. Misc.* ii. 89; *Schauer l. c.* 674. *C. javanicum*, *Walp. Rep.* iv. 113.—Eastern India; from Sikkim and Assam to Malacca, common. Distrib. Sumatra, Java, Cambodia.—The upper leaves (at least) in some examples of this are quite entire.

12. *C. venosum*, *Wall. Cat.* 1807; arboreous, leaves opposite petioled elliptic acuminate glabrescent, panicle often farinose-tomentose. *Volkameria farinosa*, *Roxb. Hort. Beng.* 46, and *Fl. Ind.* iii. 64, not *C. farinosum*, *Wall.* —*Volkameria* sp., *Griff. Itin. Notes*, 70, n. 1082. *Clerodendron* n. 30, *Herb. Ind. Or. H. f. & T.*

KHASIA MTS., alt. 4000 ft.; Mamloo, *Griffith* (Kew Distrib. n. 6052); Cherra, *H. f. & T.*, &c.

A tree (Roxburgh), 40 ft., with well-marked trunk (Clarke). *Leaves* (none ternate) 7 by 3 in., base attenuate; petiole $\frac{1}{4}$ -1 in. (or uppermost leaves sessile). *Panicle* 8 by 5 in., brachiate, branches divaricate; rachis acutely quadrangular; bracts 1-2 in., ovate, acuminate, leaf-like; bracteoles $\frac{1}{2}$ in., linear-oblong, persistent, farinose-tomentose without spreading hairs; pedicels secund. *Calyx* $\frac{1}{2}$ in., truncate, glabrescent. *Corolla* nearly as of *C. serrata*, but with a greenish-white tinge. *Drupe* nearly as of *C. serrata*.

*** *Panicles peduncled, of 1 or more heads, axillary or sometimes pseudo-terminal.*

13. **C. deflexum**, Wall. *Pl. As. Rar.* iii. 10, t. 215, and *Cat.* 1808; leaves elliptic or oblong acuminate subentire mature softly pubescent beneath, bracts narrow, a few leaf-like often added. *Schauer in DC. Prodr.* xi. 665.

PENANG; Wallich. MALACCA and SINGAPORE; Griffith, &c.

A shrub, 4 ft. (Wallich); branches pubescent. *Leaves* opposite, 13 by 4 in., base cuneate or rounded, mature glabrate above; petiole 1 in. *Peduncles* 1-5 in., axillary, or sometimes one pseudo-terminal lateral deflexed, with 1 rarely 3 heads. *Panicles* 1-3 in. diam., pubescent, red. *Calyx* $\frac{1}{4}$ - $\frac{1}{2}$ in., divided more than half-way down; lobes lanceolate, suberect, scarcely acuminate, sparingly pubescent. *Corolla* slightly pubescent, white suffused rose-purple; tube $\frac{3}{4}$ in.; lobes $\frac{1}{2}$ in., elliptic. *Drupe* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., succulent, purple.—Hardly any of Schauer's section of *axilliflora* have the inflorescence so exclusively axillary as this, which he places in a section defined as having a terminal panicle.

14. **C. bracteatum**, Wall. *Cat.* 1800; leaves ovate acuminate entire mature villous, bracts numerous ovate or oblong. *Walp. Rep.* iv. 106; *Schauer in DC. Prodr.* xi. 665.—*Clerodendron*, Griffith. *Itin. Notes*, 34, n. 563.

SIKKIM and BHOTAN, alt. 2-5000 ft., frequent. MISHMEE; Griffith. ASSAM, CACHAR and KHASIA MTS. up to 4000 ft., Wallich, *H. f. & T.*, &c.

A shrub, 8 ft., or arborescent 20 ft.; branches fulvous-villous. *Leaves* opposite, 6 by 3-4 in., base from cordate to cuneate, mature softly hairy above, villous or almost woolly beneath; petiole 1-3 in. *Inflorescence* fulvous-villous; peduncles 3 in., bearing 1 rarely 3 heads; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., prominent. *Calyx* $\frac{1}{2}$ in., divided more than half-way down; segments ovate-lanceolate, suberect. *Corolla* pubescent, white; tube 1 in.; lobes $\frac{1}{2}$ in., elliptic. *Drupe* $\frac{1}{2}$ in., purple; calyx enlarged, reddish; segments subpatent.

***** *Leaves beneath glabrate, with many round glands; petioles connected by a dense ring of hairs; panicle terminal, large, open.*

15. **C. paniculatum**, Linn. *Mant.* 90; leaves cordate-ovate 5-3-lobed, calyx $\frac{1}{2}$ - $\frac{1}{3}$ in. divided nearly to the base, segments narrowly oblong. *Vahl Symb.* ii. 74; *Bot. Reg. t.* 406; *Reichb. Fl. Exot. t.* 208; *Schauer in DC. Prodr.* xi. 668. *C. pyramidale*, Andr. *Bot. Rep. t.* 628; Wall. *Cat.* 1802. *C. splendidum*, Wall. *Cat.* 1803. *Volkameria angulata*, Lour. *Fl. Cochinch.* 389.

PENANG; Wallich. MERGUI and MALACCA; Griffith.—DISTRIB. Siam, Cochinchina, Java.

A shrub, 3-6 feet. *Leaves* 8 in. diam., lobed 1-3 in. deep, denticulate, above with scattered multicellular hairs or glabrate; petiole 1-4 in. *Panicle* 4-12 by 3-8 in., pubescent, often leafy below, very lax, the branches often prolonged subracemose, usually coloured red; bracteoles linear. *Corolla* pubescent or nearly glabrous, red orange or nearly white; tube $\frac{1}{2}$ - $\frac{3}{4}$ in., filiform; lobes $\frac{1}{4}$ - $\frac{1}{2}$ in. *Drupe* not seen.

VAR. *diversifolia*; upper leaves not lobed base cordate or hastate. *V. diversifolia*, *Vahl Symb.* ii. 75; *Schauer l. c.*—Moulmein; Parish.

16. **C. squamatum**, Vahl *Symb.* ii. 74; leaves cordate roundly ovate shortly acuminate denticulate, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. deeply divided segments broad lanceolate acute. Wall. *Cat.* 1798; *Bot. Reg. t.* 649; *Maund Bot. t.* 13; *Schauer in DC. Prodr.* xi. 669. *C. dentatum*, Wall. *Cat.* 1799; *Schauer l. c.* 674. *Volkameria Kaempferi*, Jacq. *l. c.* Pl. *Rar. t.* 500. *V. dentata*, Roxb. *Fl. Ind.* iii. 61.

SIKKIM, BHOTAN, ASSAM, KHASIA MTS. and SILHET, alt. 0-4000 ft.; Wallich. *H. f. & T.*, &c., frequent.—Widely cultivated.

A shrub, 2-5 ft.; glabrate, or the panicle and innovations minutely thinly hairy.

Leaves 6-15 in. diam., teeth usually scarcely $\frac{1}{2}$ in. deep; petiole 2-4 in. *Panicle* often 18 by 12 in., open, red; bracts small. *Corolla* nearly glabrous, scarlet; tube $\frac{3}{4}$ -1 in., filiform; lobes $\frac{1}{2}$ in. *Drupe* $\frac{1}{2}$ - $\frac{1}{2}$ in. diam., blue-black; fruiting calyx enlarged, patent $1\frac{1}{2}$ in. diam.

VAR. urticifolia; teeth of the leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. deep patent all round the leaves. *V. urticifolia*, *Wall. Cat.* 1801; *Schauer l. c.* *Volkameria urticifolia*, *Roxb. Fl. Ind.* iii. 61.—Assam, E. Bengal, Pegu; *Wallich, &c.* Distrib. Ava.

***** *Panicles terminal, capitate or corymbose; leaves beneath not or very obscurely glandular.*

17. *C. lasiocephalum*, *Clarke*; leaves ovate acuminate dentate pubescent, panicle subcapitate, calyx-segments $\frac{2}{3}$ in. linear-subulate.

MISHMEE; *Griffith* (Kew Distrib. n. 6055).

Branches pubescent upwards. *Leaves* opposite, 10 by $\frac{1}{2}$ in., base cuneate or rounded, membranous, sparsely pubescent on both surfaces; petiole 2 in. *Panicle* sessile, 2-3 in. diam., dense, depressed-globose, pubescent; bracts linear. *Calyx* divided, nearly to the base; segments flaccid caudate, pubescent. *Corolla* not seen. *Drupe* $\frac{1}{2}$ in. diam., red.

18. *C. Colebrookianum*, *Walp. Rep.* iv. 114; leaves shallowly cordate ovate acute entire mature subglabrate, panicle large spreading, flowers clustered, calyx $\frac{1}{6}$ - $\frac{1}{4}$ in. *Schauer in DC. Prodr.* xi. 672; *Gamble Indian Timbers*, 299. *C. glandulosum*, *Wall. Cat.* 1806; *Lindl. in Bot. Reg.* 1844. 19, *in note*; *Schauer l. c.*

SIKKIM, ASSAM, and KHASIA Mts., alt. 1-4000 ft., frequent; *H. f. & T.*, &c. MOULMEIN; *Parish*. PROME HILLS; *Col. Benson*. SINGAPORE; *Lobb*.

A shrub, 4-8 ft. *Leaves* often 9 in. diam., young puberulous, beneath eglandular or with a few scattered large glands especially near the apex of the petiole; petiole 2-8 in. *Panicles* 1-2 ft. diam., straggling, pubescent; flowers very numerous in clusters; bracts lanceolate, caducous at flower-time. *Calyx* pubescent, often bearing a few large glands, divided hardly half way down; teeth triangular or lanceolate. *Corolla* nearly glabrous, from rose-purple to white; tube 1 in.; lobes $\frac{1}{4}$ in., elliptic. *Drupe* $\frac{1}{2}$ in. diam., blue, pyrenes usually 4; calyx in fruit $\frac{1}{2}$ - $\frac{1}{2}$ in. diam.—*C. glandulosum*, *Wall.*, is a specimen from the Calc. Bot. Garden, with the leaves rather more pubescent, and the bracts persistent.

VAR. denticulata; leaves irregularly sinuate denticulate.—Jaintea Hills; *Jowye, Clarke*.

19. *C. infortunatum*, *Gaertn. Fruct.* i. 271, t. 57, fig. 1; leaves ovate acuminate entire or serrulate mature hairy, panicle open villous, corolla-tube exceeding the eglandular calyx-lobes $\frac{1}{2}$ in. *Lamk. Ill.* t. 544; *Wall. Cat.* 1796; *Schauer in DC. Prodr.* xi. 667; *Dalz. & Gibs. Bomb. Fl.* 200; *Wight Ic.* t. 1471; *Bedd. For. Man.* 173, and *Anal. Pl.* xxii. fig. 1; *Brand. For. Fl.* 363; *Kurz For. Fl.* ii. 267. *C. viscosum*, *Vent. Jard. Malm.* t. 25; *Bot. Mag.* t. 1805; *Bot. Reg.* t. 629. *C. cordatum*, *Don Prodr.* 103; *Schauer l. c.* 674. *C. castaneæfolium*, *Klotzsch in Reis. Pr. Wald. Bot.* 102, t. 65. *C. calycinum*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 222. *Volkameria infortunata*, *Roxb. Fl. Ind.* iii. 59.—*Clerodendron*, *Linn. Fl. Zeyl.* 232; *Burm. Thes. Zeyl.* 66; *Rumph. Herb. Amb.* iv. t. 49; *Rheede Hort. Mal.* ii. t. 25.

Throughout INDIA, from Gurwhal and Assam to CEYLON and Singapore, in the warm region; very common.—DISTRIB. Malaya.

A shrub, 4 ft., often gregarious, yellow- or white-villous upwards, sometimes a small tree according to a note in *Herb. Wallich*. *Leaves* 4-8 in., base cordate or obtuse, varying from round-ovate to broad-oblong, in the Deccan examples usually entire, in

the N. Indian denticulate, somewhat roughly hairy above, beneath densely villous or thinly hairy often with small obscure round glands; petiole 1-4 in. *Panicle* 6-12 by 4-8 in., erect, brachiate, sometimes leafy on the main rachis, upper branches and calyces more or less reddening; bracts of the cymes usually caducous. *Calyx*, in flower, $\frac{1}{2}$ in., divided nearly to the base; segments broadly lanceolate, very acute, suberect. *Corolla* pubescent without, white pink-tinged; tube $\frac{3}{4}$ in. *Drupe* $\frac{1}{2}$ in. diam., black; calyx in fruit enlarged, sometimes $1\frac{1}{2}$ in. diam.—Mountain specimens have often large leaves, and are unusually high-coloured. *Lindl. Bot. Reg.* 1844, t. 19, doubtfully referred here by Schauer, has high-red flowers, and may possibly be some garden form of *C. infortunatum*, which in the wild state produces a nearly white corolla.

20. **C. villosum**, *Blume Bijdr.* 811 (*excl. syn. Rheedee*); leaves cordate-ovate entire mature villous, panicle open silky hairy, corolla-tube about as long as the glandular calyx-lobes $\frac{1}{2}$ in. *Schauer in DC. Prodr.* xi. 667; *Kurz For. Fl.* ii. 268. *C. molle*, *Jack in Malay Misc.* i. 15, and in *Hook. Bot. Misc.* i. 283, not of H. B. K. *C. velutinum*, *Wall. Cat.* 1797. *C. ferrugineum*, *Turcz. in Bull. Soc. Imp. Nat. Mosc.* 1863, ii. 221. *C. ? trichotomum*, *Wall. Cat.* 6315, letter B, not of Thunb.

MALAY PENINSULA frequent; from Mergui (*Griffith*) to Singapore (*Sir R. Schomburgk*).—DISTRIB. Java.

A shrub 3-5 ft., or a small tree 15-20 ft. (*Kurz*). *Leaves* as of *C. infortunatum*, but slightly more silky rather than roughly villous. *Panicle* as of *C. infortunatum*, but more softly hairy, and not red. *Calyx* $\frac{1}{2}$ in., divided rather more than half-way down. *Corolla* pubescent, greenish-white, altogether smaller than of *C. infortunatum*. *Drupe* $\frac{1}{2}$ in. diam., dry black appearing hardly succulent.—Very like *C. infortunatum*, but distinguished by its small flowers, and generally also by the glandular calyx-segments. But in a few examples of *C. infortunatum* from the Malay Peninsula the calyx is full of glands.

Subgenus 2. **Siphonanthus**. Corolla-tube more than 3 in., filiform.

21. **C. Siphonanthus**, *Br. in Ait. Hort. Kew. ed.* 2, iv. 65; glabrous, leaves 3-4-nate or opposite subsessile narrowly lanceolate subentire, panicle terminal elongate lax. *Wall. Cat.* 1784; *Wight Ill.* t. 173; *Schauer in DC Prodr.* xi. 670; *Brand. For. Fl.* 364. *C. verticillatum*, *Don Prodr.* 102; *Schauer l. c.* 671. *Siphonanthus indica*, *Willd. Sp. Pl.* i. 606; *Lamk. Ill.* t. 79, fig. 1; *Poxb. Fl. Ind.* iii. 67. *S. angustifolia*, *Willd. l. c.* *Ovieda mitis*, *Burm. Fl. Ind.* 136, t. 43, fig. 1, 2.

From SIKKIM and ASSAM to TENASSERIM, frequent. MTS. of S. DECCAN PENINSULA. KUMAON, wild, fide *Brandis*.—DISTRIB. Sumatra, extensively cultivated in both hemispheres.

A shrub, 4-8 ft., branches virgate. *Leaves* 6 by 1 in., shortly acuminate, base tapering, usually entire or sinuate, rarely remotely crenately lobed; petiole $0-\frac{1}{8}$ in. *Panicle* 8-18 by 4-6 in., often leafy below; cymes very lax, few-fl.; bracts $\frac{1}{2}$ in., linear or linear-lanceolate; pedicels $\frac{1}{2}-1\frac{1}{4}$ in. *Calyx* $\frac{1}{2}$ in., divided $\frac{3}{4}$ the way down; segments oblong, cuneately acute. *Corolla* glabrous, white; tube 3-4 $\frac{1}{2}$ in.; lobes $\frac{3}{4}$ in., obovate-oblong.

VAR. *semiserrata*; leaves opposite short-petioled elliptic crenate-lobate, panicle terminal 3-4-fl. *C. semiserrata*, *Wall. Cat.* 1785.—Prome and Seguin; *Wallich*.—Apparently a much-branched shrub; but the specimens are possibly only short imperfect flower-branches rapidly developed from a normal plant of *C. Siphonanthus* cut to the base by a hot-weather jungle-fire; for the calyx and corolla are exactly as of *C. Siphonanthus*.

22. **C. hastatum**, *Lindl. in Bot. Reg.* t. 1307; pubescent or villous, leaves opposite hastate ovate or oblong often angular or sublobate, panicle

terminal densely corymbose. *Bot. Mag.* t. 3398; *Schauer in DC. Prodr.* xi. 671. *C. sagittatum*, *Wall. Cat.* 1786. *Siphonanthus hastata*, *Roxb. Fl. Ind.* iii. 67.

SILHET; *Wallich*. KHASIA MTS., alt. 0-3000 ft., *H. f. & T.*, &c.

A large shrub. *Leaves* 6 by 4 in., angular, toothed, or oblong and hardly angular; petiole 4 in. *Corymb* subsessile, 4-8 in. diam., pubescent, with reduced leaves often scattered; proper bracts $\frac{3}{4}$ in., linear. *Calyx* $\frac{1}{2}$ in., divided nearly to the base; segments oblong, shortly acute. *Corolla* pubescent, white; tube 4 in.; lobes $\frac{1}{2}$ in., elliptic. *Drupe* $\frac{1}{2}$ in. diam., succulent, black-purple; calyx much enlarged in fruit, dark red.

DOUBTFUL OR EXCLUDED SPECIES.

C. COROMANDELIANUM, *Spreng. Syst.* ii. 758, *Schauer in DC. Prodr.* xi. 673, is another name for *C. ovatum*, *Poir. Suppl.* iv. 352; a species founded on a plant from Pondicherry, resembling *C. squamatum*, but with entire glabrous leaves and whitish flowers.

C. BUCHANANI, *Roxb. Fl. Ind.* iii. 60 (under *Volkameria*), and *IC. Ined. at Kew*, is a *Clerodendron* with terminal compact red panicle and ovate leaves from Amboina and Celebes. This was united by D. Don (*Prodr. Nepal.* 103) with his *Cl. fetidum* from Nepal, a plant with axillary inflorescence, which Hamilton's original specimen in the British Museum shows to have been *Caryopteris grata*. Walpers (*Rep.* iv. 108) and Schauer (*DC. Prodr.* xi. 672) have copied; there is no reason to suppose that Roxburgh's *Buchanani* has ever been found in Nepal or in British India. *C. Buchanani*, *Wall. Cat.* 2653, is not in his Herbarium.

C. FORTUNATUM, *Linn.*, erroneously stated by Schauer (*in DC. Prodr.* xi. 671) to be an Indian species, is a Chinese plant. *C. fortunatum*, *Wall. Cat.* 2652, is not in his Herbarium.

C. SERICEUM, *Wall. Cat.* 1814, is *Hiptage sericea*, *Hook. f.*

XV. HOLMSKIOLDIA, Retz.

Shrubs. *Leaves* opposite. *Cymes* short, axillary or collected at the tips of the branches; bracts small. *Calyx* widely obconic, subtruncate, membranous, coloured. *Corolla* cylindric, curved; limb oblique; lobes 5, short. *Stamens* 4, didynamous; anthers exserted, ovate; cells parallel. *Ovary* obtuse or obscurely depressed, imperfectly (afterwards completely) 4-celled, 4-ovuled; ovules laterally attached; style terminal, shortly 2-fid. *Drupe* obovoid, included in the enlarged calyx, divaricately 4-lobed nearly half-way down, pyrenes 1-4. *Seeds* oblong.—Species 3, an Indian, Madagascanian, and Tropical African.

H. sanguinea, *Retz. Obs.* vi. 31, and in *Hoffm. Phyt. Blaett.* 35, t. 3; leaves petioled ovate acuminate base obtuse somewhat pubescent, cymes bright red. *Wall. Cat.* 2087; *Bot. Reg.* t. 692; *Benth. Lab.* 642; *Schauer in DC. Prodr.* xi. 696; *Reichb. Fl. Exot.* t. 149; *Decne. in Jacquem. Voy. Bot.* t. 140; *Bocq. Rev. Verben.* 135, t. 20, fig. 1-8; *Brand. For. Fl.* 370; *Kurz For. Fl.* ii. 257. *H. rubra*, *Pers. Syn.* ii. 144. *Hastingsia coccinea*, *Smith Exot. Bot.* ii. 41, t. 80; *Roxb. Fl. Ind.* iii. 65. *H. scandens*, *Roxb. l. c.* *Platunium rubrum*, *Juss. in Ann. Mus. d'Hist. Nat.* vii. 76.

SUBTROPICAL HIMALAYA, alt. 0-4000 ft., from Kumaon to Bhotan, and the PROMETHEUS HILLS, frequent.

A straggling shrub, 10-30 ft. *Leaves* 3 by 2 in., entire or toothed; petiole $\frac{1}{2}$ in. *Cymes* 1-2 in., puberulous, red becoming scarlet in fruit. *Corolla* 1 by $\frac{1}{2}$ in., brick-red or somewhat orange. *Stamens* glabrous. *Ovary* glandular; style glabrous. *Drupe* $\frac{1}{2}$ in.; fruiting calyx 1 in. diam.

XVI. **CARYOPTERIS.** Bunge.

Shrubs, erect or rambling. *Leaves* opposite, acuminate, toothed or subentire, minutely punctate with yellow glistening glands. *Cymes* small, dense, many-fl., axillary or running into a terminal thyrses; bracts small. *Calyx* deeply 5-fid; segments triangular or lanceolate, somewhat accrescent. *Corolla-tube* short, cylindric; limb spreading, middle lobe of the lower lip larger, crisped or (in the typical non-Indian species) fimbriate. *Stamens* 4, didynamous; anthers exserted, cells divaricate (in the Indian species), confluent. *Ovary* imperfectly 4-celled, 4-ovuled; style filiform, shortly 2-fid. *Capsule* small, globose, dividing into 4 concave valves with incurved margins holding the seeds. *Seeds* oblong, erect.—Species 5, two N.E. Asiatic and the following.

Though the genus is near *Clerodendron*, two of the Indian species are easily distinguished by their very short corolla: the third, *C. Wallichiana*, has the corolla-tube scarcely $\frac{1}{2}$ in. The capsule is hardly less succulent than in several species of *Clerodendron*, nor is the incurving of the edges of the valves different from what occurs in that genus.

1. **C. Wallichiana**, *Schauer in DC. Prodr.* xi. 625; leaves elliptic acuminate, cymes collected mostly in terminal thyrses, corolla $\frac{1}{2}$ in., calyx-segments in fruit lanceolate erect 1-3-ribbed. *Brand. For. Fl.* 370. *Volkameria odorata*, *Roxb. Hort. Beng.* 46. *Clerodendron odoratum*, *Don Prodr.* 102; *Wall. Cat.* 1812.—*Volkameria* sp., *Griff. Itin. Notes*, 128, n. 504.

SUBTROPICAL HIMALAYA, alt. 0-4500 ft., from the Punjab to Bhotan; frequent.

A spreading shrub, 4-12 ft.; shoots ashy-pubescent or subtomentose. *Leaves* 4 by $1\frac{1}{2}$ in., base cuneate, toothed or nearly entire, ashy-pubescent or puberulous; petiole $\frac{1}{4}$ in. *Cymes* mostly in terminal thyrses 3-5 by 1 in., ashy-pubescent, glandular. *Calyx* $\frac{1}{12}$ in., in fruit $\frac{1}{2}$ in. *Corolla-tube* $\frac{1}{2}$ in., pubescent, glandular; middle lobe of lower lip nearly $\frac{1}{2}$ in. blue, 4 other lobes about $\frac{1}{4}$ in., white. *Capsule* $\frac{1}{8}$ - $\frac{1}{2}$ in. diam., globose, closely pubescent.

2. **C. grata**, *Benth. in Gen. Pl.* ii. 1158; leaves elliptic acuminate pubescent, cymes mostly axillary small corymbose, corolla $\frac{1}{2}$ in., calyx-segments in fruit subpatent triangular. *Clerodendron gratum*, *Wall. Cat.* 1813; *Schauer in DC. Prodr.* xi. 674, not of Kurz. *C. foetidum*, *Don Prodr.* 103; *Schauer l. c.* 672, not of Bunge. *Vitex sex-dentata*, *Wall. Cat.* 1759; *Schauer l. c.* 696.

KUMAON; below Nynee Tal, alt. 4000 ft., *Thomson, Strachey & Winterbottom.* NEPAL; *Wallich*.

A rambling shrub; branches pubescent or tomentose. *Leaves* $4\frac{1}{2}$ by $1\frac{1}{2}$ in. (mostly smaller), base rhomboid or almost rounded, toothed or subentire, mature softly pubescent or almost villous beneath; petiole $\frac{1}{2}$ in. *Cymes* $\frac{1}{4}$ - $\frac{3}{4}$ in., densely pubescent, 3-8-fid., dichotomous, without a common rachis. *Calyx* $\frac{1}{10}$ in., densely pubescent, in fruit $\frac{1}{2}$ - $\frac{1}{2}$ in., membranous, not ribbed. *Corolla* pubescent, glandular. *Capsule* $\frac{1}{2}$ in. diam., globose, nearly glabrous, somewhat ribbed.

3. **C. paniculata**, *Clarke*; leaves elliptic acuminate mature glabrate, panicles axillary small dense many-fl., corolla $\frac{1}{2}$ in., calyx-segments in fruit small lanceolate. *Clerodendron gratum*, *Kurz For. Fl.* ii. 268, not of Wall. —*Callicarpa* n. 9, *Herb. Ind. Or. H. f. & T.*

SUBTROPICAL HIMALAYA, alt. 1-4000 ft., frequent; from E. Nepal, *J. D. H.*, to Mishmee, *Griffith* (Kew Distrib. n. 6044).—DISTRIB. Ava.

A spreading shrub; branches terete, slender, pubescent. *Leaves* mostly obtuse or rounded at the base. *Panicles* axillary, subsessile, $\frac{1}{2}$ -2 $\frac{1}{2}$ in., distinctly paniced, rachis

distinct, often 20–60-fld., pubescent or glabrate. *Corolla* pubescent, deep red. *Drupe* pubescent; calyx hardly accrescent.—Otherwise much resembling *C. grata*: the whole panicle usually is red; but in *C. grata* it is often more or less red.

XVII. GLOSSOCARYA, Wall.

Grey-tomentose, scandent shrubs. *Leaves* opposite, ovate, shortly petioled, entire. *Cymes* many-fld., in a dense terminal corymbose panicle; flowers sessile; bracts small. *Calyx* campanulate, 5-toothed, hardly accrescent. *Corolla-tube* narrow-cylindric; limb 2-lipped, 5-lobed. *Stamens* 4, didynamous; anthers long-exserted, ovate; cells parallel. *Ovary* imperfectly 4-celled, 4-ovuled; style filiform, 2-fid. *Capsule* oblong, somewhat widened upwards, exserted, 4-valved; valves narrowly obovoid, substipitate, margins inflexed holding the seed, one produced downwards as a 1-sided wing. *Seeds* narrowly oblong, erect.—Species 3, an Australian and the following.

1. **G. Linnæi**, *Benth. in Gen. Pl.* ii. 1158; leaves ovate or obovate subcordate mature glabrescent, capsule grey strigose. *Clerodendron* Linnæi, *Thuwaites Enum.* 243.

CEYLON, in hot dry places; *Walker, Thuwaites*.

Scandent; branches pubescent. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., apiculate; petiole $\frac{1}{2}$ in. *Corymbs* 3 in. diam., grey-tomentose; bracts $\frac{1}{2}$ in., elliptic, or some of the lower foliaceous. *Calyx* $\frac{1}{2}$ in., or in fruit $\frac{5}{8}$ in., limb shallowly roundly lobed. *Corolla* strigose, white; tube $\frac{1}{2}$ in., slender; lobes $\frac{1}{2}$ – $\frac{1}{4}$ in. *Filaments* exserted 1 in. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ by $\frac{1}{2}$ in.

2. **G. mollis**, *Wall. Cat.* 1741; leaves ovate mature softly pubescent beneath, capsule patently grey-hairy. *Griff. in Calc. Journ. Nat. Hist.* iii. 366; *Schauer in DC. Prodr.* xi. 626; *Kurz For. Fl.* ii. 257.

MOULMEIN; *Griffith* (Kew Distrib. n. 6017), *Lobb*.

Closely resembling *G. Linnæi*, but generally more hairy; branchlets and panicles densely softly grey-villous. *Capsule* rather longer, $\frac{1}{2}$ in.

XVIII. HYMENOPYRAMIS, Wall.

A large, rambling shrub; branches grey-tomentose. *Leaves* opposite, ovate, entire. *Cymes* lax, in large, pyramidal, axillary or terminal panicles; flowers very small; bracts minute. *Calyx* minute, 4-fid; greatly accrescent in fruit, membranous, 4-winged, utricular. *Corolla-tube* cylindric; limb oblique, 4-fid. *Stamens* 4; anthers exserted, ovate; cells parallel. *Ovary* 2-celled, 4-ovuled; style filiform, shortly 2-fid. *Capsule* small, obovoid, included, 4-valvular; valves obovoid-oblong, margins inflexed holding the seed. *Seeds* pendulous, subtriquetous.

H. brachiata, *Wall. Cat.* 774; *Griff. in Calc. Journ. Nat. Hist.* iii. 365; *Schauer in DC. Prodr.* xi. 626; *Bocq. Rev. Verben.* 113, t. 11, fig. 1–10; *Kurz For. Fl.* ii. 258.

PEGU; *Wallich*.—DISTRIB. Ava.—In N. and Central India cultivated.

Leaves $3\frac{1}{2}$ by $\frac{1}{2}$ in., acuminate, base obtuse or rhomboid, mature glabrate above, grey-tomentose or pubescent beneath; petiole $\frac{1}{2}$ in. *Panicles* 12 by 8 in., leafy below, grey-tomentose. *Calyx* $\frac{1}{4}$ in. *Corolla* $\frac{1}{2}$ in., pubescent, white. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., fulvous-hirsute; utricle $\frac{1}{2}$ – $\frac{3}{4}$ in., ovoid, acutely 4-winged, mouth minute.

XIX. **PERONEMA**, *Jack.*

A lofty tree; branchlets grey-tomentose. *Leaves* opposite, unequally pinnate; leaflets several pair, entire. *Panicles* in the upper axils large, compound; bracts small; flowers very small. *Calyx* shortly 5-fid, not accrescent. *Corolla-tube* cylindric; limb 2-lipped, 5-lobed. *Stamens* 2; anthers subexserted, ovate; cells parallel, subseparate. *Ovary* 4-celled, 4-ovuled; style filiform, subentire. *Capsule* small, globose, longer than the calyx, 4-valved; valves quarter-spheres, margins inflexed holding the seeds. *Seeds* pendulous.

P. canescens, *Jack in Mal. Misc.* 2, vii. 46, and in *Hook. Comp. Bot. Mag.* i. 152; *Wall. Cat.* 9057; *Schauer in DC. Prodr.* xi. 627; *Wight Ic.* t. 1460; *Griff. Notul.* iv. 177. C. heterophyllum, *Miq. Fl. Ind. Bat. Suppl.* 570.

MALACCA; *Griffith* (Kew Distrib. n. 6015).—DISTRIB. Sumatra, Java, Borneo.

Leaves 1-2 ft., grey-tomentose or pubescent beneath; rachis winged, leaflets 9 by 2 in., sessile, acute; petiole 2-7 in. *Panicles* 1 foot, corymbose, pubescent. *Calyx* $\frac{1}{2}$ in., deeply toothed. *Corolla* $\frac{1}{8}$ - $\frac{1}{6}$ in., pubescent. *Capsule* $\frac{1}{10}$ in., hirsute.

XX. **SYMPHOREMA**, *Roxb.*

Scandent shrubs. *Leaves* opposite, entire or toothed. *Cymes* peduncled, capitate, 7-fld.; involucre of 6 oblong bracts, accrescent in fruit. *Calyx* obovoid, short 4-8-toothed, somewhat accrescent. *Corolla* small, white; tube cylindric; lobes 6-16, subequal, narrowly oblong. *Stamens* as many as the corolla-lobes; anthers exserted, ovate; cells parallel. *Ovary* 2- (imperfectly 4-) celled, 4-ovuled; style filiform, shortly bifid. *Fruit* nearly dry, included in the calyx, 1-seeded. *Seed* erect, cotyledons fleshy.—Species 3, a Philippine Island one and the following.

1. **S. involucratum**, *Roxb. Cor. Pl.* ii. 46, t. 186, and *Fl. Ind.* ii. 262; leaves ovate or elliptic pubescent or villous, corolla $\frac{1}{4}$ in. 6-8-lobed, involucre in fruit reticulate membranous. *Wight Ic.* t. 362; *Dalz. & Gibs. Bomb. Fl.* 199, not of *Wall. nor of Schauer*. *Congea paniculata*, *Wall. Cat.* 1739, partly.

W. DECCAN PENINSULA from the Concan southwards, frequent, and in CEYLON. BEHAR; Monghyr Hills, *Hamilton*.

Innovations stellately tomentose. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{2}$ in., subacute, usually toothed, ultimately nearly glabrous above; petiole $\frac{1}{2}$ in. *Peduncles* 1 in.; bracts in flower $\frac{1}{4}$ in., pubescent or villous; in fruit $1\frac{1}{4}$ by $\frac{1}{2}$ in., spatulate-elliptic, thinly pubescent. *Calyx* $\frac{1}{2}$ in., stellately tomentose; in fruit $\frac{1}{4}$ in., or more, narrower upwards. *Fruit* $\frac{1}{2}$ in., subglobose, nearly glabrous.—The leaves on the main branches are often large; the flowering branches often produce only small leaves $\frac{1}{2}$ - $\frac{3}{4}$ in. The picture of Roxburgh shows the corolla decidedly too large, which misled Wallich, whom Schauer followed. Kurz (*For. Fl.* ii. 254) says this species is "common all over Ava, Martaban and Pegu," where no one else has found it: it might be suspected that Kurz had mistaken for it some *Sphenodesma*, but he describes the corolla as having 6-8 linear-lanceolate acute lobes, and the leaves as coarsely toothed.

2. **S. polyandrum**, *Wight Ic.* t. 363, and *Ill.* t. 173 bis, fig. 7; leaves ovate villous, corolla $\frac{1}{2}$ in. 14-18-lobed, involucre in fruit tomentose. C. involucratum, *Wall. Cat.* 1740; *Schauer in DC. Prodr.* xi. 621, not of *Roxb.* S. involucratum, *Kew Distrib.* n. 6007.

S. DECCAN PENINSULA in the hills; *Wight, Beddome, &c.*, extending north to Belgaum.

Similar to *S. involucreatum*, but larger in all its parts and more hairy. *Leaves* 4 by $2\frac{3}{4}$ in., some on the main stem 8-9 by 4 in., stellately villous beneath. *Calyx* $\frac{1}{4}$ in. and upwards in flower. *Bracts* in fruit $1\frac{1}{2}$ by $\frac{3}{4}$ in., obscurely membranous.

XXI. SPHENODESMA, Jack.

Scandent, mostly large, shrubs. *Leaves* opposite, entire, shortly petioled. *Cymes* capitate, 3- or 7-fl., with an involucre of 6 oblong or obovate bracts; paniced, i. e. the leaves at the base of the peduncles to the cymes more or less bract-like, mostly deciduous. *Calyx* funnel-shaped, 5- (rarely 4-6-) toothed, sometimes enlarged or inflated in fruit. *Corolla-tube* short, cylindric; lobes 5, rarely 6, ovate oblong or narrowly lanceolate. *Stamens* 5, included, rarely subexserted; anthers ovate. *Ovary* imperfectly 2-celled, 4-ovuled; ovules pendulous from the apex of the placentiferous axis; style filiform, shortly bifid, or (in subgenus *Brachynema*) very short or obsolete, stigma obscurely 2-lobed. *Drupe* globose or obovoid, small, included or subincluded in the calyx; 1- (or rarely 2-) seeded in the few (mostly imperfectly ripe) examples seen.—Species 9, some Bornean and those here described.

The cyme in this genus is dichotomous with a single flower in the fork; the two lateral branches are again dichotomous with a single flower in the fork; the cyme is thus 7-fl.; or, in 1 or 2 species, 3-fl. by the lateral flowers of the 2 cyme-branches being undeveloped. The flower in the principal fork is necessarily the oldest, and bracteate: hence the bracts are always 6.

Sect. 1. **Brachynema**, Griff. (Genus). *Corolla-lobes* oblong, or narrowly lanceolate. *Anthers* included. *Style* obsolete or minute.

1. **S. microstylis**, Clarke; leaves ovate mature softly pubescent or villous beneath, corolla-lobes 5-6 narrowly lanceolate. *Brachynema ferruginea*, Griff. *Nutl.* iv. 176. *Symphorema microstylis*, *Bedd. ms.*

MERGUI and MOULMEIN, Griffith (Kew Distrib. n. 6007, partly). ΤΑΥΟΥ; Parish.—DISTRIB. Siam.

A shrub, 6-8 ft. (Parish); shoots and inflorescence rusty stellate-villous or submentose. *Leaves* $5\frac{1}{2}$ by $3\frac{1}{2}$ in., subacute, base obtuse, entire, mature pubescent above at least on the nerves; petiole $\frac{1}{2}$ in. *Peduncles* $1\frac{1}{2}$ in.; heads 7-fl., rusty villous; bracts (at flower-time) $\frac{3}{4}$ by $\frac{1}{2}$ in., spatulate-elliptic, obtuse. *Calyx* in flower $\frac{1}{2}$ in. or more; teeth ovate. *Corolla-tube* $\frac{1}{2}$ in., narrowly funnel-shaped, densely hairy to the base within; lobes $\frac{1}{2}$ - $\frac{1}{3}$ by $\frac{1}{16}$ in., puberulous, submentose. *Anthers* ovate, low in the corolla-tube. *Ovary* 4-ovuled; style minute. *Drupe* not seen.—Wight, Parish and Beddome have all referred this to *Symphorema* from the narrow corolla-lobes, but the short filaments will not suit. Supposing the state of the style to be due to dimorphism, the species is distinct and possibly indicates a new genus. It cannot be Kurz's *Symphorema involucreatum*, which Kurz says has coarsely toothed leaves.

2. **S. paniculata**, Clarke; leaves ovate or elliptic mature pubescent beneath, corolla-lobes 5-6 oblong obtuse or narrowly obovoid. *Congea paniculata*, Wall. *Cat.* 1739.

DECCAN PENINSULA; Kurg, Rottler; Cochin, Johnstone.

A scandent shrub; shoots and inflorescence rusty stellately villous. *Leaves* $3\frac{1}{2}$ by $1\frac{3}{4}$ - $2\frac{1}{2}$ in., subacute; petiole $\frac{1}{4}$ in. *Peduncles* $\frac{1}{2}$ -1 in., appearing paniced, the half-bractlike leaves at their base often deciduous; bracts $\frac{3}{4}$ by $\frac{1}{2}$ in., narrowly obovoid. *Calyx* $\frac{1}{2}$ in.; lobes ovate. *Corolla-tube* $\frac{1}{2}$ in., densely hairy to the base within; lobes $\frac{1}{2}$ by $\frac{1}{16}$ in., puberulous, submentose. *Anthers* ovate, low in the corolla-tube. *Ovary* 4-ovuled; style 0. *Drupe* not seen.—Very near *S. microstylis* except as to the obtuse corolla-lobes.

3. **S. unguiculata**, Schauer in DC. Prodr. xi. 623; leaves elliptic acuminate young stellately fulvous-hairy mature glabrate, corolla-lobes 5-6 oblong or narrowly obovoid. *Congea unguiculata* & ferruginea, Wall. Cat. 1736, 1737. *Vitex involucratus*, Presl Bot. Bemerk. 148. *Symphorema unguiculatum*, Kurz For. Fl. ii. 255.—*Congea* sp., Griff. Notul. iv. 91, n. 1353.

KHASIA Mts., alt. 2-3000 ft.; Wallich, H. f. & T., &c. CACHAR; Keenan. CHITTAGONG; Wallich. MOULMEIN and TENASSERIM; Griffith & Helfer (Kew Distrib. n. 6010), &c. S. ANDAMAN; Kurz.

A large, climbing shrub. Leaves 6 by 2½ in., base obtuse or rounded, scattered stellate hairs deciduous; petiole ½ in. Bracts 1½ by ½ in., spatulate-elliptic, obtuse, membranous, whitened, ultimately nearly glabrate. Calyx less than ½ in., obconic, stellately fulvous-tomentose; teeth triangular, rather rigid. Corolla pale yellow; tube hardly so long as the calyx, lobes ½-⅓ in., obtuse. Stigma sessile, bifid. Drupe (young) obovoid, glabrous, glandular at the apex.—This has larger leaves and bracts, shorter calyx and corolla, than *S. astylis*.

Sect. 2. **Eusphenodesma**. Corolla-lobes ovate or oblong. Anthers subexserted. Style filiform.

* Bracts of the involucre small, shorter than the calyx.

4. **S. eryciboides**, Kurz in Flora 1871, 345; leaves elliptic mature pubescent or grey-tomentose beneath, flower-heads nearly sessile fulvous-tomentose, corolla white. *S. grossum*, Kurz For. Fl. ii. 254. *Sphenodesma*? Wall. Cat. 9076.

PEGU and TENASSERIM, frequent; Wallich, Helfer (Kew Distrib. n. 6011).

A large, scandent shrub, or a small tree (Parish); shoots tomentose. Leaves 4½ by 2½ in., subacute, base rhomboid, glabrate above; petiole ½ in. Heads 7-fld., hardly ½ in. diam.; bracts ½ in., round-elliptic; peduncles numerous, 0-⅓ in., bracts at their base caducous; the inflorescence thus appearing a compound spike thyrse, or panicle. Calyx ½ in., broadly funnel-shaped, fulvous-tomentose, densely white-silky within, globular and inflated in fruit; teeth triangular. Corolla ¼ in.; lobes 5-6, narrowly obovoid, puberulous.

** Bracts of the involucre mostly longer than the calyx.

5. **S. triflora**, Wight Ic. t. 1478; leaves lanceolate grey-puberulous, panicles compound, heads short-peduncled 3-fld. Griff. Notul. iv. 182. *Congea Jackiana*, Wall. Cat. 1735, partly.

PENANG; Wallich. MALACCA; Griffith (Kew Distrib. n. 6009, partly), Maingay (Kew Distrib. n. 1196).

Branchlets grey-puberulous. Leaves 5 by 1½ in., cuneate at both ends; petiole ½ in. Panicles 9 in. diam., ashy-pubescent; leaves ¼-½ in., half-bractlike; peduncles to the heads ¼-½ in.; bracts, usually 6 to each head, exceedingly variable in size on the same panicle; many small, lanceolate, hardly exceeding the calyx, others 1 by ½ in., spatulate-elliptic, obtuse, membranous, reticulate, cinereous-puberulous. Calyx ¼-½ in., ribbed, teeth triangular. Corolla ¼ in., throat hairy, lobes ovate. Style linear, subincluded. Drupe (imperfectly ripe) ½ in., narrowly obovoid, glabrous, 1-seeded; calyx not inflated.—A plant collected by Beccari in Borneo is perhaps not specifically separable, but has the heads shortly fulvous-villous.

6. **S. barbata**, Schauer in DC. Prodr. 623; branchlets and inflorescence patently rufous-hirsute, leaves elliptic acute hairy, heads 7-fld. closely capitate. *S. ferrugineum*, Wight Ic. t. 1474. *Congea barbata*, Wall. Cat. 1738. ? *Viticastrum racemosum*, Presl Bot. Bemerk. 148; Walp. Rep. vi. 691 (ex Schauer).

PENANG; *Wallich*. MALACCA; *Griffith* (Kew Distrib. n. 6009, partly), *Maingay* (Kew Distrib. n. 1194).

Leaves 3 by $1\frac{1}{4}$ in., subacute at both ends, above thinly, beneath more thickly, rufous- or fulvous-hairy; petiole $\frac{1}{2}$ – $\frac{1}{3}$ in. *Peduncles* $\frac{1}{2}$ – $1\frac{1}{2}$ in., axillary and running into terminal panicles; bracts 1 by $\frac{1}{2}$ in., spatulate-elliptic, obtuse, thinly rufous-pubescent. *Calyx* scarcely $\frac{1}{2}$ in., densely rufous-hirsute. *Corolla* $\frac{1}{2}$ in., blue. *Drupe* not seen.—*Schauer* l. c. doubtfully reduces here *Viticastrum racemosum*, Presl Bot. Bemerk. 148; but the description does not fit in several points; inter alia in the 5-celled ovary.

7. **S. Griffithiana**, *Wight Ic. t. 1477, text*; leaves ovate or lanceolate mature nearly glabrate, heads 7-fl., bracts oblong, fruit-calyx patently hairy teeth closely incurved with a narrow horn-like tooth recurved from each sinus. *S. Jackianum*, *Wight Ic. t. 1477, not of Schauer*. *Decadontia cœrulescens*, *Griff. Notul. iv. 175*. *Symphorema pentandrum*, *Kurz For. Fl. ii. 255, not Sphenodesma pentandra, Jack, nor Congea pentandra, Roxb.*

MERGUI; *Griffith*. TAVOY; *Helper* (Kew Distrib. n. 6008).

A large, scandent shrub. *Leaves* $3\frac{1}{2}$ by 1 in., oblong acuminate, or 3 by 2 in. ovate, acute, base rounded or obtuse; petiole $\frac{1}{4}$ in. *Panicles* terminal, 12–18 in. diam., leafless (i. e. main bracts caducous), minutely hairy, rufous-villous in the axils; peduncles $\frac{1}{4}$ –1 in., slender, fulvous-pubescent; bracts 1 by $\frac{1}{2}$ in., spatulate-oblong, obtuse, membranous, nearly glabrous; flowers sessile. *Calyx* $\frac{1}{8}$ in.; in fruit $\frac{1}{2}$ in., slightly inflated, obconic. *Corolla* $\frac{1}{2}$ in., purple; lobes ovate; throat hairy. *Drupe* not seen.

8. **P. pentandra**, *Jack in Mal. Misc. i. 19*, and in *Hook. Bot. Misc. i. 285*; leaves oblong or ovate acuminate mature nearly glabrous, calyx nearly glabrous funnel-shaped shortly 5-toothed in fruit mouth inflated with 5 accessory teeth. *Wight Ic. t. 1475*; *Griff. Notul. iv. 181*. *S. Wallichiana* & *Jackiana*, *Schauer in DC. Prodr. xi. 622*. *S. acuminata*, *Wight Ic. t. 1476*. *Roscoea pentandra*, *Roxb. Fl. Ind. iii. 54*. *Congea pentandra* & *Jackiana*, *Wall. Cat. 1734, 1735*. *C. azurea*, *Wall. Cat. 1733, partly*. *Symphorema Jackianum*, *Kurz For. Fl. ii. 256*.

From ASSAM and the KHASIA MTS. to MALACCA; frequent.

A scandent shrub. *Leaves* 4 by $1\frac{1}{4}$ – $1\frac{3}{4}$ in., base rounded or obtuse, maturely thinly hairy about the midrib beneath; petiole $\frac{1}{4}$ in. *Panicles* 6–15 in., often very dense with heads, sparingly pubescent; bracts 1 by $\frac{1}{2}$ in., broad-oblong, obtuse, membranous, glabrescent. *Calyx* $\frac{1}{2}$ – $\frac{1}{3}$ in., in fruit sometimes $\frac{1}{2}$ in., glabrous within; teeth usually more prominent, sometimes triangular, acuminate in fruit; accessory teeth only developed after flower. *Corolla* $\frac{1}{4}$ – $\frac{1}{2}$ in., glabrate without, densely hairy within, purple. *Ovary* fulvous-hirsute; style filiform, shortly bifid. *Drupe* size of a pea (*Roxburgh*), hairy, half hid in the calyx.—In unexpanded flowers the calyx-limb appears obtusely 5-toothed; after flowering the teeth are sometimes triangular abbreviated, sometimes lanceolate-subulate, and 5 linear teeth are developed in the sinuses. *Wallich* declares (in *Hook. Bot. Misc. i. 286*) that *Jack* mistook his Malacca plant for *Roxburgh's* Silhet one, and accordingly *Wight* and *Schauer* call the Malayan plant *S. Jackiana* or *acuminata*; but the calyx-teeth are so little longer, and other points so exactly accord, that the species have been united.

XXII. CONGEA, *Roxb.*

Large climbing shrubs. *Leaves* opposite, entire. *Cymes* peduncled, capitate, 3–9-fl., in large terminal panicles; bracts at the base of the peduncles leaf-like, often white or coloured; involucre to the cymes of 3 or 4 elliptic or oblong bracts, connate at the base. *Calyx* funnel-shaped, 5-toothed, slightly accrescent. *Corolla-tube* slender, rarely much longer

than the calyx, glabrate without; throat usually hairy; limb 2-lipped, upper lip erect-patent of 2 linear-oblong lobes, lower pendent of 3 much shorter obovate lobes. *Stamens* 4; anthers exerted, ovate; cells parallel. *Ovary* imperfectly 2-celled, 4-ovuled; ovules pendulous from the apex of the axis; style filiform, shortly bifid. *Drupe* small, obovoid, nearly dry; in the few examples seen 4-seeded, 4-partite.—Species 4, Malayan.

1. **C. vestita**, *Griff. Notul.* iv. 174, and *Ic. Pl. Asiat.* t. 458, fig. 21; branches patently fulvous-hirsute, leaves ovate villous beneath, involucrel bracts broadly elliptic white-tomentose beneath, calyx white-hirsute teeth ovate-lanceolate.

TENASSERIM; *Helper* (Kew Distrib. n. 6014); Mergui, and Donat Range, alt. 1500 ft., *Griffith*.

A large climber. *Leaves* 6 by 3 in., acute, base obtuse or shortly cordate, mature scabrous-pubescent above, villous and tomentose beneath; petiole $\frac{1}{4}$ in. *Panicles* very large, bracts like small whitened leaves; involucrel bracts 1 by $\frac{3}{4}$ in., not attenuate at the base. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., funnel-shaped, lobed $\frac{1}{2}$ the way down. *Corolla* glabrous without, tube shorter than the calyx; limb 2-lipped, rose, somewhat brown-striated, especially the upper lip (Griffith). *Ovary* glabrous, glandular upwards. *Drupe* nearly dry, obovoid, 4-partite.

2. **C. velutina**, *Wight Ic.* t. 1479, 3 or 1566; leaves ovate acuminate mature glabrous, involucrel bracts spatulate-oblong distinctly nervose, calyx densely shortly hirsute teeth triangular.

TENASSERIM; at Mergui, *Griffith* (Herb. Propr. n. 838). TAVOY; *Helper* (Kew Distrib. n. 6012).

A large climber; branches closely pubescent. *Leaves* 5 by 2 $\frac{1}{2}$ in., base obtuse or rounded, young thinly sparsely pubescent; petiole $\frac{1}{2}$ in. *Panicle* large, more lax than in *C. vestita*, closely pubescent, nodes villous; bracts 1 $\frac{1}{4}$ by $\frac{1}{3}$ in., obtuse, base attenuate, tomentose beneath. *Calyx* $\frac{1}{6}$ in., lobed scarcely $\frac{1}{4}$ the way down. *Corolla* small, tube shorter than the calyx; limb white, somewhat brown, streaked near the base of the lobes (Griffith). *Drupe* not seen.

3. **C. villosa**, *Wight Ic.* t. 1479, 1, fig. B; leaves ovate or oblong mature villous beneath, involucrel bracts spatulate-oblong, calyx tomentose teeth shortly triangular. *Roscoe villosa*, *Roxb. Hort. Beng.* 95, and *Fl. Ind.* iii. 56, and *Ic. Ined.* at Kew.

PEGU; Rangoon (Roxburgh). MERGUI; *Griffith* (Kew Distrib. n. 6012, partly).

A large climber, resembling *C. velutina*, but the leaves very villous beneath. *Leaves* in Roxburgh's drawing ovate, in Griffith's example oblong; glabrate above except the midrib. *Panicle* large, very lax; bracts uniformly 4 in Griffith's example, 3 (one of which is often bifid) in Roxburgh's picture; resembling in form the bracts of *C. velutina*.

4. **C. tomentosa**, *Roxb. Cor. Pl.* iii. 90, t. 293; branchlets tomentose, leaves ovate acute softly hairy beneath, involucrel bracts elliptic, calyx shaggy toothed $\frac{1}{2}$ the way down. *Wight Ic.* t. 1479, 2 or 1565; *Schauer in DC. Prodr.* xi. 623; *Kurz For. Fl.* ii. 256. *Roscoe tomentosa*, *Roxb. Hort. Beng.* 95, and *Fl. Ind.* iii. 57. *Calochlamys capitata*, *Presl Bot. Bemerk.* 149.

CHITTAGONG; Roxburgh. BURMA; *Griffith* (Kew Distrib. n. 6013).—DISTRIB. Siam.

A large climber. *Leaves* 3 by 2 $\frac{1}{4}$ in., base rounded or shortly cordate, minutely setulose above, closely villous beneath. *Bracts* 1 by $\frac{1}{2}$ in., not attenuated at base, tomentose, white or lilac-blue. *Corolla* white.

VAR. *azurea*; leaves elliptic acute more thinly hairy beneath, bracts oblong or narrowly oblong, calyx larger lobed half-way down teeth broadly lanceolate. *C. azurea*, *Wall. Cat.* 1733; *Wight Ic.* t. 1479, 1, fig. A. *C. tomentosa* var. oblongifolia, *Schauer l. c.* 624, excl. syn. *Roxb.*—Pegu and Tenasserim, frequent; *Wallich M. Lelland*, &c. Cultivated in N. India.

XXIII. **AVICENNIA**, Linn.

Shrubs or small trees. *Leaves* opposite, entire coriaceous. *Cymes* contracted, or densely capitate heads peduncled, in the penultimate axils or in a trichotomous corymb; bracts and bracteoles small. *Calyx* 5-partite, unaltered in fruit; segments ovate, concave, deeply imbricate. *Corolla-tube* short-cylindric, limb spreading 5-4-lobed. *Stamens* 4, on the corolla-throat; anthers shortly exerted, ovate; cells parallel. *Ovary* imperfectly 4-celled by a 4-winged central column, 4-ovuled; ovules pendulous between the wings of the central column; style long or short, tip bifid. *Capsule* broad, compressed, dehiscing by 2 thick valves, 1-seeded. *Seed* erect; embryo imperfectly clothed by its two integuments; cotyledons large, plaited lengthwise; radicle inferior, villous.

A. officinalis, Linn.; *Schauer in DC. Prodr.* xi. 700; leaves obovate or elliptic obtuse whitened beneath, corolla-limb glabrate yellow, style short. *Bedd. For. Man.* 174, and *Anal. Pl.* xx. fig. 2; *Brand. For. Fl.* 371; *Boiss. Fl. Orient.* iv. 536. *A. resinifera*, *Forst.*; *Decne. in Nouv. Ann. Mus.* iii. 402. *A. tomentosa*, *Jacq.*; *Br. Prodr.* 518; *Roxb. Fl. Ind.* iii. 88; *Wall. Pl. As. Rar.* iii. 44, t. 271; *Wight Ic.* t. 1481; *Griff. Notul.* iv. 185; *Kurz For. Fl.* ii. 276. *Halodendron Thouarsii*, *Roem. & Sch. Syst.* iii. 485.—*Rumph. Herb. Amb.* iii. t. 76. *Rheede Hort. Mal.* iv. t. 45.

Mangrove swamps of the DECCAN PENINSULA and CEYLON, common; less frequent in the Malay Peninsula.—**DISTRIB.** Malaya, Shores of the Indian and Pacific Ocean.

A shrub, or tree, 25 ft. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., base tapering, beneath with hard tomentum or glabrate; petiole $\frac{1}{2}$ in. *Bract* $\frac{1}{12}$ in., ovate; bracteoles similar, rather smaller. *Calyx* $\frac{1}{4}$ in., minutely pubescent. *Corolla* $\frac{1}{4}$ in.; lobes 4, ovate, acute, or one lobe shortly bifid, or lobes 5 subequal (not rarely all forms on one bush). *Style* distinct, sometimes nearly as long as the hairy ovary. *Fruit* 1 in.

VAR. *alba*, Blume Bijl. 821 (sp.); leaves lanceolate acute, style short or hardly any. *Decne. l. c.*; *Wight Ic.* t. 1482. *A. resinifera*, *Griff. Notul.* iv. 186, and in *Trans. Linn. Soc.* xx. 6, fig. 1. *A. intermedia*, *Griff. l. c.* *A. officinalis*, *Kurz For. Fl.* ii. 275.—Malay Peninsula; common. **Distrib.** Malaya, S.E. Asia, N. Australia.—Mr. Bentham considers the American and African *A. tomentosa* not specifically separable.

ORDER CXII. **LABIATÆ**. (By J. D. Hooker.)

Herbs, rarely shrubs, usually loaded with oil-glands. *Stem* usually 4-gonous. *Leaves* opposite or whorled, stipules 0. *Flowers* irregular, solitary 2-nate or fascicled and axillary, or in centrifugal spicate cymes which by their union in pairs form false whorls. *Calyx* persistent, subregular, 4-5-cleft or 2-lipped. *Corolla* monopetalous, hypogynous; limb 4-5-lobed or 2-lipped, lobes imbricate in bud. *Stamens* inserted in the corolla-tube, 4 didynamous, or the 2 upper imperfect. *Anther-cells* connate or separate or confluent. *Disc* prominent. *Ovary* free, 2 of 2-celled carpels; style simple, inserted between the lobes, stigma usually 2-fid; ovules one in each cell, erect, anatropous. *Fruit* of 4 dry or rarely fleshy 1-seeded lobes (nutlets) at the base of the calyx. *Seeds* small, erect, albumen sparing

or 0, radicle inferior.—Species about 2600, chiefly of north temperate regions.

Tribe 1. **Ocimoideæ**. Perfect *stamens* 4, rarely 2, declinate; anther-cells confluent. *Ovary* 4-partite. *Nutlets* dry, basal scar small.

Subtribe 1. **Euocimeæ**. Upper *calyx-lobe* usually broadest. *Corolla* with 4 of the lobes equal or the 2 upper connate, the lower (lip) dissimilar. *Stamens* usually exserted.

* *Lower lip of corolla flat or nearly so.*

- | | |
|---|------------------|
| Fruiting calyx deflexed, upper tooth very large, decurrent, stigma 2-fid | 1. OCIMUM. |
| Fruiting calyx suberect or declinate, tube deeply pitted | 2. GENIOSPOREUM. |
| Fruiting calyx declinate, 2-lipped, upper filaments toothed | 3. MESOMA. |
| Fruiting calyx declinate, 2-lipped; filaments simple, included | 4. PLATYSTOMA. |
| Fruiting calyx suberect, 4 lower teeth cuneate; filaments simple, included | 5. ACROCEPHALUS. |
| Fruiting calyx usually declinate, equally 5-toothed, or upper tooth broader; filaments included | 6. MOSCHOSMA. |
| Fruiting calyx deflexed; corolla-tube often long; stigma entire | 7. ORTHOSIPHON. |

** *Lower lip of corolla concave or boat-shaped.*

- | | |
|---|------------------|
| Calyx equally 5-toothed or 2-lipped; filaments free | 8. PLECTRANTHUS. |
| Stamens 4; filaments connate below | 9. COLEUS. |
| Calyx-mouth oblique, upper lip usually decurved; filaments free | 10. ANISOCHILUS. |
| Corolla-lip deflexed, contracted at the base | 10*. HYPTIS. |

Subtribe 2. **Lavanduleæ**. *Corolla* 2-lipped; upper lip 2-fid, lower 3-fid. *Stamens* included. *Nutlets* with an oblique basal scar.

11. LAVANDULA.

Tribe 2. **Satureiineæ**. Perfect *stamens* 4 with the upper pair longest, or 2, straight diverging or ascending; anthers (1- or) 2-celled, cells short. *Corolla-lobes* flat.

Subtribe 1. **Pogostemoneæ**. *Stamens* 4; filaments straight; anthers 1-celled.

- | | |
|---|------------------|
| Calyx 5-toothed; corolla 4-fid, lip spreading | 12. POGOSTEMON. |
| Calyx 5-toothed; corolla subequally 4-fid; stamens exserted | 13. DYSOPHYLLA. |
| Calyx 5-partite, segments plumose; stamens included | 14. COLEBROOKIA. |

Subtribe 2. **Menthoidæ**. *Stamens* 4 or 2, distant, erect or spreading; anthers 2-celled (at least when young).

* *Whorls many-fl., spiked or racemed, not axillary.*

- | | |
|---|-----------------|
| Fruiting calyx erect, elongate; stamens 4 | 15. ELSHOLTZIA. |
| Fruiting calyx declinate, 2-lipped; stamens 4 | 16. PERILLA. |
| Stamens 2 | 17. MOSLA. |

** *Whorls many-fl., axillary, rarely spicate; calyx 10-13-nerved.*

- | | |
|---|--------------|
| Calyx 10-nerved; stamens 4, anther-cells parallel | 18. MENTHA. |
| Calyx 4-5-toothed stamens 2; nutlets truncate | 19. LYCOPUS. |

*** *Whorls many-fld., capitate, involucrate.* Stamens 4.
20. ORIGANUM.

**** *Whorls few-fld.* Stamens 4. 21. THYMUS.

***** *Whorls axillary secund.* Calyx 15-nerved.
22. HYSSOPUS.

Subtribe 3. MELISSEÆ. Calyx 13-nerved. Corolla 2-lipped. Stamens 2 or 4, ascending.

Calyx 5-toothed 23. MICROMERIA.
Calyx 2-lipped; corolla-tube nearly straight 24. CALAMINTHA.
Calyx 2-lipped; corolla-tube recurved 25. MELISSA.

Tribe 3. **Monardeæ.** Perfect *stamens* 2, ascending, parallel; anther-cells linear, solitary or separated by a filiform connective.

Anther-cells equal, contiguous, pendulous from a small connective 26. PEROWSKIA.
Anther-cells equal, distant, pendulous from a long connective 27. MERIANDRA.
Anther-cells very unequal or solitary, on a long connective 28. SALVIA.

Tribe 4. **Nepeteæ.** Perfect *stamens* 4 with the upper pair longest, rarely 2, ascending or diverging; anthers 2-celled, cells at length diverging. Ovary 4-partite. Nutlets dry, with a small basal areola.

Calyx tubular, 5-toothed 29. NEPETA.
Calyx 2-lipped, upper lip much the largest. 30. DRACOCEPHALUM.
Calyx 2-lipped, lateral lobes of upper lip on the face of the midlobe 31. LALLEMANTIA.

Tribe 5. **Stachydeæ.** Perfect *stamens* 4, ascending, lower pair longest. Calyx 5-10-nerved. Upper lip of *corolla* erect hooded, lower spreading 3-fid. Nutlets dry, basal areola small.

Subtribe 1. SCUTELLARIÆ. Calyx 2-lipped, mouth closed after flowering.

Fruiting calyx 2-partite; lips entire, upper with a broad plate 32. SCUTELLARIA.
Fruiting calyx tubular, upper lip 3- lower 2-toothed 33. BRUNELLA.

Subtribe 2. MARRUBIÆ. Calyx tubular or campanulate. Stamens included in the corolla-tube 34. MARRUBIUM.

Subtribe 3. LAMIEÆ. Calyx tubular or campanulate. Stamens exerted from the corolla-tube.

* *Upper lip of the corolla short, nearly flat, glabrous or pubes cen*

Calyx subglobose; anther-cells divaricate; nutlets subglobose 35. CRANIOTOME.
Anther-cells of lower stamens parallel, transverse, of upper dimidiate 36. ANISOMELES.
Anther-cells confluent; nutlets hispid or scaly 37. ACHYROSPERMUM.
Anther-cells confluent; nutlets winged. 38. COLQUHOUNIA.

** *Upper lip of the corolla hooded, villous.*

Calyx 5-toothed; anther-cells divergent; nutlets obtuse 39. STACHYS.

- Calyx 5-spinous; anther-cells ciliate; nutlets compressed 40. GALEOPSIS.
 Calyx 5-spinous; anther-cells parallel; nutlets triquetrous 41. LEONURUS.
 Calyx 5-toothed; anther-cells hairy; nutlets triquetrous 42. LAMIAM.
 Calyx-lobes 5, oblong 5-reticulate 43. ROYLEA.
 Calyx-limb dilated; fruiting very large, membranous 44. OTOSTEGIA.
 Calyx 8-10-toothed; corolla lower lip large 45. LEUCAS.
 Calyx 8-10-toothed; corolla lower lip very small 46. LEONOTIS.
 Calyx 5-toothed; corolla upper lip compressed 47. PHLOMIS.
 Calyx-teeth 5, membranous, with hooked awns 48. NOTOCHÆTE.
 Calyx-teeth 5, broad, apiculate or spinous; nutlets bearded 49. EREMOSTACHYS.
 Calyx-limb very broad membranous, broadly 5-toothed 50. ERIOPHYTON.

Tribe 6. **Prasiææ**. *Calyx, corolla and stamens of Stachydeæ. Ovary* 4-partite or 4-fid. *Nutlets* smooth, thick or fleshy, with a small basal areola.

- Calyx 5-toothed; corolla-tube slender, throat broad 51. GOMPHOSTEMMA.

Tribe 7. **Ajugoideæ**. *Calyx* 10-nerved. *Stamens* 4, ascending. *Ovary* 4-lobed. *Nutlets* with a large very oblique or lateral areola.

- Upper corolla-lip very short; stamens very long straight diverging 52. LEUCOSCEPTRUM.
 Upper corolla-lip very short, 2-fid, with the incurved stamens exerted from the cleft; nutlets minute 53. TEUCRIUM.
 Upper corolla-lip short, notched, usually shorter than the incurved stamens 54. AJUGA.
 Upper corolla-lip arched, longer than the stamens 55. CYMARIA.

1. **OCIMUM**, Linn.

Strongly scented herbs, undershrubs, or shrubs. *Whorls* 6-10-fld., spiked or racemed, tips of pedicels recurved; bracts minute, caducous; flowers small. *Calyx* ovoid or campanulate, deflexed in fruit; upper tooth broadest, decurrent, 2 lower acuminate. *Corolla-tube* short, not annulate within; upper lip subequally 4-fid, lower hardly longer declinate entire. *Stamens* declinate, exerted, filaments free or the lower connate below, naked or the upper toothed or hairy below; anther-cells confluent. *Disc* entire or 3-4-lobed. *Style-lobes* subulate or flattened. *Nutlets* smooth or subrugose, mucilaginous when moistened.—Species about 40, tropical and chiefly Asiatic.

1. **O. canum**, Sims Bot. Mag. t. 2452 (*stamineum* in text); herbaceous, erect, pubescent, leaves petioled narrowly ovate toothed or entire, bracts petioled, two lower calyx-teeth ovate-lanceolate awned longer than the rounded upper, lateral smaller than the lower, corolla $\frac{1}{2}$ in. long. Wall. Cat. 2714 A; Benth. in DC. Prodr. xii. 32; Grah. Cat. Bomb. Pl. 147; Dalz. & Gibs. Bomb. Fl. 203. *O. americanum*, Linn. Amæn. Acad. iv. 276, and Sp. Pl. 833, not of Jacq. *O. album*, Roxb. Hort. Beng. 44, and Fl. Ind. iii. 15, not of Linn.

Plains and lower hills of INDIA; from Silhet, Bengal, Behar and Central India to the S. Deccan, &c. CEYLON; abundant about native gardens, *Thcaites*.—DISTRIB. Java, W. Asia, Trop. Africa, Madagascar (America, cult.).

Branched from the base, 1-2 ft. high. *Leaves* 1-1½ in.; petiole very slender,

usually ciliate. *Spikes* 3-8 in.; whorls rather close; flowers subsessile; bracts ovate, awned, not so large as the nearly glabrous calyx, ciliate. *Filaments* twice as long as the white corolla, hairy at the knee. *Nutlets* pitchy-black, narrowly ellipsoid, punctulate.

2. **O. Basilicum**, Linn.; herbaceous, erect, glabrous or pubescent, leaves ovate toothed or entire, bracts petiolate, fruiting calyx very shortly pedicelled, two lower teeth ovate-lanceolate awned longer than the rounded upper, lateral smaller than the lower, corolla $\frac{3}{8}$ - $\frac{1}{2}$ in. long. *Lamk. Ill. t.* 514; *Burm. Fl. Ind.* 129; *Hayne Gew.* xi. t. 3; *Boiss. Fl. Orient.* iv. 539; *Roxb. Fl. Ind.* iii. 17; *Benth. in DC. Prodr.* xii. 33; *Wall. Cat.* 2713 & 2714 (*O. canum* in part); *Dalz. & Gibs. Bomb. Fl.* 203; *Grah. Cat. Bomb. Pl.* 147. *O. minimum*, *Burm. Fl. Ind.* 129, not of Linn. *O. hispidum*, *Lamk. Dict.* i. 384. *O. pilosum*, *Willd. Enum. Hort. Berol.*; *Roxb. l. c.* 16; *Fleming in Asiat. Res.* xi. 173. *O. menthaefolium*, *Benth. in DC. l. c.* (the Indian plant). *O. ciliatum*, *Hornem. Hort. Hafn.* ii. 565. *O. americanum*, *Jacq. Hort. Vind.* iii. t. 86, not of Linn. *O. album*, Linn. *Mant.* 85, not of *Roxb.* *O. integerrimum*, *Willd. Sp. Pl.* iii. 162. *O. caryophyllatum*, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 16. *O. Basilicum*, var. *thyrsiflorum*, *Wight Ic.* t. 868; *Benth. Lab.* 5, and in *Wall. Pl. As. Rar.* ii. 13; *Wall. Cat.* 2715. *O. thyrsiflorum*, Linn. *Mant.* 84; *Jacq. Hort. Vind.* iii. t. 72; *Roxb. Fl. Ind.* 15. *O. Barrelieri*, *Roth Nov. Sp.* 278. *Plectranthus Barrelieri*, *Spreng. Syst.* ii. 691.—*Rheede Hort. Mal.* x. t. 87.

Throughout tropical and hotter INDIA, cultivated from the PUNJAB to Ava, Travancore, Malacca and Penang. Indigenous in the PUNJAB on low hills, *Aitchison*. CEYLON, cultivated; *Thwaites*.—DISTRIB. Hotter W. Asia, Africa, the Malay and Pacific Islands (perhaps always cultivated only).

This widely cultivated plant differs from *O. canum* chiefly in the much larger size of all its parts, the flowers and seeds being often three times as large. *Corolla* white, pink or purplish. I cannot distinguish the varieties described by *Bentham* by any constant characters. It varies much in robustness and the hairiness of all its parts. Var. *thyrsiflora* is a luxuriant state; var. *difforme*, *Benth. l. c.* (*O. lacerum*, *Heyne* in *Herb. Rottl.*, *O. bullatum*, *Lamk.*), has abnormal deeply cut leaves; var. *purpurascens*, *Benth. l. c.* (*O. medium*, *Mill.*), is a purple-coloured state, imported from Persia; var. *glabratum* has very large fruiting calyces sometimes $\frac{1}{2}$ in. diam., with a rather elongate upper lobe. *O. ciliatum*, *Hornem.* (*O. ciliare*, *Heyne* in *Herb. Rottl.*, *O. scabrum*, *Herb. Wight*), has a hispidulous white corolla; it is cult. in *Hort. Calcutt.* under the erroneous name of *O. cristatum*, *Roxb.*

3. **O. gratissimum**, Linn.; shrubby, glabrescent, leaves ovate acute crenate or coarsely toothed, bracts sessile lanceolate awned from a rounded base, two lower calyx-teeth minute much shorter than the rounded upper, lateral triangular broader than the lower, corolla $\frac{1}{2}$ in. *Jacq. Ic. Pl. Rar.* iii. t. 495; *Wall. Cat.* 2720; *Roxb. Fl. Ind.* iii. 17; *Benth. in DC. Prodr.* xii. 34 (excl. syn.); *Grah. Cat. Bomb. Pl.* 147; *Dalz. & Gibs. Bomb. Fl.* 203. *O. citronatum*, *Ham.*, and *O. robustum*, *Heyne* in *Herb. Wall.*—*Rheede Hort. Mal.* x. t. 86.

BENGAL, CHITTAGONG, E. NEPAL, and throughout the DECCAN PENINSULA; and CEYLON, doubtful if indigenous.—DISTRIB. Java, Trop. Africa and America (? native).

A shrub, 4-8 ft., much branched, woody below. *Leaves* 2-4 in.; petiole 1-2 in. *Racemes* strict, slender; whorls rather close-set; pedicels shorter and bracts longer than the calyx. *Calyx* pubescent, fruiting $\frac{1}{2}$ in. long, recurved. *Corolla* hardly exceeding the calyx, pale yellow. *Filaments* exserted, knee bearded. *Nutlets* subglobose, rugose with glandular depressions.

VAR. suavis; leaves densely softly tomentose on both surfaces. *O. suave*, Willd. *Enum. Hort. Berol.* 629; *Benth. in DC. Prodr.* xii. 35, excl. various syn.; *Thwaites Enum.* 236. *O. urticæfolium*, *Roth Catal. Bot.* ii. 52. *O. menthaefolium*, *Hochet. in Schimp. Herb. Abyss.* n. 1860.—Ceylon; Ambagamowa district, *Thwaites*.—Distrib. Trop. Africa and Madagascar (apparently native). Cult. in W. Indies, &c.—This differs from *O. gratissimum* only in pubescence.

4. *O. adscendens*, Willd. *Sp. Pl.* iii. 166; herbaceous, puberulous, erect, or prostrate with ascending branches, leaves small oblong-ovate obtuse entire or sparingly toothed, floral lanceolate petiolate, two lower calyx-teeth reduced to short bristles, upper broadly obovate, lateral truncate ciliate, corolla $\frac{1}{2}$ in. *Wall. Cat.* 2719; *Benth. in DC. Prodr.* xii. 35; *Dalz. & Gibs. Bomb. Fl.* 203. *O. indicum*, *Roth Nov. Sp.* 273. *O. cristatum*, *Roxb. Hort. Beng.* 45, and in *Fl. Ind.* iii. 19. *O. verticillatum*, *Heyne in Herb. Rottl.* *Plectranthus indicus*, *Spreng. Syst.* ii. 691.

The DECCAN, in sandy places; *Heyne*, &c. CENTRAL INDIA; Jubbulpore, *Beddome*.

Annual, very variable in habit, 4–16 in. high; branches often widely spreading. *Leaves* $\frac{1}{2}$ –1 in., narrowed into the petiole. *Racemes* short, rather lax-fld.; bracts lanceolate, caducous, with a gland at the base. *Corolla* $\frac{1}{2}$ in., pale rose. *Filaments* twice as long as the corolla; knees dilated, hairy. *Fruiting calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in.; lower lip as long as the upper, rather membranous. *Nutlets* subglobose, compressed, smooth, red-brown.

5. *O. sanctum*, Linn. *Mant.* 85; herbaceous, erect, softly patently hairy, leaves oblong obtuse or acute entire or subserrate, floral sessile ovate-lanceolate or cordate, racemes very slender, calyx short, two lower teeth very long-awned longer than the broadly oblong upper, lateral broadly ovate shorter than the lower, corolla scarcely exceeding the calyx. *Roxb. Fl. Ind.* iii. 14; *Wall. Cat.* 2716; *Benth. in DC. Prodr.* xii. 38, and in *Fl. Austral.* v. 74; *Grah. Cat. Bomb. Pl.* 147; *Dalz. & Gibs. Bomb. Fl.* 204; *Thwaites Enum.* 236; *Boiss. Fl. Orient.* iv. 539. *O. monachorum*, Linn. *Mant.* 85. *O. tenuiflorum*, Linn. *Sp. Pl.* 833; *Benth. in DC. l. c.* 39. *O. inodorum*, *Burm. Thes. Zeyl.* 174, t. 80, f. 2, and *Fl. Ind.* 130, not of *Koenig*.—*Burm. Thes. Zeyl.* 174, t. 80, f. 1; *Rumph. Herb. Amb.* v. t. 92, f. 2. *Parnassa*, *Jones in Asiat. Research.* iv. 288.

Throughout INDIA, ascending the Himalaya to 6000 ft. (doubtfully indigenous). CEYLON; common in waste places, *Thwaites*.—DISTRIB. Malay Islands to Australia and the Pacific, W. Asia to Arabia.

Stem sometimes woody below; branches erect, ascending or spreading. *Leaves* 1–2 $\frac{1}{2}$ in., variable in breadth, base narrowed. *Racemes* 6–8 in. long; pedicels as long as the calyx. *Corolla* very small, hardly longer than the calyx. *Filaments* exserted, knee villous. *Fruiting calyx* $\frac{1}{2}$ in. long, on a slender pedicel, broadly campanulate, membranous. *Nutlets* subglobose or broadly oblong, slightly compressed, nearly smooth, pale red-brown.

VAR. hirsuta; densely pubescent. *O. hirsutum*, *Benth. in Wall. Pl. As. Rar.* ii. 14; *Wall. Cat.* 2717? *O. villosum*, *Roxb. Fl. Ind.* iii. 13. *O. subserratum*, *Heyne in Herb. Rottl.*—South Deccan.

DOUBTFUL SPECIES.

O. MINIMUM, Linn. (*Benth. in DC. Prodr.* xii. 33), is a very small cultivated form, probably of *O. Basilicum* (with which it agrees in all essential characters), to which Linnæus has assigned Ceylon as a habitat. I have seen specimens from gardens in various parts of the world.

2. GENIOSPORUM, Wall.

Herbs. *Whorls* many-fld., in long lax racemes or spikes; bracts often

coloured; flowers small or minute. *Calyx* ovoid in flower, in fruit tubular, suberect or declinate, 5-toothed, upper tooth broadest, not decurrent; lateral free, or connate with the upper; lower short, free or connate. *Corolla-tube* short, upper lip 4-fid, lower declinate entire. *Filaments* free, toothless. *Disk* tumid, gibbous. *Style-arms* short, flattened. *Nutlets* ovoid or oblong, smooth or punctulate.—Species 6 or 7, Indian and African.

1. **G. strobiliferum**, *Wall. Cat.* 2749; erect, puberulous, leaves petioled lanceolate coarsely serrate, floral exceeding the flowers, fruiting calyces erect, throat glabrous. *Benth. Lab.* 20, and in *DC. Prodr.* xii. 45; *Hook. Ic. Pl.* t. 462. *Plectranthus coloratus*, *Don Prodr.* 116.—*Labiata*, *Griff. Itin. Notes*, 82, n. 1192.

SUBTROPICAL HIMALAYA; in dry forests from Kumaon to Bhotan, alt. 1–5000 ft. KHASIA MTS., alt. 3–5000 ft., common.

Stem 2–3 ft., obtusely angled. *Leaves* 2–5 by $1\frac{1}{2}$ –2 in., base acute or rounded, narrowed into the petiole of $\frac{1}{4}$ – $\frac{3}{4}$ in. *Spikes* 2–5 in.; bracts white, deciduous. *Flowers* $\frac{1}{2}$ in. long. *Calyx* pubescent, with 2 black glands on the lower lip. *Corolla* white with purple veins, hairy, lower lip narrow. *Filaments* exserted. *Fruiting calyx* tubular, pedicelled, $\frac{1}{2}$ in. long, deeply pitted. *Nutlets* ellipsoid, black, smooth, hispid towards the top.

2. **G. elongatum**, *Benth. Lab.* 21, and in *DC. Prodr.* xii. 45; erect or ascending, pubescent, stems very slender, leaves subsessile narrowly lanceolate, lower floral exceeding the flowers, fruiting calyces spreading, throat naked. *Thwaites Enum.* 236. *Rhinanthus indica*, *Linn.*; *Burm. Fl. Ind.* 131, t. 39, f. 1.

NORTHERN CIRCARS; Jeypur Hills, *Beddome*. CEYLON; Central Province, in grassy places, alt. 4–6000 ft.

Stem 1–2 ft., angles thickened. *Leaves* in distant pairs, 1–2 by $\frac{1}{4}$ – $\frac{1}{3}$ in., crenate-serrate, base narrowed. *Spikes* 3–5 in.; bracts orbicular-ovate, subsistent; flowers $\frac{1}{10}$ in. long. *Calyx* hirsute. *Corolla* very small, hairy. *Filaments* exserted. *Fruiting calyx* $\frac{1}{12}$ in. long, ovoid, strongly ribbed, pitted, lobes short. *Nutlets* ellipsoid, smooth.

3. **G. prostratum**, *Benth. in Pl. As. Rar.* ii. 18, *Lab.* 21, 708, and in *DC. Prodr.* xii. 45; prostrate, stems slender glabrous pubescent or hirsute, leaves small sessile or petioled obovate-lanceolate or oblong or linear sparingly toothed, fruiting calyces spreading shorter than their pedicels, calyx-throat with a ring of hairs. *Wall. Cat.* 2751; *Grah. Cat. Bomb. Pl.* 148; *Thwaites Enum.* 237. *Ocimum menthoides*, *Burm. Fl. Ind.* 129. *O. prostratum*, *Linn. Mant.* 166. *O. macrostachyum*, *Poir. Suppl.* i. 492; *Benth. Lab.* 16. *O. tenuiflorum*, *Heyne in Herb. Rottl., not of Benth. ? of Linn.* *Mentha ocimoides*, *Lamk. Dict.* iv. 103. *Elsholtzia ocimoides*, *Pers. Syn.* ii. 114. *Lumnitzera prostrata*, *Spreng. Syst.* ii. 687. *Thymus indicus*, *Burm. Fl. Ind.* 129.—*Mentha*, *Burm. Thes. Zeyl.* 158, t. 70, f. 2.

DECCAN PENINSULA, from the Concan southwards. CEYLON; warmer part of the island.

Stems many from a woody stock. *Leaves* in distant pairs, very variable, from $\frac{1}{4}$ by $\frac{1}{2}$ in. to 2 by $\frac{3}{4}$ in., rather thick, base narrowed. *Spikes* elongate, slender; whorls close or distant; bracts ovate, acute, reflexed; flowers minute, pedicelled. *Calyx* hairy, upper lip very variable in size, throat hairy. *Corolla* $\frac{1}{12}$ in., hairy. *Filaments* exserted. *Fruiting calyx* $\frac{1}{12}$ in., subcampanulate, ribbed, tube not pitted, pubescent. *Nutlets* extremely minute, ellipsoid, smooth, naked.

VAR. *gracilis*, *Thwaites Enum.* 237; stems very slender, 12–18 in., leaves glabrous, narrower. *G. gracile*, *Benth. Lab.* 21, and in *DC. Prodr.* xii. 45.—Deccan Peninsula and Ceylon.

3. **MESONA**, Blume.

Annuals. *Whorls* many-fl., racemose; flowers small; bracts caducous. *Calyx* campanulate; fruiting tubular, declinate, 2-lipped, tube deeply pitted between the nerves; lips rather broad, upper 3-fid, lower entire. *Corolla-tube* short, upper lip truncate or 4-toothed, lower oblong. *Stamens* 4, filaments exserted, free, upper toothed at the base. *Style* 2-fid. *Disk* tumid, gibbous. *Nutlets* ellipsoid or ovoid.—Species 4, Trop. Asiatic and Malayan.

M. Wallichiana, Benth. in DC. Prodr. xii. 46; erect, sparsely hairy, leaves ovate-lanceolate serrate. *Geniosporum parviflorum*, Wall. Cat. 2750; Benth. Lab. 20, and in Wall. Pl. As. Rar. ii. 18.

KHASIA MTS., alt. 3–5000 ft.; De Silva, &c.

Stem 1–2 ft., branching upwards, slender, rigid. *Leaves* 1–3 in., narrowed into a petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. *Racemes* numerous, slender, erect, 3–7 in.; flowers very numerous, purplish, $\frac{1}{2}$ in. long; bracts deflexed, ovate, purplish. *Fruiting calyx* $\frac{1}{2}$ in. long, on a slender rigid pedicel longer than itself. Smells like Patchouli.

4. **PLATYSTOMA**, Beauv. (Platostoma.)

Small annuals. *Whorls* many-fl., racemose; flowers minute; bracts caducous. *Calyx* campanulate; fruiting deflexed 2-lipped, upper lip ovate, toothed on each side; lower broad inflexed, sinus very open. *Corolla-tube* short; lips subequal, upper broad 2-fid, lower entire concave. *Stamens* 4, declinate, filaments free included, dilated downwards. *Disk* tumid, gibbous. *Style* 2-fid. *Nutlets* ovoid.—Species 3, Indian and African.

P. flaccidum, Benth. in Gen. Pl. ii. 1173; sparingly pubescent, leaves ovate serrate, fruiting pedicel as long as the calyx-tube. *Ocimum flaccidum*, A. Rich. Tent. Fl. Abyss. ii. 179.

The CONCAN; on the Kela nuddeh, Ritchie, Dalzell.—DISTRIB. Trop. Africa.

Strict, erect, slender, 4–8 in. high, simple or branched, branches erect. *Leaves* $\frac{1}{2}$ –1 in., membranous. *Racemes* slender, strict, as long as the whole plant; flowers $\frac{1}{2}$ in. long. *Calyx-lobes* ovate. *Nutlets* black, minutely reticulate.—Probably only a state of *P. africanum*, Beauv.

5. **ACROCEPHALUS**, Benth.

Annuals. *Whorls* in terminal or axillary globose or ovoid dense heads with imbricate bracts; flowers very small, sessile. *Calyx* ovoid, fruiting tubular, base gibbous; upper lip flat, entire, lower entire or 4-toothed; throat naked. *Corolla-tube* very short, subequally 4-lobed. *Stamens* 4, filaments free, toothless, included. *Disk* small, gibbous. *Style* 2-fid. *Nutlets* smooth.—Species 10, Tropical and Subtropical Asiatic and African.

1. **A. capitatus**, Benth. in Wall. Pl. As. Rar. ii. 18, Lab. 23, and in DC. Prodr. xii. 47; sparingly pubescent, leaves petioled few-nerved, heads terminal. Dalz. & Gibs. Bomb. Fl. 204; Hook. Ic. Pl. t. 456. *A. scariousus*, Wall. Cat. 1563. *A. Blumei*, Benth. l. c. *Prunella indica*, Burm. Fl. Ind. 130. *Ocimum capitellatum*, Linn. f. Suppl. 276. *O. capitatum*, Roth Nov. Sp. 276. *O. acrocephalum*, Blume Bijdr. 834. *O. Chandra*, Ham. in Herb. Wall. *Lumnitzera capitata*, Spreng. Syst. ii. 687.

Throughout INDIA from Kashmir to Bhotan in the Himalaya, ascending to 5000 ft.; and in hilly districts from the Khasia Mts. to Cape Comorin and Pegu. (Not seen from Ceylon or the Malay Peninsula.)—DISTRIB. Muneypoor, Burma, Java, Borneo.

Stem 6–12 in., simple or branched from the base; branches ascending or decumbent. *Leaves* $\frac{1}{2}$ –1 in., ovate or lanceolate, coarsely serrate, narrowed into the petiole. *Heads* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., rarely cylindric, often with two spreading leaves at the base; flowers imbricating, suberect, $\frac{1}{2}$ in. long, pale purple.

2. A. axillaris, *Benth. in DC. Prodr.* xii. 48; stems and leaves beneath pubescent, leaves small lower oblong upper orbicular many-nerved, heads axillary sessile.

ASSAM; *Jenkins, Mack.*

Stem slender, erect, simple, a foot long and upwards. *Leaves* in distant pairs, lower $\frac{3}{4}$ in., upper $\frac{1}{2}$ in.; nerves very strong beneath, forming salient parallel ribs. *Heads* $\frac{1}{4}$ – $\frac{1}{2}$ in. diam.—A very singular plant, with the habit and ribbed leaves of a *Spermacoce*; the corollas have fallen away.

6. MOSCHOSMA, *Reichb.*

Herbs, annual or perennial. *Whorls* 6–10-fld., secund, in axillary and terminal paniced racemes, flowers very minute; bracts small. *Calyx* ovoid or campanulate, 5-toothed, fruiting declinate, upper or 3 upper teeth largest, margins not decurrent; throat naked. *Corolla-tube* very short; upper lip shortly 4-fid; lower entire with 4 flat lobes. *Stamens* 4, declinate, filaments free, toothless; anther-cells confluent. *Style* clavate-capitate, tip 2-fid. *Nutlets* compressed, smooth.—Species 6, Tropical Asiatic, African and Australian.

M. polystachyum, *Benth. in Wall. Pl. As. Rar.* ii. 13, *Lab.* 24, 708, and in *DC. Prodr.* xii. 48; nearly glabrous, stem acutely 4-angled, leaves long-petioled ovate long-acuminate coarsely serrate, racemes very slender. *Reichb. in Wall. Cat.* 2711; *Dalz. & Gibs. Bomb. Fl.* 204. *Ocimum tenuiflorum*, *Burm. Fl. Ind.* 129, *excl. syn. Rumph., not of Linn.* *O. polystachyum*, *Linn. Mant.* 567; *Roxb. Fl. Ind.* iii. 18. *Plectranthus parviflorus*, *Br. Prodr.* 506, *not of Willd.* *P. micranthus*, *Spreng. Syst.* ii. 691.

Wet places in BENGAL; Dacca, *Clarke*. DECCAN PENINSULA, BURMA and TENASSERIM. CEYLON.—DISTRIB. Java, China, Philippine Islands, Trop. Africa and Australia.

A very slender much-branched annual glabrate or puberulous herb, 2–3 ft.; angles of stem often scabrid. *Leaves* 1–2 in., very membranous, base cuneate, rounded or subcordate, quite entire, narrowed into a filiform petiole as long as the blade. *Racemes* 3–6 in.; peduncles and rachis filiform; whorls about 6-fld.; bracts minute, caducous; pedicels shorter than the calyx. *Flowers* $\frac{1}{8}$ in. long. *Fruiting calyx* $\frac{1}{10}$ in. *Corolla* flesh-coloured. *Nutlets* black, smooth, ellipsoid.

7. ORTHOSIPHON, *Benth.*

Under-shrubs or shrubs. *Whorls* 6- or fewer-fld., racemose. *Calyx* ovoid, campanulate or tubular, fruiting deflexed, upper tooth broad membranous, margins decurrent on the tube, lateral and lower distinct or shortly connate, usually subulate. *Corolla-tube* often slender, straight or incurved; upper lip 3–4-fid; lower entire, concave. *Stamens* 4, declinate, filaments free, toothless; anther-cells confluent. *Disc* usually gibbous. *Style* with a

minute capitate or clavate entire or notched stigma. *Nutlets* ovoid or orbicular, smooth or nearly so.—Species 16, tropics of the Old World.

* Calyx-throat villous. Stamens included.

1. **O. diffusus**, *Benth. in DC. Prodr.* xii. 50; woody, diffusely branched, viscidly tomentose, leaves ovate or elliptic obtuse crenate, corolla-tube shortly exserted, fruiting calyx $\frac{1}{8}$ – $\frac{1}{4}$ in. *Ocimum* ? *diffusum*, *Benth. in Wall. Cat.* 2718, and in *Wall. Pl. As. Rar.* ii. 14. *O. hirsutum*, *Wall. Cat.* 2717 in part.

DECCAN PENINSULA; Pulney and Nilghiri Mts., in dry rocky places, *Klein*, &c. ? CEYLON; *Walker*.

Branches many and straggling from the woody stock, stout, cylindric, 6–8 in. high. *Leaves* $\frac{1}{2}$ in. long, tomentose on both surfaces, base rounded; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Racemes* 3–4 in., stout or slender; whorls rather distant, 2–4-fl., floral leaves minute. *Calyx* pubescent, throat with long hairs, fruiting ribbed, 2 lower lobes rigid, subulate. *Corolla* about $\frac{1}{4}$ in. long. *Nutlets* oblong, obscurely reticulate, brown, nearly smooth.—I suspect that the Ceylon habitat is an error.

VAR. hispida; tomentose or villous, branches longer more slender, leaves more narrowed at the base. *O. hispidus*, *Benth. l. c.*—Nilghiri and Cuddapah Hills.

** Calyx-throat naked. Stamens included.

† *Leaves petioled*.

2. **O. pallidus**, *Royle mss.*; *Benth. in Hook. Bot. Misc.* iii. 70, *Lab.* 708, and in *DC. Prodr.* xii. 50; woody, diffusely branched, glabrous or finely pubescent, leaves petioled ovate obtuse coarsely toothed or crenate, two lowest calyx-teeth awned, corolla-tube about equalling the calyx. *Dalz. & Gibs. Bomb. Fl.* 205; *Boiss. Fl. Orient.* iv. 539. *O. verticillatus*, *Heyne in Herb. Rottl.* *O. inodorus*, *Koen.*; *Roxb. Ic. ined. in Herb. Kew*, not of *Fl. Ind.* iii. 19.

NORTH-WESTERN INDIA; from Kashmir and the Punjab to Behar, and southwards to Travancore.—DISTRIB. Beluchistan, Arabia.

Branches 6–12 in., many, ascending from a stout woody stock. *Leaves* $\frac{1}{2}$ –2 in., obtuse or acute, scentless, base cuneate entire and narrowed into a petiole $\frac{1}{4}$ – $\frac{1}{2}$ the length of the blade. *Racemes* long or short, stout or slender; floral leaves minute; flowers $\frac{1}{2}$ in. long. *Corolla* white. *Fruiting calyx* as long as the pedicel, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, deflexed; lower teeth subulate or aristate. *Nutlets* subglobose, compressed, pale, nearly smooth.—With difficulty distinguished from states of *Ocimum adscendens*, the calyx being nearly identical. Roxburgh's figure of *O. inodorus* is this plant, but his description refers to some other with cordate rugose leaves and cordate bracts.

3. **O. tomentosus**, *Benth. in Wall. Pl. As. Rar.* ii. 14, *Lab.* 27, and in *DC. Prodr.* xii. 51; tomentose, pubescent or glabrate, sometimes viscid, leaves petioled ovate, base rounded cuneate or cordate, racemes elongate, bracts ovate, 4 lower calyx-teeth awned, corolla from half as long to thrice as long as the calyx, tube subincurved, nutlets subglobose compressed pale brown nearly smooth.

DECCAN PENINSULA; on the Ghats, and from the Concan southwards. CEYLON.

A most variable plant. I am quite unable to find any characters whereby to define strictly the following forms. The *O. rubicundus* is distinguished by the long sessile or subsessile leaves.

VAR. tomentosa proper; 12–18 in., rarely more, pubescent or tomentose, leaves $\frac{1}{2}$ –1 in., petiole half the length of the blade or less, corolla about $\frac{1}{2}$ in. long, twice as long as the calyx or less. *O. tomentosus*, *Benth. l. c.* ? *O. triste*, *Roth Nov. Sp.* 270. *Plectranthus tristis*, *Spreng. Syst.* ii. 690.—Nilghiri Hills.

VAR. *viscosa*; usually taller and stouter, viscidly pubescent or tomentose with spreading hairs, leaves 1-3 in., base often cordate, petiole slender, corolla $\frac{1}{2}$ - $\frac{3}{4}$ in. twice or thrice as long as the calyx. *O. viscosus*, *Benth. in Wall. Cat.* 2723 and ll. c.—On the Ghats from Canara southwards.

VAR. *rubiginosa*, Clarke mss.; branches and leaves beneath clothed with a fine close rusty pubescence, leaves of var. *viscida*, flowers rather larger.—Nilghiris; *Wight, Clarke, &c.*

VAR. *glabrata*; usually more slender, quite glabrous or sparsely patently hairy, leaves 1-3 in., usually broadly ovate-cordate or base rounded coarsely toothed, petiole sometimes as long as the blade and very slender, corolla about $\frac{1}{2}$ in., tube slender 2-3 times as long as the calyx. *O. glabratus*, *Benth. in Wall. Cat.* 2724, and ll. c.; *Dalz. & Gibs. Bomb. Fl.* 205; *Thwaites Enum.* 237. ? *Ocimum thymiflorum*, *Roth Nov. Sp.* 269. ? *Plectranthus thymiflorus*, *Spreng. Syst.* ii. 690. *Ocimum glaucum*, *Heyne in Herb. Rottl.* *O. ascendens*, *Wight*, and *O. cordifolium*, *Herb. Madr. in Wall. Cat.*—Common from the Concan southwards. Ceylon common. Thwaites remarks that this in Ceylon varies much in the size of the flowers. *O. petiolaris*, *Miquel*, of Java, with the habit of this, differs in the narrow bracts and form of the calyx.

VAR. *parviflora*; pubescent or glabrate, leaves $\frac{1}{2}$ - $\frac{3}{4}$ in. ovate, calyx shorter broader, fruiting $\frac{1}{2}$ in. long campanulate, corolla $\frac{1}{2}$ in. long very narrow, twice as long as the calyx. *O. tomentosus*, var. *parviflora*, *Benth. in DC. Prodr.* xii. 51.—Nilghiris; *Wight, &c.*—Probably a distinct species.

4. ***O. incurvus***, *Benth. in Wall. Cat.* 2725, and in *Wall. Pl. As. Rar.* ii. 15, *Lab.* 28, and in *DC. Prodr.* xii. 52; puberulous, pubescent or tomentose, stem usually subsimple ascending 4-angled, leaves 3-6 in. petioled ovate or ovate-lanceolate coarsely crenate, bracts ovate, 2 lower calyx-teeth awned, corolla $\frac{1}{2}$ -1 in. straight or incurved, nutlets broadly ellipsoid compressed asperulous. *Hook. Bot. Mag.* t. 3847; *Maund Botanist.* iv. t. 173.

SUBTROPICAL HIMALAYA; Nepal, *Hamilton*; Sikkim (*Herb. Griff.*), *J. D. H.*, &c. KHASIA HILLS, alt. 3-4000 ft.; *Bruce, Masters, &c.*

Stem 1-3 ft., rarely branched. Leaves narrowed into winged petioles $\frac{1}{2}$ -3 in. long, rough or smooth above, sometimes of a fine purple beneath. Calyx in fruit $\frac{1}{2}$ in.; lateral teeth triangular, hardly awned. Corolla pale pink, variable in size and curvature.—*O. rubicundus*, *Benth.*, consists of two plants, one of which with petioled leaves I refer to *O. incurvus*, the other with more lanceolate subsessile leaves is the true *rubicundus*, *Bth.*

VAR. *elata*; tall, branched, racemes densely tomentose, bracts larger longer than the pedicels.—E. Nepal, Tambur and Khabili rivers, alt. 4-6000 ft.; *J. D. H.*—A very large form with ovate-lanceolate leaves 4-7 in. long, scaberulous above and beneath. Corolla $\frac{1}{2}$ in. long, tube slender.

5. ***O. robustus***, *Hook. f.*; finely pubescent, stem robust terete, leaves 5-6 in. shortly petioled oblong-lanceolate subacute obscurely crenate, bracts ovate acute, 2 lower calyx-teeth awned, corolla 1 in.

ASSAM; Jyrungh Hills, *Simons (Herb. Calcutt.)*.

Whole plant when dried a dark rusty purple colour, clothed uniformly with a fine pubescence. Stem nearly as thick as a goose-quill. Leaves $2\frac{1}{2}$ in. broad, base cuneate; petiole stout, $\frac{1}{2}$ - $\frac{3}{4}$ in. Racemes stout, whorls rather distant. Fruiting calyx (unripe) $\frac{1}{2}$ in. long.

†† Leaves sessile, rarely petioled in *O. rubicundus*.

6. ***O. rubicundus***, *Benth. in Wall. Pl. As. Rar.* ii. 141, *Lab.* 26, and in *DC. Prodr.* xii. 57; erect, tomentose pubescent or glabrate, stems 4-angled, leaves ovate or ovate-lanceolate coarsely toothed, bracts minute, 4 lower calyx-teeth subulate, corolla twice as long as the calyx pubescent, nutlets

suborbicular compressed nearly smooth. *Wall. Cat.* 2721; *Hook. Ic. Pl.* t. 459. *O. virgatus*, *Benth. ll. c.*; *Wall. Cat.* 2722. *Ocimum tuberosum*, *Roxb. Fl. Ind.* iii. 18. *Plectranthus rubicundus* & *virgatus*, *Don Prodr.* 116. *P. mollissimus*, *Wall. mss.* *P. amœnus*, *Wall.* *Lumnitzera rubicunda* & *virgata*, *Spreng. Syst., Cur. post.* 223. *Ocimum Miria*, *Ham. in Wall. Cat.* 2722. *O. rubicundum* & *virgatum*, *Ham. mss.* *O. mollissimum*, *Wall. mss.* *O. tuberosum*, *Roxb. mss.*

WESTERN SUBTROPICAL HIMALAYA; from Central Nepal to Jamu, alt. 2–4000 ft. and southward to the Circars and Nilghiris. *AVA*; *Wallich.*—DISTRIB. Upper Burma.

Stem 1–2 ft., slender. *Leaves* 2–4 in., variable in breadth, and toothed obtuse or acute, base cuneate. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., white rose or pink, throat funnel-shaped. *Nutlets* punctulate.

VAR. rigida; leaves petiolate. *O. rubicundus*, *v. rigida*, *Benth. ll. c.* *Ocimum rigidum*, *Ham.*

VAR. ? Hohenackeri; smaller, laxly tomentose, leaves 1 in., corolla $\frac{1}{4}$ in., fruiting calyx smaller $\frac{1}{2}$ in.—Nilghiri Mts.; *Hohenacker*, n. 1394.—Possibly a distinct species, but the specimens are insufficient. The nutlets are as in *O. rubicundus*.

7. *O. comosus*, *Wight mss.*; *Benth. in DC. Prodr.* xii. 52; tomentose, shrubby, branches opposite terete leafy, leaves close set oblong or linear-oblong or obovate obtuse crenate, racemes sessile, bracts deciduous upper very large coloured, calyx tubular, lips subequal in length, 4 lower teeth subequal subulate. *O. bracteatus*, *Wight Ic.* t. 1428.

DECCAN PENINSULA; Shevagherry and Tinnevely Hills, *Wight*, *Beddome*.

This differs greatly in habit from its congeners. *Wight* figures the stem as 4-angled, but they appear quite cylindric. *Branches* as thick as a crow-quill. *Leaves* $\frac{3}{4}$ –1 in., rugose. *Rachis* of raceme stout; whorls 6-fld.; flowers suberect. *Calyx* nearly $\frac{1}{2}$ in., upper lip orbicular, straight. *Corolla* $\frac{3}{4}$ –1 in., pubescent, tube very slender. *Nutlets* not seen.

*** Calyx-throat naked. Stamens far exerted.

8. *O. stamineus*, *Benth. in Wall. Pl. As. Rar.* ii. 15, *Lab.* 29, and in *DC. Prodr.* xii. 52; slender, glabrous or pubescent, leaves petioled ovate acuminate coarsely toothed, base cuneate, calyx campanulate, 2 lower teeth subulate, corolla-tube thrice as long very slender, filaments capillary twice as long as the corolla. *Wall. Cat.* 2727; *Bot. Mag.* t. 5833; *Miquel Fl. Ind. Bat.* ii. 944. *Ocimum grandiflorum*, *Blume Bijdr.* 835. *O. longiflorum*, *Ham. in Wall. Cat.* 2727.

ASSAM; *Jenkins.* BURMA and MARTABAN; *Wallich.* DECCAN PENINSULA; Anamallay Hills, *Wight.* NICOBAR ISLANDS.—DISTRIB. Malay and Philippine Islands, Australia.

Stem 1–2 ft., 4-angled. *Leaves* in distant pairs, 2–4 in., narrowed into the petiole. *Racemes* very lax-fld. *Calyx* $\frac{1}{2}$ in. *Corolla* 1 in., glabrous, white or purplish. *Nutlets* broadly oblong, compressed, rugulose.

9. *O. scapiger*, *Benth. in Wall. Pl. As. Rar.* ii. 15, *Lab.* 28, and in *DC. Prodr.* xii. 52; glabrous, stem very short, leaves subradical petioled oblong obtuse coarsely crenate, racemes very long, calyx campanulate, 4 lower teeth subulate, corolla-tube short, throat funnel-shaped, filaments twice as long as the limb, nutlets oblong rugulose. *Wall. Cat.* 2726 (*scapigerum*).

NEPAL; *Wallich.*

Rootstock short, woody. *Leaves* 4–6 in., narrowed into a short or long slender petiole. *Racemes* 1 foot, strict, puberulous. *Calyx* $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, blue; upper lip short, 4-toothed; lower longer, concave.

8. **PLECTRANTHUS**, *L'Herit.*

Herbs or undershrubs. *Flowers* usually small, in lax (rarely close) paniced or racemed 6-8-fld. cymes (whorls). *Calyx* 5-toothed, 2-lipped, enlarged in fruit. *Corolla-tube* exserted, long or short, straight or decurved, limb equal or gibbous or spurred, 2-lipped; upper lip usually short, broad, 3-4-fld recurved; lower much longer, entire, boat-shaped, narrow at the base or stipitate. *Stamens* 4, declinate; filaments simple, free; anther-cells usually confluent. *Disc* usually produced in front, and there equalling or exceeding the ovary. *Style* subequally 2-fld. *Nutlets* orbicular, ovoid or oblong, smooth, granulate or punctate.—Species about 80, Tropical and Subtropical Asiatic, African, Australian and Polynesian.

The species of the sections *ISODON* and *COLEOIDES* are numerous and very difficult of discrimination, and the latter should perhaps be referred to *Coleus*, or better still refer all the *Plectranthi* to sections of *Coleus*, of which genus *P. coleoides* and *urticifolius* have all the habit.

Sect. 1. **Isodon**. *Fruiting calyx* decurved, subequally 5-toothed, or 2-lipped, upper lip 3-toothed, lower 2-toothed. *Nutlets* oblong or rounded, obtuse.

* *Fruiting calyx* broad, open, deeply 2-lipped, upper lip very broad with 3 distant spinous teeth, lower of 2 long subulate teeth. *Corolla* 1 in. long, tube straight, base equal.

1. **P. macranthus**, *Hook. f.*; sparsely hairy, leaves petioled ovate-lanceolate coarsely serrate, inflorescence racemose, flowers opposite.

SIKKIM HIMALAYA; Chola, alt. 6-8000 ft., *J. D. H.* KHASIA MTS., alt. 5-6000 ft.; *Lobb, J. D. H. & T. T., &c.* BURMA; *Griffith*.

Stem 6-12 in., simple or branched, weak. *Leaves* 3-5 in., membranous. *Racemes* 6-12 in.; bracts ovate-lanceolate, persistent; pedicels $\frac{1}{4}$ in. *Corolla-tube* straight, 1 in. long, $\frac{1}{8}$ in. diam.; lips short, subequal, rounded. *Fruiting calyx* $\frac{1}{2}$ in. long. *Nutlets* globose, $\frac{1}{16}$ in. diam.—Very near the Japanese *P. longitubus*, *Miq.*, and possibly a variety of it, but the cyme branches are much shorter and 1-fld.; the inflorescence being a simple raceme with opposite flowers.—Probably both should be referred to *Orthosiphon*.

** *Fruiting calyx* longer than broad, distinctly 2-lipped for $\frac{1}{3}$ way down, upper lip subequally 3-toothed, lower 2-toothed. *Corolla* $\frac{1}{6}$ - $\frac{1}{3}$ in. long, tube straight, base equal. (It is not easy to distinguish this section from the next.)

2. **P. scrophularoides**, *Wall. Pl. As. Rar. ii. 16*, and *Cat. 2738*; tall, slender, nearly glabrous, leaves long-petioled ovate crenate, base cordate or cuneate, corolla-tube broad about twice as long as the lower lip, fruiting calyx with obtuse teeth, nutlets subglobose smooth. *Benth. Lab. 40*, and in *DC. Prodr. xi. 55*; *Hook. Ic. Pl. t. 464 in part*.

TEMPERATE HIMALAYA, alt. 8-1000 ft., from Kumaon to Sikkim; *Wallich, &c.*

Stem 2-4 ft. or more. *Leaves* 3-7 in., often as broad, sparsely minutely hairy; petiole 1-4 in. *Cymes* in broad open slender panicles. *Corolla* $\frac{1}{2}$ in., pale rose, tube nearly straight, upper lip very short, lower short, narrow, acute, hardly cymbiform. *Stamens* far exserted. *Fruiting calyx* $\frac{1}{4}$ in.—A much larger plant than *P. Gerardianus*, which it closely resembles. The figure in *Icones Plantarum* (copied from a drawing by Heyland of Paris) is, I suspect, made up of the magnified calyx and corolla of this, but of the leaves, panicle and nutlets of *P. Gerardianus*.

3. **P. pulneyensis**, *Hook. f.*; tall, robust, villous, lower leaves stoutly petioled ovate-cordate reticulate crenate, racemes narrow, branches short, corolla-tube short broad, lips short subequal, stamens far exserted, fruiting calyx $\frac{1}{2}$ in. sparingly hispid, lobes obtuse, nutlets broadly oblong. *P. striatus*, *Herb. Wight* 2096.

DECCAN PENINSULA; Pulney Mts., *Wight*.

Foliage, hairiness, and stout stems of *P. nilghiricus*, but flowers and fruit quite different.

4. **P. nigrescens**, *Benth. Lab.* 710, and in *DC. Prodr.* xii. 58; erect, finely pubescent, rarely subvillous, blackish when dry, leaves small petioled ovate or ovate-cordate crenate, cymes narrow usually terminal and solitary, corolla-tube short, lips subequal short, stamens shortly exserted or included, fruiting calyx sparsely scabrid, lobes obtuse, nutlets suborbicular. *Thwaites Enum.* 237, excl. syn. *P. Walkeri*. *P. montanus*, *Herb. Wight*. *P. hians*, and *P. scabrellus*, *Benth. in DC. l. c.* 57, 58.

CEYLON; Central Province, alt. 4-7000 ft., *Mackenzie, &c.*

Stem stout or slender, simple or branched, variable in pubescence. *Leaves* 1-1 $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ in., white, spotted with red. *Fruiting calyx* about as long.

5. **P. Walkeri**, *Arn. Pugill. Fl. Ind. Or.* 36, and in *Nov. Act. Nat. Cur.* xviii. 354; stems subsimple ascending leafy pubescent, leaves petioled lanceolate serrate above the middle glabrous, cymes terminal solitary narrow hoary, corolla-tube rather broad longer than the subequal lips, stamens shortly exserted, fruiting calyx nearly glabrous, lobes obtuse, nutlets broadly oblong. *P. nigrescens*, var. *Thwaites Enum.* 237.

CEYLON; Ramboddi, &c., alt. 4-5000 ft., *Sir G. Mackenzie, Walker*. DECCAN PENINSULA; Tinnevely Hills, alt. 4000 ft., *Beddome*.

A very distinct plant, blackish when dry. *Stem* 12-18 in. *Leaves* 1 $\frac{1}{2}$ -2 in., acute, puberulous on the nerves. *Racemes* 2-5 in. *Calyx* nearly as in *P. nigrescens*.

6. **P. rivularis**, *Wight mss.*; stem erect leafy pubescent, leaves long-petioled lanceolate crenate to below the middle pubescent or glabrate, racemes terminal and axillary narrow pubescent, corolla-tube rather broad longer than the subequal lips, stamens shortly exserted, fruiting calyx nearly glabrous, lobes subacute, nutlets broadly oblong. *P. nigrescens*, β . *scabrellus*, *Wight* (*Kew Distrib.* 2093).

NILGHIRI and ANAMALLAY HILLS; Sispara, *Wight, Gardner, Beddome*.

Very near *P. Walkeri*, and perhaps a variety, but taller, more hairy, green when dry, leaves longer petioled, crenate (not serrate) to near the base.

*** *Fruiting calyx* indistinctly 2-lipped, shortly 5-toothed. *Corolla* $\frac{1}{2}$ - $\frac{1}{3}$ in. long, tube straight, equal at the base.

7. **P. Gerardianus**, *Benth. in Wall. Pl. As. Rar.* ii. 17, *Lab.* 40, and in *DC. Prodr.* xii. 56 (*all in part*); tall, branched, nearly glabrous, leaves large lower petioled ovate crenate or toothed, floral and bracts small, cymes in branched panicles, corolla $\frac{1}{2}$ in., tube subcylindric, lips subequal, fruiting calyx $\frac{1}{10}$ in. glabrous or nearly so, teeth subacute, nutlets ellipsoid. *Wall. Cat.* 2742. *P. oblongifolius*, *Wall. Pl. As. Rar.* ii. 16; *Cat.* 2739; *Benth. ll. c.*

TEMPERATE HIMALAYA, alt. 3-9000 ft.; from Kashmir to Sikkin (ascending to 12,000). KHASIA MTS., alt. 4-6000 ft.; *Wallich, &c.*

Stem 4-6 ft., glabrous or puberulous above. *Leaves* 3-7 by 1-4 in., acuminate,

membranous or rigid, sparsely scaberulous above or more so all over; base of lower narrowed into the long or short petiole. *Panicles* pyramidal, branches slender. *Flowers* white, speckled with pink. *Stamens* exserted.—I cannot distinguish *P. graciliflorus* by any sufficient character. *Hyssopus lophanthoides*, Ham., referred here by Bentham, is, according to an original specimen of Hamilton's, a different plant (see end of genus). *P. oblongifolius* is a diseased state with inflated barren calyces.

VAR. graciliflora; leaves more scabrous above, and usually red-brown when dry. *P. graciliflora*, Benth. in *DC. Prodr.* xii. 56. *P. Gerardianus*, var. *hispidus*, *Herb. Ind. Or. H. f. & T.*—Nepal, Sikkim, and Khasia Mts.

VAR. brachyantha; corolla-tube very short and wide, scarcely exceeding the calyx. —Khasia Mts.; Churra, alt. 4000 ft., *J. D. H. & T. T.* Sikkim, alt. 5–8000 ft., Clarke, *J. D. H.* Prome Hills, Benson (in *Herb. Maingay*).—A dubious plant, referred by Clarke (inss.) to *P. striatus*, which small specimens resemble. Fruiting calyx not seen.

8. *P. striatus*, Benth. in *Wall. Pl. As. Rar.* ii. 17, and in *DC. Prodr.* xii. 56; stem usually 6–12 in. glabrous pubescent or subvillous, leaves small lower petioled broadly ovate crenate, cymes paniced, corolla-tube broad or narrow short or tubular, fruiting calyx $\frac{1}{2}$ in. hispid, teeth obtuse, nutlets oblong. *Wall. Cat.* 2740.

TEMPERATE HIMALAYA; from Kashmir to Bhotan, alt. 4–8000 ft., Wallich, &c. KHASIA MTS., alt. 3–6000 ft., common.

The usually much smaller size, shorter broader leaves, more flaccid habit, and hispid calyx best distinguish this from *P. Gerardianus*, but there are many specimens that I am in doubt about. The corolla is very variable, and the stamens are normally far exserted.

9. *P. Stracheyi*, Benth. mss.; stem simple ascending puberulous, leaves 4–5 in. short-petioled narrowly lanceolate serrate above the middle, cymes in a terminal narrow panicle.

WESTERN HIMALAYA; Kumaon, in the Surja valley, alt. 4500 ft., Strachey & Winterbottom.

Flowers of *P. Gerardianus*, but very distinct in foliage and habit, which resemble *P. Walkeri*. The fruit is not ripe. A very similar but more flaccid plant (specimens without corolla and fruit), and with longer petioles, is found in Pegu by Dr. Brandis.

10. *P. hispidus*, Benth. in *Wall. Pl. As. Rar.* ii. 17, Lab. 41, and in *DC. Prodr.* xii. 57; stout, erect, scaberulous, densely pubescent or villous, leaves subsessile ovate crenate or serrate tomentose beneath, corolla tubular pubescent, lower lip much longer than the upper, fruiting calyx $\frac{1}{2}$ in. densely villous, nutlets very minute ellipsoid. *Wall. Cat.* 2741.

KHASIA MTS., alt. 4000 ft.; Wallich, &c.

Like a robust and (usually) densely woolly form of *P. Gerardianus*, with a very minute woolly calyx. *Flowers* white, speckled with red.

11. *P. Stocksii*, Hook. f.; slender, simple or branched, glabrous or sparsely hairy, leaves petioled ovate or ovate-cordate crenate membranous, panicles pyramidal, corolla-tube short broad, fruiting calyx $\frac{1}{10}$ in. scaberulous, teeth subacute, nutlets broadly oblong. *P. striatus* & Concan, *Herb. Ind. Or. H. f. & T.* *P. Wightii*, *Grah. Cat. Bomb. Pl.* 148; Dalz. & Gibs. *Bomb. Fl.* 205.

DECCAN PENINSULA; the Concan, Stocks, Law, &c.; Bababoodan Hills, Heyne in *Herb. Rottler*; Belgaum, at Purwar Ghat, Ritchie.

Possibly a form of *P. striatus*, but is a larger plant. Small specimens from the Kala Nuddi (banks above Saopa), from Ritchie, have very minute fruiting calyces. Heyne's specimen is a very small one, but, I think, of this species.

12. **P. Wightii**, *Benth. Lab.* 41, and in *DC. Prodr.* xii. 56; tall, robust, branched, glabrous or scaberulous, leaves petioled broadly ovate or cordate crenate-toothed rather rigid, cymes lax-fld. often leafy, large pyramidal panicles, corolla-tube short broad, fruiting calyx $\frac{1}{10}$ – $\frac{1}{8}$ in. scaberulous, teeth obtuse, nutlets oblong. *Wight Ic.* t. 1429.

NILGHIRI and PULNEY MTS., alt. 1–7000 ft.; *Wight, &c.*

The var. *macrophylla*, *Benth.*, is only a larger-leaved specimen.

13. **P. nilghiricus**, *Benth. in DC. Prodr.* xii. 57; villous, stem very robust, leaves thick stoutly petioled broadly ovate-cordate rugose crenate, cymes in pyramidal panicles, flowers rather crowded, corolla tubular, lobes pubescent, fruiting calyx $\frac{1}{12}$ in. densely woolly, nutlets suborbicular. ? *P. bullatus*, *Benth. l. c.*

NILGHIRI and ANAMALLAY MTS.; *Sir F. Adams, Wight, Beddome.*

Apparently a very distinct species. Whole plant yellowish-brown when dry. *P. bullatus*, *Benth.*, may be the same thing; I have seen no authentic specimens of it.

14. **P. capillipes**, *Benth. in DC. Prodr.* xii. 57; annual, small, softly pubescent, rather slender, leaves small petioled ovate or cordate crenate, cymes in narrowly pyramidal panicles, corolla tubular, lips subequal lower very small, fruiting calyx $\frac{1}{10}$ in. puberulous, teeth obtuse, nutlets oblong. *Thwaites Enum.* 237.

CEYLON; Central Province, alt. 3–5000 ft., *Walker, &c.*

Habit of *P. striatus*, which small specimens resemble, whilst larger ones approximate to *P. Wightii*. Corolla white, with pink spots on upper lip. Stamens exerted.

15. **P. nepetæfolius**, *Benth. in DC. Prodr.* xii. 57; villous with soft spreading hairs, stem 1–2 ft. simple, leaves petioled ovate-cordate crenate soft and softly hairy on both surfaces, cymes in narrowly pyramidal panicles, corolla tubular, lips subequal, fruiting calyx $\frac{1}{4}$ in. pubescent, teeth obtuse, nutlets ovoid-oblong.

DECCAN PENINSULA, *Wight, Perrottet*; Nilghiri and Anamallay Hills, *Beddome.*

A much smaller plant than *P. Wightii*, clothed with long hairs, and with a tubular corolla $\frac{1}{4}$ in. long.

**** *Fruiting calyx longer than broad, 2-lipped or subequally 5-toothed. Corolla $\frac{1}{6}$ – $\frac{1}{4}$ in., tube declinate or abruptly decurved (except *P. repens*), base usually gibbous.*

16. **P. repens**, *Wall. Pl. As. Rar.* ii. 17, and *Cat.* 2746; pubescent or villous, stem short, leaves long-petioled broadly ovate- or orbicular-cordate obtuse crenate, cymes in narrow racemes which are longer than the stem, corolla-tube nearly straight cylindric obtusely spurred at the base above, stamens included, fruiting calyx scaberulous, teeth short obtuse, nutlets very minute broadly oblong. *Benth. Lab.* 43, and in *DC. Prodr.* xii. 58.

CENTRAL and EASTERN HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 6–9000 ft., *J. D. H., Clarke.*

Stem 4–6 in., prostrate below. Leaves $1\frac{1}{2}$ –3 in. broad, membranous; petiole 1–3 in. Panicles solitary and terminal, or few axillary, 1 foot long and under, lax fld. Corolla $\frac{1}{6}$ in. *Fruiting calyx $\frac{1}{4}$ in.*—The corolla is not like that of *P. Coetsa*, nor are the calyx-teeth lanceolate and acute (as described in *DC. Prodr.*).

17. **P. Coetsa**, *Ham. in Don Prodr.* 117; tall, erect, branched, pubescent

or glabrate, leaves ovate crenate narrowed into the winged petiole, cymes in lax-fld. paniced racemes, corolla-tube much shorter than the large saccate lower lip, fruiting calyx narrow shortly 2-lipped, teeth acute, nutlets oblong or subglobose. *Benth. in Wall. Pl. As. Rar.* ii. 17, *Lab.* 42, and in *DC. Prodr.* xii. 58 (excl. syn. Burm.); *Wall. Cat.* 2743. *Ocimum Coetsa*, *Spreng. Syst., Cur. post.* 223.

TEMPERATE and SUBTROPICAL HIMALAYA; from Murree to Mishmi, alt. 3–8000 ft., abundant. KHASIA MTS., alt. 3–5000 ft.; Burma, *Wallich*.

A tall strong-smelling 6–8 ft. undershrub. *Leaves* 1–3 in. *Cymes* very numerous, branchlets subsecund. *Corolla* $\frac{1}{2}$ in., lavender-blue; upper lip very short. *Stamens* included in the lower lip. *Fruiting calyx* $\frac{1}{10}$ – $\frac{1}{8}$ in., hoary or scabrous. *Nutlets* apparently variable.

VAR. *Hookeri*; tall, leaves sometimes 5 in. glabrous or puberulous, fruiting calyx larger $\frac{1}{4}$ – $\frac{1}{2}$ in. very broad, teeth longer more acute, nutlets twice as large. *Plectranthus* no. 15, *Herb. Ind. Or. H. f. & T.* *P. Hookeri*, *Clarke mss.*—Khasia Mts.; Moflong, alt. 5000 ft., *J. D. H. & T. T.*

18. ***P. menthoides***, *Benth. in Wall. Pl. As. Rar.* ii. 17, *Lab.* 42, and in *DC. Prodr.* xii. 59; tall, erect, branched, hoary pubescent or tomentose, leaves petioled ovate crenate narrowed into the winged petiole, cymes in long racemes dense or lax-fld., corolla short, tube about as long as the saccate lower lip, fruiting calyx hoary, teeth subequal subacute, nutlets oblong. *Wall. Cat.* 2744. *P. Macraei*, *Benth. Lab.* 42, and in *DC. l. c.*; *Wight Ic. t.* 1430. *P. rugosus*, β . tomentosus, *Benth. in Wall. l. c. ii.* 17; *Wall. Cat.* 2745 B. *P. Coetsa*, *Thwaites Enum.* 237. *Scutellaria japonica*, *Burm. Fl. Ind.* 130.

SOUTH DECCAN PENINSULA, from Belgaum southward; Nilghiri and Pulney Mts., by wet ditches, *Wight*. CEYLON; Central Province, alt. 4–6000 ft.

The southern representative of *P. Coetsa*, and probably only a variety of that plant. The length of the corolla-tube is variable, as is the pubescence of the leaves.

19. ***P. Maddeni***, *Benth. in Strach. Cat. Pl. Kumaon*, 86; stout, erect, branched, nearly glabrous, leaves ovate crenate narrowed into the winged petiole, cymes in lax- or dense-fld. racemes, corolla-tube much shorter than the saccate lower lip, fruiting calyx broadly campanulate glabrous, teeth obtuse, nutlets subglobose.

TEMPERATE HIMALAYA; Kumaon, alt. 7–8500 ft., *Strachey & Winterbottom, Duthie*; Sikkim, alt. 5–10,000 ft., *J. D. H.*

Very near *P. Coetsa*, and perhaps a form of it, but more glabrous, with broader fruiting calyces, which have obtuse teeth and more rounded nutlets.

20. ***P. melissoides***, *Benth. Lab.* 39, and in *DC. Prodr.* xii. 62; herbaceous, erect, tomentose or puberulous, leaves small sessile or shortly petioled ovate or rounded crenate, cymes in lax-fld. slender racemes, corolla-tube short broad, fruiting calyx 2-lipped subhispid, teeth acute, nutlets globose. *Wall. Cat.* 7122.

KHASIA MTS., alt. 4–6000 ft.; *Wallich, Mack, Griffith, H. f. & T.*, &c.

Stem 1–2 ft., rather slender, strict. *Leaves* $\frac{1}{2}$ –1 in., glabrate or very tomentose beneath or on both surfaces, narrowed into the short petiole. *Racemes* long, slender, strict. *Corolla* $\frac{1}{2}$ in., pink; lips short, gibbously hemispheric. *Fruiting calyx* $\frac{1}{4}$ in., broadly campanulate.

21. ***P. rugosus***, *Wall. Pl. As. Rar.* ii. 17, and *Cat.* 2745; shrubby, erect, hoary with stellate down, leaves small petioled ovate or elliptic obtuse crenate rugose above beneath densely white-tomentose, cymes axillary lax-

fld. panicked, corolla-tube very short, lips very large, fruiting calyx hoary, teeth subequal acute, nutlets oblong. *Benth. Lab.* 43, and in *DC. Prodr.* xii. 59, var. a.; *Gamble Ind. Timbers*, 300.

WESTERN HIMALAYA; dry hills from Kashmir to Garwhal, alt. 3–8000 ft. BHOTAN; *Griffith.* MARWAR; on Mt. Abo, *Stocks.*—DISTRIB. Afghanistan.

A shrub; branches slender, strict. *Leaves* 1 in. and less, leathery, finely reticulate above; base subcordate, rarely acute; petiole slender. *Cymes* in leafy racemes, with slender peduncles and pedicels. *Corolla* $\frac{1}{2}$ in., white, with rose or purple spots; lips much longer than the tube, lower longest. *Fruiting calyx* $\frac{1}{8}$ in. long, very shortly 2-lipped.

Sect. 2. **Pyramidium.** *Fruiting calyx* erect, tubular, equally 5-toothed. *Corolla-tube* decurved, base gibbous. *Nutlets* trigonous, ovoid-oblong, acuminate.

22. **P. ternifolius**, *Don Prodr.* 117; robust, densely white-tomentose, leaves opposite and ternately whorled subsessile lanceolate acuminate serrate rugose, cymes in dense long white villous panicles, corolla very short villous, fruiting calyx cylindric, teeth subequal. *Wall. Cat.* 2748; *Benth. in Lab.* 44; in *Wall. Pl. As. Rar.* ii. 17, and in *DC. Prodr.* xii. 61; *Hook. Ic. Pl.* t. 460. *Ocimum ternifolium*, *Spreng. Syst.*, *Cur. post.* 224.

TROPICAL HIMALAYA; from Kashmir to Bhotan, alt. 0–4000 ft. KHASIA MTS., alt. 0–3000 ft. BENGAL, ASSAM. BEHAR, at Parusnath, *J. D. H.*—DISTRIB. Burma, S. China.

A bush, 3–5 ft., with strict erect branches. *Leaves* 3–7 in., thick, rugose, base acute. *Panicles* cylindric, white; lower bracts leafy; flowers subsessile, densely crowded. *Corolla* white, with pink spots at base of upper lip; tube inflated, and lips very short. *Stamens* included. *Fruiting calyx* $\frac{1}{8}$ – $\frac{1}{4}$ in., straight, erect; teeth rounded. *Nutlets* trigonous, acuminate.

Sect. 3. **Coleoides.** *Fruiting calyx* 2-lipped, upper lip large, rounded, reflexed, very shortly 2-toothed or entire; lower with 3 acute, awned, or subulate pointed teeth. *Corolla-tube* deflexed or declinate, base gibbous or not.

23. **P. incanus**, *Link Enum. Hort. Berol.* ii. 120; herbaceous, pale, hoary, stem subsimple, leaves large long-petioled broadly ovate-cordate crenate, cymes lax-fld. racemose, corolla-tube short longer than the short hemispheric lower lip, base not gibbous, fruiting calyx broadly campanulate, lower lip longest, teeth with long points, nutlets large subglobose. *P. cordifolius*, *Don Prodr.* 116; *Benth. Lab.* 35, in *Wall. Pl. As. Rar.* ii. 16, and in *DC. Prodr.* xii. 66; *Wall. Cat.* 2736; *Grah. Cat. Bomb. Pl.* 148; *Dalz. & Gibs. Bomb. Fl.* 205. *P. secundus*, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 20. *P. divaricatus*, *Weinm. in Syll. Pl. Soc. Ratisb.* i. 68, and in *Flora*, 1826, 174. *P. mollis*, *Spreng. Syst.* ii. 690. *Ocimum molle*, *Ait. Hort. Kew.* ii. 322. *O. mayporensis*, *Roth Nov. Sp.* 271.—*Rheede, Hort. Mal.* x. t. 84.

Hills of CONTINENTAL INDIA, from the HIMALAYA (Simla to Sikkim), ascending to 5500 ft., KHASIA MTS. and CENTRAL INDIA, to the ANAMALLAYS. (Absent in Ceylon and in the Malay Peninsula.)

Whole plant usually hoary with very fine pubescence. *Stem* robust below. *Leaves* 2–4 in., sometimes as broad; petiole as long or longer than the blade. *Corolla* $\frac{1}{4}$ in. long, slightly decurved, white pubescent. *Stamens* included. *Fruiting calyx* $\frac{1}{2}$ in. *Nutlets* $\frac{1}{2}$ in. diam.—Lower lip of corolla longest of any Indian species.

24. **P. subincisus**, *Benth. in Wall. Pl. As. Rar.* ii. 16, *Lab.* 36, and in *DC. Prodr.* xii. 66; glabrous or puberulous, stem short branched, leaves long petioled orbicular ovate obtuse sinuate-crenate, corolla very small, tube

slender decurved longer than the short lower lip, fruiting calyx campanulate, lips short upper rounded, teeth of lower with subulate tips, nutlets globose smooth or rugose. *Wall. Cat.* 2737.

DECCAN PENINSULA; near Courtallum and Dindigul, *Herb. Rottler, Wight*. CEYLON (var. *Gardneri*).

Stem a foot high, flaccid, vaguely branched. *Leaves* $1\frac{1}{2}$ –2 in. long and broad, flaccid; petiole as long. *Corolla* $\frac{3}{8}$ in. long, pubescent. *Fruiting calyx* dimorphic, larger $\frac{1}{2}$ in., with deeply pitted brown nutlets; smaller $\frac{3}{8}$ in., with smooth pale nutlets.—The specimens in Wallich's, Wight's, and Rottler's Herbaria are very imperfect.

VAR. *Gardneri*; leaves narrowed into the petiole, purplish when dry. P. Gardneri, *Thwaites Enum.* 237.—Ceylon; Central Province, Adam's Peak, &c., *Walker, &c.*

25. **P. Parishii**, *Hook. f.*; annual, puberulous, flaccid, branched, leaves orbicular-ovate narrowed into the very long petiole coarsely crenate or lobulate, cymes in lax-fl. racemes, corolla $\frac{3}{8}$ in., tube very slender with the inflated throat much longer than the narrow lip.

TENASSERIM; Moulmein, *Parish*.

Stem succulent, 6–10 in. *Leaves* 2 in. long and broad, membranous, obtuse. *Calyx* minute in flower; peduncles and pedicels pubescent; lower lip with subulate teeth. *Corolla* with pale blue lower lip. *Fruiting calyx* $\frac{1}{2}$ in., broadly campanulate, subequally very shortly 2-lipped; upper lip triangular, tip subulate; teeth of lower similar but narrower. *Nutlets* very pale.—I have but one specimen of this very distinct species.

26. **P. zeylanicus**, *Benth. Lab.* 36, and in *DC. Prodr.* xii. 66; tall, slender, densely finely glandular-pubescent, leaves shortly petioled orbicular-crenate crenate, flowers minute whorled in very long slender racemes, corolla-tube longer than the short lower lip, fruiting calyx minute subspheric, upper lip rounded mucronate, teeth of lower subulate.

CEYLON; Central Province, at Ramboddi, *Gardner*. (Commonly cultivated in native gardens as a medicine, unknown wild, *Thwaites*.)

Stem 2–3 ft., stout, succulent, naked. *Leaves* in few pairs, 1–4 in. diam., rather thick. *Racemes* 6–12 in., very narrow; flowers in 6–10-fl. whorls on the main rachis; pedicels $\frac{1}{4}$ in. *Corolla* $\frac{1}{2}$ in. long, slightly curved, tube hardly gibbous at the base. *Fruiting calyx* $\frac{1}{10}$ in., densely glandular-pubescent like the whole raceme. *Nutlets* not seen.

27. **P. coleoides**, *Benth. in DC. Prodr.* xii. 64; very stout, branched, glandular-tomentose or glabrate, leaves long-petioled ovate or orbicular-ovate crenate obtuse, flowers racemed on the branches of a pyramidal densely glandular-tomentose panicle, corolla pubescent, tube about equalling the lower lip, upper lip of fruiting calyx rounded, teeth of lower lanceolate acuminate, nutlets oblong black shining. *Bot. Mag. t.* 5841; *Saunders Refug. Bot. t.* 256. *Coleus* Wightii, *Benth. Lab.* 58, and in *DC. Prodr.* xii. 78; *Wight Ic. t.* 1433. *C. glabratus*, *Benth. Lab.* 58, and in *DC. l. c.* *C. paniculatus*, *Benth. in Wall. Plant. As. Rar.* ii. 79; *Wall. Cat.* 2734, and in *DC. l. c.*

NILGHIRI and ANAMALLAY MTS.; ascending to 7000 ft. in moist places, *Wight, Perrottet, &c.*

Stem 2–3 ft., succulent. *Leaves* 1–4 in. diam., fleshy; petiole as long as the blade. *Panicles* thyrsiform, sometimes 1 foot across the lower branches. *Corolla* $\frac{1}{2}$ in. long, lilac; lower lip ciliate. *Stamens* included. *Fruiting calyx* very variable, broad straight and campanulate, or narrowed and curved.

28. **P. urticifolius**, *Hook. f.*; very robust, glabrous except the

puberulous panicle, leaves very large stoutly petioled broadly ovate obtusely acuminate, margin regularly obtusely lobulate, lobules crenate, cymes in stout branched panicles, corolla-tube equalling the narrow lower lip, fruiting calyx large, upper lip orbicular ovate, teeth of lower subulate-lanceolate, nutlets large orbicular oblong brown shining. *Coleus urticifolius*, *Benth. in DC. Prodr.* xii. 78.

DECCAN PENINSULA; Courtallum, *Wight*; Tinnevely Hills, alt. 4500 ft., *Beddome*. *Stem* short. *Leaves* 3-6 in. long and nearly as broad, sometimes minutely puberulous above, gland-dotted beneath, lobules rounded or ovate; petiole 2-3 in., very thick. *Panicle* very large; branches suberect; flowers racemed or corymbose. *Flowers* $\frac{2}{3}$ in. long. *Corolla-tube* cylindric, decurved; lips subequal, upper very broad, lower narrowly cymbiform. *Stamen* quite free. *Fruiting calyx* $\frac{1}{2}$ in. long, 2 lowest teeth longest, incurved. *Nutlets* large.—Near *P. coleoides*.

29. **P. fruticosus**, *Wight Cat.* 2524; very robust, shrubby, branches and leaves beneath densely tomentose, leaves large rounded ovate or cordate obtusely acuminate coarsely crenate, flowers secundly racemed on the erect branches of a dense stout glandular-pubescent thyrsus, corolla decurved. *Coleus fruticosus*, *Benth. in DC. Prodr.* xii. 78.

DECCAN PENINSULA; Pulney Mts., *Wight*.

Stem as thick as the middle finger, spongy. *Leaves* 3-5 in. long and broad, pubescent above, margin sublobulate; petiole 1-2 in., very stout, almost woolly. *Panicle* 6-10 in., rachis and primary branches woody, ultimate 1-3 in., flexuous, many-flid.; flowers alternate, shortly pedicelled. *Corolla* pubescent, $\frac{2}{3}$ in. long. *Filaments* quite free. *Upper calyx-lip* ovate, teeth of lower acuminate.—A very robust well-marked species. The fruit is not ripe.

30. **P. Griffithii**, *Hook. f.*; erect, branched, hirsutely tomentose, leaves petioled ovate acuminate toothed or crenate, cymes very short in long slender narrow racemes, corolla-tube very slender longer than the lower lip, fruiting calyx sparsely hairy, upper lip broad rounded, teeth of lower acuminate, nutlets orbicular smooth black shining.

EASTERN ASSAM; Mishmi Hills, *Griffith*.

Stem rather woody, tomentose; branches, racemes and leaf nerves beneath with long hairs amongst the tomentum. *Leaves* 3-5 in., hirsute on both surfaces, base rounded, shortly cordate at the insertion of the $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long petiole. *Racemes* 6-10 in., $\frac{3}{4}$ in. diam., leafless, rather dense-flid., rachis very hirsute; cymes short, sessile, with pedicelled flowers. *Corolla* $\frac{1}{2}$ in. long, tube declinate, curved, white, lips subequal, pale rose-coloured. *Fruiting calyx* $\frac{1}{6}$ in., contracted above the swollen base, mouth campanulate, lips subequal in length.

31. **P. crenulatus**, *Hook. f.*; erect, densely finely tomentose throughout, leaves petioled ovate acute crenulate, cymes short in axillary racemes, fruiting calyx hairy, upper lip broad rounded, teeth of lower acuminate, nutlets orbicular black granulate opaque.

UPPER ASSAM; Namroop, *Griffith*.

Very near *P. Griffithii*, but not at all hirsute, leaves similar in shape but less acuminate, and crenatures smaller, racemes shorter and nutlets opaque and granulate. *Flowers* not seen.

32. **P. Helferi**, *Hook. f.*; stem woody below and branches and young leaves finely puberulous, leaves shortly petioled lanceolate subacute crenate above the entire base glabrous, cymes short subsessile in branched glandular-tomentose racemes, upper lip of glandular-hairy fruiting calyx orbicular, teeth of lower subulate.

TENASSERIM; *Helfer*.

Stem 1–2 feet. *Leaves* $1\frac{1}{2}$ – $2\frac{1}{2}$ in., narrowed into the petiole, rather coriaceous, nerves oblique. *Fruiting calyx* $\frac{1}{2}$ in. *Corolla* and *nutlets* not seen.—The specimens are hardly fit for description, but the species is too remarkable to be passed over.

DOUBTFUL SPECIES.

P. PATCHOULI, *Clarke mss.*; tall, erect, branched, hirsutely tomentose, leaves petioled ovate-cordate crenate-toothed, cymes branched, flowers subsecundly sessile on the branchlets of a loose panicle, calyx-teeth subequal, corolla-limb subclavate with a large incurved cymbiform obtuse lower lip and shorter narrow upper lip.

ASSAM; *Jenkins* (Herb. Calcutt.). KHASIA MTS.; Johra, alt. 4000 ft., cult., *Clarke*.

Stem stout, branched. *Leaves* 2–3 in., hairy on both surfaces. *Cymes* paniced, irregularly branched; bracts small, leafy; pedicels $\frac{1}{10}$ in. or 0. *Calyx* hardly 2-lipped, teeth acute. *Corolla* $1\frac{1}{2}$ in., tube slender, upper lip much shorter and narrower than the saccate obtuse lower, which is much larger than the tube.—“This, I am told, is the true Patchouli plant, and has the true scent, which *Pogostemon Patchouli* has not,” *C. B. Clarke*. I have seen no fruit, and the inflorescence is very peculiar; it may not be a *Plectranthus*.

P. ? MONTANUS, *Benth. in Wall. Pl. As. Rar.* ii. 17, and in *DC. Prodr.* xii. 60; *Wall. Cat.* 2747; densely tomentose, stem short very robust, leaves shortly petioled ovate or rounded crenate very thick rugose, racemes dense-fld. pyramideate, branches very thick ascending, whorls close set but not confluent, flowers sessile or pedicelled, calyx $\frac{1}{10}$ in. hemispheric with 5 triangular subacute teeth, nutlets suborbicular polished pale.—Mysore; at Nundydroog, *Klein. Herb. Rottler*.—Habit of *P. coleoides*, but calyx very different. The specimens are very imperfect, and have no corolla.

HYSSOPUS LOPHANTHOIDES, *Ham. in Don Prodr.* 110, referred to *P. Gerardianus* by *Bentham*, can hardly be that plant; a specimen of it from Hamilton more resembles *P. striatus*, being very pubescent. It may, however, be a hairy form of *P. Gerardianus*.

OCIMUM DENSIFLORUM, *Roth Nov. Sp.* 275, doubtfully referred by *Bentham* to *P. rugosus*, must be a very different plant, according to the description.

P. ROTUNDIFOLIUS, *Spreng. Syst.* ii. 690; *Benth. Lab.* 34, and in *DC. Prodr.* xii. 65; *Grah. Cat. Bomb. Pl.* 148. *Coleus ? rugosus*, *Benth. in Wall. Pl. As. Rar.* ii. 15. *Germania rotundifolia*, *Poir. Dict.* ii. 763. *Nepeta madagascariensis*, *Lam. ? Dict.* i. 712.—*Kurka, Rheede Hort. Mal.* xi. t. 25?—A reputed native of Mauritius and Coromandel? The last habitat is no doubt founded on the supposed identity of the Mauritian with the plant figured by *Rheede*, which represents a flowerless tuberiferous herb which has not been identified. Local botanists should be able to discover what *Rheede's* plant is.

9. COLEUS, *Lour.*

Characters of *Plectranthus*, but filaments combined below into a sheath around the style.—Species about 50, Tropical African and Asiatic, and one Australian.

* *Calyx-throat villous within.*

1. *C. spicatus*, *Benth. in Wall. Pl. As. Rar.* ii. 15, *Lab.* 49, and in *DC. Prodr.* xii. 71; stem very stout villous with long spreading hairs or glabrate, leaves sessile obovate ovate or orbicular glabrous fleshy entire or crenate, floral large concave deciduous, whorls in a dense cylindric spiciform villous thyrses, upper calyx-lip very broad truncate. *Wight Ic.* t. 1431; *Wall. Cat.* 2729. *C. Heynii*, *Benth. Lab.* 50, and in *DC. l. c.* *C. Zatarhendi*, *Dalz. & Gibs. Bomb. Fl.* 206; ? *Benth. Lab.* 50. *Plectranthus*

monadelphus, *Heyne mss.*; *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 22. *P. caninus*, *Roth Nov. Sp.* 279. *Ocimum monadelphum*, *Roth l. c.* 267. ? *O. Zatarhendi*, *Forsk. Fl. Æg. Arab.* 109.

SOUTH DECCAN; on low rocky hills, common.

Stem 6–12 in., simple or branched. *Leaves* few, very variable, $\frac{1}{2}$ by $3\frac{1}{2}$ in. *Spikes* 4–8 in. by $\frac{1}{2}$ – $\frac{3}{4}$ in. diamf.; bracts broad, acute, ciliate; flowers $\frac{1}{2}$ in. long; upper calyx-lip crenulate, teeth of lower acute. *Corolla-tube* slender, bent above the middle; upper lip 4-lobed, lower boat-shaped.

2. **C. barbatus**, *Benth. in Wall. Pl. As. Rar.* ii. 15, *Lab.* 49, and in *DC. Prodr.* xii. 71; stem stout villous with long hairs, leaves petioled ovate or obovate obtuse crenate villous or hispid, floral ovate deciduous, whorls distant, upper calyx-lip rounded ovate acute. *Wall. Cat.* 2728; *Grah. Cdt. Pl. Bomb.* 148; *Dalz. & Gibs. Bomb. Fl.* 205; *Wight Ic.* t. 1432. *C. Schimperii*, *Vatke in Linnæa*, xxxvii. 320. *Plectranthus barbatus*, *Andr. Bot. Rep.* t. 494. *P. comosus*, *Bot. Mag.* t. 2318. *P. Forskohlii*, *Willd. Sp. Pl.* iii. 169; *Bot. Mag.* t. 2036. *P. asper*, *Spreng. Syst.* ii. 690. *P. mysorensis*, *Heyne mss.* *Germania Forskohlii*, *Poir. Dict.* ii. 764. *Ocimum asperum*, *Roth Nov. Sp.* 268. *O. cinereum*, *Brown in Salt. Abyss. App.* *O. saccharoides*, *Willd. f. Heyne.*

SUBTROPICAL HIMALAYA; Nepal and Kumaon, ascending to 8000 ft. BEHAR; top of Parusnath, *Thomson*. DECCAN PENINSULA; common. CEYLON; Oovah district, alt. 3–5000 ft.—DISTRIB. Tropical E. Africa.

Stem 1–2 ft., ascending, branched. *Leaves* 3–5 in., narrowed into the petiole. *Racemes* 6–12 in., stout; flowers $\frac{3}{4}$ –1 in. *Corolla* pale blue, much like *C. spicatus*. *Fruiting calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., upper lip acuminate, teeth of lower subulate, all pungent.

** *Calyx-throat glabrous within.*

3. **C. aromaticus**, *Benth. in Wall. Pl. As. Rar.* ii. 15, *Lab.* 51, and in *DC. Prodr.* xii. 72; shrubby below, hispidly villous or tomentose, leaves petioled broadly ovate or cordate crenate fleshy, floral minute, whorls distant densely many-fld., upper calyx-lip ovate acute membranous, lower acuminate. *Wall. Cat.* 2730; *Wight Ill.* ii. t. 175; *Grah. Cat. Bomb. Pl.* 148; *Dalz. & Gibs. Bomb. Fl. Suppl.* 66; *Bot. Reg.* t. 1520. *C. amboinicus*, *Lour. Fl. Coch.* 372. *C. crassifolius*, *Benth. in Wall. Pl. As. Rar.* ii. 13, and *Lab.* 52; *Wall. Cat.* 2731. *Plectranthus aromaticus*, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 22.

Cultivated throughout INDIA, CEYLON and various tropical countries.

Stem 1–3 ft., fleshy. *Leaves* 1–2 in., very aromatic. *Flowers* shortly pedicelled, $\frac{1}{2}$ in. long. *Corolla* pale purplish, tube short, throat inflated, lips short. *Stamens* shortly exserted. *Fruiting calyx* suberect.—*Roxburgh* describes the flowers as blue. *C. amboinicus* is the earliest name, but not very appropriate.

4. **C. parviflorus**, *Benth. in DC. Prodr.* xii. 72; stem stout fleshy, roots tuberous, leaves petioled rounded-ovate obtuse coarsely crenate glabrous or nearly so, whorls subdistant slender pubescent, racemes laxly many-fld., upper calyx-lip ovate, teeth of lower obtuse or lowest mucronate. ? *C. tuberosus*, *Benth. Lab.* 59 (*Plectranthus tuberosus*, *Blume*).

DECCAN PENINSULA; Quilon and Panpanassum, *Wight*. CEYLON, cultivated, *Gardner*.

Stem 1–2 ft. *Leaves* $1\frac{1}{2}$ –2 in., often as broad, base cuneate or subcordate. *Flowers* $\frac{1}{4}$ – $\frac{1}{2}$ in. *Corolla* decurved, lips short. *Stamens* included. *Fruiting calyx* not seen.—Probably *C. tuberosus*, which is cultivated for its tubers in Java as this is in Ceylon, but *Blume* describes the Javan plant as having quite entire leaves.

5. **C. scutellarioides**, *Benth. in Wall. Pl. As. Rar.* ii. 16, *Lab.* 53, and in *DC. Prodr.* xii. 73; tall, slender, glabrous or minutely hairy, leaves petioled ovate or ovate-lanceolate acuminate crenate membranous, whorls in distant slender puberulous racemes laxly many-fl., upper calyx-lip ovate, lateral teeth of lower obtuse, lowest acute. *Wall. Cat.* 2732. *Ocimum scutellarioides*, *Linn.*; *Burm. Fl. Ind.* 130; *Bot. Mag.* t. 1446. *Plectranthus scutellarioides*, *Br. Prodr.* 506; *Roxb. Fl. Ind.* iii. 21. *P. nudiflorus*, *Willd. Sp. Pl.* iii. 168. *Germania nudiflora*, *Poir. Dict. Suppl.* ii. 763.

Cultivated in INDIA.—DISTRIB. Malay Islands, Australia.

Stem 2-3 ft. *Leaves* 1-3 in., usually purplish beneath, base rounded or cuneate. *Flowers* $\frac{1}{2}$ in., white with a blue lower lip, tube abruptly decurved. *Stamens* included. —There are several very distinct varieties described from Australia (*Benth. Fl. Austral.* v. 30).

6. **C. atropurpureus**, *Benth. in Wall. Pl. As. Rar.* ii. 17, *Lab.* 54, and in *DC. Prodr.* xii. 74; tall, slender, finely pubescent, leaves long-petioled broadly ovate or rounded obtuse or acute coarsely crenate, flowers in lax whorled cymes which form narrow panicles, upper calyx-lip ovate sub-acute, teeth of lower variable, two lowest aristate. *Nunes Fl. Filip.* t. 208; *Wall. Cat.* 2733.

MALACCA, PENANG and SINGAPORE; *Wallich, &c.*—DISTRIB. Malay and Pacific Islands.

Stem 2-3 ft. *Leaves* 2-4 in., membranous, base rounded truncate or cuneate; petiole 1-2 in. *Cymes* irregularly branched, peduncled; flowers pedicelled. *Corolla* $\frac{1}{2}$ in., much as in *C. scutellarioides*. *Stamens* included. *Fruiting calyx* variable, $\frac{1}{6}$ - $\frac{1}{4}$ in. long.

7. **C. malabaricus**, *Benth. in Wall. Pl. As. Rar.* ii. 16, *Lab.* 57, and in *DC. Prodr.* xii. 76; glabrous, puberulous or villous, leaves large membranous long-petioled ovate or lanceolate acute or acuminate crenate, flowers laxly cymose or racemose on the branches of spreading panicles, fruiting calyx broad membranous, upper lip large rounded acute, teeth of lower longer acuminate. *Wall. Cat.* 2735; *Thwaites Enum.* 238. *C. ovatus* & *Macraei*, *Benth. Lab.* 57, 58, and in *DC. l. c.* 76, 77. *C. Macraei*, *Bot. Mag.* t. 4690. *C. Walkeri*, *Benth. in DC. l. c.* 77.

TRAVANCORE and the NILGHIRI MTS.; *Wight, Gardner*. CEYLON; common up to 6000 ft.

Stem 2-3 ft., usually dark purple, as are the leaves beneath and peduncles, pedicels, and calyx. *Leaves* 3-6 in., petiole often as long, base rounded, cuneate or narrowly cordate; floral caducous. *Panicles* usually pyramidal; branches with distant whorls of cymes; flowers $\frac{3}{4}$ -1 in. long. *Calyx* $\frac{1}{4}$ in. long and broad. *Corolla-tube* pale lilac, abruptly decurved, throat inflated; upper lip short, crenate, dark blue; lower boat-shaped, acute, pale. *Stamens* included.—Very variable.

VAR. mollis; leaves softly pubescent. *C. mollis*, *Benth. in D.C. l. c.* 77.—Ceylon.

VAR. leptostachys; puberulous, leaves narrowly oblong or lanceolate, flowers smaller.—Ceylon.

8. **C. inflatus**, *Benth. Lab.* 58, and in *DC. Prodr.* xii. 78; stout, glabrous or puberulous, leaves long-petioled ovate or lanceolate acuminate toothed or serrate, base cuneate, cymes lax-fl. racemed on the branches of a pyramidal panicle, corolla-tube very long flexuous, lips very small, calyx membranous, upper lip ovate acuminate, lateral teeth of lower small, lowest longer acuminate. *Bot. Mag.* t. 5236. *Waurra*, *Itin. Pr. S. Cob. Bot.* 105. *C. Benthamianus*, *Arn. Pugill.* 36, and in *Nov. Act. Nat. Cur.* xviii. 354.

CEYLON; Central Province, alt. 6-8000 ft., *Macrae*, &c.

Stem stout, green. *Leaves* 2-5 in., petiole 1-2 in. *Racemes* or branches of the panicle 3-6 in.; pedicels short. *Corolla* 1 in. long, pale lilac, slightly decurved at the middle, tube slender, as long as the cylindric throat, lips very short, upper crenate larger than the small ovate acute lower.

10. ANISOCHILUS, Wall.

Herbs or undershrubs. *Flowers* small, in dense oblong 4-gonal or cylindric spikes. *Calyx* suberect, inflated below the middle, 2-lipped or 5-toothed, rarely 1-lipped, upper lip entire and deflexed or short and 3-crenate. *Corolla* 2-lipped; tube slender, decurved; throat inflated; upper lip short, entire or 3-4-fid; lower elongate, concave. *Stamens* 4, filaments free. *Style* 2-fid. *Disc* lobed.—*DISTRIB.* Species about 16, Asiatic.

* *Fruiting calyx with the upper lip large, broad, entire, deflexed, concealing the mouth, lower truncate obscurely toothed.*

1. **A. carnosus**, Wall. *Pl. As. Rar.* ii. 18, *Cat.* 2753; annual, erect, glabrous or tomentose, leaves petioled ovate oblong or rounded obtuse crenate fleshy, floral ovate obtuse, fruiting spikes 4-gonous then cylindric obtuse, calyx glabrous pubescent or ciliate, lip deflexed ovate acute ciliate. *Benth. Lab.* 59, and in *DC. Prodr.* xii. 81; *Wight Ill.* t. 176 b, f. 1; *Grah. Cat. Bomb. Pl.* 148; *Dalz. & Gibs. Bomb. Fl.* 206. *A. crassus*, *Benth. in DC. l. c.* *A. glaber*, *Schrad. Ind. Sem. Hort. Goett.* 1833, 1. *A. rupestris*, *Wight Cat.* 2521. *Plectranthus strobiliferus*, *Roxb. Hort. Beng.* 45, and in *Fl. Ind.* iii. 23. *P. carnosus*, *Smith in Rees Cyclop.* v. 27. *P. dubius*, *Spr. Syst.* ii. 691. *Lavandula carnosa*, *Linn. Amœn. Acad.* x. 56, t. 3. *Organum watariense*, *IC. Roxb.—Rheede Hort. Mal.* x. t. 90.

WESTERN HIMALAYA; Kumaon and Garwhal, ascending to 8000 ft., *Edgeworth*, and throughout CENTRAL and SOUTHERN INDIA to Travancore and CEYLON.—*DISTRIB.* Ava.

Stem 1-2 ft., stout, 4-angled. *Leaves* 2-3 in., rugose, sometimes densely tomentose; petiole $\frac{1}{2}$ -2 in. *Spikes* long-peduncled, 1-3 in. long, $\frac{1}{3}$ - $\frac{3}{4}$ in. diam.; flowers $\frac{1}{2}$ in. long, pale purple. *Calyx-tube* very variable in length, glabrous or pubescent; upper lip sometimes with the tip erect throughout the spike.—A protean plant, the varieties of which I fail to distinguish by good characters.

VAR. purpurascens, *Benth.*, from Ava, has narrow purple cylindric spikes and very short calyces.

VAR. glabrior and *villosior*, *Benth.*, explain themselves.

VAR. ? viridis, *Benth. (A. rupestris, Wight)*, is founded on an immature plant with the habit of *A. eriocephalus*. *A. crassus*, *Benth.*, differs in no way from the type.

2. **A. scaber**, *Benth. in DC. Prodr.* xii. 81; shrubby, hoary-tomentose; leaves small petioled oblong obtuse crenulate thick, peduncles very long stout, spikes 1-3 oblong, calyx pubescent, lip deflexed ovate obtuse ciliate.

DECCAN PENINSULA; Courtallum, *Wight*.

Branches short, stout, ascending from a woody stem. *Leaves* 1-1 $\frac{1}{2}$ in., densely tomentose beneath. *Peduncles* 6-12 in.; spikes 1-1 $\frac{1}{2}$ by $\frac{1}{2}$ in., purplish when dry. *Calyx-tube* very short; upper lip glabrous except the ciliate margins.

3. **A. eriocephalus**, *Benth. in DC. Prodr.* xii. 81; herbaceous, glabrous or puberulous, leaves petioled broadly ovate or cordate crenate, peduncles slender, spikes many ovoid or cylindric, calyx villous or woolly.

upper lip deflexed broadly ovate acuminate. *A. decussatus*, *Dalz. & Gibs. Bomb. Fl.* 206.

BEHAR; on the Kymore Hills, *J. D. H.* DECCAN PENINSULA; rocky ghats from the Concan, *Dalzell, &c.*, southwards; Bellary, *Wight*.

A more slender plant than the Concan form of *A. carnosus*, but perhaps only a state of that variable plant.

4. ***A. Wightii***, *Hook. f.*; shrubby, hoary-tomentose, leaves shortly petioled oblong or ovate obtuse crenate, peduncles long stout, spikes 3-6 cylindric narrow, calyx minute villous, upper lip deflexed very small acute.

DECCAN PENINSULA; Anamallay Mts., *Wight*.

A very distinct-looking plant, with the habit and dense pubescence of *A. scaber*, but the long narrow spikes not $\frac{1}{4}$ in. diam., almost black when dry, and the minute calyx (about $\frac{1}{10}$ in. long) with acute upper lip, seem very different.

5. ***A. paniculatus***, *Benth. in DC. Prodr.* xii. 82; stout, shrubby?, glabrous or hoary-tomentose, leaves shortly petioled obovate or rounded obtuse crenate, spikes numerous small short paniced, calyx pubescent or tomentose very short, upper lip small deflexed obtuse ciliate.

DECCAN PENINSULA; Maisor? *G. Thomson*. CEYLON; *Herb. Rottler, Walker*.

Stem very stout below. *Leaves* and *branches* densely ciliate-tomentose in the Madras specimens, puberulous brown in the Ceylon ones. *Spikes* $\frac{1}{4}$ - $\frac{2}{3}$ in. long, on divaricating peduncles and pedicels. *Calyx* hispidly pubescent, about $\frac{1}{12}$ in. long, tube very short. *Fruit* not seen.

** *Fruiting calyx with the upper lip short, broad, recurved or hooded. entire or 3-notched, not concealing the mouth, lower truncate.*

6. ***A. dysophylloides***, *Benth. in Wall. Pl. As. Rar.* ii. 19, *Lab.* 60, and in *DC. Prodr.* xii. 82; silkily tomentose, stout, shrubby, decumbent, leaves thick subsessile obovate or oblong obtuse entire or crenate, spikes very many longer than the leaves axillary and terminal cylindric, peduncles very stout, calyx woolly, corolla-tube very short included. *Wall. Cat.* 2756; *Wight Ic.* t. 1434. *A. purpureus*, and *A. albidus*, *Wight Ic.* tt. 1435, 1436.

NILGHIRI HILLS; *Wight, &c.*; ANAMALLAYS, *Beddome*.

Stem as thick as a swan's quill, woody. *Leaves* 1-2 in., narrowed into the petiole, silky on both surfaces. *Spikes* 1-3 in.; peduncles short, very stout. *Fruiting calyx* $\frac{1}{10}$ in. long, nearly as broad. *Corolla* white or purple.

7. ***A. plantagineus***, *Hook. f.*; dwarf, shrubby, pubescent, stem or branches very short, leaves sessile oblong-obovate obtuse entire, spikes terminal solitary elongate narrow, peduncles very stout tomentose, calyx woolly, corolla-tube exerted declinate.

DECCAN PENINSULA; Bababoodan Hills, *Dalzell, Law, Stocks*.

Rootstock often as thick as the thumb, sending up short stout branches leafy at the top. *Leaves* $\frac{3}{4}$ -1 $\frac{1}{2}$ in. *Spikes* 2-3 in., longer than their peduncles; bracts 3-lobed. *Calyx* small, upper lip obscurely lobed.

8. ***A. suffruticosus***, *Wight Ic.* t. 1437; shrubby, very stout, densely thickly tomentose, leaves shortly petioled ovate-lanceolate subacute entire, nerves very stout and close beneath, spikes numerous long peduncled in terminal racemes, calyx pubescent, corolla-tube exerted sharply declinate from above the base, calyx-lips very short truncate.

NILGHIRI MTS.; Sisparah, *Wight, Gardner*; Tinnevely, *Beddome* (a drawing).

Branches (annual from a woody rootstock, *Wight*) as thick as a swan's quill, covered with broad scars, spreading, tomentose above. *Leaves* towards the ends of the branches, $1\frac{1}{2}$ –2 in. long; petiole and midrib very stout. *Spikes* $1\frac{1}{2}$ –2 in., stout, peduncles usually longer, rarely with 2 spikes, rusty brown when dry.—The Ceylon plant referred to this by Thwaites seems quite different (see end of genus).

9. **A. sericeus**, *Benth. in DC. Prodr.* xii. 82; erect, densely silkily tomentose, leaves densely crowded sessile linear-oblong obtuse subcrenate or entire, nerves stout parallel, spikes in terminal panicles, bracts much longer than the flowers.

DECCAN PENINSULA; Courtallum, *Wight*.

Stem stout, simple, 1–2 ft., densely leafy. *Leaves* $1\frac{1}{2}$ –2 $\frac{1}{4}$ in., rather thick, imbricating, narrowed at the very base. *Spikes* 1–2 in., shortly peduncled; bracts ovate acute, $\frac{1}{8}$ in. long, imbricating over the young flowers.—The material from which Bentham described this consists of two very imperfect specimens of the true plant, along with one of *A. dysophylloides*. *Wight's* later specimens are in full leaf, but very young flower.

10. **A. robustus**, *Hook. f.*; suffruticose, very robust, densely tomentose, leaves very large stoutly petioled ovate crenulate thick reticulate above, spikes slender in terminal panicles with a stout woolly rachis and short peduncles, fruiting calyx ventricose, upper lip truncate recurved, lower very short.

DECCAN PENINSULA; Courtallum, *Wight*.

Stem as thick as the little finger, densely woolly. *Leaves* 4–6 by 2–3 $\frac{1}{2}$ in., obtuse, most densely woolly beneath, nerves diverging, base rounded; petiole 1–2 in., woolly. *Panicle* of spikes 10 in.; rachis woolly. *Spikes* 2–3 in., slender, fruiting only seen. *Fruiting calyx* $\frac{1}{8}$ in., hoary; upper calyx-lip contracted at the truncate tip. *Nutlets* oblong.—A very singular species.

11. **A. verticillatus**, *Hook. f.*; silkily villous, stem stout erect simple, leaves mostly whorled sessile narrowly lanceolate obtuse or acute crenulate or entire, spike large solitary terminal, bracts large lanceolate, fruiting calyx shortly cylindric, lips very short truncate.

THE CONCAN; Cheetah Hills, at Purwar Ghat, *Ritchie, Dalzell, &c.*; Golconda, *Beddome*.

Stem $1\frac{1}{2}$ –3 $\frac{1}{2}$ ft., channelled when dry. *Leaves* 4–6 in a whorl, 2–3 in., spreading and recurved, upper smaller rarely alternate. *Spike* 2–7 in., peduncled; bracts very variable, sometimes $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ in. long, pubescent, very pale blue. *Fruiting calyx* $\frac{1}{8}$ in. long, pubescent, mouth transverse, small.

*** *Fruiting calyx with the upper lip forming a narrow 3-toothed galeate beak decurved closing the mouth; lower very short.*

12. **A. pallidus**, *Wall. Pl. As. Rar.* ii. 18, and *Cat.* 2754; stem tall, branched, puberulous, leaves long-petioled ovate-lanceolate acuminate membranous toothed, spikes paniced long-peduncled, flowering narrowed upwards, fruiting-calyx tomentose, midlobe of upper lip subulate. *Benth. Lab.* 60, and in *DC. Prodr.* xii. 82.

SIKKIM HIMALAYA, alt. 1–5000 ft.; *J. D. H., Clarke*. BURMA; Taong-dong, *Wallich*; Patkoye Mts., *Griffith*; Prome Hills, *Benson*.

Annual, 2–3 ft. *Leaves* 3–8 in.; petiole 1–2 in., very slender. *Spikes* $1\frac{1}{2}$ –3 in., submentose, shorter than their peduncles; fruiting cylindric, much thickened. *Corolla* bluish, tube slender; upper lip inflated, minutely toothed; lower longer, linear, obtuse. *Fruiting calyx* $\frac{1}{8}$ in. long, like a cat's claw.

**** *Fruiting calyx slit in front, mouth very oblique, 1-lipped, lip decurved, 5-toothed, not closing the mouth.*

13. **A. polystachyus**, *Benth. in Wall. Pl. As. Rar.* ii. 19, *Lab.* 66, and in *DC. Prodr.* xii. 82; finely tomentose, stem tall branched, leaves subsessile lanceolate acuminate membranous serrate, spikes paniced long peduncled, flowering narrowed upwards, fruiting calyx curved upwards tomentose. *Wall. Cat.* 2755.

TROPICAL HIMALAYA, from Nepal, *Wallich*, to Mishmi, *Griffith*. KHASIA MTS.; *J. D. H. & T. T. ASSAM*; *Jenkins*.

Annual. *Stem* strict, 3-9 ft., subsimple below. *Leaves* 3-6 in., much narrowed at the base, almost petioled. *Panicles* of spikes sometimes much branched branches and peduncles stout, stiff, suberect. *Spikes* 1-1½ in., hoary-tomentose, fruiting thickened, cylindric. *Corolla* cream-coloured, form as in *A. pallidus*, but tube longer. *Fruiting calyx* ½ in. long, mouth vertical, teeth subequal. *Nutlets* ellipsoid.

DOUBTFUL SPECIES.

A. SUFFRUTICOSUS, *Thwaites Enum.* 238, is not Wight's plant of that name, but more like *A. paniculatus*. The specimen is too imperfect for determination.

A. ADENANTHUS, *Dalz. & Gibs. Bomb. Fl.* 206; spikes dense, pyramidal, floral leaves lanceolate acuminate pubescent 3-nerved 3 lines long, calyx minute oblique truncate scarcely toothed tomentose, corolla glandular-dotted 5 lines long tomentose, lower lip long entire boat-shaped, upper 3- or 4-lobed rounded obtuse short.—Bababoodan Hills, near Darwar, *Dalzell*.

10*. **HYPTIS**, *Jacq.*

Herbs or shrubs. *Inflorescence* various, capitate in the following species. *Corolla* 5-lobed, lower lobe or lip abruptly deflexed, saccate, contracted at the base. *Stamens* 4, declinate; anther-cells confluent. *Style* subentire or 2-fid. *Nutlets* various.—Species 250, all American.

1. **H. brevipes**, *Poit.*; *Benth. in DC. Prodr.* xii. 107; erect, stem pilose or glabrate, leaves petioled ovate oblong or lanceolate serrate hispid above or glabrate, peduncles equalling the globose heads or shorter, bracts lanceolate, calyx pubescent, teeth erect subulate.

MALACCA, *Griffith*; introduced. SINGAPORE; *Anderson*.—DISTRIB. Mexico to Brazil, introduced into Tropical Africa and the Malay Archipelago.

An erect annual. *Leaves* 2-3 in. long, nerves beneath hispid or glabrous. *Heads* ½ in. diam.; bracts often as long, inner and calyx ciliate. *Corolla* about equalling the calyx.

2. **H. suaveolens**, *Poit.*; *Benth. in DC. Prodr.* xii. 126; stem hairy, leaves petioled broadly ovate sinuate and serrulate pubescent villous or tomentose lower cordate, peduncles racemose equalling the globose heads, bracts minute setaceous, calyx striate, mouth villous, teeth erect subulate. *Bysteropogon graveolens*, *Blume Bijl.* 824. *Schauera graveolens*, *Hassk. in Flora*, 1842, ii. *Beibl.* 25.

DECCAN PENINSULA, CACHAR and NICOBAR ISLANDS; introduced.—DISTRIB. Trop. America, introduced into Trop. Asia.

A rigid annual, 2-3 ft. *Leaves* 1-3 in., very variable. *Heads* secund, fruiting ½ in. long, sometimes reduced to a few flowers.

11. **LAVANDULA**, *Linn.*

Herb or shrub. *Leaves* entire or cut. *Flowers* in 2-10 fld. whorls

collected into simple or branched spikes. *Calyx* erect, 13-15-nerved, 5-toothed. *Corolla* blue, 2-lipped, upper lip 2-fid, lower 3-partite, lobes all spreading. *Stamens* 4, declinate, included, filaments free; anther-cells confluent. *Style* 2-fid. *Nutlets* smooth.—Species about 20, chiefly Mediterranean.

1. **L. Gibsoni**, *Grah. Cat. Bomb. Pl.* 149; villous, leaves pinnatifid, lobes oblong or linear, spikes densely villous, bracts ovate-lanceolate. *Dalz. & Gibs. Bomb. Fl.* 206. *L. Perrottetii*, *Benth. in DC. Prodr.* xii. 147. *L. Lawii*, *Wight Ic.* t. 1439.

The CONCAN; hills at Sattara, Law, &c.

Stem 2-3 ft., robust, leafy. *Leaves* 4-8 in., lower petioled, lobes acute or obtuse. *Spikes* few, 1-2 in., robust; bracts villous, 1-fid., $\frac{1}{4}$ in. *Fruiting calyx* 1 in. long.

2. **L. Burmanni**, *Benth. Lab.* 157, and in *DC. Prodr.* xii. 147; pubescent, leaves pinnatisect, segments linear simple or cut, spikes pubescent, bracts subulate. *Grah. Cat. Bomb. Pl.* 149; *Wight Ic.* t. 1438; *Dalz. & Gibs. Bomb. Fl.* 1438. Wawra, *Itin. Pr. S. Cob. Bot.* 109. *L. multifida*, *Burm. Fl. Ind.* 126 (excl. t. 33, f. 1). *Bysteropogon bipinnatus*, *Roth Nov. Sp.* 255. *Chætostachys multifida*, *Benth. in Wall. Pl. As. Rur.* ii. 19, and *Cat.* 2757.

DECCAN PENINSULA; common on the West from the Concan to Coorg. CENTRAL INDIA; Jubbulpore, *Beddome*.

Stem 2-3 ft., stout or slender, simple or branched. *Leaves* 3-4 in. long and broad; segments $\frac{1}{15}$ - $\frac{1}{8}$ in. broad. *Spikes* solitary or few, or numerous and subumbellate; bracts 1-fid., nearly glabrous, tips capillary. *Corolla* blue or white. *Fruiting calyx* $\frac{1}{8}$ in. long.

12. POGOSTEMON, Desf.

Herbs or undershrubs. *Leaves* opposite, very rarely 3-nately whorled. *Flowers* small, in solitary or panicled spikes or contracted racemes formed of many and dense-fid. subcapitate cymes (whorls). *Calyx* subequally 4-5-toothed. *Corolla-tube* exserted or included; limb spreading, sub-2-lipped; lobes 4, lower usually longest. *Stamens* 4, exserted, straight or declinate, filaments usually bearded; anther-cells confluent. *Disc* subentire, equal. *Style* 2-fid. *Nutlets* smooth, ovoid or oblong.—Species about 30, Indian and E. Asiatic.

* Spikes or racemes terminal and axillary, forming a panicled inflorescence. Filaments bearded in all.

† Whorls forming continuous (rarely interrupted) spikes.

1. **P. paniculatus**, *Benth. in Wall. Pl. As. Rar.* i. 30, *Lab.* 153, and in *DC. Prodr.* xii. 151; erect, branched, laxly hairy or villous, leaves petioled ovate irregularly inciso-serrate, base cuneate, whorls globose secund in slender spikes, bracts obliquely suborbicular membranous ciliate, calyx narrow, teeth lanceolate ciliate, filaments bearded. *Wall. Cat.* 1561; *Grah. Cat. Bomb. Pl.* 149; *Dalz. & Gibs. Bomb. Fl.* 207. *Elsholtzia paniculata*, *Willd. Sp. Pl.* iii. 59. *Hyssopus cristatus*, *Lamk. Dict.* iii. 187.—*Rhede Hort. Mal.* x. t. 65.

TENASSERIM; MARTABAN and Tavoy, *Wallich*, &c. PEGU; *McClelland*. W. DECCAN PENINSULA, from the S. Concan to Travaucore.

Stem 3-5 ft., rather flexuous. *Leaves* 3-5 in., very membranous; petiole short or long. *Spikes* 4-8 in.; whorls $\frac{1}{2}$ in. diam.; bracts very variable, shorter or longer than the calyces, regularly secund and imbricate. *Calyx* $\frac{1}{8}$ - $\frac{1}{2}$ in. long, membranous; teeth variable in length.—*P. comosus*, *Miq.*, of Java, is very near this.

2. ***P. Gardneri***, *Hook. f.*; erect, stout, villous, leaves long-petioled ovate inciso-crenate, base cuneate, whorls globose in stout dense spikes, bracts oblong-lanceolate membranous ciliate, calyx-teeth short broad ciliate.

NILGHIRI Mts.; Wynaad, *Wight*, *Gardner*.

Very near *P. paniculatus*, but much stouter, more villous, leaves longer petioled, whorls denser, bracts much narrower, not so unilateral and regularly secund and imbricate, and calyx shorter with broader teeth.

3. ***P. plectranthoides***, *Desf. in Ann. Mus.* ii. 156, t. 6; shrubby, hoary-pubescent, leaves petioled ovate acute doubly-toothed or -serrate, whorls subsecund crowded in large stout spikes, bracts ovate glandular exceeding the hirsute calyx, calyx-teeth shortly triangular-lanceolate ciliate. *Wall. Cat.* 1530; *Benth. in Wall. Pl. As. Rar.* i. 31, *Lab.* 153, and in *DC. Prodr.* xii. 151; *Dalz. & Gibs. Bomb. Fl.* 207; *Bot. Mag.* t. 3238. ? *Origanum benghalense*, *Burm. Fl. Ind.* 128, t. 38, f. 3. ? *O. indicum*, *Roth Nov. Sp.* 265. *Mentha secunda*, *Roxb. Hort. Beng.* 44. ? *M. fruticosa*, *Roxb. Fl. Ind.* iii. 6 (not of his drawings).

WESTERN HIMALAYA, from Nepal to Simla, alt. 1-5000 ft. LOWER BENGAL and BEHAR; Patna and top of Parusnath, *J. D. H.*, &c. The CONCAN, CANARA and the CIRCARS.

A large bush; branches round, often dark purple. *Leaves* 3-6 in., longer than the petiole. *Panicle* usually elongate, whorls distant or confluent, silkily villous. *Calyx* subcylindric, $\frac{1}{8}$ in., silky, ciliate. *Corolla* pink or white.—Roxburgh's description of *Mentha fruticosa* agrees with this, but his drawing represents a different plant with glabrous filaments.

4. ***P. villosus***, *Benth. Lab.* 153, and in *DC. Prodr.* xii. 152; stout, erect, villous all over, leaves large long-petioled ovate acute crenulate or subsinuate and crenate, whorls crowded in cylindric panicle stout spikes not secund, bracts ovate equalling the villous calyx, calyx silky or villous, teeth shortly lanceolate. ? *Elscholtzia villosa*, *Roxb. Fl. Ind.* iii. 4.

SILHET; *Wallich*.

There are two forms of this in *Herb. Wallich*, both with leaves 5-7 in. long and 2-4 broad; one is more robust with exactly ovate finely crenulate leaves; the other is more villous, and has broader sinuate and obscurely crenate leaves, and much more numerous denser and shorter branched panicles. In both the whorls form continuous cylindric spikes 2-3 in. long and $\frac{1}{2}$ in. diam. *Calyx* $\frac{1}{8}$ in., sessile, narrow.

5. ***P. purpurascens***, *Dalz. in Hook. Kew Journ.* ii. 337; erect, branched, softly villous with spreading hairs, leaves long-petioled large membranous ovate or ovate-lanceolate sinuate or cut and toothed or crenate, base narrowly cuneate, whorls dense-fl. globose secund continuous or separate in long peduncled hirsute spikes, bracts narrow falcate equalling the calyx ciliate, calyx tubular, teeth long-subulate ciliate. *Dalz. & Gibs. Bomb. Fl.* 207.

The CONCAN and CANARA; *Law*, &c.

Habit and villosity of *P. Gardneri*, but the calyx-teeth are much longer and more slender. *Stem* 4-angled. *Leaves* sometimes 9 in. long. *Spikes* sometimes as long. *Calyx* $\frac{1}{2}$ in. long. *Corolla* white, with purple upper lip.—Probably a large form of *P. parviflorus*.

6. ***P. parviflorus***, *Benth. in Wall. Pl. As. Rar.* i. 31, *Lab.* 154, and

in *DC. Prodr.* xii. 152; stout, erect, branched, glabrous pubescent or scabrous, leaves long-petioled ovate or ovate-lanceolate singly or doubly crenate-toothed or serrate, base cuneate, whorls dense-fld. subglobose in dense cylindric or one-sided softly hairy spikes, bracts elliptic-ovate exceeding the hirsute calyx, calyx-teeth short triangular-lanceolate ciliate. *Wall. Cat.* 1531. *P. pubescens*, *Benth. in DC. l. c.* *P. frutescens*, *Grah. Cat. Bomb. Pl.* 149. *P. purpuricaulis*, *Dalz. in Hook. Kew Journ.* ii. 336; *Dalz. & Gibs. Bomb. Fl.* 207. *P. intermedius*, *Wall. Cat.* 2327.

SUBTROPICAL HIMALAYA, from Kumaon to Bhotan, alt. 500–4000 ft. ASSAM, KHASIA MTS. and SILHET, alt. 2–3000 ft. CHITTAGONG and TENASSERIM. WEST DECCAN PENINSULA, from the Concan to the Anamallays.—DISTRIB. Burma, Hong-kong.

This most resembles a small *P. plectranthoides*, the bracts imbricating over the flowers in the young spikes, but spikes and narrower bracts are much smaller, and the whole plant when pubescent is never hoary. In its usual glabrous form it is a very distinct plant. The leaves vary much in shape and cutting of the margin, and attain 9 inches in length, and are sometimes velvety beneath. The stem and branches are usually dark purple, but not constantly. *Calyx* $\frac{1}{8}$ in. long, narrow, usually purplish.—It is difficult to distinguish some states of this from *P. Heyneanus*. Benthams says that his var. *Jacquemontii* is almost intermediate between *P. parviflorus* and *glaber*; it has more glabrous leaves and villous spikes.

7. ***P. glaber***, *Benth. in Wall. Pl. As. Rar.* i. 31, *Lab.* 154, and in *DC. Prodr.* xii. 152; erect, branched, glabrous or sparsely hairy, leaves long-petioled ovate or ovate-lanceolate acuminate doubly-toothed or -serrate, whorls small subglobose dense-fld. continuous in slender ciliate spikes, bracts ovate much shorter than the very small calyx, calyx-teeth triangular shortly ciliate. *Wall. Cat.* 1533.

SUBTROPICAL HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 1–3000 ft., *J. D. H. KHASIA Mts.*, alt. 4000 ft.; *Griffith, J. D. H. & T. T.*

Habit of *P. parviflorus*, but spikes more slender, bracts smaller, and calyx only $\frac{1}{10}$ in. long, obovoid, with shortly ciliate teeth. *Stem* and *branches* green or purple, sometimes very dark.

†† *Whorls usually separate, forming interrupted spikes (except P. Patchouli, var. suavis).*

8. ***P. tuberosus***, *Benth. in Wall. Pl. As. Rar.* i. 31, *Lab.* 154, and in *DC. Prodr.* xii. 152; stout, erect, branched, scabrid with stellate hairs, leaves long-petioled ovate or deltoid-ovate acuminate doubly toothed, base cuneate, whorls small subglobose many-fld. distant or separate on the long slender paniced spikes, bracts scabrid oblong shorter than the small scabrid obovoid calyx, calyx-teeth short triangular ciliate.

TROPICAL HIMALAYA, alt. 1–5000 ft.; from Nepal, *Wallich*, to Bhotan, *Clarke*.

Stem and *branches* woody, terete, striate. *Leaves* 3–5 by $1\frac{1}{2}$ – $3\frac{1}{2}$ in., scabrid on both surfaces. *Spikes* 7–10 in. *Calyx* $\frac{1}{10}$ in. *Corolla* twice as long, purple.

9. ***P. Patchouli***, *Pelletier in Mem. Soc. Sc. Orleans*, v. 5, with fig.; erect, branched, pubescent or glabrate, leaves long-petioled ovate acute acuminate or obtuse crenate or simply or doubly toothed or incised, base cuneate, whorls subglobose many- and dense-fld. distinct or subconfluent on the slender pubescent or tomentose paniced spikes, calyx pubescent or tomentose, teeth triangular ciliate. *Benth. in DC. Prodr.* xii. 153; *Dalz. & Gibs. Bomb. Fl., Addend.* 66. *P. Heyneanus*, *Benth. in Wall. Pl. As. Rar.* i. 31, *Lab.* 154, and in *DC. l. c.*; *Wall. Cat.* 1532; *Grah. Cat. Bomb. Pl.*

149; *Dalz. & Gibs. Bomb. Fl.* 207; *Thwaites Enum.* 239; *Wight Ic.* t. 1440.
 ? *Origanum indicum*, *Roth Nov. Sp.* 265.—*Rheede Hort. Mal.* x. 77.

WESTERN PENINSULA, from Bombay southwards, wild and cultivated. CEYLON, common. (MALACCA and SINGAPORE, cult.)—DISTRIB. Sumatra and Borneo (cult. ?).

A herb, 2-3 ft.; stem more or less softly hairy. *Leaves* 2-3 in., rarely more, subglabrous, membranous, sometimes incised; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Spikes* 3-6 in., rarely short and dense; whorls $\frac{1}{2}$ in. diam., usually distant; bracts elliptic, acute, equalling the calyx or shorter. *Calyx* $\frac{1}{8}$ in., teeth acute. *Corolla* very small, tube shortly exserted.—Perhaps only a var. of *P. parviflorus*. A tracing of Pelletier's figure kindly sent me by M. de Candolle enables me to identify *P. Heyneanus* with *P. Patchouli*. It is a common Indian garden plant, noted for its perfume, often much altered by cultivation.

VAR. *suavis*; leaves larger more rounded 3 in. long and broad, margin lobulate and crenate, spike much broader, whorls $\frac{3}{4}$ in. diam., calyx $\frac{1}{4}$ in. angular more pubescent, teeth subulate-lanceolate. *P. suavis*, *Tenore in Giorn. Bot. Ital.* (1847), ii. 56. *P. Patchouli*, *Hook. Kew Journ. Bot.* i. 328, t. 11, *excl. syn. Putcha-pat.*; *Wallich in Kew Journ.* i. 22.—Cult. in Palermo and Kew Bot. Gardens.—This more resembles *parviflorus* in the shape of the calyx-teeth, but it has the scent of *Patchouli*.

10. ***P. amarantoides***, *Benth. in DC. Prodr.* xii. 153; glabrous or minutely pubescent, leaves ovate or oblong acuminate incised-serrate, whorls small few- or many-fld. separate or confluent on the long slender paniced spikes, bracts short, calyx small terete glabrous or hoary, teeth short triangular pubescent within, edges not ciliate but with finely pubescent margins.

SIKKIM HIMALAYA, alt. 5-6000 ft. KHASIA MTS., alt. 5-6000 ft.; *Griffith, &c.*

A tall leafy herb. *Leaves* 3-6 in., serrate or biserrate, membranous; petiole 1-2 in., slender. *Spikes* 2-6 in.; whorls $\frac{1}{4}$ - $\frac{1}{2}$ in. diam.; bracts elliptic. *Calyx* $\frac{1}{2}$ - $\frac{1}{10}$ in., campanulate, terete, more pubescent in the Khasia form. *Corolla* minute, white or pink. *Filaments* purple.—Flowers much smaller, and whole plant more glabrous than in its allies.

11. ***P. elsholtzioides***, *Benth. in DC. Prodr.* xii. 153; erect, branched, stem above young parts and inflorescence hoary-tomentose, leaves petioled lanceolate long-acuminate serrulate glabrous, whorls small subsecund many-fld. separate or confluent in very slender spikes, calyx small terete hoary, teeth narrow subacute not ciliate.

BHOTAN, *Griffith*. KHASIA MTS., *Griffith*; Churra, alt. 4000 ft., *J. D. H. & T. T.*

Very leafy; stem and branches slender. *Leaves* 4-6 in., petiole rather short. *Spikes* 3-4 in.; whorls sometimes all secund, $\frac{1}{6}$ - $\frac{1}{4}$ in. diam. *Calyx* $\frac{1}{10}$ in. long. *Corolla* very short, purple. *Filaments* sparingly hairy.—The very narrow leaves and small second hoary spikes well distinguish this.

** Spikes or racemes simple, axillary and terminal or solitary.

† *Filaments bearded*.

12. ***P. rupestris***, *Benth. Lab.* 156, and in *DC. Prodr.* xii. 154; glabrous, leaves small ovate or ovate-lanceolate coarsely obtusely serrate, racemes slender, whorls distant few-fld., bracts and bracteoles minute, calyx glabrous, teeth short ovate.

CEYLON; Central Province, alt. 5-8000 ft., *Macrae, &c.*

Stem 1-2 ft., often decumbent below. *Leaves* 1-1 $\frac{1}{2}$ in., obtuse, base cuneate

rounded or subcordate, brown when dry; petiole slender, $\frac{1}{4}$ – $\frac{3}{4}$ in. Racemes 1–3 in.; whorls 3–5-fld. Calyx $\frac{1}{4}$ in. long. Corolla minute.

13. **P. hirsutus**, *Benth. Lab.* 155, and in *DC. Prodr.* xii. 154; stem hirsute with reflexed hairs or glabrate, leaves small ovate or ovate-lanceolate coarsely serrate, spikes short stout usually dense-fld., bracts linear-subulate, calyx hispid, teeth lanceolate subulate ciliate. *P. rupestris*, var. β . *hirsutus*, *Thwaites Enum.* 239.

CEYLON; Central Province, alt. 5–7000 ft., *Macrae*, &c.

Stem 1–2 ft., branched, decumbent and rooting below. *Leaves* 1–2 in., hairy above and on the nerves beneath, base rounded or acute; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. *Spikes* usually sessile and dense-fld., $\frac{1}{2}$ in. diam., hirsute. *Calyx* $\frac{1}{4}$ in. long, inflated. *Corolla* minute.—*Thwaites* regards this as a var. of *P. rupestris*, but this must be through inadvertence.

14. **P. paludosus**, *Benth. in DC. Prodr.* xii. 154; stem sparingly pubescent or glabrate, leaves rounded-ovate obtuse coarsely crenate, base rounded, spike strict stiff, whorls small remote few-fld., bracts and bracteoles minute, calyx terete hispid, teeth triangular subacute ciliate.

NILGHIRI HILLS; Ootamacund, *Perrottet*, *Wight*.

Stem stiff, erect. *Leaves* 2 in. long, and nearly as broad, sparingly hairy above and on the nerves beneath; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in., slender. *Spike* 3–5 in., rachis and calyces hispid with spreading hairs; whorls $\frac{1}{2}$ in. diam. *Calyx* $\frac{1}{4}$ in. long.—I have seen only indifferent specimens gathered by *Wight*.

15. **P. fraternus**, *Miquel Fl. Ind. Bat.* ii. 963; much branched, branches above and racemes glandular-tomentose or hirsute, leaves ovate singly or doubly crenate or serrate, racemes terminating all the branches elongate, whorls distinct many-fld., bracts and bracteoles linear, calyx pedicelled hirsute, teeth long lanceolate ciliate. *Pogostemon* n. 28, *Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA, alt. 3–5000 ft.; *J. D. H., Clarke.* KHASIA MTS.; *Lobb. TENASSERIM; Beddome.*—DISTRIB. Java.

Stem 2–3 ft.; branches straggling. *Leaves* 2–4 $\frac{1}{2}$ in., base acute rounded or cordate; petiole sometimes as long as the blade. *Racemes* 3–6 in. long, nearly $\frac{1}{2}$ in. diam.; whorls close but distinct; bracts and bracteoles often as long as the flowers, but very variable; pedicel sometimes as long as the calyx, which is $\frac{1}{2}$ in. long or less and angled. *Corolla* funnel-shaped, twice as long as the calyx.—*Miquel* describes the filaments as glabrous in the Javan plant; they are hairy towards the base in the Indian.

16. **P. Wightii**, *Benth. Lab.* 155, and in *DC. Prodr.* xii. 154; hirsute with long lax cellular often glandular hairs, much branched, leaves ovate doubly crenate or sublaciniate, base rounded or broadly cuneate, spikes stout cylindric dense-fld., whorls densely crowded, bracts and bracteoles short linear, calyx inflated membranous terete glabrous or sparsely hairy, teeth triangular ciliate. *P. petiolaris*, *Benth. in DC. l. c.* *P. hirsutus*, *Wight Ic. t.* 1442.

NILGHIRI and ANAMALLAY MTS., *Wight*, &c., in wet places.

Branches suberect or spreading, stout. *Leaves* 1–2 in., base rarely subcordate; petiole half as long as the blade. *Spikes* 2–4 in., very stout, $\frac{3}{4}$ in. diam.; lowest whorls sometimes remote. *Calyx* $\frac{1}{2}$ in. long, sessile. *Corolla-tube* very short.—Two specimens were amongst the Concan collections of *Stocks*, but I suspect were from the south.

17. **P. mollis**, *Benth. Lab.* 155, and in *DC. Prodr.* xii. 154; villous,

softly tomentose or finely pubescent, leaves shortly petioled orbicular or oblong crenate, tip rounded, spikes cylindric dense-fl., whorls crowded or the lowest distant, bracts and bracteoles slender, calyx small sessile terete villous, teeth subulate-lanceolate ciliate. *P. rotundatus*, *Wight Ic. t. 1441*.

NILGHIRI HILLS; common on outskirts of forests, alt. 7-8000 ft., *Wight*, &c. The CONCAN; *Dalzell, Stocks*.

A low-growing plant, very variable in hairiness, branched from the woody base; hairs of branches not reflexed. *Leaves* 1-1½ in. *Spikes* 3-7 in., ½ in. diam., flexuous, rachis stout. *Calyx* ⅙ in. *Corolla* white, tube hardly exerted. *Filaments* bearded at the middle.—I do not find the leaves to be acute, as represented by *Wight*, in any of the numerous specimens examined.

18. *P. rotundatus*, *Benth. in Wall. Pl. As. Rar. i. 31, Lab. 155*, and in *DC. Prodr. xii. 155*; low, villous, leaves orbicular doubly crenate, base rounded truncate or cordate, spikes stout dense-fl., whorls distinct but close many-fl., bracts and bracteoles linear-subulate, calyx large angled villous, teeth triangular-lanceolate ciliate. *Wall. Cat. 1535*.

DECCAN PENINSULA; *Heyne*.

Stem short, ascending, hairs not reflexed. *Leaves* 1-2½ in. long and broad, laxly hairy on both surfaces; petiole 1 in. and less. *Spikes* 3-5 in., ⅓ in. diam., rachis stout. *Calyx* sessile, ¼ in. long. *Corolla-tube* hardly exceeding the calyx. *Filaments* bearded.—Only known from specimens distributed by *Wallich*. In foliage it much resembles the *P. Patchouli* figured in the *Kew Journal of Botany*, but the calyx is much larger, with broader teeth and the corolla-tube shorter, and there is no appearance of a paniculate form of inflorescence.

19. *P. vestitus*, *Benth. in Wall. Pl. As. Rar. i. 31, Lab. 155*, and in *DC. Prodr. xii. 155*; shrubby, densely white-woolly, leaves shortly petioled thick ovate oblong or cordate crenate rugose above, tip rounded, spikes short thick dense, whorls confluent, bracts and bracteoles linear-subulate, calyx large terete densely villous, teeth triangular-lanceolate. *Wall. Cat. 1534*.

DECCAN PENINSULA, *Heyne*; *Paul Ghaut, Wight*.

A low species; branches stout, terete, often bearing below tufts of long soft shaggy or silky hairs. *Leaves* 1-1½ in., nerves beneath very thick, surfaces equally woolly; petiole stout, ¼-½ in. *Spikes* 2-4 in., ⅓-1 in. diam. *Calyx* ¼ in. long and upwards, teeth woolly not ciliate. *Corolla-tube* a little longer than the calyx. *Filaments* bearded in the middle.

20. *P. strigosus*, *Benth. in DC. Prodr. xii. 155*; erect, branches strigose with erect hairs, leaves subsessile lanceolate acuminate serrate hairy, spikes long slender, whorls confluent or separate below, bracts and bracteoles long slender, calyx tubular terete hirsute, teeth unequal subulate ciliate. *Dysophylla strigosa*, *Benth. in Wall. Plant. As. Rar. i. 30, and Cat. 1549, Lab. 157*.

KHASIA MTS., alt. 4-5000 ft.; *Wallich*, &c.

Stem 2-3 ft.; branches erect. *Leaves* sometimes ternately whorled, 2-3 in., narrowed into the very short stout petiole. *Spikes* 3-5 in., ½ in. diam., rachis stout. *Calyx* ⅙ in., sessile. *Corolla* very small, tube hardly exerted, lobes sparingly hairy. *Filaments* ⅙ in., bearded in the middle.

†† *Filaments naked or nearly so*.

21. *P. atropurpureus*, *Benth. in DC. Prodr. xii. 154*; shrubby, densely velvety, leaves thick stoutly petioled ovate subacute doubly crenulate, spikes with the rachis very stout, whorls crowded few-fl., bracts and

bracteoles minute setaceous, calyx terete tubular velvety, lobes short triangular obtuse ciliate. *P. imberbe*, *Wight mss.*

NILGHIRI HILLS; *Perrottet, Wight, Gardner.*

Branches terete, woody; hairs most dense, reflexed. *Leaves* 1-2 in., dark brown when dry, velvety on both surfaces, base subacute. *Calyx* $\frac{1}{2}$ - $\frac{1}{4}$ in. long, teeth short, throat villous. *Corolla* dark purple; tube slender, exserted. *Filaments* glabrous.

22. ***P. speciosus***, *Benth. in Wall. Pl. As. Rav. i. 31, Lab. 156*, and in *DC. Prodr. xii. 155*; branches above petioles and spikes hirsute with long spreading and glandular hairs, leaves large long-petioled broadly ovate doubly crenate, base rounded or cordate, spikes stout dense, whorls confluent, bracts minute, calyx tubular angled glabrous or sparsely hairy, teeth subulate ciliate or not. *Wall. Cat. 2328; Wight Ic. t. 1443.*

NILGHIRI and ANAMALAY HILLS; on the outskirts of woods, alt. 7-8000 ft.

Stem 2-3 ft., woody. *Leaves* 2-3 in., sometimes nearly as broad, sparsely hairy above and beneath; petiole 1-1 $\frac{1}{2}$ in. *Spikes* 3-5 in. by 1 in. or less. *Calyx* sessile, membranous, $\frac{1}{10}$ in. and under, teeth very narrow. *Corolla-tube* not exserted. *Filaments* $\frac{1}{2}$ in., glabrous.

23. ***P. travancoricus***, *Beddome Ic. Pl. Ind. Or. t. 159*; quite glabrous, leaves long-petioled ovate doubly crenate subacute, base rounded or cuneate, racemes lax-flid., flowers pedicelled reflexed, whorls few-flid., bracts minute or 0, calyx terete glabrous, teeth triangular not ciliate.

TRAVANCORE; Attraymallay Ghat, alt. 4000 ft., *Beddome.*

Stem woody below, branches smooth and racemes black when dry. *Leaves* 1-2 in.; petiole $\frac{1}{2}$ -1 in., slender. *Racemes* 3-6 in., tapering upwards. *Calyx* $\frac{1}{4}$ in., pedicel half its length. *Corolla* funnel-shaped, tube exserted, lobes pubescent. *Filaments* $\frac{1}{2}$ in., glabrous.

24. ***P. reflexus***, *Benth. in DC. Prodr. xii. 155*; branches stout densely shortly tomentose with reflexed hairs, leaves long-petioled ovate or ovate-cordate subacute doubly crenate, spikes villous dense-flid., whorls confluent or lower distinct, bracts minute, flowers sessile spreading or reflexed, calyx densely hirsute or villous terete, teeth triangular-subulate ciliate.

CEYLON; higher parts of the island, alt. 5000 ft., *Mackenzie, Walker, &c.*

Erect, branched, woody below. *Leaves* 2-3 in., pubescent above, velvety beneath, base cordate rounded or acute; petiole stout, $\frac{1}{2}$ -1 in. *Spikes* 2-4 in., $\frac{1}{2}$ - $\frac{3}{4}$ in. diam. *Calyx* $\frac{1}{4}$ in., sessile. *Corolla-tube* shortly exserted, lobes sparsely pubescent. *Filaments* $\frac{1}{3}$ in., glabrous or nearly so.

25. ***P. brachystachys***, *Benth. in DC. Prodr. xii. 156*; low, procumbent below, much branched, branches pubescent with reflexed hairs, leaves small ovate subacute doubly crenate hirsute or finely tomentose, spikes narrow dense villous, whorls confluent or the lower separate, bracts minute linear, calyx minute hirsute or hispid, teeth subulate ciliate.

KHASIA MTS., alt. 4-6000 ft.; *Griffith, Mack, &c.* ASSAM; Naga Hills to N. Burma. *Griffith.*

A low, straggling, much-branched species, procumbent and rooting below, variable in hairiness. *Leaves* 1-2 in., very variable in form, rarely oblong-lanceolate. *Spikes* 1-4 in., narrow, very dense-flid. *Calyx* sessile, $\frac{1}{12}$ in. *Corolla* very small, dull purple; tube hardly exserted; lobes hirsute. *Filaments* $\frac{1}{6}$ in., glabrous or nearly so.—The specific name is not very appropriate.

13. **DYSOPHYLLA**, *Blume.*

Herbs. *Leaves* opposite or whorled. *Flowers* minute, in very dense long spikes formed of many- and dense-flid. cymes (whorls). *Calyx* very

minute, ovoid, equal, 5-toothed, throat naked within. *Corolla* minute, tube exserted or included; limb equally 4-fid; upper lobe entire or 2-fid, lower spreading. *Stamens* 4, exserted, straight or subdeclinate; filaments very long, bearded; anther-cells confluent. *Disc* equal, subentire. *Style* 2-fid. *Nutlets* smooth or rough, ovoid or oblong.—Species about 12, Tropical Asiatic and Australian.

* Calyx-tube terete or obscurely angled.

† *Leaves opposite*.

1. ***D. myosuroides***, *Benth. in Wall. Pl. As. Rar.* i. 30, *Lab.* 157, and in *DC. Prodr.* xii. 156 (*all in part*); perennial, erect, silkily tomentose, branches woody, leaves subsessile linear-oblong obtuse denticulate, spikes very slender 3–5 in. by $\frac{1}{2}$ in. diam. tomentose, calyx-teeth very short triangular. *Wall. Cat.* 1547; *Dalz. & Gibs. Bomb. Fl.* 208. *Mentha myosuroides*, *Roth Nov. Sp.* 257. *M. venulosa*, *Herb. Heyne*.

DECCAN PENINSULA, *Heyne, Wight*; Bababoodan Hills and Copper Mts., Bellary, *Law, Stocks*.

Stem erect, 8–12 in., from a large woody rootstock, terete. *Leaves* 1–1½ by $\frac{1}{4}$ – $\frac{1}{2}$ in., thick, silkily pubescent on both surfaces. *Spikes* very slender, shortly peduncled, flexuous. *Calyx* $\frac{1}{4}$ in., densely tomentose, fruiting hardly enlarged, teeth erect in fruit. *Corolla* minute, glabrous; tube included. *Nutlets* ellipsoid, compressed, granulate.—*Bentham's* var. *bracteata* is founded on a young spike with the bracts protruded.

2. ***D. rugosa***, *Hook. f.*; perennial, erect, appressed, fulvous-woolly, branches woody, leaves subsessile linear-oblong obtuse subentire, spikes slender 2 in. by $\frac{1}{4}$ in. diam. tomentose, calyx-teeth very short triangular. *D. myosuroides*, *Benth. ll. c. in part*. *Mentha rugosa*, *Herb. Heyne*.

DECCAN PENINSULA; Mountains of Tinnevely, *Beddome*; at Pallamcotta, *Heyne*.

Very closely allied to *D. myosuroides*, and confounded with it by Wallich and *Bentham*; of the same size and habit, but not at all silky; form of leaves the same, but nerves more spreading, spikes much shorter and thicker.—*Heyne* seems to have distinguished the two from the names quoted by Wallich, of which that of *M. rugosa* is attached to a specimen in *Rottler's* Herbarium, no doubt collected by *Heyne* himself.

3. ***D. salicifolia***, *Dalz. mss.*; stem and young leaves appressedly pubescent or silky, leaves sessile or petioled linear-lanceolate subentire or remotely serrate, spikes slender 2–4 in. villous, calyx villous short, teeth triangular almost equalling the tube. *Dysophylla* sp. 3, *Herb. Ind. Or. H. f. & T.*

The CONCAN; Mahableshwur Hills, *Gibson*; Hingreege Watercourse, Belgaum, *Ritchie*; Bombay, *Dalzell*.

Stem 1–2 ft., much branched; branches slender, erect, woody. *Leaves* 1–3½ in., rather membranous. *Spikes* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., on slender peduncles; whorls confluent. *Calyx* in fruit $\frac{1}{2}$ in., with erect teeth. *Corolla-tube* exserted, lobes sparsely hairy. *Nutlets* ellipsoid, obtusely 3-gonous, shining.

4. ***D. auricularia***, *Blume Bijl.* 826; annual, hirsute or villous, leaves sessile or shortly petioled oblong serrate, spikes 2–3 in. villous, calyx-teeth triangular incurved in fruit. *Benth. Lab.* 158, in *Wall. Pl. As. Rar.* i. 30, and in *DC. Prodr.* xii. 156; *Wall. Cat.* 1548; *Wight Ic. t.* 1445; *Grah. Cat. Bomb. Pl.* 150. *Mentha auricularia*, *Linn. Mant.* 81; *Roxb. Fl. Ind.* iii. 4; *Griff. Notul.* iv. 200. *M. foetida*, *Burm. Fl. Ind.* 126.

From SIKKIM and ASSAM through E. BENGAL to PENANG and SINGAPORE. DECCAN PENINSULA, from Goa southwards. CEYLON.—DISTRIB. East to S. China, Borneo and the Philippines.

A coarse annual, 1-2 ft.; hairs often shaggy, spreading. *Leaves* 1-3 in., acute or obtuse; petiole rarely $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., pedicelled; whorls all confluent. *Calyx* not $\frac{1}{16}$ in., enlarged in fruit. *Corolla* $\frac{1}{10}$ in., usually pink; tube slender, far exserted; lobes hairy. *Filaments* very villous. *Nutlets* ellipsoid, nearly smooth.—Some very villous specimens from S. India and Ceylon have stouter spikes and white flowers, and may prove to belong to a distinct form.

†† *Leaves in whorls of three or four (rarely more).*

5. **D. quadrifolia**, *Benth. in Wall. Pl. As. Rar.* i. 30, *Lab.* 158, and in *DC. Prodr.* xii. 157; perennial, erect, tomentose, subsilky or pubescent, leaves 4 in a whorl, shortly petioled linear or linear-oblong acute or obtuse serrate or subentire, spikes elongate tomentose or pubescent, base often interrupted. *Wall. Cat.* 1539. *D. velutina*, *Benth. in Wall. Cat.* 1538. *D. linearis*, *Wall. Cat.* 1540. *D. rupestris*, *Dalz. in Hook. Kew Journ.* iii. 120; *Dalz. & Gibs. Bomb. Fl.* 208. *Mentha quadrifolia*, *Roxb. Hort. Beng.* 44, and *Fl. Ind.* iii. 4. *M. quaternifolia*, *Heyne in Herb. Rottl.*; ? *Roth Nov. Sp.* 256. *Chotellia sericea*, *Opiz & Corda in Flora*, 1830, 35.

KHASIA MTS.; on rocks by streams, alt. 3-6000 ft. CHITTAGONG, alt. 300 ft., CLARKE, to TENASSERIM, *Wallich.* SOUTH CANARA; on dry rocks, Malwar, *Dalzell*, &c., from the CIRCARS and CONCAN to MYSORE and the Anamallay Hills, *Heyne*, &c.; Anamallays, *Beddome*.

A stout undershrub, 2-4 ft., with a woody rootstock; stem simple or branched. *Leaves* very variable, 1-4 by $\frac{1}{2}$ - $\frac{3}{4}$ in.; petiole very short. *Spikes* 4-8 in., $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. *Calyx* sometimes glabrate, teeth triangular.—Order of chamomile (*Dalzell*).

6. **D. cruciata**, *Benth. in Wall. Pl. As. Rar.* i. 30, and *Cat.* 1541; *Lab.* 158, and in *DC. Prodr.* xii. 157; hirsute, stem simple erect, leaves 3-6 in a whorl sessile linear obtuse, margins revolute quite entire, spikes villous. *D. tetraphylla*, *Wight Ic.* t. 1444. *Mentha quadrifolia*, *Don Prodr.* 113. *Dysophylla*, *Griff. It. Notes*, 80, n. 1165.

SUBTROPICAL HIMALAYA, from Kumaon, alt. 5000 ft., *Royle*, &c., to Nepal, *Wallich.* KHASIA MTS., alt. 2-4000 ft.; *Griffith*, &c. NILGHIRI HILLS; *Wight*.

Stem 12-18 in., stout, strict. *Leaves* 1-1 $\frac{1}{2}$ in., suberect. *Spikes* sometimes 5 in., $\frac{1}{2}$ in. diam.; whorls confluent. *Calyx* villous. *Corolla-tube* scarcely exserted, lobes glabrous.

7. **D. linearis**, *Benth. in DC. Prodr.* xii. 157; annual, stem erect simple and leaves sparsely hairy or glabrate, leaves sessile 4 in a whorl linear or linear-lanceolate obtuse, margins revolute entire or sparingly toothed, spikes short, calyx glabrous.

KHASIA HILLS, alt. 4-6000 ft., in swamps and rice-fields; *Mack, H. f. & T., Clarke*.

Habit of *D. cruciata*, but nearly glabrous, with very different spikes, $\frac{1}{2}$ -2 in. long and 1- $\frac{3}{4}$ broad, and corolla and nutlets twice as large.

8. **D. verticillata**, *Benth. in Wall. Pl. As. Rar.* i. 30, and *Lab.* 159, and in *DC. Prodr.* xii. 157; annual, erect, branched, glabrous or very sparsely hairy, leaves 4-10 in a whorl linear quite entire or obscurely toothed, spikes sometimes whorled tomentose or villous, teeth of fruiting calyx stellately spreading. *Wall. Cat.* 1544; *Thwaites Enum.* 239, excl. *syn.* *D. ramosissima*, *Benth. in Wall. Cat.* 1543. *D. Benthamiana*,

Hance in Ann. Sc. Nat. Ser. 5, v. 234. *Mentha stellata*, *Lour. Fl. Cochinch.* 36. *M. verticillata*, *Roxb. Hort. Beng.* 44, and *Fl. Ind.* iii. 5. *Pogostemon verticillatus*, *Miq. Fl. Ind. Bat.* ii. 965.

BENGAL, SILHET, RANGOON and TENASSERIM, in swamps and rice-fields. CEYLON; *Rottler, Thwaites*.—DISTRIB. Malay Archipelago, China, Philippine Islands, Australia.

Very variable, sometimes 2 ft. high, excessively branched, with stem as thick as the thumb, at others very slender (var. ? *gracilis*, Benth.), subsimple, with stem as thick as a crow-quill; branches erect. *Leaves* 1–3 in., rarely $\frac{1}{4}$ in. diam., spreading and deflexed. *Spikes* 1–3 in., $\frac{1}{4}$ in. diam. *Calyx* very conspicuous in fruit from the spreading teeth.

9. **D. crassicaulis**, *Benth. in Wall. Pl. As. Rar.* i. 30, *Lab.* 159, and in *DC. Prodr.* xii. 158; annual, glabrous, decumbent below, leaves 4–6 in. a whorl sessile linear or linear-oblong or -lanceolate obtuse subentire or serrate, spikes elongate glabrate or pubescent, calyx campanulate, teeth erect or conniving in fruit. *Wall. Cat.* 1545.

N.W. HIMALAYA, in swamps; Kashmir, Chumba and Kulu, alt. 2–4000 ft., *Jacquemont, Thomson, Clarke*. SIKKIM; *Herb. Griffith, J. D. H.* BENGAL; ASSAM, SILHET and KHASIA MTS., *Wallich, &c.*

Very similar to *D. verticillata*, and similarly variable, best distinguished by the larger flowers, more glabrous calyx with teeth that do not spread stellately. *Leaves* rounded subcordate or acute at the base, very variable in breadth. *Bracts* oblanceolate. *Calyx* $\frac{1}{8}$ in., lobes triangular, fruiting $\frac{1}{10}$ in. *Corolla-tube* exserted, lobes nearly glabrous. *Nutlets* very small, orbicular, compressed, pale, shining.

VAR. *pumila*; dwarf, spikes $\frac{1}{2}$ –1 in., calyx more hairy. *D. pumila*, *Benth. l. c.*; *Wall. Cat.* 1546. *Mentha pumila*, *Grah. in Edinb. New Phil. Journ.* 1828, 393. *M. verticillata*, *Don Prodr.* 114; *Hook. Bot. Mag.* t. 2907.

10. **D. Helferi**, *Hook. f.*; annual, dwarf, erect, glabrous, leaves few 4 in a whorl sessile linear or oblong serrate, spikes short pubescent, calyx-teeth lanceolate erect in fruit.

TENASSERIM; East Pagoda, *Helfer*.

Stem a span high and under, very slender; branches slender, spreading. *Leaves* $\frac{1}{2}$ –1 in. *Spikes* $\frac{1}{2}$ –1 $\frac{1}{4}$ in.; bracts minute, linear-lanceolate. *Calyx* (fruiting) $\frac{1}{2}$ in., campanulate, membranous, sparsely pubescent. *Corolla* not seen. *Nutlets* very minute, orbicular-oblong, dark chestnut, shining.

††† *Annuals. Leaves in whorls of 5 or more, sessile, very narrow, quite entire* (see also sp. 5, 8 and 9).

11. **D. stellata**, *Benth. in Wall. Pl. As. Rar.* i. 30, *Lab.* 159, and in *DC. Prodr.* xii. 158; stem decumbent or creeping below much branched, branches short densely leafy hairy, internodes very short, leaves many in a whorl very short narrowly linear obtuse, margins revolute, spikes slender tomentose, bracts linear or clavellate equalling the flowers, flowering calyx $\frac{1}{30}$ in. hemispheric, teeth short erect or incurved in fruit. *Wall. Cat.* 1542; *Bot. Reg.* 1845, t. 23; *Grah. Cat. Bomb. Pl.* 150; *Dalz. & Gibs. Bomb. Fl.* 209. *Mentha stellata*, *Ham. in Roxb. Fl. Ind.* iii. 5. *M. malabarica*, *Herb. Heyne*.

DECCAN PENINSULA; from Belgaum southwards, in rice-fields.

Branches numerous, ascending, flexuous, stout, leafy to the base with close-set whorls. *Leaves* $\frac{1}{4}$ – $\frac{1}{2}$ in., rarely $\frac{1}{10}$ in. broad, base obtuse, upper often pubescent. *Spikes* 1–2 in., $\frac{1}{4}$ – $\frac{1}{2}$ in. diam., bracteoles filiform or clavellate. *Calyx* $\frac{1}{30}$ – $\frac{1}{20}$ in., cupular or obconic, very variable, a little enlarged in fruit. *Corolla-tube* very short, lobes hirsute. *Nutlets* very small, shining.—The differences between the extreme

forms of fruiting calyx are great, and possibly indicate two species; in some specimens it is almost campanulate with erect teeth, in others almost globose with incurved teeth.

12. **D. tomentosa**, Dalz. in Hook. *Kew Journ.* ii. 337; stout, erect, branched, softly pubescent all over with long hairs, internodes very short, leaves many in a whorl linear obtuse, margins revolute, spikes stout villous, bracts equalling the flowers linear, flowering calyx $\frac{1}{2}$ in. subcampanulate. Dalz. & Gibs. *Bomb. Fl.* 208.

SOUTHERN CONCAN; Malwar, in rice-fields, Dalzell.

Probably a large hairy state of *D. stellata*, with spikes $\frac{1}{2}$ in. diam. Young specimens are decumbent, old and large ones have the habit of *D. Stocksii* and *pentagona*.

13. **D. gracilis**, Dalz. in Hook. *Kew Journ.* ii. 377; stem erect stout or slender hairy or glabrate, internodes very short, leaves sessile 5-20 in a whorl narrowly linear obtuse, or subacute glabrous or hoary, margins revolute quite entire, spikes 1-2 in. slender villous, bracts equalling the flowers filiform, calyx $\frac{1}{10}$ in. campanulate hemispheric and hardly enlarged in fruit with erect teeth. Dalz. & Gibs. *Bomb. Fl.* 208.

DECCAN PENINSULA; Sihadree Hills, near Phonda Ghat, Ritchie, Dalzell.

Very near *D. tomentosa*, with which it agrees in habit, but the spikes are more slender, and the calyx much smaller. The form of the bracts affords an inconstant character in this and in *D. stellata*, of which I suspect this is only a tall form. Stem 2-3 ft., sometimes as thick as a swan's quill. Leaves $\frac{1}{4}$ - $\frac{1}{2}$ in., often recurved. Spikes $\frac{1}{2}$ in. diam. Calyx densely villous.—I do not find the toothing of the leaves described by Dalzell.

14. **D. erecta**, Dalz. in Hook. *Kew Journ.* ii. 337; stem erect tall hispidulous, leaves 9-12 in a whorl linear or almost filiform obtuse or acute glabrous or scaberulous, margins recurved, spikes slender pubescent, bracts very short equalling the calyx clavellate, calyx shortly campanulate, teeth obtuse erect. Dalz. & Gibs. *Bomb. Fl.* 208.

SOUTHERN CONCAN; margins of swamps, Malwar, Dalzell.

This is hardly distinguishable from *D. gracilis*. Dalzell's specimens (named by himself) are of two forms; one from very wet places has nearly simple flexuous stems, almost capillary lower leaves (evidently immersed), and linear obtuse glabrous upper ones $\frac{2}{3}$ in. long, in whorls of about 12; the other, from drier places, is shorter, more robust, much branched, with scaberulous leaves 4-8 in a whorl, and spikes exactly like *D. stellata*, of which I suspect the species is a form.

** Calyx-tube deeply 5-grooved, with 5 elevated ridges (all annuals, with sessile quite entire leaves).

15. **D. pentagona**, Clarke mss.; slender, erect, nearly glabrous, leaves 4 in a whorl linear obtuse, spikes slender pubescent, calyx densely pubescent all over, angles obtuse, mouth closed by the minute obtuse teeth.

CHOTA NAGPORE; at Songhboom, alt. 2000 ft., Clarke.

Stem 12-18 in., branches suberect. Leaves 1-1 $\frac{1}{2}$ in., erecto-patent, base obtuse or acute. Spikes 2-3 in., $\frac{1}{4}$ - $\frac{1}{2}$ in. diam.; rachis hirsute; bracts linear. Fruiting calyx $\frac{1}{18}$ in., nearly globose, pointed at either end; angles or wings thick. Nutlet solitary, linear-oblong, completely enveloped by the calyx-tube.

16. **D. Griffithii**, Hook. f.; slender, erect, nearly glabrous, leaves 4 in a whorl linear obtuse, spikes slender pubescent, fruiting calyx obconic acutely 5-angled, tube glabrous, lobes incurved villous.

ORISSA; at Sumbulpore, *Griffith*.

Habit and foliage of *D. pentagona*, but calyx very different, fruiting about $\frac{1}{2}$ in., chestnut brown and shining below, crowned with white bearded lobes. *Nutlets* 4, minute suborbicular.

17. **D. Stocksii**, *Hook. f.*; very stout, erect, nearly glabrous, leaves 9–20 in. a whorl narrowly linear obtuse, margins recurved, spikes slender, fruiting calyx densely pubescent all over, angles acute, mouth closed by the minute obtuse teeth.

The CONCAN; *Stocks*.

Stem as thick as a goose-quill, decumbent and closely annulate below, branches suberect. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ by $\frac{1}{12}$ – $\frac{1}{15}$ in., spreading. *Spikes* 2–3 in. by $\frac{1}{8}$ – $\frac{1}{4}$ in. diam.; rachis hairy; bracts filiform, tips clavellate. *Calyx* $\frac{1}{4}$ in., lobes as long as the tube, obtuse. *Corolla-tube* very short; lobes nearly glabrous. *Fruiting calyx* $\frac{1}{8}$ in., very concave between the angles. *Nutlet* solitary enclosed as in *D. pentagona*.

14. **COLEBROOKIA**, *Smith*.

A densely woolly hoary shrub. *Leaves* opposite or 3-nate, petioled, rugose, elliptic-oblong, crenulate. *Whorls* dense-fid. in panicled spikes, flowers small; bracts connate. *Calyx-tube* very short; teeth long, subulate, at length elongate, capillary and feathery. *Corolla* minute, tube short; limb very short, subequally 4-fid. *Stamens* 4, very short, included, equal, distant; anthers orbicular, cells confluent. *Disk* equal. *Style* 2-fid; lobes subulate. *Nutlets* hairy, obovoid.

C. oppositifolia, *Smith Exot. Bot.* ii. t. 111; *Benth. in Wall. Pl. As. Rar.* i. 29, *Lab.* 165, and in *DC. Prodr.* xii. 158; *Wall. Cat.* 1528; *Roxb. Fl. Ind.* iii. 26; *Kurz For. Fl.* ii. 277; *Gamble Darjeel. Timbers*, 63, and *Indian Timbers*, 300. *C. ternifolia*, *Roxb. Cor. Pl.* iii. 40, t. 245, and *Fl. Ind.* iii. 25; *Wall. Cat.* 1529; *Benth. ll. c.*; *Grah. Cat. Bomb. Pl.* 150; *Dalz. & Gibs. Bomb. Fl.* 209. *Elsholtzia oppositifolia*, *Poir. Dict. Suppl.* v. 663.

SUBTROPICAL HIMALAYA; from the Salt range and Peshawur to Sikkim, alt. 1–4000 ft. BEHAR, CENTRAL INDIA and the DECCAN PENINSULA to TRAVANCORE. TENASSERIM; *Helper*.

Shrub, 5–10 ft. high; trunk stout; branches stout, terete, often whorled in threes. *Leaves* 4–8 in.; petiole stout, $\frac{1}{2}$ –1 in. *Spikes* very numerous, 2–4 in. long, flowering $\frac{1}{4}$ in. diam., fruiting $\frac{1}{2}$ in. *Calyx* very minute, teeth in fruit $\frac{1}{8}$ in., tube deeply grooved, villous. *Corolla* white.

15. **ELSHOLTZIA**, *Willd.*

Herbs or undershrubs. *Leaves* opposite. *Whorls* in simple or panicled slender or stout terete or second spikes; flowers minute; bracts various. *Calyx* 5-toothed, throat naked, fruiting erect often enlarged or inflated. *Corolla* small, tube straight or incurved; limb oblique or sub-2-lipped, 4-fid, upper lobe or lip erect, notched, the others spreading. *Stamens* 4, diverging or distant, filaments naked; anther-cells divaricate, or at length confluent. *Disk* much produced behind the ovary. *Style* subequally 2-fid, lobes subulate. *Nutlets* smooth or tubercled.—Species about 20, Temperate and Tropical Asiatic and Malayan, one of them also European.

* *Spikes* panicled, cylindric or subsecund; bracts narrow, linear subulate or acicular. *Nutlets* shining. *Aphanochilus*, *Benth.*

1. **E. flava**, *Benth. Lab.* 161, and in *DC. Prodr.* xii. 160; tall,

branches and petioles scaberulous, leaves large long-petioled ovate or rhombic-ovate caudate-acuminate toothed, spikes stout terete puberulous, corolla-tube twice as long as the calyx, fruiting calyx $\frac{1}{2}$ in. pedicelled tubular inflated below, teeth erect. *Aphanochilus flavus*, *Benth. in Wall. Pl. As. Rar.* i. 28, t. 34, and *Cat.* 1553.

TEMPERATE HIMALAYA; from Kumaon to Nepal, alt. 5-9500 ft. KHASIA MTS., alt. 5-6000 ft.

An annual bush, 3-5 ft.; branches obtusely 4-angled, sometimes muricate. *Leaves* 4-8 in., base cuneate rounded or cordate. *Spikes* axillary and terminal, 2-4 in., $\frac{1}{2}$ in. broad in fruit. *Bracts* ovate or lanceolate acute, deciduous. *Flowers* shortly pedicelled. *Corolla* yellow, puberulous. *Nutlets* ellipsoid, dark brown.

2. **E. polystachya**, *Benth. Lab.* 161, and in *DC. Prodr.* xii. 159; tall, branched, puberulous or hoary-pubescent, leaves subsessile lanceolate or elliptic-lanceolate acuminate serrate, spikes long slender, corolla villous, tube twice as long as the calyx, fruiting calyx $\frac{1}{2}$ in. pedicelled narrowly tubular curved, teeth erect. *Gamble Ind. Timbers*, 301. *Aphanochilus polystachyus*, *Benth. in Wall. Pl. As. Rar.* i. 27, t. 33, and *Cat.* 1554. *Colebrookia oppositifolia*, *Lodd. Bot. Cab.* t. 487. ? *Perilla fruticosa*, *Don Prodr.* 115.

TEMPERATE HIMALAYA; from Kashmir to Sikkim, alt. 7-9000 ft., *Wallich, &c. KHASIA MTS.*, alt. 4-5500 ft., *Griffith, &c.*

An annual bush, 3-4 ft.; branches obscurely 4-angled. *Leaves* 3-6 in., rather rigid, base acute, sometimes deeply toothed or crenate. *Spikes* 4-10 in., often fascicled, flowering $\frac{1}{2}$ in. diam., narrower in fruit; bracts minute. *Corolla* white, pubescent. *Fruiting calyx* ribbed to the base, with short triangular acute teeth. *Nutlets* narrow.—Bentham cites Don's *Perilla fruticosa*, but his description of the calyx with linear teeth and corolla with a very large midlobe of the lower lip is wholly at variance. Graham (*Cat. Bomb. Pl.* 150) gives "Chibler in the Surat collectorate as a habitat," which is very unlikely, and is not taken up in Dalzell and Gibson's Bombay Flora.

3. **E. Thompsoni**, *Hook. f.*; stout, densely tomentose, leaves subsessile lanceolate acuminate serrate, spikes leafy interrupted, corolla-tube shortly exserted, fruiting calyx $\frac{1}{2}$ in. pedicelled tubular straight woolly, teeth spreading.

ODDH; at Gadughat, *R. Thompson.*

Branches terete, very stout, with brown close short pubescence. *Leaves* 4-5 in., hard, scabrid above, almost woolly beneath. *Spikes* many, panicle, bracts leafy, buds woolly. *Corolla* pubescent. *Calyx* ribbed to the base; teeth short, broadly triangular. *Nutlets* linear-oblong.

4. **Beddomi**, *Clarke mss.*; hoary-tomentose, branches slender, leaves shortly petioled narrowly oblong-lanceolate obtuse crenulate, hoary on both surfaces, spikes long slender terete white-villous interrupted, corolla tomentose, tube incurved twice as long as the calyx.

TENASSERIM; Thongyeen forests, *Beddomi.*

Shrubby? *Branches* nearly terete. *Leaves* 2-3 by $\frac{1}{2}$ - $\frac{1}{2}$ in., rather thick, base entire narrowed into the petiole. *Spikes* 3-4 in., $\frac{1}{2}$ in. diam., very white; bracts minute, lanceolate; flowers $\frac{1}{2}$ in. long, sessile. *Calyx-teeth* lanceolate; fruiting not seen.

5. **E. blanda**, *Benth. Lab.* 162, and in *DC. Prodr.* xii. 160; slender, puberulous or hoary, leaves petioled elliptic-lanceolate acuminate serrate, spikes slender panicle one-sided, corolla-tube short, fruiting calyx

$\frac{1}{2}$ in. pedicelled urceolate glandular-pubescent, teeth erect lanceolate. *Aphanochilus blandus*, *Benth. in Wall. Pl. As. Rar.* i. 19, and *Cat.* 1550; *Bot. Mag.* t. 3091. ? *Perilla elata*, *Don Prodr.* 115. *Mentha blanda*, *Wall. mss.*

CENTRAL and EASTERN HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 3-7500 ft., *J. D. H.*, &c. KHASIA MTS., alt. 2-6000 ft., *De Silva*, &c. Tenasserim, *Beddome*.—DISTRIB. Ava, Sumatra.

Bushy, 2-5 ft. high; branches slender, obtusely 4-angled. *Leaves* 1-4 in.; petiole short. *Spikes* 2-5 in., flowering $\frac{1}{2}$ in. diam., fruiting broader, whorls lax or dense; bracts subulate-lanceolate. *Corolla* white, sparingly pubescent. *Fruiting calyx* short, mouth contracted. *Nutlets* broadly ellipsoid.—Bentham refers *Don's Perilla elata* to this, but the description of the leaves "scabrid above, tomentose beneath," does not agree. He also quotes "Arabia" on Forsköl's authority as a habitat, which is most improbable.

6. ***E. incisa***, *Benth. Lab.* 162, and in *DC. Prodr.* xii. 161; puberulous, leaves long-petioled broadly ovate obtuse coarsely crenate-toothed, petiole winged above, spikes terete, flowering very slender terete, corolla-tube short, fruiting calyx urceolate $\frac{1}{2}$ in. sessile glandular-pubescent, teeth erect lanceolate. *Aphanochilus incisus*, *fœtens* & *paniculatus*, *Benth. in Wall. Pl. As. Rar.* i. 29, 30, and *Cat.* 1551, 1552, 1557. *Perilla leptostachya*, *Don Prodr.* 115. *Hyptis stachyodes*, *Link Enum.* ii. 106. *Mentha paniculata*, *Roxb. Fl. Ind.* iii. 4. *M. blanda*, *DC. Pl. Rar. Hort. Genes.* 27, t. 8.

TEMPERATE and SUBTROPICAL HIMALAYA; often in cultivated fields, from Kishmir to Mishmi, alt. 3-5000 ft. CHITTAGONG; *Roxburgh*.—DISTRIB. Ava.

A tender herb, 1-3 ft., branches 4-gonous. *Leaves* 1-2 in., membranous, base entire, cuneate, produced into the slender petiole, which is as long as the blade. *Spikes* paniced, 4-6 in., flowering $\frac{1}{2}$ in. diam., fruiting $\frac{1}{2}$ in.; bracts setaceous, often exceeding the flowers. *Corolla* minute, tube short, lobes glabrous. *Nutlets* ellipsoid.

VAR. ? *major*; tall very stout, stem with soft spreading hairs, fruiting spikes very stout, $\frac{1}{2}$ in. diam., fruiting calyx $\frac{1}{2}$ -nearly $\frac{1}{2}$ in.—Kumaon, near Dol, alt. 6500 ft., *Strachey*. Sikkim, at Ryang, alt. 6000 ft., *Clarke*.—I have seen only fruiting branches.

7. ***E. Griffithii***, *Hook. f.*; hoary-pubescent, leaves short-petioled lanceolate subacute, spikes short terete dense-fld., calyx in flower narrow, teeth lanceolate, 2 upper much the longest.

UPPER ASSAM; Mishmi Hills, *Griffith*.

Habit of *E. incisa*, but leaves rigid, 1 by $\frac{1}{2}$ in., narrowed into a petiole not one-third the length of the blade. *Spikes* 1-2 in., flowering $\frac{1}{2}$ in. diam., very dense-fld.; bracts setaceous, exceeding the flowers. *Calyx* hoary-pubescent; fruiting not seen. *Corolla-tube* twice as long as the calyx, lobes pubescent.

8. ***E. pilosa***, *Benth. Lab.* 163, and in *DC. Prodr.* xii. 162; coarsely hairy, leaves petioled ovate obtuse coarsely crenate, spikes subsolitary short stout terete dense-fld., bracts subulate awned ciliate longer than the flowers, fruiting calyx $\frac{1}{2}$ in. urceolate hispid, teeth lanceolate. *Aphanochilus pilosus*, *Benth. in Wall. Pl. As. Rar.* ii. 30, and *Cat.* 1556.

TEMPERATE HIMALAYA; from Kumaon to Sikkim, alt. 5-7000 ft., *Wallich*, &c. KHASIA MTS., alt. 4-6000 ft.

A coarse herb, 1-2 ft.; stem stout or slender, hairs flaccid. *Leaves* 1-2 by $\frac{1}{2}$ - $\frac{3}{4}$ in., membranous, base cuneate; petiole $\frac{1}{2}$ - $\frac{1}{2}$ in. *Spikes* 1-1 $\frac{1}{2}$ in., stout both in flower and fruit, hispid, very dense-fld.; bracts rigid, with a stout pale midrib. *Calyx-teeth* very unequal. *Corolla* minute, lobes hairy.

** *Bracts rounded or broadly ovate, very short. Nutlets opaque.*

9. **E. densa**, *Benth. Lab.* 714, and in *DC. Prodr.* xii. 162; sparsely pubescent, leaves shortly petioled oblong-lanceolate or elliptic acute or obtuse serrate, spikes oblong or shortly cylindric villous, bracts short rounded, fruiting calyx $\frac{1}{4}$ in. broadly funnel-shaped inflated membranous, teeth short rounded. *Jacquem. Voy. Bot.* 127, t. 131. *E. eriostachya*, *Herb. Ind. Or. H. f. & T.*

WESTERN HIMALAYA and WESTERN TIBET; from Kumaon to Ladak, alt. 10–13,000 ft., *Jacquemont*, &c.

Annual, 6–18 in., branched from the base; stem slender to very stout, 4-angled. *Leaves* 1–3 in., rarely ovate or elliptic; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Spikes* 1–1 $\frac{1}{2}$ in., or more and interrupted, fruiting $\frac{3}{4}$ – $\frac{3}{8}$ in. broad; bracts shorter than the flowers. *Calyx*, flowering very minute, cupular; fruiting greatly enlarged. *Corolla* minute, villous, lilac, tube very short. *Nutlets* $\frac{1}{10}$ in. long, ellipsoid, opaque.

10. **E. eriostachya**, *Benth. Lab.* 163, and in *DC. Prodr.* xii. 162; softly hairy, leaves shortly petioled oblong or ovate-oblong obtuse denticulate, spikes solitary cylindric stout villous, bracts short ovate, fruiting calyx $\frac{1}{2}$ in. campanulate membranous, teeth minute triangular. *E. Hoffmeisteri*, *Klotzsch in Reise Pr. Waldem. Bot.* 105, t. 66. *Aphanochilus eriostachya*, *Benth. in Wall. Pl. As. Rar.* i. 29, and *Cat.* 155.

ALPINE HIMALAYA; from Kumaon, alt. 10–12,000 ft., *Blinkworth*, &c., Nepal, *Wallich*, to Sikkim, alt. 14–16,000 ft., *J. D. H.*

A strong-scented annual, 6–18 in., branched from the base, branches 4-angled suberect. *Leaves* 1–1 $\frac{1}{2}$ in., sometimes tomentose beneath; petiole $\frac{1}{2}$ – $\frac{1}{4}$ in. *Spikes* 1–2 $\frac{1}{2}$ in., flowering $\frac{1}{2}$ in. fruiting $\frac{1}{2}$ in. diam.; flowers densely imbricate. *Calyx*, flowering $\frac{1}{10}$ in. *Corolla* very minute, yellow. *Nutlets* $\frac{1}{10}$ in., ellipsoid, opaque.

VAR. *pusilla*; dwarf, 3–6 in., stem usually simple, leaves $\frac{1}{2}$ – $\frac{1}{3}$ in., fruiting calyx smaller. *E. pusilla*, *Benth. Lab.* 714, and in *DC. Prodr.* xii. 162.—Interior Himalaya; from Sikkim to W. Tibet, alt. 12–16,000 ft., and to 18,000 ft. in Rupchu, *Stoliczka*.

*** *Spikes cylindric; bracts broad, obcuneate, membranous, ciliate, forming together imbricating cups longer than the calyx.* CYCLOSTIGIA, *Benth.*

11. **E. strobilifera**, *Benth. Lab.* 163, and in *DC. Prodr.* xii. 162; sparsely hairy, leaves small petioled ovate obtuse crenulate or serrate, spikes villous or pubescent. *Cyclostigia strobilifera*, *Benth. in Wall. Pl. As. Rar.* i. 30, *excl. syn.*, and *Cat.* 1562.

TEMPERATE and ALPINE HIMALAYA; from Simla, alt. 5–10,000 ft., to Sikkim, alt. 6–14,000 ft.

Very variable, from a simple filiform stem 2 in. high, to a much-branched herb of 18 in.; stem and branches with usually a line of crisp hairs. *Leaves* $\frac{1}{2}$ –1 in., rarely ovate and coarsely serrate; petiole $\frac{1}{2}$ – $\frac{1}{4}$ in. *Spikes* $\frac{1}{2}$ –2 in., fruiting sometimes $\frac{1}{2}$ in. diam.; bracts imbricating all round the spike very broad, margin semicircular. *Calyx* hyaline, narrow-tubular, fruiting $\frac{1}{10}$ in., teeth lanceolate. *Corolla-tube* very slender, much longer than the calyx, lobes minute glabrous. *Nutlets* $\frac{1}{10}$ in., oblong, red-brown, not shining.

**** *Spikes completely one-sided; bracts large, secund, orbicular, cuspidate, closely imbricate, membranous, ciliate.* ELSHOLTZIA, *Willd.*

12. **E. cristata**, *Willd. Sp. Pl.* iii. 29; nearly glabrous, leaves long-petioled ovate- or elliptic-lanceolate acuminate coarsely serrate, spikes broad pubescent or villous, fruiting calyx $\frac{1}{2}$ in. tubular hairy. *Benth. in Wall.*

Pl. As. Rar. i. 29, and *Cat.* 1560; *Lab.* 164, and in *DC. Prodr.* xii. 163; *Bot. Mag.* t. 2560. *Mentha ovata*, *Cav. Ic.* 36, t. 360, f. 1. *Hyssopus ocyimifolius*, *Lamk. Dict.* iii. 187. *Perilla polystachya*, *Don Prodr.* 115.

TEMPERATE and TROPICAL HIMALAYA; from Kashmir to Mishmi, alt. 1–9000 ft. WESTERN TIBET, alt. 9–11,000 ft. (Nilghiris, introduced).—DISTRIB. N. Europe, N. Asia, China, Japan.

An erect fragrant herb, very variable in size, from 6 in. to 2 ft.; stem simple or branched. *Leaves* 1–3 in., membranous, base cuneate; petiole half as long as the blade or more. *Spikes* 1–3 in., fruiting $\frac{1}{2}$ in. diam. or less, rather villous; bracts shortly petioled, cusps acicular. *Calyx* minute in flower, in fruit vesicular, teeth triangular. *Corolla* pink or purplish, tube exserted, curved; limb villous. *Nutlets* $\frac{1}{8}$ in., oblong, smooth.—Some N. Chinese specimens are almost woolly.

DOUBTFUL SPECIES.

E. LEPTOSTACHYA, *Benth. Lab.* 713, and in *DC. Prodr.* xii. 160; *Cambess. in Jacquem. Voy. Bot.* 128, t. 32, from Kashmir (Jacquemont). I have seen no specimens. Bentham compares it with *E. polystachya*, from which the extremely slender spike distinguishes it, as do the distant whorls, and leaves contracted above the base. Is it an *Elsholtzia*?

16. *PERILLA*, *Linn.*

Herbs. *Leaves* opposite. *Whorls* 2-fld., in second axillary and terminal simple or paniced racemes; flowers and bracts small. *Calyx* campanulate, 5-toothed; fruiting greatly enlarged, 2-lipped, base gibbous, upper lip dilated 3-toothed, lower of 2 lanceolate-subulate teeth. *Corolla-tube* short, throat bell-shaped, 5-fld. *Stamens* 4, subequal, erect, distant, hardly exserted; anther-cells distinct, parallel, at length diverging. *Disk* a large posticous gland. *Style* equally 2-fld. *Nutlets* subglobose, coarsely reticulate.—Species 1 (or 2), Eastern Asiatic.

P. ocimoides, *Linn.*; *Benth. Lab.* 166, in *Wall. Pl. As. Rar.* i. 29, and *Cat.* 1558, and in *DC. Prodr.* xii. 163; *Grah. Cat. Bomb. Pl.* 150; *Don Prodr.* 114; *Bot. Mag.* t. 2395. *P. macrostachya*, *Benth. in Wall. Cat.* 1559. *Ocimum frutescens*, *Linn. Sp. Pl.* ii. 832, excl. syn. *Rheede. Melissa maxima*, *Arduin Sp.* ii. 28, t. 13. *Mentha perilloides*, *Willd.*; *Lamk. Dict.* iv. 112; *Roxb. Fl. Ind.* iii. 7.

TROPICAL and TEMPERATE HIMALAYA; from Kashmir to Bhotan, alt. 1–10,000 ft., common, often cultivated. KHASIA MTS., alt. 3–6000 ft.—DISTRIB. Burma, China, Japan.

A coarse aromatic often shaggy annual, 2–4 ft. *Leaves* 3–6 in., ovate or rounded, obtuse toothed serrate or coarsely crenate; petiole 1–3 in. *Racemes* 3–8 in., erect; bracts lanceolate. *Corolla* white, $\frac{1}{2}$ in. *Fruiting calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., villous. *Nutlets* $\frac{1}{10}$ in.—Some Japan specimens are nearly glabrous; others have fruiting calyx $\frac{1}{4}$ in., and nutlets nearly $\frac{1}{12}$ in.

DOUBTFUL SPECIES.

PERILLA FRUTICOSA, *Don Prodr.* 115, see under *Elsholtzia polystachya*, p. 643.

PERILLA ELATA, *Don Prodr.* 115, see *Elsholtzia blanda*, p. 643.

17. *MOSLA*, *Ham.*

Annual fragrant herbs. *Leaves* opposite. *Whorls* 2-fld., in terminal and axillary second racemes; flowers and bracts very minute or the lower leafy. *Calyx* campanulate, 5-toothed, fruiting enlarged, subequal or 2-lipped, base gibbous; upper lip truncate or 3-toothed, lower of 2 longer teeth; throat closed with hairs. *Corolla-tube* naked or with a ring of hairs; lips

short, upper notched, lower 3-fid. *Stamens* 2, posticous, short, erect, distant; anther-cells 2, divaricate; staminodes 2. *Disk* a large posticous gland. *Nutlets* globose, smooth or reticulate.—Species 6, East Asiatic.

M. dianthera, *Maximovicz in Bull. Imp. Acad. Petersb.* ix. 430; slender, sparsely pubescent, leaves petioled ovate acute serrate, nutlets reticulate. *M. ocimoides*, *Ham. mss. in Benth. Lab.* 366. *Hedeoma nepalensis*, *Benth. Lab.* 366, and in *DC. Prodr.* xii. 244; *Dene. in Jacquem. Voy. Bot.* 133, t. 138. *Melissa nepalensis*, *Benth. in Wall. Pl. As. Rar.* i. 66; *Wall. Cat.* 2124. *Moschosma ocimoides*, *Reichb. in Wall. Cat.* 2712. *Lycopus dianthera*, *Ham. in Roxb. Fl. Ind.* i. 144. *Cunila Buchanaui*, *Spreng. Syst.* i. 54. *C. nepalensis*, *Don Prodr.* 107.

TROPICAL and TEMPERATE HIMALAYA and N. BENGAL PLAINS; from Kashmir to Bhotan, alt. 1–6000 ft. KHASIA MTS., alt. 0–5000 ft. CHITTAGONG, *J. D. H. & T. T.*—DISTRIB. Burma, China.

A very strong-scented strict erect herb, 1–3 ft. *Leaves* 1–1½ in.; petiole ½–¾ in. *Racemes* very slender, terminating the branches, lax-fld. *Corolla* ¼ in. long, white or purplish, tube short. *Fruiting calyx* ½ in., hemispherical. *Nutlets* as in *Perilla*.—The other described species are all extremely near *M. dianthera*, and perhaps forms of it.

18. MENTHA, Linn.

Strong-scented perennial herbs, rootstock creeping. *Whorls* many-fld., in axillary and terminal spikes, bracts various; flowers small. *Calyx* campanulate or tubular, 5-toothed, throat naked or villous. *Corolla* subequally 4-lobed. *Stamens* 4, equal, erect, distant; anther-cells parallel. *Style-arms* short. *Nutlets* smooth or reticulate.—Species about 25, N. temp. regions, introduced in many countries.

Mentha viridis, L. (spear-mint), *M. piperita*, L. (peppermint), *M. sativa*, L., and *M. aquatica*, L., occur in Indian gardens, and as escapes.

1. **M. sylvestris**, Linn.; leaves broadly or narrowly oblong obovate or lanceolate subacute serrate hoary beneath, whorls in terminal spikes, calyx-teeth triangular or lanceolate, corolla hairy glabrous within. *Benth. Lab.* 171, and in *DC. Prodr.* xii. 166; *Reichb. Ic. Fl. Germ.* t. 82.

TEMPERATE WESTERN HIMALAYA and WESTERN TIBET; from Kashmir to Gurwhal, alt. 4–12,000 ft., *Royle, &c.*—DISTRIB. Afghanistan, Temp. Europe and W. and Central Asia.

Stem robust or slender, 2–3 ft., hoary-tomentose. *Leaves* 1–3 by ¾–2 in., base rounded or cordate. *Spikes* 1–3 in., ¼–½ in. diam.; bracts lanceolate; pedicels hairy. *Corolla* lilac, about ½ in. diam. *Nutlets* usually pale, smooth, sometimes brown and conspicuously delicately reticulate.

I have vainly endeavoured to find any character whereby to distinguish *M. incana* and *Royleana* from *M. sylvestris*, the only available one afforded by the calyx being excessively variable. Boissier unites them under one variety *δ. petiolata* (*Fl. Orient.* iv. 543), distinguished from *sylvestris* proper by the hoariness and petioled leaves, but I think the slender spike and usually minute calyx of *incana* are better varietal characters. Strachey and Winterbottom's specimens from Gurwhal (Niti, alt. 11,500 ft.) appear to be typical *M. sylvestris* with purplish calyces.

VAR. incana; uniformly hoary-tomentose, spikes slender much interrupted, calyx very small, teeth short. *M. incana*, *Willd. Enum. Hort. Berol.* 609; *Benth. Lab.* 170, and in *DC. Prodr.* xii. 169.—Simla to Murree, Mooltan, *Edgeworth*.—Sometimes densely woolly. Peshawur specimens have small capitate spikes.

VAR. Royleana; uniformly hoary-tomentose, spikes stout usually continuous, calyx-teeth lanceolate or triangular with subulate lips. *M. Royleana*, *Benth. in Wall. Pl. As. Rar.* i. 29, and *Cat.* 1537; *Lab.* 171, and in *DC. Prodr.* xii. 169.

2. **M. arvensis**, Linn.; hairy or glabrate, leaves shortly petioled or sessile oblong ovate or lanceolate serrate, whorls axillary capitate, calyx-teeth triangular or lanceolate. *Benth. in DC. Prodr.* xii. 171; *Boiss. Fl. Orient.* iv. 544.

WESTERN HIMALAYA; Kashmir, alt. 5–10,000 ft.—DISTRIB. Europe, N. and W. Asia to China.

Stem 1–2 ft. *Leaves* 1–2 in., obtusely or acutely serrate. *Bracts* acute, shorter than the flowers. *Calyx* hairy. *Corolla* hairy without and within.

VAR. *javanica*; leaves lanceolate, calyx-teeth longer, often exceeding the tube. *M. javanica*, *Blume Bijl.* 826; *Benth. l. c.* *M. sativa*, *Roxb. Fl. Ind.* iii. 6. *M. arvensis*, *Thwaites Enum.* 239.—Malacca, *Griffith*; Ceylon, *Gardner*, &c., borders of paddy-fields in the Central Province, *Thwaites*.—I suspect this is introduced, and is *M. sativa*, L., to which Boissier refers as a synonym to *M. arvensis*, L.

19. **LYCOPUS**, Tourn.

Marsh perennial herbs. *Leaves* toothed or pinnatifid. *Flowers* small in dense axillary whorls. *Calyx* subequally 4–5-toothed, throat naked. *Corolla* campanulate, subequally 4–5-fid. *Stamens* 2, distant; anther-cells parallel; staminodes 2. *Style* 2-fid, lobes flattened. *Nutlets* smooth, obovate, compressed, margins thickened.—Species 2, N. temp. regions and Australia.

L. europæus, Linn.; glabrous or puberulous, leaves sinuate-toothed or serrate, staminodes minute. *Benth. in DC. Prodr.* xii. 179; *Boiss. Fl. Orient.* iv. 545.

WESTERN HIMALAYA; Kashmir, alt. 1–6000 ft.—DISTRIB. Europe, W. N. and Central Asia.

Rootstock creeping or stoloniferous. *Stem* 1–3 ft. *Leaves* subsessile, elliptic-oblong, sometimes pinnatifid. *Corolla* blueish-white, dotted with purple, hairy within. *Nutlets* longer than the calyx-tube.

VAR. *exaltata*; stouter, leaves more pinnatifid, staminodes capitellate. *L. exaltatus*, Linn.; *Benth. in DC. Prodr.* xii. 179; *Boiss. Fl. Orient.* iv. 545.—Kashmir, alt. 3–6000 ft.—Distrib. of *L. europæus*.

20. **ORIGANUM**, Tourn.

Aromatic herbs or undershrubs. *Leaves* entire or toothed. *Cymes* corymbose, bracts large, imbricating. *Calyx* 10–13-nerved, 5-toothed or 2-lipped; throat villous. *Corolla* obscurely 2-lipped, upper lip notched or 2-fid; lower spreading, 3-fid. *Stamens* 4, distant, ascending; anther-cells distinct, spreading. *Style-lobes* acute. *Nutlets* smooth.—Species about 25, of N. temperate regions.

The Marjoram, *O. Marjorana*, L. (*O. Wallichianum*, *Benth. in Wall. Cat.* 1565) is extensively cultivated in India.

O. vulgare, Linn.; erect, villous or glabrate, corymbosely branched, leaves broadly ovate. *Benth. in DC. Prodr.* xii. 193; *Boiss. Fl. Orient.* iv. 551. *O. Watsoni*, *T. A. Schmidt in Trim. Journ. Bot.* 1868, 234, t. 82, f. 5–7. *O. normale*, *Don Prodr.* 113; *Benth. in Wall. Pl. As. Rar.* i. 31, in *Lab.* 335, and in *DC. l. c.*; *Wall. Cat.* 1564. *O. laxiflora*, *Royle in Hook. Bot. Misc.* iii. 376; *Benth. Lab.* 336, and in *DC. l. c.* 194.

TEMPERATE HIMALAYA; from Kashmir to Sikkim, alt. 7–12,000 ft.—DISTRIB. Europe, N. Africa, W. and N. Asia.

Stoloniferous, erect or prostrate; stem 1–3 ft. *Leaves* $\frac{1}{2}$ –1 in., entire or toothed,

lower early withering. *Cymes* $\frac{1}{2}$ –1 in., ovoid, 4-gonous; bracts green or purple, ovate, obtuse or acute. *Flowers* dimorphic, larger 2-sexual, purple, smaller ♀, paler. *Calyx-teeth* short. *O. laxiflorum*, Royle, is a prostrate state. *O. normale*, Don, has usually smaller less-coloured bracts, but intermediates are very common.

21. THYMUS, Linn.

Small, slender, much-branched shrubs, very aromatic. *Leaves* small, quite entire. *Cymes* few-fld., in dense or lax spikes, bracts minute; flowers small. *Calyx* 10–13-nerved, 2-lipped; throat villous. *Corolla* obscurely 2-lipped; upper lip straight, flattish, notched, lower 3-fld. *Stamens* 4, distant, straight, lower pair longer; anther-cells parallel or diverging. *Style-lobes* subulate. *Nutlets* nearly smooth.—Species about 50, of N. temperate regions.

T. Serpyllum, Linn.; branches prostrate or ascending, leaves ovate linear oblong or obovate obtuse. *Benth. in DC. Prodr.* xii. 200; *Boiss. Fl. Orient.* iv. 554. *T. linearis*, *Benth. in Wall. Pl. As. Rar.* i. 31, *Lab.* 346, and in *DC. Prodr.* xii. 202; *Wall. Cat.* 1567.

WESTERN TEMPERATE HIMALAYA; from Kashmir to Kumaon, alt. 5–13,000 ft. WESTERN TIBET, alt. 10–15,000 ft.; *Strachey & Winterbottom*, &c.—DISTRIB. Europe, N. Africa, W. and N. Asia.

Glabrous or hairy. *Rootstock* woody, stems or branches usually decumbent. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., short-petioled. *Whorls* capitate; flowers dimorphic, males largest. *Calyx-teeth* ciliate. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in., purple, very variable.—Common Thyme.

22. HYSSOPUS, Linn.

An undershrub. *Leaves* sessile, obtuse, entire. *Whorls* 6–15-fld., secund, axillary and in terminal spikes. *Calyx* 15-nerved, 5-toothed, throat naked. *Corolla* 2-lipped; upper lip erect, flat, notched; lower spreading, 3-lobed, midlobe very broad. *Stamens* 4, exserted, diverging, lower longer; anther-cells linear, spreading. *Style-lobes* subequal, subulate. *Nutlets* narrow, nearly smooth, triquetrous.

H. officinalis, Linn.; *Benth. in DC. Prodr.* xii. 251; *Boiss. Fl. Orient.* iv. 584; *Reichb. Ic. Fl. Germ.* t. 1259.

WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 8–11,000 ft., *Falconer*, &c.—DISTRIB. E. Europe, W. Asia.

Usually glabrous; stem below branched, woody; branches 1–2 ft., erect or diffuse. *Leaves* sessile, oblong-linear or lanceolate. *Calyx*, fruiting $\frac{1}{2}$ – $\frac{3}{4}$ in. long. *Corolla* blueish-purple.

23. MICROMERIA, Benth.

Herbs or undershrubs. *Leaves* usually small, entire or toothed. *Whorls* axillary or in terminal spikes, rarely panicle; flowers small. *Calyx* 13-nerved, 5-toothed or 2-lipped. *Corolla* 2-lipped; upper lip erect, flattish, entire or notched; lower spreading, 5-lobed. *Stamens* 4, lower longer ascending, incurved with diverging tips; anther-cells distinct, parallel, at length diverging, connective usually thickened. *Style-lobes* equal or upper very-short, lower recurved flattened. *Nutlets* smooth.—Species about 60, all regions but Australia.

1. **M. capitellata**, *Benth. in DC. Prodr.* xii. 218; pubescent, stems tall slender erect, leaves entire or subserrate obtuse, whorls subglobose

distant in slender spikes, lower peduncled. *M. Malcolmiana*, *Benth. in Pl. Hohenack*, n. 1402; *Dalz. & Gibs. Bomb. Fl.* 209. *Marrubium Malcolmii*, *Dalz. in Hook. Kew Journ.* iv. 109.

BEHAR; or Parusnath, alt. 4500 ft., *Clarke*. WESTERN HIMALAYA; Dehra Doon, *Duthie*. WESTERN GHATS; from the Concan to the Nilghiris, *Wight*, &c.

Rootstock woody; stem 1-2 ft. *Leaves* $\frac{1}{2}$ -1 in., ovate or oblong, flat; floral small; petiole short. *Bracts* small. *Flowers* $\frac{1}{2}$ in. *Calyx* villous; teeth long, subulate, erect; fruiting $\frac{1}{2}$ in.—Very aromatic.

2. *M. biflora*, *Benth. Lab.* 378, and in *DC. Prodr.* xii. 220; glabrous, hairy or puberulous, stems short dense leafy, leaves small sessile ovate subacute, whorls axillary small few-fld. *Dcne. in Jacquem. Voy. Bot.* 129, t. 134; *Wight Ill.* t. 176 bis, f. 5, and *lc.* t. 1446. *M. ovata*, *Beck. in Schimp. Pl. Iter Abyss.* n. 12. *Thymus biflorus*, *Ham. in Wall. Cat.* 1556, *Don Prodr.* 112; *Benth. in Wall. Pl. As. Rar.* i. 31.

TROPICAL and TEMPERATE HIMALAYA (exclusive of Sikkim); from Kashmir to Bhotan, alt. 1-7000 ft. NILGHIRI and ANAMALLAY HILLS.—DISTRIB. Afghanistan, Arabia, Abyssinia, S. Africa.

Dwarf. *Rootstock* woody, stems or branches excessively numerous, 3-6 in., fastigate, filiform. *Leaves* $\frac{1}{2}$ - $\frac{1}{4}$ in., margins thickened. *Flowers* small, often solitary, pedicelled. *Calyx* hirsute, fruiting $\frac{1}{2}$ in.; teeth subulate, very variable in length.

3. *M. hydaspidis*, *Falc. mss.*; *Benth. in DC. Prodr.* xii. 224; pubescent, stem erect, leaves shortly petioled ovate obtuse subcrenate, whorls spicate many-fld. shortly peduncled, flowers pedicelled.

WESTERN KASHMIR; Jhelum Valley from Patlee to Nashga Valley, *Falconer*.

Stem 10-18 in., erect, rather stout, subsimple. *Leaves* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Spikes* continuous or interrupted. *Calyx* $\frac{1}{2}$ in. long, erect, puberulous; teeth lanceolate.

24. CALAMINTHA, Moench.

Herbs or shrubs. *Leaves* entire or toothed. *Whorls* dense and axillary or loose and paniced or spiked. *Calyx* 13-nerved, 2-lipped, upper lip 3-toothed, lower 2-fid, teeth narrower than of the upper; throat naked or villous. *Corolla-tube* straight, throat villous; upper lip erect, flattish; lower spreading, 3-lobed. *Stamens* 4 (or 2 upper imperfect), ascending under the upper lip; anther-cells parallel or diverging. *Style-lobes* equal, or the lower larger. *Nutlets* minute, subglobose, smooth, dry.—Species about 40, of N. temperate regions.

1. *C. Clinopodium*, *Benth. in DC. Prodr.* xii. 233; erect, softly hairy, whorls dense-fld., bracts filiform equalling the calyx, calyx-teeth subequal in length all very slender. *Boiss. Fl. Orient.* iv. 579; *Reichb. Ic. Fl. Germ.* t. 1274, f. 1. *Melissa Clinopodium*, *Benth. Lab.* 392. *Clinopodium vulgare*, *Linn.*

WESTERN TEMPERATE HIMALAYA; from Kashmir to Kumaon, alt. 4-12,000 ft.—DISTRIB. Europe, N. Africa, N. and W. Asia, Canada.

Rootstock woody, stoloniferous. *Stem* 1-3 ft., slender, subsimple. *Leaves* remote, 1-2 in., ovate, subacute, subcrenate. *Whorls* terminal and axillary, $\frac{1}{2}$ -1 in. diam., depressed. *Calyx* $\frac{1}{2}$ in. usually curved, hispid. *Corolla* $\frac{3}{4}$ -1 in., purple, hairy.—*Wild Basil*.

2. *C. umbrosa*, *Benth. in DC. Prodr.* xii. 232; procumbent, laxly hairy, whorls globose lax or dense-fld., bracts short or long, upper calyx-teeth with triangular teeth, lower with often longer subulate ones. *Boiss.*

Fl. Orient. iv. 578. *C. Clinopodium*, var. *umbrosa*, *Hook. f. in Thwaites Enum.* 239. *C. repens*, *Benth. in DC. l. c.* 233. *C. nepalensis*, *Fisch. & Mey. Ind. Sem. Hort. Petrop.* 1845, 53, n. 521. *Clinopodium repens*, *Roxb. Hort. Beng.* 44, and *Fl. Ind.* iii. 13; *Benth. in Wall. Pl. As. Rar.* i. 66; *Wall. Cat.* 2130. *Thymus repens*, *Don Prodr.* 113. *Melissa umbrosa*, *Bieb. Fl. Taur. Cauc.* ii. 63; *Benth. Lab.* 392; *Wight Ic.* t. 1447. *M. repens*, *Benth. Lab.* 392.

TEMPERATE HIMALAYA; from Kashmir to Bhotan, alt. 4-12,000 ft. KHASIA MTS., alt. 4-6000 ft. WESTERN GHATS; from the Concan to the Anamallay Hills. CEYLON; at Newera Elia.—DISTRIB. Afghanistan, Caucasus, China, Japan, Java.

A very common and variable Indian plant with difficulty distinguishable in some states from *C. Clinopodium*, Wallich's Nepal specimens being as robust, and with equally long bracts, and calyx almost as large; but the habit is usually decumbent or procumbent, and more slender, the bracts shorter, calyces only $\frac{1}{2}$ – $\frac{1}{4}$ in., their upper-lip segments shorter and more recurved. I am quite unable to distinguish *C. repens* from *C. umbrosa*; a diminutive form of it has very small calyces with short broad upper teeth sometimes strongly recurved. *C. nepalensis* is a very stout suberect Kashmir form with numerous often close-set and sometimes spicate whorls, short bracts and short calyx-teeth.

3. ***C. longicaulis***, *Benth. in DC. Prodr.* xii. 234; erect or decumbent, softly hairy, whorls lax-fld. subsecund, bracts very minute, calyx-teeth short subequal in length not $\frac{1}{2}$ the length of the tube. *Thymus piperitus* & *origanifolius*, *Don Prodr.* 112. *Clinopodium longicaule*, *Benth. in Wall. Pl. As. Rar.* i. 66; *Wall. Cat.* 2131. *Melissa longicaulis*, *Benth. Lab.* 395.

CENTRAL HIMALAYA; Nepal, *Wallich*.

Stem 2-3 ft., slender, woody below. *Leaves* $\frac{1}{2}$ in., quite entire or with a few crenatures. *Whorls* towards the ends of the branches, 2-6-fld.; bracts shorter than the calyx. *Calyx* $\frac{1}{2}$ in., hispid, glabrate or hairy within, teeth short. *Corolla* violet, tube slender, twice as long as the calyx.—A very distinct plant.

25. MELISSA, Linn.

Erect branched herbs. *Leaves* opposite, crenate. *Whorls* axillary, secund, lax-fld. *Calyx* 13-ribbed; lips small; upper flattish, 3-toothed; lower 2-toothed. *Corolla-tube* recurved and ascending; upper lip erect; lower flat, spreading, 3-lobed. *Stamens* 4, arching and meeting under the upper lip; anther-cells at length divaricate. *Style-lobes* subequal, subulate. *Nutlets* narrowly obovoid, smooth, dark.—Species 2 or 3, S. European and Asiatic.

1. ***M. parviflora***, *Benth. Lab.* 394, in *Wall. Pl. As. Rar.* i. 65, and in *DC. Prodr.* xii. 241; leaves ovate or ovate-lanceolate acute, calyx $\frac{1}{4}$ – $\frac{1}{2}$ in., corolla white, tube very short. *Wall. Cat.* 2825. *Geniosporum axillare*, *Benth. in Wall. Pl. As. Rar.* ii. 18; *Wall. Cat.* 2752.

TEMPERATE HIMALAYA; from Gurwhal, alt. 5-8000 ft., to Sikkim, alt. 7-10,000 ft., and Mishmi. KHASIA MTS., alt. 4-6000 ft.—DISTRIB. Java.

Pubescent or glabrate. *Stem* tall, erect, angles hirsute. *Leaves* 1-4 in., base acute rounded or cordate; petiole $\frac{1}{4}$ –1 in., slender. *Whorls* numerous, few- or many-fld.; flowers pedicelled. *Calyx-teeth* very variable in length of the acute points; bracts narrow. *Corolla-tube* scarcely exceeding the calyx.—Very near *M. officinalis*, which has its Eastern limit in Eastern Persia, but the leaves are more acute and the lower calyx-teeth are broader and shorter, but these are variable characters in the European plant.

2. *M. flava*, *Benth. Lab.* 394, in *Wall. Pl. As. Rar.* i. 65, and in *DC. Prodr.* xii. 241; calyx nearly $\frac{1}{2}$ in., corolla yellow, tube longer than the calyx. *Wall. Cat.* 2126.

NÉPAL, *Wallich*; KUMAON, alt. 7600 ft., *Madden, Strachey & Winterbottom. BHOTAN, Griffith.*

I much doubt this being more than a variety of *M. parviflora*. It is, however, a larger plant.

26. *PEROWSKIA*, *Karel.*

Erect, branched, strong-scented, rigid, hoary and scurfy, dioecious undershrubs. *Leaves* opposite, incised or crenate. *Whorls* small, distant, in simple or compound or paniced spikes, 2- or more-fld.; flowers small. *Calyx* short, terete; lips short, upper minutely 2-3-toothed, lower 2-toothed. *Corolla* 2-lipped, tube exserted, with a ring of hairs within, lower lip oblong entire, upper broad spreading erect 3-lobed. *Stamens*, 2 lower fertile, erect, diverging; 2 upper minute, imperfect; anther-cells linear, parallel. *Disk* swollen behind. *Style-lobes* acute. *Nutlets* pyriform, smooth, dry.—Species 4 or 5, Central Asiatic:—Genus of doubtful affinity.

1. *P. atriplicifolia*, *Benth. in DC. Prodr.* xii. 261; densely clothed with white stellate scurf, leaves oblong-ovate or lanceolate crenate-serrate or incised, calyx hispid. *Boiss. Fl. Orient.* iv. 589.

WESTERN TIBET, *Falconer*; Lahul, *Capt. Hay*; Karakoram and Iskardo, alt. 7500–10,200 ft., *Clarke*.—DISTRIB. Afghanistan and Beluchistan.

A rigid herb, 2–3 ft., paniculately branched. *Leaves* 1–2 in., rigid, rugose. *Whorls* 2–6-fld. *Calyx* $\frac{1}{2}$ in. *Corolla* twice as long.—I doubt this being more than a form of the following.

2. *P. abrotanoides*, *Kiril. in Bull. Mosq.* 1841, 15, t. 1; densely or sparsely clothed with white or grey stellate scurf, leaves linear-oblong incised or pinnatisect, calyx clothed with long cottony wool. *Boiss. Fl. Orient.* iv. 389.

WESTERN TIBET, alt. 8–13,000 ft., *Thomson, &c.*—DISTRIB. Afghanistan, Persia, Turcomania.

A much-branched twiggy shrub or undershrub, 2–4 ft. high, woody below, with the habit of a *Lavandula*. *Leaves* 1–2 in., sometimes bipinnatisect, crenatures or lobes or segments obtuse.

27. *MERIANDRA*, *Benth.*

Shrubs smelling of sage, hoary or woolly. *Leaves* opposite, coriaceous, oblong, crenulate, rugulose above. *Whorls* many, dense-fld., large and in terminal broad spikes or small and in paniced calkin-like spikes with closely imbricating bracts; flowers small. *Calyx* ovoid, upper lip concave, subentire; lower 2-fld; throat naked. *Corolla-tube* short, equally 4-fld; lobes flat, upper entire or 2-fld. *Stamens* short, stout; 2 lower fertile erect distant, one or both of upper imperfect; anther-cells separate, stipitate, pendulous. *Style* 2-lamellate. *Nutlets* obovoid, smooth, brown.—The following are the only species.

1. *M. strobilifera*, *Benth. Lab.* 188, in *Wall. Pl. As. Rar.* i. 29, and in *DC. Prodr.* xii. 262; flocculently woolly, spikes 4-angled with imbricating appressed bracts. *Wall. Cat.* 1527; *Gamble Ind. Timbers*, 301.

WESTERN TEMPERATE HIMALAYA; on dry rocks from Simla to Kumaon, alt. 5–6000 ft.

A small shrub; branches obscurely angled. *Leaves* 3-4 by $\frac{3}{4}$ -1 $\frac{1}{2}$ in., obtuse or acute, base sagittate or cordate, upper surface almost granulate, lower white; petiole $\frac{1}{2}$ in., very stout. *Spikes* 1-2 in. by $\frac{1}{2}$ in. diam., paniced; bracts broadly ovate. *Calyx* $\frac{1}{15}$ in., woolly. *Corolla* rather longer, as much in diameter.

2. **M. bengalensis**, *Benth. Lab.* 189, in *Wall. Pl. As. Rar.* i. 29, and in *DC. Prodr.* xii. 262; finely tomentose or hoary, spikes terminal with interrupted ebracteate globose whorls. *Wall. Cat.* 1526; *Grah. Cat. Bomb. Pl.* 151; *Dalz. & Gibs. Bomb. Fl., Addend.* 66; *Dcne. in Jacquem. Voy. Bot.* 134, t. 139. *Salvia bengalensis*, *Roxb. Fl. Ind.* i. 145. *S. dianthera*, *Roth Nov. Sp.* 18. *S. abyssinica*, *Br. in Append. Salt's Travels.* *S. Schimperiana*, *Hochst. in Schimp. Iter Abyss.* n. 1781.

Cultivated in INDIA. DISTRIB. Native of Abyssinia.

A large straggling shrub; branches cylindric. *Leaves* 2-3 by 1-1 $\frac{1}{2}$ in., finely crenulate, obtuse, thinner than in *M. strobilifera*, as finely granulate above and reticulate beneath, base rounded or bractate; petiole slender, $\frac{1}{4}$ - $\frac{1}{2}$ in. *Whorls* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., villous. *Calyx* $\frac{1}{4}$ in. long, pedicelled, teeth acute. *Corolla* white, lips spreading or recurved.

28. SALVIA, Linn.

Herbs or shrubs. *Whorls* usually racemed or spiked; bracts small or large. *Calyx* tubular or campanulate, upper lip entire or 3-toothed, lower 2-fid, throat naked. *Corolla-tube* naked or with a ring of hairs inside; upper lip erect, lower 3-lobed, lateral lobes spreading. *Stamens*, 2 perfect, filaments short, jointed on the slender connective which bears 1 or 2 perfect cells. *Disk* tumid behind. *Style* ascending, 2-fid. *Nutlets* 3-quetrous, smooth.—Species 450, tropical and temperate.

Sect. 1. **Drymosphace**, *Benth.* Perennial herbs; floral leaves very small. *Upper calyx-lip* entire or 3-toothed. *Corolla-tube* exserted, annulate within; upper lip falcate, compressed. *Connectives* with an imperfect cell behind.

1. **S. glutinosa**, *Linn.*; herbaceous, tall, robust, viscidly hairy, leaves hastately ovate-oblong toothed, whorls distant few- and lax-fid., calyx tubular-campanulate, corolla large yellow. *Benth. in DC. Prodr.* xii. 276; *Reichb. Ic. Fl. Germ.* t. 1246, f. 1; *Boiss. Fl. Orient.* iv. 609. *S. nubicola*, *Benth. Lab.* 219, and in *Wall. Pl. As. Rar.* i. 68; *Sweet Brit. Fl. Gard.* t. 140; *Wall. Cat.* 2146.

TEMPERATE HIMALAYA; from Kashmir, alt. 6-9000 ft., to Sikkim, alt. 10-12,000 ft. DISTRIB. Affghanistan, S. Europe, W. Asia.

Stem 2-3 ft. *Leaves* 4-7 by 2-4 in.; petiole 1-3 in. *Flowers* in large branched spreading panicles, shortly pedicelled. *Calyx* $\frac{1}{2}$ in., upper lip ovate acute entire, teeth of lower ovate acute. *Corolla* 1-1 $\frac{1}{2}$ in., tube exserted, throat dilated, limb gaping. *Nutlets* $\frac{1}{8}$ in., elliptic-obovate, compressed, smooth.

2. **S. hians**, *Royle mss. in Hook. Bot. Misc.* iii. 373, and *Ill. Pl. Himal.* 303, t. 75, f. 3; herbaceous, tall, robust, viscidly hairy, leaves long-petioled ovate-hastate or -cordate toothed, whorls distant few- and lax-fid., calyx broadly shortly campanulate, corolla very large blue. *Benth. Lab.* 219, 717, and in *DC. Prodr.* xii. 276; *Bot. Reg.* 1841 t. 39; *Bot. Mag.* t. 6517 (*excl. syn. S. macrophylla*?).

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 8-11,000 ft., *Falconer, &c.*

Habit of *S. glutinosa*, but petioles much longer, often 10 in., and leaves rather broader; calyx much broader; corolla 1 $\frac{1}{2}$ in., blue with very inflated throat and shorter lips; nutlets similar but larger, $\frac{1}{6}$ in. long.

3. **S. campanulata**, *Wall. Cat.* 2143; herbaceous, robust, viscidly hirsute, leaves long-petioled ovate-cordate toothed, whorls few- and lax-fl., calyx broadly shortly campanulate, corolla large yellow. *Benth. in Wall. Pl. As. Rar.* i. 67, and in *DC. Prodr.* xii. 276.

SUBALPINE HIMALAYA; from Kumaon to Sikkim, alt. 9-13,000 ft., *Wallich*, &c.

Habit of *S. hians*, but leaves much broader with more cordate bases, and petioles equally long; calyx $\frac{1}{2}$ in., gaping very wide; corolla-tube shortly exserted, inflated, lips very stout; nutlets the same.

Sect. 2. **Æthiopis**, *Benth.* Perennial herbs with large orbicular cuspidate floral leaves. *Upper calyx-lip* 3-toothed. *Corolla-tube* exserted, not annulate within; upper lip falcate, compressed; lower with the side lobes oblong often erect or twisted, midlobe rounded, *Connectives* connected by callous tips deflexed backwards, imperfect cell abruptly dilated.

4. **S. asperata**, *Falc. mss. ex Benth. in DC. Prodr.* xii. 282; stout, erect, branched, sparsely glandular and hispid, leaves oblong-ovate cordate obtuse crenate, whorls distant 6-10-fl., calyx broadly campanulate hispid. *Bot. Mag.* t. 4884.

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 5-6000 ft., *Falconer, Thomson*.

A harsh coarse herb. *Leaves* 3-6 by 2-3 in., petiole as long stout, floral orbicular 1 in. diam. and under, ciliate. *Calyx* $\frac{1}{2}$ in. long, rigid, teeth spinous. *Corolla* $\frac{3}{4}$ in. long, white, tube short, slender; throat shortly inflated, upper lip long, narrow, arched, lower shorter. *Nutlets* $\frac{1}{10}$ in., subglobose.

5. **S. Moorcroftiana**, *Wall. Cat.* 2144; tall, robust, woolly, leaves long-petioled oblong or oblong-cordate obtuse doubly crenate and lobulate, whorls many distant 6-10 fl., calyx campanulate equally spinous-5-toothed scabrid. *Benth. in Wall. Pl. As. Rar.* i. 67, *Lab.* 228, and in *DC. Prodr.* xii. 286.

WESTERN TEMPERATE HIMALAYA; from Kashmir to Kumaon, alt. 6-9000 ft.

Very robust; stem leaves beneath and often above petiole and branches of panicle usually thickly woolly, rarely glabrate. *Leaves* 6-12 by 3-5 in., thick, rugose, rarely acute, base rounded or cordate; petiole 4-8 in., stout, floral 1 in. diam. and under, white and rose-coloured. *Calyx*, flowering $\frac{1}{2}$ in., fruiting $\frac{2}{3}$ in. *Corolla* 1 in., rose-coloured, tube slender, upper lip long arched, very narrow. *Nutlets* subglobose.—The Ladak habitat given by Wallich is an error, for the plant is not Tibetan. Moorcroft no doubt collected it en route to Ladak.

6. **S. lanata**, *Roxb. Fl. Ind.* i. 147; robust, densely softly woolly, leaves sessile oblong or oblanceolate obtuse crenulate, whorls many distant, calyx campanulate 2-lipped subequally spinous-5-toothed. *Benth. in Wall. Pl. As. Rar.* i. 67, and ii. 11, t. 116, *Lab.* 228, and in *DC. Prodr.* xii. 286; *Wight Ic.* t. 325, and *Ill.* t. 176 bis, f. 3. *S. integrifolia*, *Hardw. in Asiat. Res.* vi. 349. *S. cana*, *Wall. Cat.* 2145. *Stenarrhena lanata*, *Don Prodr.* 111.

WESTERN TEMPERATE HIMALAYA; Kumaon to Murree, alt. 5-8000 ft.

Stems usually many from the root, 12-18 in. high, simple or branched. *Leaves* subradical, 6-8 by 1-1 $\frac{1}{2}$ in., white beneath, narrowed at the base; floral $\frac{1}{2}$ in. diam.; whorls distant, viscidly hairy, 6-8-fl. *Calyx*, flowering $\frac{1}{2}$ in., fruiting $\frac{1}{3}$ in., glandular-hairy. *Corolla* $\frac{2}{3}$ in. long, tube slender, throat inflated, upper lip about as long as the tube, lower small. *Nutlets* $\frac{1}{10}$ in., brown.

Sect. 3. **Plethiospace**, *Benth.* Perennial herbs, floral leaves

small. *Calyx* ovoid-campanulate, upper lip recurved with 3 conniving teeth, lower acutely 2-toothed. *Corolla-tube* not annulate within; upper lip arched, lower with oblong lateral lobes and a rounded midlobe. *Connectives* deflexed behind, united by the callous tips, imperfect cell abruptly dilated.

7. **S. dumetorum**, Andr. in Rep. Enum. Pl. Volhyn. 3, 40; hirsute tomentose or pubescent, lower leaves long-petioled ovate- or oblong-cordate doubly crenate rugulose above, floral rounded, whorls viscid distant 6-fld., calyx subsessile viscid. Benth. in DC. Prodr. xii. 290; Ledeb. Fl. Alt. i. 24.

WESTERN HIMALAYA; Kashmir, alt. 6000 ft., Falconer, Clarke.—DISTRIB. Volhynia, Podolia, Altai.

Stem 1-3 ft., very robust, tall and much branched in Kashmir specimens. *Leaves* 3-4 by $1\frac{1}{2}$ - $2\frac{1}{2}$ in., petiole of lower 1-4 in.; floral cuspidate, $\frac{1}{2}$ in. diam. *Calyx*, flowering $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ - $\frac{3}{4}$ in., blue, tube exserted, throat inflated.—Very near and perhaps only a variety of *S. pratensis*, L.

Sect. 4. **Notiosphace**, Benth. Herbs or shrubs with minute floral leaves. *Calyx* with the upper lip entire, or shortly 3-toothed, lower 2-fid. *Corolla* small, tube annulate within. *Connectives* distant in front, acute or bearing an empty anther.

8. **S. saxicola**, Wall. Cat. 2147; dwarf, subscapigerous, radical leaves long-petioled broad oblong or rounded cordate coarsely crenate, cauline few or 0, floral minute ovate, whorls distant or the upper crowded, calyx nodding, corolla very short. Benth. in Wall. Pl. As. Rar. i. 68, Lab. 310, and in DC. Prodr. xii. 355.

KHASIA Mts., alt. 4-6000 ft.; Wallich, &c.

Rootstock woody. *Leaves* 1- $1\frac{1}{2}$ in. diam., nearly glabrous; petiole 2-3 in., slender. *Scapes* 6-12 in., pubescent. *Calyx*, flowering $\frac{1}{2}$ in., fruiting $\frac{1}{2}$ in., glandular-hairy. *Corolla* very short, pale purple, lips short. *Connective* with the antheriferous arm decurved, the other shorter, acute, *Nutlets* $\frac{1}{2}$ in., ellipsoid.

9. **S. plectranthoides**, Griff. Notul. iv. 199, and Ic. Pl. Asiat. t. 450; herbaceous, slender, sparsely hairy, leaves chiefly radical pinnate, segments few ovate or broadly oblong-cordate, terminal much the largest, lateral sessile or petiolulate, petiole very slender, scape long, spike simple. calyx nodding glandular-hairy. *Plectranthus*, Griff. It. Notes, 163, n. 845.

EASTERN HIMALAYA; Bhotan, near Panukka, Griffith.

Habit of a *Valeriana*. *Rootstock* rather slender. *Leaves* membranous, 3-5 in.; pinnules 2-5 pairs, terminal 2-3 in. long, base rounded or deeply lobed, lateral ovate-lanceolate. *Scape* or stem very slender, 18 in.; whorls few-fld. *Calyx* pedicelled, upper lip entire, lower 2-toothed. *Corolla* flesh-coloured; tube shortly exserted, hairy; upper lip arched, lower with small erect lateral lobes and an orbicular notched midlobe. *Connectives* recurved, barren arm obtuse.—Griffith's figure of this remarkable species represents a very stout plant with sessile leaflets; his specimens are very slender, with usually petiolulate leaflets. It is very near *S. japonica*, Thunb., differing only in the shorter calyx-teeth.

10. **S. plebeia**, Br. Prodr. 501; annual, stem stout erect hoary or scaberulous, leaves petioled oblong obtuse or upper ovate acute crenate, spikes paniced often fastigate, whorls very numerous, upper calyx-lip entire, lower obtusely 2-toothed, stamens very small whitish. Benth. Lab. 309, and in DC. Prodr. xii. 355; Dalz. & Gibs. Bomb. Fl. 209. *S. brachiata*, Roxb. Fl. Ind. i. 145; Wall. Cat. 2149. ? *S. parviflora*, Roxb. Hort. Beng. 4.

S. minutiflora, *Bunge Enum. Pl. Chin. Bor.* 50. *Ocimum fastigiatum*, *Roth Nov. Sp.* 277. *Lumnitzera fastigiata*, *Spreng. Syst.* ii. 687.

Throughout INDIA, in the plains and ascending the hills to 5000 ft. (absent from Ceylon).—DISTRIB. China, Malay Islands, Australia.

Stem stout, 6–18 in., strict, fastigiately branched. *Leaves* 1–3 in., narrowed at both ends; floral small, lanceolate. *Calyx* pedicelled, $\frac{1}{8}$ in. *Corolla-tube* very short, not exserted, limb very small. *Nutlets* very minute, $\frac{1}{35}$ in. long, ellipsoid.

11. *S. ægyptiaca*, *Linn.*; a very dwarf scaberulous hispid or hoary much-branched undershrub, leaves few small sessile linear or lanceolate acute rigid crenate, whorls remote 2–3-fld., flowers small, calyx glandular-hairy. *Benth. in DC. Prodr.* xii. 355; *Boiss. Fl. Orient.* iv. 631; *Jacq. Hort. Vind.* ii. 49, t. 108.

PANJAB PLAIN, from Delhi westwards, alt. 1–2000 ft.; *Jacquemont, &c.*—DISTRIB. Afghanistan, W. Asia, N. Africa to the Cape Verde Islands.

Branched from the base; branches straggling, divaricate, rigid. *Leaves* rarely 1 in. *Whorls* distant. *Calyx* nodding, pedicelled, ovoid-campanulate, fruiting $\frac{1}{4}$ in. long; upper lip orbicular minutely 3-toothed, teeth of lower subulate. *Corolla* and *stamens* as in *S. plebeia*. *Nutlets* $\frac{1}{2}$ in. long, narrowly oblong, nearly black.

VAR. *pumila*; more scabrid and hispid, leaves very rigid and rugose, calyx villous with long hairs. *S. pumila*, *Benth. Lab.* 726, and in *DC. Prodr.* xii. 356; *Dcne. in Jacquem. Voy. Bot.* 128, t. 133.—The Panjab plains and hills from Delhi westward; Scinde, *Stocks*; Afghanistan and Beluchistan.

12. *S. santolinæfolia*, *Boiss. Diagn. Ser.* 1, v. 13, and *Fl. Orient.* iv. 632; a dwarf much-branched hoary undershrub, leaves minute petioled linear pectinately lobed, lobes rounded, margins revolute, whorls 2–3-fld. on very slender spikes, flowers minute, calyx hispid with long hairs.

SCINDE; on the Boogie Hills, *Vicary*.—DISTRIB. Afghanistan, Persia.

The specimens are flowerless and very insufficient, but I think referable to this curious little species. The calyx resembles that of *S. ægyptiaca*, var. *pumila*. Floral leaves persistent, elliptic, acute, $\frac{1}{10}$ in. long.

EXCLUDED AND UNKNOWN SPECIES.

S. INDICA, *Linn.*, is a Syrian plant, and not Indian, whence the name is changed by Boissier to *S. brachycalyx*.

S. ACAULIS, *Vahl Enum.* i. 157; *Benth. in DC. Prodr.* xii. 354 (*S. ocimoides*, *Roxb. in Wall. Cat.* 2148; *Benth. in Wall. Pl. As. Rar.* i. 68. *S. lyrata*, *Roxb. Hort. Beng.* 4, fid. *Wight in Herb.*), is only known as a plant cultivated in the Mission Garden by Rottler, and is doubtless not Indian; it has a long tubular corolla. Roxburgh says his *S. lyrata* is American.

S. GERARDIANA, *Benth. in Wall. Cat.* 2150, is the American *S. coccinea*, L. (see *Wall. Cat.*, p. 92), cultivated in India.

29. *NEPETA*, *Linn.*

Erect or prostrate herbs. *Leaves* opposite. *Whorls* axillary or terminal; flowers blue, yellow or white. *Calyx* tubular, 15-ribbed, equally 5-toothed, or 2 lower teeth narrower. *Corolla-tube* not annulate within, throat inflated; upper lip straight, notched or 2-fid; lower 3-fid, midlobe largest. *Stamens* 4, ascending under the upper lip or exserted, upper pair longest; anther-cells diverging. *Style-lobes* subulate. *Nutlets* smooth.—Species about 120, Temp. Europe, N. Africa and Asia.

The following arrangement of the species of this troublesome genus is very artificial. I think that much better characters may be found in the corolla, but this would

require a careful re-examination of the whole genus. I suspect that some of the Indian species will prove identical with Persian. *Dracocephalum stamineum* & *Hookeri* should probably be transferred to *Nepeta*.

A. Whorls in simple terminal oblong or cylindric spikes, which are rarely interrupted at the base.—(The spikes of 13. *N. discolor* and others are occasionally interrupted; and species placed under C. occasionally present solitary simple spikes.)

* *Leaves bipinnatifid.*

1. **N. botryoides**, *Ait. Hort. Kew*, ii. 287; annual, branched, laxly hairy; leaves sub-2-pinnatifid, bracts linear-subulate, spikes cylindric dense-fld., calyx tubular straight. *N. multifida*, *Linn. Suppl.* 273. *N. annua*, *Pall. in Act. Petrop.* 1879, ii. 263, t. 12. *N. bipinnata*, *Cav. Ic. Rar.* i. 36, t. 49.

WESTERN TIBET; Rupchu, alt. 14,500 ft., *Thomson*.—DISTRIB. Soongaria, Altai.

Annual, 6–12 in., robust. *Leaves* $\frac{1}{2}$ –1 in., segments linear or oblong, obtuse. *Spikes* 1–3 in., flowers small. *Calyx* pedicelled, fruiting $\frac{1}{4}$ in. long, membranous, teeth mucronate. *Corolla* very small, yellow. *Stamens* short.

** *Leaves entire or crenate, sessile or subsessile.*

2. **N. linearis**, *Royle mss. ex Benth. in Hook. Bot. Misc.* iii. 377, *Lab.* 469, and in *DC. Prodr.* xii. 371; rootstock tuberous, stems ascending, leaves sessile linear acute or obtuse, spike ovoid or oblong, bracts lanceolate or subulate, calyx $\frac{1}{4}$ in. peduncled hairy, teeth spinescent.

WESTERN TEMPERATE HIMALAYA; from Kashmir to Simla, alt. 7–11,000 ft., *Falconer*, &c.

Rootstock often as large as a walnut. *Stems* 6–18 in., stout, sparsely leafy, glabrous or puberulous. *Leaves* 1–3 by $\frac{1}{10}$ – $\frac{1}{4}$ in. *Spikes* 1–2 $\frac{1}{2}$ in. *Calyx* tubular, fruiting $\frac{1}{4}$ in. or more. *Corolla-tube* twice as long, throat dilated, lips short.—Varies much in size of all parts.

3. **N. connata**, *Royle ex Benth. in Hook. Bot. Misc.* iii. 378, *Lab.* 469, and in *DC. Prodr.* xii. 371; tall, stout, glabrous or hairy, rootstock tuberous, stem simple, leaves sessile narrowly linear-lanceolate acuminate entire, base cordate, spike cylindric, lowest floral bracts large ovate aristate, upper narrow, calyx $\frac{1}{2}$ in. pedicelled hairy, teeth very long-awned.

WESTERN TEMPERATE HIMALAYA; from Dalhousie to Kashmir, alt. 8–11,000 ft., *Falconer*, &c.

Stem 1–2 ft., sometimes as thick as a swan's quill, glabrous, rarely woolly. *Leaves* 3–6 by $\frac{1}{8}$ – $\frac{3}{4}$ in., coriaceous, sometimes sinuate-toothed. *Spikes* 1–5 in., lower whorls sometimes axillary. *Calyx-teeth* as long as the tube, very slender. *Corolla* twice as long, blue. *Stamens* included. *Nutlets* $\frac{1}{2}$ in., orbicular, compressed-trigonal, brown, shining.

4. **N. eriostachya**, *Benth. Lab.* 734, and in *DC. Prodr.* xii. 371; stem subsimple sparsely hairy, leaves sessile broadly ovate or ovate-cordate obtuse crenate, lower floral similar, spike cylindric-oblong dense-fld. villous, calyx sessile $\frac{1}{4}$ in., teeth slender plumose.

WESTERN TEMPERATE HIMALAYA; Buspa Valley, *Jacquemont*; Kashmir, over Sonamurg, alt. 11,500 ft., *Clarke*; Gurwhal, alt. 11–12,000 ft., *Duthie*.

Stem ascending, 6–10 in. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., sometimes nearly as broad, pubescent beneath. *Spikes* 1–3 in. *Calyx* membranous, teeth as long as the tube. *Corolla* twice as long, bright blue. *Stamens* included.—I have not seen *Jacquemont's*

specimens. Clarke makes of his a var. *latibracteata* with broader bracts than Bentham describes. Habit of *Brunella*.

5. **N. nervosa**, *Royle ex Benth. in Hook. Bot. Misc.* iii. 378, *Lab.* 469, and in *DC. Prodr.* xii. 372; stem tall subsimple glabrous, leaves sessile or shortly petioled linear-lanceolate acuminate serrate, spike cylindric robust, bracts ovate or lanceolate mucronate, calyx sessile $\frac{1}{2}$ in., teeth very slender laxly villous. *N. campestris*, *Herb. Ind. Or. H. f. & T.*

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 6–10,000 ft., *Falconer, Jacquemont, &c.*

Rootstock long, woody. *Stems* 1–2 ft. *Leaves* 2–4 by $\frac{1}{2}$ – $\frac{3}{4}$ in., base rounded or cordate. *Spike* stout, 1–3 in. *Calyx* membranous; teeth as long as the tube, filiform. *Corolla* twice as long, pale blue. *Stamens* included.

VAR. *lutea*; flowers yellow.—Western Tibet; Karakoram, alt. 14,000 ft., *Clarke*.

6. **N. campestris**, *Benth. Lab.* 734, and in *DC. Prodr.* xii. 372; stem tall subsimple sparsely hairy, leaves sessile narrowly oblong-lanceolate subacute serrate, spikes slender, bracts all ovate mucronate, calyx sessile $\frac{1}{2}$ in., teeth very slender glabrous or ciliate.

WESTERN TEMPERATE HIMALAYA; from Kashmir, *Jacquemont*, to Kumaon, alt. 7–9000 ft., *Madden, &c.*

Closely allied to *N. nervosa*, but the leaves appear to be always sessile (which distinguishes it from *N. spicata*), the spikes are much longer and more slender, the calyx-teeth more glabrous and divergent, and the corolla-tube more slender.

7. **N. elliptica**, *Royle ex Benth. in Hook. Bot. Misc.* iii. 378, *Lab.* 470, and in *DC. Prodr.* xii. 373; stem branched villous, leaves subsessile elliptic oblong or oblong-cordate, tip rounded or acute pectinately crenate, spike long slender often interrupted, bracts ovate or lanceolate awned, calyx sessile $\frac{1}{2}$ in., teeth filiform ciliate as long as the tube. *N. polystachya*, *Benth. in Hook. Bot. Misc. l. c.*

WESTERN TEMPERATE HIMALAYA; from Kashmir to Kumaon, alt. 5–8000 ft.

Stem 1–2 ft., often flexuose, usually woolly. *Leaves* $\frac{1}{2}$ –1 in., tomentose. *Flowers* very much as in *N. nervosa*.

8. **N. Thomsoni**, *Benth. mss.*; finely pubescent, stems short stout very leafy, leaves sessile or shortly petioled oblong-cordate obtuse or acute crenate, floral large, whorls in a dense ovoid or conical spike with large leafy crenate bracts, calyx $\frac{1}{2}$ in. scaberulous, teeth ovate-lanceolate much shorter than the tube.

WESTERN TIBET; Hanle, alt. 14,500–16,000 ft., *Thomson*. EASTERN TIBET; north of Sikkim, *J. D. H.*

Stem a span to a foot high, stout, simple or with simple ascending branches from the base. *Leaves* close set, 1–2 by $\frac{1}{2}$ – $\frac{3}{4}$ in.; petiole rarely $\frac{1}{2}$ in.; floral similar. *Spike* of dense approximate superposed whorls with green elliptic bracts far exceeding the calyces. *Corolla* not seen. *Nutlets* large, nearly $\frac{1}{4}$ in., suborbicular.

9. **N. supina**, *Stev. in Mem. Soc. Nat. Mosq.* iii. 365; erect, branched, finely pubescent, leaves small sessile ovate obtuse crenate, floral subsimilar or narrow, whorls dense-fld., lower axillary, upper in an ovoid spike, bracts lanceolate, calyx $\frac{1}{2}$ in. curved narrow villous, mouth very oblique, teeth setaceous shorter than the tube, nutlets linear. *Benth. Lab.* 473, and in *DC. Prodr.* xii. 374; *Boiss. Fl. Orient.* iv. 462.

WESTERN TEMPERATE HIMALAYA; from Murree, *Fleming*, to Gurwhal, alt. 15,000 ft., *Strachey & Winterbottom*. WESTERN TIBET; Iskardo, alt. 12,000 ft., *Clarke*.—DISTRIB. Caucasus.

Stem 8–18 in. *Leaves* $\frac{1}{2}$ –1 in., tomentose beneath. *Corolla* $\frac{1}{4}$ – $\frac{1}{2}$ in. long. *Nutlets* nearly $\frac{1}{2}$ in. long, trigonous.—The largest Indian specimens are taller, stouter and more branched than the Caucasian, and the flowers are smaller, but the remarkable long narrow seeds are quite the same.

*** *Leaves distinctly petioled, entire or crenate.*

10. **N. spicata**, *Benth. in Wall. Pl. As. Rar.* i. 64, *Lab.* 470, and in *DC. Prodr.* xii. 372; stem erect branched glabrous hoary or pubescent, leaves petioled ovate- or triangular-cordate acute coarsely crenate or serrate, spike oblong or cylindric, bracts ovate or lanceolate awned, calyx sessile $\frac{1}{4}$ in. scabrid, teeth slender as long as the tube ciliate or hispid. *Wall. Cat.* 2083; *Bot. Mag.* t. 6405 (starved form). *Betonica lævigata*, *Don Prodr.* 110.

WESTERN TEMPERATE HIMALAYA; from Kashmir to Kumaon, alt. 6–12,000 ft.—DISTRIB. Afghanistan.

Stem 1–3 ft., with often spreading branches. *Leaves* $1\frac{1}{2}$ –4 by $\frac{1}{2}$ –3 in., glabrous or pubescent or hoary beneath; petiole 1–3 in. *Spike* 2–4 in., stout or slender, often interrupted; bracts very variable. *Flowers* as in *N. campestris*, pale blue.—Bentham's var. *elata* seems only a large state.

11. **N. lamiopsis**, *Benth. mss.*; stems ascending subsimple flaccid sparsely hairy, leaves few sessile or petioled broadly ovate-cordate obtuse coarsely crenate, floral large, whorls dense-fld., lower axillary, upper in ovoid spikes, bracts orbicular and green crenate or narrower or linear, calyx $\frac{1}{2}$ in. pubescent, mouth oblique, teeth slender diverging as long as the tube, nutlets broadly oblong.

ALPINE SIKKIM HIMALAYA; alt. 12–16,000 ft., *J. D. H.*

Stems succulent, 6–18 in. *Leaves* $\frac{1}{2}$ –1 $\frac{1}{2}$ in., flaccid; petiole 0– $\frac{1}{2}$ in., floral sessile. *Axillary whorls* few, much shorter than the leaves, terminal in an ovoid spike $\frac{1}{2}$ –1 $\frac{1}{2}$ in.; bracts sometimes all linear. *Corolla* deep blue, tube twice as long as the calyx, limb small. *Nutlets* about $\frac{1}{14}$ in. long.—Habit of a *Lanium*.

12. **N. raphanorhiza**, *Benth. Lab.* 734, and in *DC. Prodr.* xii. 373; rootstock tuberous, stems weak ascending glabrous or villous, leaves small petioled broadly ovate or ovate-cordate obtuse crenate or toothed, spikes short ovoid, bracts ovate to lanceolate, calyx $\frac{1}{2}$ in. sessile, teeth lanceolate ciliate shorter than the tube.

WESTERN TEMPERATE HIMALAYA; Kashmir to Chamba, alt. 5–12,000 ft., *Jacquemont, &c.*—DISTRIB. Afghanistan.

Stems many from a globose black rootstock as large as a nut or walnut, diffuse or ascending, 6–18 in. high, simple or branched. *Leaves* $\frac{1}{2}$ –1 in., sometimes nearly as broad; petiole half their length. *Spikes* 1 in. and less, pubescent or villous. *Calyx* smaller than in the preceding species, with shorter teeth. *Corolla* purplish blue, tube twice as long as the calyx, slender.—Roots eaten.

13. **N. discolor**, *Benth. in Hook. Bot. Misc.* iii. 378, *Lab.* 470, and in *DC. Prodr.* xii. 373; rootstock elongate, stems weak ascending glabrous or villous, leaves small petioled broadly ovate or ovate-cordate crenate, spikes ovoid or cylindric, bracts elliptic mucronate, calyx $\frac{1}{4}$ in. sessile villous, teeth filiform as long as the tube. *N. Sabinei*, *T. A. Schmidt in Trim. Journ. Bot.* 1868, 238, t. 82, f. 1–4.

WESTERN TEMPERATE and ALPINE HIMALAYA; from Kashmir to Gurwhal and WESTERN TIBET, alt. 10–15,000 ft.—DISTRIB. Afghanistan.

Closely resembles in habit and foliage large forms of *N. raphanorhiza*, but wants the tuberous rootstock, and has much longer spikes with long calyx-teeth as in *N. spicata*. *Leaves* often white with appressed tomentum beneath. *Flowers* white or pale blue.

14. ***N. longibracteata***, *Benth. Lab.* 737, and in *DC. Prodr.* xii. 392; dwarf, diffuse, softly pubescent or woolly, leaves petioled fan-shaped or cuneate-obovate crenate or lobulate, spikes capitate with the cymes sessile amongst the crowded uppermost and long silky bracts, calyx $\frac{1}{2}$ in. silky, teeth subequal nearly equalling the tube, stamens included, nutlets oblong. *Dcne. in Jacquem. Voy. Bot.* 132, t. 137.

ALPINE WESTERN HIMALAYA and WESTERN TIBET, alt. 14,000–17,000 ft.; *Falconer, Jacquemont*, &c.

Rootstock long, stout, excessively divided at the top; stems 3–6 in., suberect or prostrate, simple or branched. *Leaves* $\frac{1}{2}$ in. long or broad or less, petiole about as long. *Heads* subglobose, 1 in. diam.; lower bracts fan-shaped, pectinate. *Corolla* twice as long as the calyx, blue, tube curved, funnel-shaped, limb small. *Stamens* included. *Nutlets* $\frac{1}{10}$ in.—Strongly aromatic, lemon-scented. Placed by Benthham in the *Glechoma* section. It very closely resembles the Siberian *Dracocephalum pinnatum* except in the calyx-teeth, which are, however, very variable in that plant.

B. Whorls all or mostly axillary, many, distant.

15. ***N. glutinosa***, *Benth. Lab.* 735, and in *DC. Prodr.* xii. 377; glandular-pubescent, stem stout strict erect leafy, leaves small sessile ovate-cordate acute pectinately inciso-serrate, whorls few-fld., bracts linear-oblong aristate, calyx $\frac{1}{2}$ in. pedicelled, teeth ovate mucronate much shorter than the tube.

WESTERN SUBALPINE HIMALAYA; Kashmir and WESTERN TIBET, alt. 11–13,000 ft., *Jacquemont, Thomson*, &c.

Strongly scented. *Stem* $1\frac{1}{2}$ –2 ft., stiff. *Leaves* $\frac{3}{4}$ –1 in., sometimes $\frac{1}{2}$ -amplexicaul; floral often equalling the calyx. *Corolla* $\frac{3}{4}$ in. long, white or blue, tube curved, slender, limb small.

C. Whorls forming interrupted spikes, rarely solitary heads.

16. ***N. mollis***, *Benth. Lab.* 734, and in *DC. Prodr.* xii. 378; softly tomentose, stem slender subsimple, leaves shortly petioled ovate-cordate obtuse crenate or subcrenate, whorls few-fld., bracts elliptic ovate or lanceolate awned, calyx $\frac{1}{4}$ in., mouth oblique, teeth lanceolate shorter than the tube softly hairy. *Nepeta* n. 23, *Herb. Ind. Or. H.f. & T.*

WESTERN TEMPERATE HIMALAYA; Marri, *Fleming*; Kashmir, alt. 8–9000 ft., *Jacquemont, Falconer, Thomson*, &c.

Rootstock elongate, woody. *Stems* 6–18 in., slender, sparingly leafy. *Leaves* 1–2 by $\frac{1}{2}$ –1 in., grey-tomentose; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Spikes* 3–8 in.; lower bracts (floral leaves) ovate or lanceolate, longer or shorter than the cymes, which are sometimes peduncled. *Whorls* white, softly hairy. *Calyx* villous, often decurved. *Corolla* rose-coloured, tube shortly exserted, limb small.

17. ***N. distans***, *Benth. in Hook. Bot. Misc.* iii. 379, *Lab.* 475, and in *DC. Prodr.* xii. 378; softly tomentose, stem slender subsimple, leaves shortly petioled ovate-cordate obtuse crenate, whorls few-fld., bracts narrowly linear, calyx $\frac{1}{4}$ in. curved, mouth oblique, teeth lanceolate shorter than the tube glabrous or softly hairy.

WESTERN TEMPERATE HIMALAYA; Gurwhal, Mussorie and the Syen Range, *Royle*. Panjab Himalaya, *Falconer, Stewart*.

I doubt this being more than a form of *N. mollis* with narrow bracts and a longer more curved calyx.

18. *N. ciliaris*, Benth. in Wall. Pl. As. Rar. i. 64, Lab. 475, and in DC. Prodr. xii. 379; tall, erect, branched, softly densely tomentose, leaves shortly petioled ovate-cordate obtuse crenate, whorls secund dense-fld. in long interrupted villous spikes, upper crowded, bracts lanceolate, calyx $\frac{1}{4}$ in. curved villous, teeth slender shorter than the tube, nutlets broadly ellipsoid. Wall. Cat. 2082.

WESTERN TEMPERATE HIMALAYA, alt. 6-8000 ft.; from Kashmir to Gurwhal, Royle, Jacquemont, Edgeworth.

Stem 2-3 ft., strict. Leaves $\frac{3}{4}$ -1 $\frac{1}{2}$ in., sometimes almost as broad, lower floral large. Spikes 4-8 in., pale; whorls sometimes shortly pedicelled. Corolla very small, about $\frac{1}{2}$ in., lilac, tube slender.—Very like *N. ruderalis*, but the inflorescence is more simple, the whorls rarely peduncled. Bentham describes the nutlets as minutely granular, but I find them smooth. Clarke doubts Royle's habitat of "road to Kashmir," and suspects that the species is confined to the Simla and neighbouring hills.

D. Whorls in branched panicles, some or all more or less peduncled.

* Corolla less than $\frac{1}{2}$ in. long.

21. *N. ruderalis*, Hamilt. mss.; annual, erect or ascending, finely pubescent or hoary, leaves petioled broadly ovate- or orbicular-cordate obtuse crenate, whorls very dense-fld. subglobose in interrupted spikes villous, the lower peduncled, calyx $\frac{1}{4}$ in. villous, mouth subequal, 3 upper teeth triangular aristate, 2 lower filiform, nutlets obscurely granulate. Benth. Lab. 475, in Wall. Pl. As. Rar. i. 64, and in DC. Prodr. xii. 381. *N. secunda*, Wall. Cat. 2122. *N. calaminthoides*, Benth. in DC. l. c. in part. *N. clinopodioides*, Royle ex Benth. in Hook. Bot. Misc. iii. 379, Lab. l. c., and in DC. Prodr. l. c. 382. *Glechoma erecta*, Rorb. Fl. Ind. ii. 7. *G. hindostana*, Roth Nov. Sp. 258. *G. indica*, Spreng. Syst. ii. 727. *Thymus nepetoides*, Don Prodr. 113.

TROPICAL AND SUBTROPICAL INDIA; from the Indus to Behar, Central India and the Concan, ascending the Himalaya to 8000 ft.—DISTRIB. Afghanistan.

Stem 6-18 in., branched from the base, robust or slender, obtusely angled. Leaves $\frac{1}{2}$ -2 $\frac{1}{2}$ in., green or hoary; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. Whorls $\frac{1}{2}$ -1 in. diam., unilateral, depressed; peduncles sometimes 1 in.; flowers pedicelled. Corolla very small, $\frac{1}{4}$ in., purplish, tube shortly exerted. Nutlets $\frac{1}{8}$ in. long, broadly oblong. The granulation consists of more or less tumid separated areolæ, and is sometimes very indistinct.—*N. clinopodioides*, with a calyx less hairy and flowers smaller, is scarcely a variety, found on the Jumna by Royle. Woodrow sends from Poona a plant resembling *N. ruderalis* in habit, but with a large calyx and nutlets like *N. bombaiensis* (from which the calyx-teeth distinguish it).

22. *N. bombaiensis*, Dalz. in Dalz. & Gibs. Bomb. Fl. 209; erect, branched, tomentose or laxly villous, leaves long-petioled rounded ovate-cordate coarsely crenate, cymes all axillary few and lax-fld., peduncles equalling the petioles, flowers long pedicelled, calyx $\frac{1}{4}$ in. laxly hairy, 3 upper teeth broadly triangular acute much shorter than the tube, 2 lower subulate, nutlets nearly smooth.

The CONCAN; old walls and rocks at Swenere Fort, Dalzell.

Stem 1 foot. Leaves 2 in., green, sparsely hairy; petiole 1 in. Cymes 6-8-fld.; bracts at the base elliptic-lanceolate, acuminate, green. Corolla very small, pale blue, with purple spots. Nutlets ellipsoid, $\frac{1}{10}$ in. long.—A remarkable species, unlike

any other in habit, in the great size of the foliage and smallness of the long peduncled axillary cymes.

23. **N. Cataria**, Linn.; perennial, erect, branched, hoary-pubescent, leaves petioled ovate or ovate-cordate acute coarsely crenate or toothed, whorls in long narrow terminal shortly peduncled dense-fl. spikes, bracts subulate equalling the calyx or shorter, calyx $\frac{1}{4}$ in. curved pubescent, mouth oblique, teeth subequal subulate shorter than the tube, nutlets smooth. *Benth. in DC. Prodr.* xii. 383; *Boiss. Fl. Orient.* iv. 643; *Reichb. Ic. Fl. Germ.* xviii. t. 1242. *N. calaminthoides*, *Benth. in DC. l. c. in parts.* *N. ruderalis*, var. *clinopodioides*, *Herb. Ind. Or. H. f. & T.* *N. ruderalis*, *Boiss. l. c.* 644.

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 1-5000 ft., *Falconer, Jacquemont, Thomson*.—DISTRIB. Afghanistan to W. Europe.

Stem 2-3 ft., leafy, acutely angled. *Leaves* 1-3 in.; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Spikes* 4-10 in., narrow, strict, with 6-20 whorls or cymes; bracts of lower leafy, of upper reduced; flowers pedicelled. *Corolla* $\frac{1}{2}$ in., dotted with purple. *Nutlets* $\frac{1}{10}$ in., broadly oblong, smooth.

24. **N. leucophylla**, *Benth. Lab.* 476, and in *DC. Prodr.* xii. 381; slender, branched, erect or ascending, hoary-tomentose, leaves small shortly petioled ovate-cordate obtuse or acute crenate rugose above, whorls distant dense-fl. in very long narrow interrupted shortly peduncled terminal spikes, bracts subulate, calyx $\frac{1}{4}$ in. villous, mouth oblique, teeth lanceolate-subulate rather shorter than the tube, corolla very small, nutlets smooth. *Wight III. t.* 176 bis, f. 6.

WESTERN TEMPERATE HIMALAYA; Simla to Kumaon, alt. 6-8000 ft., *Royle, Edgeworth, &c.*

Stem 2-3 ft., obtusely angled, leafy. *Leaves* 1-1 $\frac{1}{2}$ in.; petiole $\frac{1}{8}$ - $\frac{1}{2}$ in. *Spikes* as in *N. Cataria*, but more slender and villous. *Corolla* about twice as long as the calyx. *Nutlets* as in *N. Cataria*.

25. **N. leucolaena**, *Benth. mss.*; erect, branched, white-tomentose, leaves small subsessile ovate acute or obtuse crenate, whorls distant in interrupted terminal spikes, the lower very shortly peduncled, bracts lanceolate, calyx $\frac{1}{2}$ in. woolly, upper teeth much shorter than the tube triangular, lower subulate much shorter, nutlets linear-oblong.

WESTERN TIBET; Zaskar and Ladak, alt. 12-13,000 ft., *Thomson*.

Stem 2-3 ft., nearly cylindrical, leafy. *Leaves* $\frac{1}{2}$ -1 in., furfuraceously tomentose on both surfaces, petiole 0- $\frac{1}{2}$ in. *Whorls* few-fl., the lower axillary. *Corolla* thrice as long as the calyx, tube curved, funnel-shaped; lips short. *Nutlets* $\frac{1}{16}$ in. long, smooth.—Habit of *N. ciliaris*, and perhaps referable to Section C, but the spikes which are not very advanced have pedicelled lower cymes.

26. **N. floccosa**, *Benth. Lab.* 736, and in *DC. Prodr.* xii. 380; floccose with white wool, stems many from the root ascending, leaves long-petioled orbicular cordate crenate, whorls distant in brachiate branches or terminating long peduncles woolly, bracts linear, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. villous, mouth oblique, teeth much shorter than the tube, upper triangular or lanceolate, lower much shorter, nutlets linear-oblong. *N. rotundifolia*, *Benth. in DC. l. c.* 392. *Marmoritis rotundifolia*, *Benth. Lab.* 490.

WESTERN TIBET, alt. 7-11,000 ft., *Jacquemont, Falconer, &c.*

Stems stout or slender, central sometimes 2-3 ft. and branched, obtusely 4-angled. *Leaves* 1-3 in. diam., margin sometimes sinuate; petiole stout, 4 in. and less. *Whorls* dense-fl., often coloured rose or purple; peduncle of lateral often 3 in. *Calyx-teeth* variable. *Corolla* $\frac{1}{2}$ in., tube slender, lips small. *Nutlets* $\frac{1}{12}$ in., quite

smooth.—*N. rotundifolia* (*Marmoritis*, Benth. Lab.) is founded on imperfect specimens of *N. floccosa*.

27. **N. gracilliflora**, *Benth. in Wall. Pl. As. Rar. i. 65, Lab. 476*, and in *DC. Prodr. xii. 382*; annual, glabrate or pubescent, stems many from the root very slender branched, leaves long-petioled ovate or ovate-cordate acute coarsely serrate or crenate, whorls very few-fl. axillary and forming lax panicles with capillary branches and peduncles and long pedicelled flowers, bracts setaceous, calyx $\frac{1}{2}$ in. pubescent or glabrous, upper teeth triangular or lanceolate awned, lower shorter setaceous, nutlets granulate. *Wall. Cat. 2123*.

PANJAB PLAINS, from Hurdwar to the Indus, and SUBTROPICAL HIMALAYA N. of it, ascending to 4000 ft.

Nearly allied to *N. ruderalis*, but much more slender, with membranous coarsely crenate leaves, longer petioles and very lax few-fl. cymes, often on axillary long filiform peduncles, and nutlets more strongly tubercled. *Calyx-teeth* as long as the tube or shorter, variable in breadth. *Corolla* $\frac{1}{4}$ in., pale rose. *Nutlets* oblong, $\frac{1}{16}$ in. long.

**** Corolla more than $\frac{1}{2}$ inch long.**

28. **N. Govaniana**, *Benth. Lab. 482*, and in *DC. Prodr. xii. 388*; tall, erect, branched, finely pubescent, leaves large petioled ovate oblong or elliptic acute crenate, cymes few-fl. distant long-peduncled in axillary and terminal racemes, calyx $\frac{1}{2}$ in. pedicelled puberulous, teeth triangular much shorter than the tube, corolla 1 in. yellow, nutlets broadly oblong. *Dracocephalum Govanianum*, *Benth. in Wall. Pl. As. Rar. ii. 65*, and *Cat. 2127*.

WESTERN TEMPERATE HIMALAYA; from Kashmir to Kumaon, alt. 8–11,000 ft.

Stem 2–4 ft., 4-angled. *Leaves* 3–6 by $1\frac{1}{2}$ –3 in., very variable, base acute rounded or cordate; petiole $\frac{1}{2}$ –2 in. *Racemes* 3–6-fl.; bracts minute. *Calyx* straight, cylindric. *Corolla* yellow; tube long, very small, curved, greatly dilated above the middle. *Nutlets* $\frac{1}{16}$ in. long, broadly obovoid-oblong, quite smooth.

29. **N. erecta**, *Benth. Lab. 482*, and in *DC. Prodr. xii. 388*; tall, erect, branched, finely pubescent, leaves petioled ovate or oblong acute, whorls many-fl. distant axillary or in terminal spikes, the lower usually peduncled, calyx $\frac{1}{2}$ in. pubescent, teeth triangular much shorter than the tube, corolla $\frac{1}{2}$ –1 in. blue, nutlets broadly oblong. *Dracocephalum erectum*, *Royle ex Benth. in Hook. Bot. Misc. iii. 380*. *N. macrantha*, *Led. Herb. Ind. Or. H. f. & T.*

Foliage of *N. Govaniana*, and calyx the same, but the inflorescence is contracted to spikes of interrupted sometimes many-fl. whorls with only a tendency to the lower being peduncled, and the flowers are blue.—It is very near the Siberian *N. macrantha*, but the nutlets are not linear.

30. **N. Clarkei**, *Hook. f.*; finely pubescent, erect, branched, leaves shortly petioled ovate-oblong or lanceolate subacute toothed or crenate, whorls dense-fl. distant in strict terminal spikes and shortly peduncled in the lower axils, bracts lanceolate, lower leafy, calyx $\frac{1}{2}$ in. pubescent, teeth triangular acute much shorter than the tube, corolla $\frac{1}{2}$ in. blue, tube very slender, nutlets linear.

WESTERN HIMALAYA; Kashmir, at Tilail, alt. 11,000 ft., and Kunylwan, alt. 7500 ft., *Clarke*.

Stem strict, obtusely angled. *Leaves* 1–2 in., base acute or cordate; petiole

$\frac{1}{4}$ – $\frac{1}{2}$ in. *Spikes* terminal, 3–6 in.; bracts of upper lanceolate, inner linear about equalling the calyx. *Calyx* nearly straight, mouth oblique; teeth subequal. *Nutlets* $\frac{1}{2}$ in., smooth. *Corolla-tube* three times as long as the calyx, mouth dilated; lips small, not $\frac{1}{4}$ in. across.—I have seen no lower leaves of this very distinct species.

31. ***N. salviæfolia***, *Royle ex Benth. in Hook. Bot. Misc.* iii. 397, and in *DC. Prodr.* xii. 388; slender, erect, branched, densely white-tomentose all over, leaves small shortly petioled oblong or ovate obtuse crenate, whorls or cymes shortly peduncled distant in long strict narrow racemes or spikes, bracts minute subulate, calyx $\frac{1}{4}$ in. pedicelled scaberulous, teeth triangular subequal much shorter than the tube, corolla $\frac{3}{4}$ in. pale blue or white, tube very slender, nutlets oblong.

TEMPERATE WESTERN HIMALAYA; Kashmir, alt. 6–10,000 ft., *Jacquemont, Falconer, &c.* WESTERN TIBET, alt. 10–12,000 ft.; *Thomson*.

Stem 1–2 ft., nearly cylindric. *Leaves* thick, 1–1 $\frac{1}{2}$ in., base acute rounded or cordate, wrinkled above, densely closely woolly beneath. *Racemes* a foot long and under; peduncles of cymes $\frac{1}{2}$ –1 in. *Corolla* $\frac{1}{2}$ – $\frac{3}{4}$ in.; tube very slender, throat shortly dilated, limb $\frac{1}{4}$ in. across. *Nutlets* $\frac{1}{3}$ in. long, smooth.—The Tibetan specimens have more contracted racemes than the Kashmir, and the nutlets are rather narrower. Habit and white tomentum of *N. leucophylla* and *N. leucolana*, but the calyx is very different.

E. Dwarf species. *Leaves* crowded. *Cymes* or whorls axillary, floral leaves as large as the cauline, and close set. (GLECHOMA, L.) See 14. *longibracteata* in A.

32. ***N. nivalis***, *Benth. Lab.* 737, and in *DC. Prodr.* xii. 391; erect, pubescent, leaves sessile orbicular rugose green crenate, cymes all axillary few-fl. shorter than the leaves, calyx $\frac{1}{3}$ in. pubescent, teeth subequal lanceolate, stamens exserted, nutlets linear-oblong.

WESTERN TIBET; alt. 15–16,000 ft., *Jacquemont, Thomson*.

Rootstock creeping; stems 3–6 in. *Leaves* $\frac{1}{2}$ –1 in. diam., close-set, base rounded or cordate. *Cymes* shortly peduncled, bracts minute. *Corolla* $\frac{1}{2}$ – $\frac{2}{3}$ in., pale blue, resupinate, tube upcurved, throat slightly dilated, limb small. *Nutlets* $\frac{1}{2}$ in., smooth.

33. ***N. tibetica***, *Benth. Lab.* 737, and in *DC. Prodr.* xii. 392; prostrate, softly tomentose, leaves petioled fan-shaped rugose crenate, cymes all axillary few-fl. shorter than the leaves, calyx $\frac{1}{2}$ in. woolly, teeth subequal lanceolate shorter than the tube, stamens included, nutlets linear-oblong.

WESTERN TIBET; Kookioghong, *Jacquemont*; Lunjar (N. of Kumaon), alt. 17,500 ft., *Strachey & Winterbottom*.

Rootstock long, slender, branching; stems 3–6 in. *Leaves* $\frac{1}{2}$ –1 in. diam., close-set; base cuneate; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Cymes* subsessile, bracts filiform. *Corolla* $\frac{3}{4}$ in., white; tube straight, funnel-shaped; limb small, regular. *Nutlets* $\frac{1}{2}$ in., smooth.

DOUBTFUL SPECIES.

N. NEPALENSIS, *Spreng. Syst.* ii. 730, *Benth. in DC. Prodr.* xii. 395, from Nepal.—Of this nothing is known, and the description is insufficient to identify it.

30. **DRACOCEPHALUM**, *Linn.*

Erect or prostrate herbs. *Whorls* axillary or terminal, flowers blue, purple or white. *Calyx* tubular, 15-nerved, 5-toothed; teeth all subequal,

or upper much the largest, or 3 upper combined into a broad lip. *Corolla-tube* not annulate within, upper lip erect notched, lower spreading 3-fid, midlobe largest. *Stamens* 4, ascending under the upper lip, anther-cells diverging. *Style-lobes* subulate. *Nutlets* smooth.—Species about 30, S. European and Temperate Asiatic.

As characterized in modern works, *Dracocephalum* cannot be distinguished from *Nepeta*, to which latter genus the two last described species should probably be referred.

* *Calyx* coriaceous, 2-lipped, upper lip of one very broad ovate entire acute tooth. *Stamens* included.

1. **D. speciosum**, *Benth. in Wall. Pl. As. Rar.* ii. 65, *Lab.* 494, and in *DC. Prodr.* xii. 399; stem simple tall robust, radical leaves long-petioled orbicular-cordate crenate, cauline sessile, floral orbicular, whorls in a large solitary spike or axillary, calyx $\frac{1}{2}$ in. coriaceous, upper tooth ovate, lower lanceolate. *Wall. Cat.* 2128; *Bot. Mag.* t. 6281.

ALPINE HIMALAYA; from Simla to Sikkim, alt. 12–15,000 ft.

Glabrous or woolly upwards. *Root* of very thick fleshy fibres; stem solitary, 6–18 in., 4-angled. *Leaves*, radical 2–4 in. diam., cauline smaller; petiole 5–12 in., slender. *Flowers* sessile in dense heads; bracts small, orbicular. *Calyx-teeth* apiculate, very variable in length and breadth. *Corolla* 1 in., blue-purple with dark spots, tubular, pubescent, lips short. *Stamens* subexserted. *Nutlets* $\frac{1}{8}$ in., linear-oblong, top crenate.—Near *D. altaica*.

2. **D. nutans**, *Linn.*; stem ascending, leaves shortly petioled ovate or oblong obtuse crenate, spikes long interrupted, lower whorls axillary, calyx $\frac{1}{4}$ in. coriaceous puberulous, upper tooth broadly ovate, lower setaceous. *Benth. Lab.* 499, and in *DC. Prodr.* xii. 400; *Pall. Fl. Ross.* iii. t. 17; *Bot. Reg.* t. 841. *Zornia nutans*, *Moench Meth.* 411.—*Gmel. Fl. Sibir.* iii. 231, t. 49.

TEMPERATE WESTERN HIMALAYA; Kashmir, alt. 9–10,000 ft., *Falconer & Thomson, Clarke*.—DISTRIB. Central Asia, from Soongaria to Dahuria.

Scaberulous. *Stems* 6–12 in., simple or branched, 4-angled. *Leaves* $\frac{1}{2}$ –1 in.; petiole $\frac{1}{8}$ – $\frac{1}{2}$ in. *Spikes* 4–6 in.; whorls dense-fld., flowers horizontal or drooping, sessile; bracts ovate or oblong. *Calyx* often purple. *Corolla* $\frac{1}{2}$ in., bright blue, tube slender. *Stamens* included. *Nutlets* $\frac{1}{2}$ in., linear-oblong.

** *Calyx* coriaceous, 2-lipped; upper lip broad, 3-toothed. *Stamens* included.

3. **D. moldavicum**, *Linn.*; annual, erect, branched, leaves sessile or petioled lanceolate obtusely deeply serrate or subpinatifid, spikes long leafy, whorls distinct or distant, bracts lanceolate, teeth long-awned, calyx $\frac{1}{2}$ in. glabrous, upper teeth broadly ovate mucronate. *Benth. in DC. Prodr.* xii. 401; *Lamk. Ill.* t. 513, f. 1; *Pall. Fl. Ross.* iii. t. 18; *Reichb. Ic. Fl. Germ.* t. 1240, f. 1.

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 7–8000 ft., *Falconer, Edgeworth, Clarke*.—DISTRIB. Siberia, Dahuria.

Quite glabrous. *Stem* 1–2 ft., branched from the base. *Leaves* 1–2 in., narrowed into a short slender petiole. *Spikes* 4–8 in. *Flowers* pedicelled, shorter than the floral leaves. *Corolla* $\frac{3}{4}$ –1 in., blue, tube greatly dilated to the throat. *Stamens* subexserted. *Nutlets* $\frac{1}{10}$ in., narrowly oblong truncate.

4. **D. heterophyllum**, *Benth. Lab.* 738, and in *DC. Prodr.* xii. 401; stems ascending, leaves petioled oblong ovate or cordate obtuse crenate,

spikes large dense-fl. leafy, floral leaves and bracts pectinate, teeth awned, calyx $\frac{1}{3}$ –1 in. glabrous or pubescent, upper teeth broadly ovate aristate.—*D. acanthoides*, *Edgew. ex Benth. in DC. l. c.*

WESTERN TIBET, alt. 13–16,000 ft.; *Jacquemont, Falconer, &c.*—DISTRIB. Turkestan.

Glabrous or scaberulous, brittle. *Stems* 6–8 in., stout, ascending, obtusely angled, simple or divided. *Leaves* 1–1½ in., coriaceous; petiole $\frac{1}{4}$ –1 in. *Spikes* often larger than the rest of the plant, cylindric, 1–1½ in. diam.; bracts green, elliptic, membranous. *Calyx* most variable in size, thinly coriaceous. *Corolla* $\frac{3}{4}$ –1½ in., white, hoary, inflated beyond the calyx, lower lip short. *Stamens* included. *Nutlets* $\frac{1}{4}$ – $\frac{1}{2}$ in., narrow oblong, tip truncate or crenulate.—*D. acanthoides* is a rather larger leaved and flowered state from Tibet N. of Kumaon, alt 12–15,500 ft. (*Edgeworth, Strachey & Winterbottom*).

5. ***D. Ruprechtii***, *Regel Descr. Plant. Nov. fasc. vii. 77*; stems ascending scaberulous, leaves sessile pinnatifid, lobes linear, whorls few-fl. distant, bracts pinnatifid with awned lobes, calyx $\frac{1}{2}$ – $\frac{3}{4}$ in. glabrous, upper teeth broadly ovate mucronate. *D. bipinnatum*, *Rupr. Sert. Thianschen. 65 (ex Regel)*.

WESTERN TIBET; Gilgit, *Col. Tanner*.—DISTRIB. Turkestan.

Nearly allied to *D. moldavicum*, but leaves pinnate with narrow lobes, corolla much larger, 1–1½ in. long, more tubular, not so abruptly inflated, nutlets larger. *Calyx* often purple. *Corolla* pubescent, blue.

*** *Calyx* nearly equally 5-cleft. *Stamens* exserted.

6. ***D. stamineum***, *Karel. & Kiril.*; low, diffusely branched from the base, stems terete few-leaved, leaves small petioled orbicular-cordate or reniform deeply crenate, whorls tomentose dense-fl. in terminal heads and one or more lower on the stem, calyx $\frac{1}{4}$ – $\frac{1}{2}$ in. tomentose, teeth ovate-lanceolate aristate.

WESTERN HIMALAYA; Kashmir, on Barjila, alt. 11,000 ft., *Clarke*. WESTERN TIBET, alt. 14–16,000 ft., *Thomson, Clarke*.—DISTRIB. Turkestan, Alatau Mts.

Stems excessively numerous from the root, ascending, green or purple. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., rugose, glabrous or tomentose; petiole of lower 1–3 in., very slender. *Heads* $\frac{1}{2}$ in. diam.; bracts small, cuneate, entire or toothed. *Calyx* sessile, often coloured. *Corolla* small, dark blue, tube shortly exserted, limb small. *Filaments* sometimes twice the length of the tube. *Nutlets* $\frac{1}{12}$ in. long, oblong, smooth.—Rather a *Nepeta* than a *Dracocephalum*.

7. ***D. Hookeri***, *Clarke mss.*; scaberulous, leaves pinnatifid, segments narrow linear, margins recurved, whorls in a dense terminal spike interrupted at the base, bracts pinnatifid, calyx $\frac{1}{2}$ – $\frac{3}{4}$ in. scaberulous, teeth equal nearly as long as the tube lanceolate pungent, sinus thickened.

EASTERN TIBET; north of Sikkim, alt 15,000 ft. ? *J. D. H.*

Specimens incomplete procured by collectors; upper portions of stem and spikes alone seen. *Stem* 4-angled. *Leaves* 1 in., sessile; segments few, spreading. *Spikes* 2–3 in. long by 1 broad. *Flowers* sessile. *Calyx* straight or curved. *Corolla* twice as long, tube narrow, throat moderately inflated. *Stamens* shortly exserted. *Nutlets* $\frac{1}{10}$ in., oblong, smooth.

31. **LALLEMANTIA**, *Fisch. & Mey.*

Characters of *Dracocephalum*, but upper lip of calyx with 3 obtuse lobes, of which the lateral are placed under the central.—DISTRIB. Species 4, Oriental and N.W. Indian.

This genus would better be included in *Dracocephalum*.

L. Royleana, *Benth. in DC. Prodr.* xii, 404; hoary-pubescent or glabrate, leaves shortly petioled ovate or oblong obtuse coarsely crenate, bracts oblong or lanceolate, teeth long-awned, calyx-teeth erect with incurved margins. *Boiss. Fl. Orient.* iv. 674. *Dracocephalum Royleanum*, *Benth. in Wall. Pl. As. Rar.* i. 65, and *Lab.* 497; *Wall. Cat.* 2129. *D. inderiense*, *Karel. & Kiril. in Bull. Soc. Imp. Mosc.* xv. 424. *Nepeta erodiifolia*, *Boiss. Diagn.* v. 24.

PANJAB PLAINS and HILLS; from Lahore westward indigenous? and cultivated. —DISTRIB. Afghanistan, Persia, Turkestan.

Annual, erect, 6–18 in.; stem branched or simple, obtusely angled. *Leaves* $\frac{1}{2}$ –1 in., base cordate or narrowed into the petiole. *Whorls* very numerous, in long interrupted narrow spikes; flowers shortly pedicelled; bracts small, deciduous. *Calyx* $\frac{1}{2}$ in., erect, rigid. *Corolla* pale lilac, tube hardly exerted, limb small. *Stamens* included. *Nutlets* $\frac{1}{16}$ in., narrowly oblong, smooth.

32. SCUTELLARIA, Linn.

Herbs or undershrubs. *Inflorescence* various. *Calyx* 2-lipped, lips closed in fruit, upper deciduous; tube with a large deciduous shield or pouch opposite the upper lip. *Corolla-tube* long, usually sharply recurved from the base and erect, not annulate within; upper lip entire or notched, lower broad, 3-lobed. *Stamens* 4; anthers conniving, ciliate, lower 1- upper 2-celled. *Disk* elongate. *Ovary* oblique, upper style-lobe short. *Nutlets* very minute, smooth, granulate or hispidulous.—Species about 90, N. Temp. and Tropical, many Andean.

* *Flowers in short leafy terminal spikes that are 4-angled in bud, bracts leafy.*

1. **S. prostrata**, *Jacquem. mss.*; *Benth. Lab.* 733, and in *DC. Prodr.* xii. 413; dwarf, prostrate, much branched, tomentose, leaves small petioled ovate coarsely toothed, spikes short 4-gonous, bracts ovate, corolla 1 in.

WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 8–14,000 ft., *Jacquemont*, &c.

Rootstock stout; stems many, 4–8 in., flexuous, subterete. *Leaves* $\frac{1}{2}$ –1 in., base cordate or cuneate. *Spikes* 1–2 in. *Corolla* yellow tipped with violet. *Nutlets* hispidulous.

2. **S. Heydel**, *Hook. f.*; dwarf, prostrate, much branched, branches and calyx hirsute with long spreading hairs, leaves very small shortly petioled ovate or cordate obtuse crenate, spikes short 4-gonous, bracts ovate, corolla $\frac{3}{4}$ in. *S. glutinosæ*, *Benth. var.?*, *Aitchison in Journ. Linn. Soc. Bot.* xix. 183.

WESTERN ALPINE HIMALAYA; Zaskar, alt. 15–16,000 ft., *Thomson, Heyde.* —DISTRIB. Afghanistan.

Habit of *S. prostrata*, but leaves more woolly, smaller, shorter-petioled, and with long spreading white hairs on the branches and calyx. *Corolla* yellow, tipped with blue or rose.—Near *S. pulchella*, Bunge, of the Altai.

** *Flowers in long narrow racemes, bracts shorter than the pedicel and calyx.*

3. **S. discolor**, *Coleb. in Wall. Pl. As. Rar.* i. 66; pubescent or tomentose, leaves long-petioled elliptic obtuse crenate, base rounded or cordate, floral minute, racemes very long slender, flowers scattered rarely

opposite secund, corolla $\frac{1}{2}$ – $\frac{3}{4}$ in., nutlets scabrid. *Benth. in DC. Prodr.* xii. 417; *Dalz. & Gihb. Bomb. Fl.* 210. *S. indica*, *Blume Bijdr.* 839; *Wall. Cat.* 2134; *Don Prodr.* 109; *Grah. Cat. Bomb. Pl.* 152. *S. heteropoda*, *Miq. Fl. Ind. Bat.* ii. 972.

SUBTROPICAL HIMALAYA; from Kumaon to Assam, alt. 1–6000 ft. KHASIA MTS., alt. 4–6000 ft. TENASSEEIM, *Parish*. MALABAR GHATS; Concan and Canara, *Ritchie*, &c.—DISTRIB. Burma, Java.

Stem ascending from a creeping rootstock, 1–2 ft., rarely branched, often naked above. *Leaves* 2–5 by $\frac{1}{2}$ –3 in., rarely orbicular; petiole 1–3 in. *Racemes* 6–10 in.; pedicels $\frac{1}{2}$ in.; bracts linear or oblong, all or all but the lowest shorter than the pedicel.

4. ***S. violacea***, *Heyne mss.*; *Benth. in Wall. Pl. As. Rar.* i. 66, *Lab.* 429; and in *DC. Prodr.* xii. 418; pubescent tomentose or glabrate, leaves long-petioled ovate-cordate subacute coarsely crenate or sinuate-toothed, flowers opposite secund. *Wall. Cat.* 2136; *Wight Ic.* t. 1449, and *Ill.* 176 bis, f. 7. *Thwaites Enum.* 239. *S. indica*, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 24.

DECCAN PENINSULA; Mts. from the Nilghiris, alt. 5–7000 ft., southwards. CEYLON, ascending to 7000 ft.

Habit of *S. discolor*, but at once distinguished by the opposite flowers. *Corolla* 1 in. long, "white or tinged with rose," *Wight*. *Nutlets* hispid. The following forms do not seem to me to constitute definitely marked varieties.

VAR. *Colebrookiana*; leaves more deltoid thicker softly tomentose on both surfaces, calyx larger. *S. Colebrookiana*, *Benth. in Wall. Pl. As. Rar.* i. 67, and in *DC. l. c.*; *Wall. Cat.* 2135.

VAR. *hispidior*, *Benth. in DC. l. c.*; stouter, more rigid, leaves thick, bracts sometimes equalling the pedicels. *S. robusta*, *Benth. in DC. l. c.* *S. Wightiana*, *Benth. in Wall. Pl. As. Rar.* i. 67; *Wall. Cat.* 2708. *S. nodulosa*, *A. Ham. Monogr. Scutell.* 26.—Ceylon and Nilghiris.

VAR. *floribunda*; branched, inflorescence compound, flowers rather smaller. *S. floribunda*, *Benth. in DC. l. c.*—Ceylon.

VAR. *sikkimensis*; often tall, rambling and much branched.—Sikkim, *J. D. H.*

5. ***S. oblonga***, *Benth. in Bot. Reg.* x. t. 1493 in note, *Lab.* 429, and in *DC. Prodr.* xii. 418; pubescent or glabrate, erect or decumbent, leaves petioled oblong- or linear-lanceolate obtuse or acute or acuminate serrate or sinuate-toothed, flowers opposite, corolla $\frac{1}{2}$ in. *Thwaites Enum.* 240.

CEYLON; Central Province, ascending to 7000 ft.

Stem often woody below, 6–24 in., simple or branched, leafy. *Leaves* 1–2 $\frac{1}{2}$ by $\frac{1}{2}$ –1 in., base acute, rarely rounded, never cordate, pale beneath. *Racemes* rarely 6 in.; pedicels $\frac{1}{2}$ in., longer than the bracts. *Corolla* blue. *Nutlets* minutely granulate.

6?. ***S. incurva***, *Wall. Pl. As. Rar.* i. 67; "stem ascending branched pubescent, leaves subsessile elliptic-oblong acute remotely serrate almost glabrous, floral minute, flowers opposite secund, pedicels thrice as long as the calyx, corolla-tube slender incurved, lips deeply split, upper broad hooded, lower shorter." *Benth. in DC. Prodr.* xii. 418; *Wall. Cat.* 2138.

BURMA; at Taongdong, *Wallich*.

The above is Bentham's description of the solitary imperfect specimen in the Wallichian Herbarium. The habitat is beyond the British boundary.

*** *Flowers in long narrow racemes, bracts longer than the pedicel and calyx but hardly leafy.*

7. **S. glandulosa**, *Hook. f.*; dwarf, erect, glandular-hairy, leaves small sessile oblong-lanceolate obtuse subserrate, flowers opposite, pedicels very short, corolla $\frac{1}{2}$ in.

BURMA; valley of Mogoung, dry plains towards the Serpentine mines, *Griffith*.

A span high; rootstock woody; stem simple or sparingly branched. *Leaves* few, $\frac{1}{2}$ -1 in., sparsely hairy on both surfaces. *Racemes* strict, very glandular; bracts elliptic, longer than the pedicels.—A curious little species from beyond the British boundary.

8. **S. grossa**, *Wall. Pl. As. Rar. i.* 67; *Cat.* 2142; pubescent, stem procumbent below much branched, leaves petioled ovate acute coarsely crenate-serrate, base truncate rarely cuneate, bracts elliptic exceeding the calyx, corolla $\frac{3}{4}$ in. *Benth. in DC. Prodr. xii.* 419. *S. mussooriensis*, *Wawra in Estr. Bot. Zeit.* 1881, 69, and *It. Pr. Sax. Cob. Bot.* 106.

TEMPERATE WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 4-8000 ft., *Wallich*, &c.

Black when dry. *Stems* slender, 1-2 ft., creeping below. *Leaves* 1-2½ in., nearly glabrous; petiole $\frac{1}{2}$ -1 in., slender. *Raceme* slender, 3-6 in.; pedicels very short; bracts $\frac{1}{2}$ -½ in. *Corolla* pubescent, blue-purple. *Nutlets* puberulous.

9. **S. khasiana**, *Clarke mss.*; glabrescent, slender, leaves long-petioled ovate acute crenate, base acute, bracts small longer than the pedicels, corolla $\frac{1}{2}$ in. throat inflated.

KHASIA MTS., alt. 4-5000 ft.; Nunklow, *Griffith*; Kala pani, *Clarke*.

Stem 2-3 ft., branched, rambling, terete, glabrous. *Leaves* 1½-2 in., glabrous, membranous; petiole $\frac{1}{2}$ -1 in. *Racemes* 3-4 in., lax-fl., pubescent; bracts $\frac{1}{2}$ -½ in., elliptic or ovate, lower crenate. *Corolla* pale blue? *Nutlets* granulate.

10. **S. angulosa**, *Benth. in Wall. Pl. As. Rar. i.* 67, *Lab.* 444, and in *DC. Prodr. xii.* 430; tall, sparsely hairy, branches diffuse acutely 4-angled, leaves short-petioled ovate or lanceolate obtuse or acute crenate or serrate, base rounded or subcordate, racemes tomentose, lower bracts leafy, corolla 1 in. *Wall. Cat.* 2139. *S. scandens*, *Don Prodr.* 110; *Benth. Lab.* 444. *S. celtidifolia*, *A. Ham. Monogr. Scutell.* 27.

TEMPERATE WESTERN and CENTRAL HIMALAYA; from Kashmir to Nepal, alt. 4-9000 ft., *Wallich*, &c.

Stem very stout below; branches rambling for several feet (not scandent); angles with slender ribs. *Leaves* 1-3 in., with a few small scattered hairs, often purple beneath; petiole $\frac{1}{2}$ -½ in. *Racemes* 3-4 in.; bracts all leafy, upper small entire. *Corolla* white. *Nutlets* granulate.

11. **S. repens**, *Ham. in Don Prodr.* 110; pubescent or tomentose, diffuse, branches long ascending, leaves petioled ovate acute entire or crenate-serrate, base acute or truncate, racemes long glandular-hairy, bracts $\frac{1}{2}$ -½ in. ovate, corolla $\frac{1}{2}$ in. *Benth. Lab.* 443, and in *DC. Prodr. xii.* 429. *S. cana*, *Wall. Pl. As. Rar. i.* 67, and *Cat.* 2141. *S. Wallichiana*, *A. Ham. Monogr. Scutell.* 28, t. 2, f. 1.

SUBTROPICAL HIMALAYA; from Kashmir to Sikkim, alt. 1-5000 ft.—DISTRIB. Ava.

Stems long, stout, curved, brittle, obtusely 4-angled; branches crowded, curved, ascending. *Leaves* $\frac{1}{2}$ -1½ in., upper quite entire; base rarely subcordate; petiole $\frac{1}{2}$ -1 in. *Racemes* 6-10 in., stout or slender, curved; bracts ovate, $\frac{1}{2}$ -½ in., entire or crenate; pedicels very short. *Corolla* sharply recurved, pale purple ("yellow," *Don*). *Nutlets* subgranulate.

12. **S. linearis**, *Benth. in Wall. Pl. As. Rar. i.* 66, *Lab.* 435, and in

DC. Prodr. xii. 423; dwarf, puberulous, stems prostrate and ascending, leaves subsessile linear obtuse, margins recurved quite entire, racemes very short glandular-pubescent, bracts ovate entire, corolla $\frac{3}{4}$ –1 in., throat much inflated. *Wall. Cat.* 2137.

TEMPERATE WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 3–8000 ft.—DISTRIB. Afghanistan.

Rootstock stout, woody; stems very numerous, 4–8 in., terete. *Leaves* $\frac{1}{2}$ –1 $\frac{1}{2}$ in., rarely oblong-lanceolate. *Racemes* $\frac{1}{2}$ –1 in.; pedicels very short; bracts $\frac{1}{4}$ – $\frac{1}{2}$ in., *Corolla* purple, tube nearly straight. *Nutlets* puberulous.

**** *Flowers all axillary.*

13. *S. rivularis*, *Wall. Pl. As. Rar.* i. 66, and *Cat.* 2140; dwarf, glabrous, stems subsimple leafy, leaves lower shortly petioled, upper sessile ovate or lanceolate obtuse entire or crenate, base acute dilated or cordate, flowers axillary subsessile or spicate, corolla $\frac{1}{4}$ – $\frac{1}{2}$ in. nearly straight. *Benth. Lab.* 437, and in *DC. Prodr.* xii. 426; *Wight Ic.* t. 1450. *S. peregrina*, *Roxb. Hort. Beng.* 45, and *Fl. Ind.* iii. 24. *S. barbata*, *Don Prodr.* 109. *S. squamulosa*, *A. Ham. Monogr. Scutell.* 35. *S. minor*, β indica, *Benth. in DC. l. c.* 427.

CENTRAL HIMALAYA; Nepal, *Wallich.* KHASIA MTS., alt. 4–5000 ft.; *Griffith*, &c. TENASSERIM; at Moulmein, *Parish.* NILGHIRI and ANAMALLAY MTS.; *Wight*, &c.—DISTRIB. China.

Stem creeping below, ascending 6–8 in. and leafy, or drawn out to 12–15 in., subterete. *Leaves* very variable, $\frac{1}{2}$ –1 in., close set, passing into the floral or bracts. *Spikes* 3–6 in., bracts quite entire ovate or lanceolate. *Calyx* and *corolla* (blue) glabrous or pubescent. *Nutlets* granular.—Very near *S. minor*, L.

14. *S. galericulata*, *Linn.*; puberulous, erect, leaves shortly petioled ovate-lanceolate obtuse or subacute, base cordate crenate or upper entire, flowers axillary, bracts all leafy much exceeding the calyx, pedicels very short, corolla $\frac{3}{4}$ in. *Benth. in DC. Prodr.* xii. 425; *Boiss. Fl. Orient.* iv. 690 *Reichb. Ic. Fl. Germ.* t. 1256, f. 2.

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 5–8000 ft.—DISTRIB. Europe, from the Caucasus westward, N. Africa, Central and N. Asia, N. America.

Stem below creeping, then erect, 2–3 ft. *Leaves* 1 $\frac{1}{2}$ –2 $\frac{1}{2}$ in., crenatures rather remote, upper often entire.

33. *BRUNELLA*, *Linn.* (PRUNELLA, *Linn.*)

Perennial herbs. *Whorls* in dense heads; bracts orbicular; flowers purplish, rarely white. *Calyx* reticulate, 2-lipped, closed in fruit, upper lip flat, 3-toothed, lower 2-lobed; throat naked. *Corolla* ascending, tube annulate at the base within; upper lip erect, concave; lower spreading, side lobes deflexed, midlobe concave. *Stamens* 4, exserted, filaments 2-fid, lower arm antheriferous; anthers conniving, cells diverging. *Disk* erect, symmetrical. *Style-lobes* subulate. *Nutlets* oblong, smooth.—Species 3, N. and S. temp. regions.

B. vulgaris, *Linn.*; leaves petioled ovate or oblong entire toothed or pinnatifid. *Don Prodr.* 109; *Benth. in Wall. Pl. As. Rar.* i. 66, and in *DC. Prodr.* xii. 410; *Wall. Cat.* 2132; *Wight Ic.* t. 1448; *Boiss. Fl. Orient.* iv. 691.

TEMPERATE HIMALAYA and WESTERN TIBET; from Kashmir to Bhotan; alt.

4-11,000 ft. KHASIA MTS., alt. 4-6000. NILGHIRI and TRAVANCORE MTS., alt. 6-8000 ft.—DISTRIB. N. Temp. Zone, Andes, Australia.

Rootstock creeping. *Stem* 4-12 in., erect or ascending. *Leaves* 1-2 in., upper sessile. *Spikes* 1-3 in., cylindric; bracts ovate-cordate, ciliate, edges often purple. *Flowers* dimorphic, larger 2-sexual, smaller female. *Calyx-teeth* very variable, awned or not. *Corolla* $\frac{1}{2}$ - $\frac{3}{4}$ in., purple or white.

VAR. *vulgaris*; glabrous or sparingly hairy.—Himalaya Mts.

VAR. *hispida*, Benth. in DC. l. c.; hispidly hairy. B. *hispida*, Benth. in Wall. Pl. As. Rar. i. 66. B. *ovata*, Wall. Cat. 2133.—Sikkim, Khasia and Nilgiri Mts.

34. MARRUBIUM, Linn.

Perennial tomentose or woolly herbs. *Whorls* axillary, flowers small. *Calyx* tubular, 5-10-nerved; teeth 5-10, equal, short, subspinescent. *Corolla* short, tube naked or annulate within, upper lip erect, lower spreading, midlobe largest. *Stamens* 4, included; anthers glandular, cells diverging. *Style-lobes* short, obtuse. *Nutlets* obtuse.—Species 30, temperate and warm regions of the Old World.

1. *M. vulgare*, Linn.; tall, robust, shortly woolly, leaves petioled ovate or orbicular crenate rugose, whorls axillary many and dense-fld., calyx-teeth 10 subulate spreading and recurved, throat woolly. Benth. in DC. Prodr. xii. 153; Boiss. Fl. Orient. iv. 703; Reichb. Ic. Fl. Germ. t. 1224, f. 1. M. *propinquum*, Benth. in DC. l. c. (the Kashmir plant).

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 5-8000 ft., Falconer.—DISTRIB. Westward through Europe and N. Africa.

Stem 2-4 ft., leafy. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in. diam., base rounded or cordate or cuneate, leathery, wrinkled; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Whorls* depressed, villous. *Calyx* $\frac{1}{2}$ - $\frac{1}{2}$ in., coriaceous; teeth often hooked at the tip. *Corolla* $\frac{1}{2}$ in., white, tube slender, upper lip long, 2-fid. *Nutlets* $\frac{1}{2}$ in., smooth.

2. *M. lanatum*, Benth. Lab. 587, and in DC. Prodr. xii. 448; dwarf, clothed with long soft white wool, leaves petioled rounded lobed and crenate or $\frac{1}{2}$ -pinnatifid, whorls in a dense terminal cylindric or oblong thickly woolly spike, calyx-teeth 5 acicular spreading and recurved, throat naked. Mollucella *Marrubiastrum*, Steph. in Mem. Soc. Nat. Mosc. ii. 8; Ledeb. Ic. Pl. Fl. Ross. Alt. t. 150. *Lagopsis incana*, Bunge Monog. Molucc. ined.

WESTERN TIBET, alt. 15-16,000 ft.; Thomson, Henderson. NORTHERN GUERWAE; at Sheshil, alt. 16,000 ft., Strachey & Winterbottom. DISTRIB. Turkestan and Altai Mts.

Stems many, ascending from the stout rootstock, stout, 3-6 in. *Leaves* very thick, $\frac{1}{2}$ -1 in. diam.; petiole stout, as long or shorter. *Spikes* 1-2 in., 1 in. diam.; flowers immersed in wool; bracts linear or setaceous. *Calyx-tube* $\frac{1}{2}$ in., membranous, teeth as long, pungent. *Corolla* very small, upper lip short, entire. *Nutlets* $\frac{1}{2}$ in. long, hoary.

35. CRANIOTOME, Reichb.

A perennial erect branched herb. *Leaves* long-petioled. *Flowers* minute, in slender lax-fld. paniced racemes. *Calyx* ovoid, fruiting globose, equally 5-toothed; throat constricted, villous within. *Corolla*, upper lip minute, concave, entire; lower longer, spreading, 3-fid. *Stamens* ascending under the upper lip; anther-cells didymous, at length diverging. *Style* subequally 2-fid. *Nutlets* very minute, subglobose, smooth.

C. *versicolor*, Reichb. Iconogr. i. 39, t. 54; Benth. in Wall. Pl. As.

Rar. i. 64, *Lab.* 704, and in *DC. Prodr.* xii. 455; *Wall. Cat.* 2081. *Nepeta versicolor*, *Trevir. in Nov. Act. Nat. Cur.* xii. 183. *Anisomeles nepalensis*, *Spreng. Syst.* ii. 706. *Ajuga furcata*, *Link Enum.* ii. 99.

TEMPERATE HIMALAYA; from Simla to Bhotan, alt. 5-7000 ft., *Wallich*, &c. KHASIA MTS., alt. 4-6000 ft.

Usually densely patently softly hirsute all over. *Stem* erect, 1-2 ft., terete, stout or slender. *Leaves* 2-4 by 1-3 in., broadly ovate-cordate, acuminate, toothed or crenate; petiole slender, 1-2 in. *Cymes* copious and very compound; bracts subulate. *Calyx* $\frac{1}{15}$ in., teeth triangular. *Corolla* about twice as long, pale purple or rose-coloured. *Nutlets* $\frac{1}{16}$ in., pale, shining.—In Sikkim a state occurs with the fruiting calyx campanulate and $\frac{1}{2}$ in. long, without nutlets.

36. ANISOMELES, Br.

Tall, erect, branching, coarse herbs. *Flowers* in axillary whorls or lax-fld. branched panicked cymes, purplish. *Calyx* ovoid or tubular, straight, equally 5-toothed. *Corolla-tube* short, annulate within; upper lip erect, entire; lower broad, spreading, midlobe notched. *Stamens* exerted; anthers conniving, of the longer pair dimidiate, of the shorter 2-celled, cells transverse parallel. *Style* subequally 2-fid. *Nutlets* smooth.—Species about 8, warmer Asia and Australia.

1. **A. Heyneana**, *Benth. in Wall. Pl. As. Rar.* i. 59, *Lab.* 702, and in *DC. Prodr.* xii. 455; sparsely hairy or glabrate, leaves ovate-lanceolate acuminate crenate-serrate, cymes peduncled lax-fld., calyx $\frac{1}{6}$ - $\frac{1}{4}$ in. hispid, teeth triangular-lanceolate acuminate, margins fringed. *Dalz. & Gibs. Bomb. Fl.* 210. *Teucrium secundum*, *Heyne in Wall. Cat.* 2028.

DECCAN PENINSULA; Western Ghats, from the Concan southwards.

Stem 3-4 ft., acutely angled. *Leaves* 2-3 in., green; petiole $\frac{1}{2}$ - $\frac{1}{3}$ in. *Cymes* sometimes elongate and many-flowered; bracts small, subulate. *Calyx-teeth* strongly reticulate, hairy within, margin fringed. *Corolla* $\frac{1}{2}$ in., white. *Nutlets* $\frac{1}{16}$ in., broadly oblong, polished.—Perhaps only a variety of *A. ovata*.

2. **A. ovata**, *Br. in Ait. Hort. Kew*, ed. 2, ii. 364; tomentose or densely woolly rarely sparsely hairy, leaves ovate acuminate crenate-serrate, whorls axillary dense-fld. and in dense terminal spikes, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. hirsute, teeth triangular-lanceolate acuminate. *Wall. Cat.* 2040; *Jacq. Eclog.* i. t. 86; *Hook. Bot. Misc.* ii. 358, *Suppl.* t. 19; *Benth. in Wall. Pl. As. Rar.* i. 59, and in *DC. Prodr.* xii. 455; *Grah. Cat. Bomb. Pl.* 153; *Wight Ic.* t. 865. *A. disticha*, *Heyne in Roth Nov. Sp.* 254; *Roxb. Fl. Ind.* iii. 2; *Dalz. & Gibs. Bomb. Fl.* 210. *A. glabrata*, *Benth. in Wall. Cat.* 2041. *A. mollissima*, *Wall. Cat.* 2039. *Nepeta indica*, *Linn. Sp. Pl.* 799. *N. amboinica*, *Linn. fil. Suppl.* 273. *N. disticha*, *Blume Bijl.* 823. *Ballota disticha*, *Linn. Mant.* 83. *B. mauritiana*, *Pers. Syn.* ii. 126. *Ajuga disticha*, *Roxb. Fl. Ind.* iii. 2. *Marrubium indicum*, *Burm. Fl. Ind.* 227. *M. odoratissimum*, *Burm. Thes. Zeyl.* t. 71, f. 1. *Monarda zeylanica*, *Burm. Fl. Ind.* 12. *Phlomis alba*, *Blanco Fl. Filip.* ed. i. 474.—*Rheede Hort. Mal.* x. t. 88.

TROPICAL AND SUBTROPICAL INDIA, from the INDUS to ASSAM, ascending the Himalaya to 5000 ft., and south to SINGAPORE, TRAVANCORE and CEYLON.—DISTRIB. Malay Archipelago, China, Philippines.

Annual, 3-6 ft., most variable in hairiness. *Leaves* 1-3 in., thick, 6 in. green and membranous in Sikkim specimens, white or green; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Whorls* many- and dense-fld.; bracts variable. *Corolla* purplish. *Nutlets* as in *A. Heyneana*.—Order of Camphor.

3. **A. candicans**, *Benth. in Wall. Pl. As. Rar.* i. 59, and in *DC. Prodr.* xii. 456; softly tomentose or velvety, leaves shortly petioled lanceolate or oblong acuminate serrate, whorls axillary dense-fl. and in dense terminal spikes, calyx $\frac{1}{4}$ – $\frac{1}{2}$ in. hirsute, teeth triangular-lanceolate acuminate. *Wall. Cat.* 2038. *M. malabarica*, β nigrescens, *Benth. in DC. l. c.* 457; *Wall. Cat.* 2037.

BURMA; at Prome and Yenanghuen, *Wallich*.

A very doubtful species, of which there are two forms in *Wallich's Herbarium* under the name, one with oblong obtuse petioled leaves, the other with subsessile lanceolate ones, the latter agreeing with *Bentham's A. malabarica*, var. *nigrescens*. Of this last the calyx is that of *ovata*, the leaves of *malabarica*.

4. **A. malabarica**, *Br. in Bot. Mag.* t. 2071; densely tomentose or thickly woolly, leaves short-petioled oblong linear-oblong or oblong-lanceolate obtuse acute or acuminate crenate or serrate, calyx $\frac{1}{4}$ – $\frac{1}{2}$ in. villous or woolly, teeth narrow lanceolate. *Wall. Cat.* 2037; *Hook. Journ. Bot.* i. 225, t. 127; *Wight Ic.* t. 164; *Benth. in Wall. Pl. As. Rar.* i. 59, Lab. 702, and in *DC. Prodr.* xii. 456; *Grah. Cat. Bomb. Pl.* 153; *Dalz. & Gibs. Bomb. Fl.* 210. *A. intermedia*, *Wight in Benth. Lab.* 703, and in *DC. l. c.* *Nepeta malabarica*, *Linn. Mant.* 566. *Ajuga fruticosa*, *Roxb. Fl. Ind.* iii. 1.

DECCAN PENINSULA, abundant; Penang, *Wallich*. CEYLON, in hot dry places.—*DISTRIB.* Mauritius.

Shrubby, 4–6 ft.; branches sometimes very stout and most densely clothed with snow-white appressed wool. *Leaves* 2–6 in., very thick, base cuneate, very rarely cordate; petiole $\frac{1}{8}$ – $\frac{1}{2}$ in., very stout. *Spikes* sometimes very heavy with dense whorls 2 in. diam., densely woolly; bracts filiform, teeth very slender. *Corolla* purple. *Nutlets* pale.

37. **ACHYROSPERMUM**, *Blume*.

Softly pubescent undershrubs or herbs; branches terete. *Whorls* in dense spikes. *Calyx* 10-nerved, lips short, upper erect, 3-fid; lower shorter, spreading, 2-fid. *Corolla-tube* slender, not annulate within; upper lip short, erect, notched; lower 3-lobed, midlobe largest concave. *Stamens* 4, subequal, ascending; anthers 2- or by confluence 1-celled. *Style* 2-fid. *Nutlets* crowned with a rugged annulus or chaffy beard.—Species 5 or 6, of India, the Malaya Islands, Tropical Africa and Madagascar.

A. Wallichianum, *Benth. mss.*; hoary or tomentose or villous, leaves elliptic-ovate acuminate crenate-toothed, blade decurrent on the long petiole, bracts exceeding the calyx orbicular acuminate, nutlets crowned with a jagged annulus. *Teucrium Wallichianum*, *Benth. in Wall. Pl. As. Rar.* ii. 19, Lab. 671, and in *DC. l. c.* 580; *Wall. Cat.* 2758.

EASTERN SUBTROPICAL HIMALAYA; from Sikkim, alt. 3–6000 ft., *J. D. H.*, to Mishmi, *Griffith*. KHASIA HILLS, alt. 2–5000 ft.; *Bruce, Griffith*. TENASSERIM, *Helper*.

Suffrutescent; stem terete, 1–3 ft., simple or branched, rigid. *Leaves* 4–6 by 2–4 in., membranous, sparsely pubescent. *Spikes* 2–6 in., cylindric, glabrate or villous; bracts membranous, ciliate. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., rather inflated, membranous; teeth triangular, reticulate. *Corolla* $\frac{1}{2}$ in., white dotted with rose. *Nutlets* $\frac{1}{2}$ in., turgid, faintly hairy.—There are two varieties, one tomentose with villous spikes from Silhet (*Wallich*) and Tenasserim; the other more glabrous from the Khasia and Himalaya. I suspect both may prove forms of the Javan *A. densiflorum*, *Bl.*, from which *A. philippinense*, *Benth.*, does not differ.

38. **COLQUHOUNIA**, Wall.

Tall, robust, rambling shrubs; branches terete. *Whorls* axillary and in lax-fld. spikes or racemes of orange or scarlet flowers. *Calyx* obscurely 10-nerved, subequally 5-toothed, throat naked. *Corolla-tube* incurved, not annulate, throat inflated; upper lip short, entire or notched, lower subequally 3-lobed. *Stamens* 4, ascending; anthers conniving in pairs; cells divaricate, confluent. *Style* subequally 2-fid. *Nutlets* winged above.—Species 3 or 4, Indian.

I am quite unable to distinguish the first three species, or to reconcile their specimens, descriptions and published drawings with one another.

1. **C. coccinea**, Wall. in *Trans. Linn. Soc.* xiii. 608; *Tent. Fl. Nap.* i. 13, t. 6, and *Cat.* 2085; branches tomentose, leaves elliptic ovate or cordate glabrate or subtomentose, calyx $\frac{1}{3}$ – $\frac{1}{2}$ in. hoary. *Benth.* in *DC. Prodr.* xii. 457; *Bot. Mag.* t. 4514. *C. tomentosa*, *Houlet* in *Rev. Hort.* 1873, 131, with fig.

TEMPERATE HIMALAYA; from Kumaon, *Wallich*, to Sikkim, alt. 7–9000 ft., *J. D. H.*

A shrub, 8–10 ft. *Leaves* 2–5 in., very variable in form and clothing. *Flowers* in an original drawing named by Wallich, and in the Tentamen figure, chiefly axillary, with a short subhemispheric calyx $\frac{1}{2}$ in. long (Bentham's var. *β parviflora*), and dull red corolla with the broad cylindric tube not twice the length of the calyx; in Wallich's and other specimens the flowers are very different, both axillary and in terminal spikes, the calyx and corolla are both twice as long, and the latter has a narrow tube. The plant figured in the Botanical Magazine, which was raised from seed sent by Wallich, has flowers all axillary, small calyces, a corolla $\frac{2}{3}$ in. long, funnel-shaped above the calyx, with much narrower orange-red lobes, the latter golden yellow at the base and in the throat.—*Nutlets* $\frac{1}{2}$ in. long, wing obliquely truncate.

2. **C. vestita**, Wall. *Tent. Fl. Nap.* i. 14; *Plant. As. Rar.* iii. 43, t. 267, and *Cat.* 2086; densely clothed with thick white wool, leaves elliptic ovate or cordate, calyx $\frac{1}{3}$ – $\frac{1}{2}$ in. woolly. *Benth.* in *DC. Prodr.* xii. 457.

TEMPERATE HIMALAYA; Kumaon, alt. 6–8000 ft.; Bhotan and Mishmi, *Griffith*. KHASIA MTS., alt. 5–7000 ft.; *Griffith*, &c.

This, I suspect, is only a woolly variety of *C. coccinea*, which, owing to the wetness of the climate, does not occur in Sikkim. Wallich's figure, however, represents a plant of very different habit from that of *C. coccinea*, having long subracemose terminal spikes of rose-pink flowers $1\frac{1}{2}$ in. long. Of the specimens both from Kumaon and the Khasia, many agree with the plate; others with smaller more axillary flowers and less clothed leaves pass into *C. coccinea*. Khasia specimens have often very thick leaves finely rugose on the upper surface, and densely cottony beneath.

3. **C. elegans**, Wall. *Pl. As. Rar.* i. 65, iii. 43, t. 268, and *Cat.* 2084; densely softly tomentose, leaves shortly petioled, flowers in small axillary heads, calyx $\frac{1}{2}$ in. subhemispheric, corolla-tube broad thrice as long as the calyx. *Benth.* in *DC. Prodr.* xii. 457.

BURMA; on Taëng Dong, *Wallich*.

Probably only another variety of *C. coccinea*, which I cannot distinguish from Bentham's var. *parviflora* of that plant, except in the longer corolla.

4. **C. tenuiflora**, *Hook. f.*; branches scaberulous and hirsute, leaves elliptic serrate pubescent, flowers subcapitate on very short lateral villous branches, calyx $\frac{1}{4}$ in., teeth acuminate, corolla 1 in. very slender densely pubescent.

PEGU; Karene Hills, *Rev. F. Mason*. TEXASSERIM; at Moulmein, *Parish*.

Apparently a very distinct species, of which the specimens are indifferent; the acuminate calyx-teeth and long slender corolla are very unlike any form of *C. coccinea*.

39. STACHYS, Linn.

Herbs or undershrubs. *Leaves* crenate or serrate. *Whorls* axillary and in terminal spikes or racemes. *Calyx* 5-10-nerved, teeth 5 subequal. *Corolla* with usually a ring of hairs within, throat not dilated, upper lip erect; lower spreading, 3-lobed, midlobe the largest. *Stamens* 4, ascending; anthers conniving, cells parallel or diverging. *Style-lobes* subequal. *Nutlets* obtuse.—Species about 160, all temperate and some warm climates, chiefly Oriental.

* *Herbs, stem 4-angled. Whorls many-fld., bracts as long as the calyx.*

1. *S. floccosa*, *Benth. Lab.* 739, and in *DC. Prodr.* xii. 465; stout, tall, erect, densely clothed with soft white wool, leaves petioled ovate or ovate-lanceolate cordate acute crenulate, whorls many-fld. axillary and in a terminal spike, calyx-teeth spinescent, corolla woolly.

WESTERN TEMPERATE HIMALAYA; Kashmir, alt. 5-6000 ft.; *Jacquemont, Falconer, &c.*—DISTRIB. Afghanistan.

Stem 2-4 ft., simple, sometimes as thick below as the little finger, obtusely 4-gonous. *Leaves* 3-4 by 1-2 in., thick, velvety above; petiole $\frac{1}{2}$ -1 in., very stout. *Whorls* dense, depressed, villous; bracts nearly equalling the calyx; flowers sessile. *Calyx* $\frac{1}{2}$ in.; fruiting $\frac{3}{4}$ in., villous; teeth triangular, spinous point coloured. *Corolla-tube* shortly exserted. *Nutlets* turgidly obpyriform, smooth.

2. *S. sericea*, *Wall. Pl. As. Rar.* i. 64, and *Cat.* 2077; tall, erect, more or less densely villous with long silky hairs, leaves shortly petioled ovate or oblong-cordate acute crenate, whorls many-fld. axillary and in terminal spikes, calyx-teeth spinescent, spines coloured. *Benth. Lab.* 537, and in *DC. Prodr.* xii. 465. *S. vestita*, *Benth. ll. c. in part.* *S. splendens*, *Wall. l. c.*, and *Cat.* 2075, *Benth. ll. c.*, and in *DC. l. c.* 466, *in part.*

TEMPERATE HIMALAYA; from Nepal to Kashmir, alt. 6-9000 ft.—DISTRIB. Afghanistan, Central Asia.

A most variable plant, differing only in the hairiness from *S. floccosa*, of which it is possibly a form. I cannot distinguish most of the specimens of *Bentham's S. vestita* and *S. splendens* from it, though some plants under the former name may be separated by the usually shorter calyx, the teeth of which have not the yellow spines of *sericea*; and these must be referred to *S. melissæfolia*. The corolla varies in length of tube, which is rarely exserted (*S. splendens*), and in breadth across the lips, of $\frac{1}{3}$ - $\frac{2}{3}$ in.; the usual colour is pale pink spotted with purple.

3. *S. melissæfolia*, *Benth. Lab.* 538, and in *DC. Prodr.* xii. 466, *in part*; tall, erect, tomentose or villous with silky hairs, rarely pubescent only, leaves sessile or shortly petioled ovate- or oblong-cordate acute crenate, whorls many-fld. axillary distant, calyx short, teeth triangular acute not spinescent. *S. oblongifolia*, *Benth. partly (Nepal specimens)*. *S. splendens*, *Wall. in part.*

TEMPERATE HIMALAYA; from Kashmir to Sikkim, alt. 8-10,000 ft.

Usually a smaller more slender and less hairy silky and leafy plant than *S. sericea*, best distinguished in its typical state by the shorter calyx as broad as long, with the triangular teeth acute or with a thickened tip, not ending in a pale spine; but there

are specimens difficult to refer to either one. The specimens described by Bentham under the names of *sericea*, *vestita*, *splendens* and *melissæfolia*, are so mixed up that it is useless to individualize them. *Corolla* colour as of *S. sericea*; tube exserted or not.

** *Herbs, stem 4-angled. Whorls few-fl'd.; bracts minute.*

4. ***S. oblongifolia***, Benth. in Wall. Pl. As. Rar. i. 64, Lab. 545, and in DC. Prodr. xii. 474; erect, pubescent or villous, leaves shortly petioled oblong-lanceolate subacute crenate-serrate, floral longer than the calyx, whorls 2-6-fl'd. all distant, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. villous, teeth triangular or lanceolate, tips setaceous, corolla-tube included. Wall. Cat. 2076, in part.

Plains of BENGAL, ASSAM and SILHET; in wet places, Wallich, &c.

Annual. Stem 1-2 ft., scabrid below. Leaves 2-3 by $\frac{3}{4}$ -1 in., base broadly cordate; petiole $\frac{1}{4}$ - $\frac{3}{4}$ in., floral sessile. Whorls $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., never spicate. Calyx variable, sometimes short and cupular with very broad teeth. Corolla very small, pink. Nutlets subglobose, smooth.—The form of the leaves best distinguishes this from *S. melissæfolia*.

5. ***S. palustris***, Linn.; erect, stem scabrid or hispid with reversed hairs, leaves sessile narrowly oblong- or ovate-lanceolate acuminate serrate, base rounded or cordate, floral longer than the calyx, whorls sub-6-fl'd. all distant, calyx $\frac{1}{2}$ in. hispid, teeth lanceolate, tips spinescent, corolla-tube included. Benth. in DC. Prodr. xii. 470; Boiss. Fl. Orient. iv. 726; Reichb. Ic. Fl. Germ., t. 1211.

WESTERN HIMALAYA; Kashmir, alt. 5-6000 ft.; Thomson.—DISTRIB. N. and W. Asia, Europe, N. America.

Herbaceous, 1-2 ft., perennial. Leaves 3-4 by $\frac{3}{4}$ -1 in., floral leafy. Whorls $\frac{1}{2}$ -1 in. diam., never spicate. Calyx-teeth equalling the tube. Corolla small, pink. Nutlets broadly obovoid, nearly smooth.

6. ***S. sylvatica***, Linn.; stem erect hispidly hairy, leaves long-petioled broadly ovate-cordate serrate softly hairy, floral sessile longer than the calyx, whorls few-fl'd., calyx $\frac{1}{2}$ in., teeth triangular, tips acicular, corolla small, tube exserted. Benth. in DC. Prodr. xii. 469; Boiss. Fl. Orient. iv. 726; Reichb. Ic. Fl. Germ. t. 1211, 1232.

WESTERN HIMALAYA; Kashmir, Falconer.—DISTRIB. Europe and N. Asia.

Fœtid when bruised. Rootstock creeping, stoloniferous. Stem 1-3 ft., rather slender. Leaves 2-4 in., radical early withering; petiole of lower often longer. Whorls glandular-hairy. Corolla $\frac{1}{2}$ in. long, pink. Nutlets subglobose.

7. ***S. scaberula***, Vatke in Bot. Zeit. 1875, 462; erect, stem scabrid with reversed hairs, leaves petioled ovate-cordate acuminate crenate pubescent, floral longer than the calyx sessile, whorls 4-6-fl'd. distant or upper crowded, calyx $\frac{1}{2}$ in. glandular-pubescent, teeth triangular acuminate, corolla-tube exserted.

KHASIA MTS.; banks of the Kala Panee, alt. 5-6000 ft., J. D. H. & T. T.

Rootstock slender, creeping; stem 1-2 ft., simple or branched. Leaves 1-2 in., broadly cordate, beneath subscaberulous; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., scabrid. Calyx broadly campanulate, teeth shorter than the tube. Corolla $\frac{1}{2}$ in. long, white dotted with pink. Nutlets subglobose, smooth.

*** *Shrubs or undershrubs, stems terete or nearly so.*

8. ***S. tibetica***, Vatke in Bot. Zeit. 1875, 447; glabrous or puberulous, much branched, branches slender, leaves shortly petioled oblong ovate lan-

ceolate or linear entire or irregularly lobed, whorls 1-2-fld. all axillary. *Stachys*, n. 8, *Herb. Ind. Or. H. f. & T.*

WESTERN TIBET and NORTHERN KASHMIR, alt. 10-14,000 ft.; *Thomson, &c.*—**DISTRIB.** Kashgar.

Rootstock stout, woody; stems 1-2 ft., twiggy, much branched. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., obtuse, narrowed into the petiole or sessile, green. *Flowers* sessile. *Calyx* $\frac{1}{2}$ in., campanulate, glabrous or villous; teeth as long as the tube, triangular; tips long, pubescent, erect or spreading. *Corolla* $\frac{3}{4}$ -1 in., long, pink, pubescent; tube thrice as long as the calyx; upper lip long, narrow. *Nutlets* $\frac{1}{2}$ in., broadly obovoid-oblong. —Near the Persian *S. macrocheilos*, but the tube of the corolla is much longer than the calyx.

9. ***S. parviflora***, *Benth. in DC. Prodr.* xii. 490; densely clothed with flocculent white wool, leaves sessile thick elliptic oblong or oblong-ovate or -lanceolate subacute entire or serrate, floral far exceeding the flowers, whorls distant 2-4-fld., calyx $\frac{1}{2}$ - $\frac{1}{2}$ in. densely woolly cupular, teeth short acute, corolla very small. *Boiss. Fl. Orient.* iv. 740.

PANJAB PLAINS and HILLS, from the Jhelum eastwards and northwards to Murree.—**DISTRIB.** Afghanistan.

Erect, branched from the base and upwards; stem and branches very stout, nearly terete. *Leaves* 1-3 in., extremely variable, glabrous and shining or cottony above, upper woolly all over. *Calyx* immersed in wool, fruiting closed over the nutlets with the teeth incurved. *Corolla* red-purple; lips very small, upper short rounded. *Nutlets* enclosed in the ovoid or subglobose calyx, usually 2, turgid, plano-convex, $\frac{1}{4}$ in. long, grey, granulate.

40. **GALEOPSIS**, *Linn.*

Annuals. *Whorls* many-fld., axillary and in terminal leafy spikes. *Calyx* 5-nerved; teeth 5, subequal, spinescent. *Corolla-tube* straight, not annulate; throat dilated; upper lip arched, lower 3-fld, midlobe obcordate or 2-fld; palate with erect teeth at the union of the lips. *Stamens* 4, exserted; anther-cells transversely 2-valved, inner valve rounded, ciliate; outer larger, naked. *Nutlets* rounded, compressed, subreticulate.—Species 3, Europe, N. and W. Asia.

G. Tetrahit, *Linn.*; hispid, nodes thickened, calyx-teeth equalling or exceeding the tube. *Benth. in DC. Prodr.* xii. 198. *Reichb. Ic. Fl. Germ.* t. 1231.

SIKKIM HIMALAYA; fields at Lachen, alt. 11-12,000 ft., *J. D. H.*—**DISTRIB.** of the genus.

Stem 1-3 ft., hairs spreading and deflexed, nodes very hispid. *Leaves* 1-4 in., ovate or ovate-lanceolate, acute or acuminate, coarsely serrate. *Calyx* $\frac{1}{2}$ - $\frac{3}{4}$ in., teeth straight. *Corolla* $\frac{1}{2}$ -1 $\frac{1}{4}$ in., yellow and purple.

41. **LEONURUS**, *Linn.*

Erect, leafy, stout herbs. *Leaves* lobed. *Whorls* axillary, dense-fld., distant; bracts subulate, flowers small. *Calyx* 5-nerved, turbinate; teeth 5, spreading, spinescent. *Corolla-tube* naked or annulate within, upper lip entire, erect; lower 3-fld, midlobe obcordate. *Stamens* 4; anthers conniving, cells transverse. *Style-lobes* obtuse or subulate. *Nutlets* triquetrous, truncate, smooth.—Species 10, Europe, Asia and America.

* *Corolla-tube annulate within, upper lip flattish, narrowed at the base, lower spreading, midlobe entire.*

1. **L. Cardiacæ**, Linn.; leaves lanceolate ovate or orbicular lacerate or pinnatifid, corolla with the galea densely villous. *Benth. in DC. Prodr.* xii. 500; *Boiss. Fl. Orient.* iv. 753; *Reichb. Ic. Fl. Germ.* t. 1232, 1233.

TEMPERATE WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 6–10,000 ft.—DISTRIB. Europe, N. Asia and Asia Minor.

Rootstock stout. *Stem* 2–4 ft., stout, erect. *Leaves* very variable, close set, radical long-petioled, 1–3 in. long, often as broad, base cuneate, lower sometimes multifid, upper palmately lobed. *Whorls* very many; bracts large, lower petioled; bracteoles subulate. *Calyx* $\frac{1}{2}$ in., teeth triangular, spines long. *Corolla* $\frac{1}{2}$ in., rosy or white. *Nutlets* smooth.

L. Cardiacæ proper; leaves cordate-ovate serrate or lacerate pubescent or villous beneath.

VAR. *pubescens*; leaves elliptic-lanceolate coarsely serrate finely pubescent. *L. pubescens*, *Benth. in Wall. Fl. As. Rar.* i. 63, and *Lab.* 518, and in *DC. Prodr.* xii. 499; *Wall. Cat.* 2072.—Kashmir to Kumaon.

VAR. *Royleana*; leaves ovate-lanceolate rhomboid or orbicular or obovate, base rounded or cordate pinnatifidly cut white-tomentose beneath. *L. Royleanus*, *Benth. Il. c.*; *Wall. Cat.* 2073.—Kashmir to Scinde.

** *Corolla-tube* straight, not annulate; upper lip arched, lower sub-erect or with the midlobe alone spreading obcordate or 2-fid.

2. **L. sibiricus**, Linn.; glabrous or pubescent, leaves pinnati- or palmati-partite, segments linear incised, galea of corolla pubescent. *Benth. in DC. Prodr.* xii. 501; *Wall. Cat.* 2071; *Sm. Exot. Bot.* ii. 67, t. 94; *Sweet Brit. Fl. Gard.* iii. 204. *L. tartaricus*, *Burm. Fl. Ind.* 127; *Roxb. Fl. Ind.* iii. 8 (not Linn.). *L. heterophyllus*, *Sweet l. c.* ii. 197. *Stachys Artemisiæ*, *Lour. Fl. Coch.* 365.

Plains of INDIA; from Bengal and Silhet to Coorg, indigenous?—DISTRIB. Tropical Asia, Africa and America.

Annual. *Stems* 2–6 ft. *Leaves* 2–4 in., long-petioled, 3-multi-partite, upper floral entire, all pale beneath; petiole slender. *Whorls* numerous; bracts equalling the calyx, spinescent. *Calyx* $\frac{1}{2}$ in.; teeth spinescent. *Corolla* red. *Stamens* exserted. *Nutlets* smooth (hispid, *Benth.*).

42. **LAMIUM**, Linn.

Annual or perennial hairy herbs. *Whorls* axillary, many-fld. or in leafy heads, bracteoles 0 or subulate. *Calyx* 5-nerved; teeth 5, equal or the upper longer. *Corolla-tube* annulate or not within, throat dilated; upper lip arched; lower spreading, 3-lobed, midlobe broad contracted at the base. *Stamens* 4; anthers conniving; cells diverging. *Style-lobes* subulate. *Nutlets* triquetrous, truncate, smooth, scaly or tubercled.—Species 40, Europe, Temp. Asia and N. Africa.

1. **L. rhomboideum**, *Benth. Lab.* 509, and in *DC. Prodr.* 504; dwarf, densely softly velvety, leaves very large crowded rhomboid rugose crenate, flowers very large, corolla thrice as long as the calyx, anthers hirsute. *Dcne. in Jacquem. Voy. Bot.* t. 135. *Erianthera rhomboidea*, *Benth. in Hook. Bot. Misc.* iii. 380.

ALPINE WESTERN HIMALAYA and WESTERN TIBET; in stony debris from Kashmir to Kunawur, alt. 12–15,000 ft.—DISTRIB. Afghanistan, Turkestan.

Stem 6–12 in., very stout, often as thick as a goose-quill, more slender below where it is sunk deep in the ground, flexuous, densely tomentose, rarely divided. *Leaves*, lower small, upper 2–4 in. diam., base suddenly contracted into a very thick short woolly petiole; veins flabellate and reticulate, crenatures shallow or deep. *Bracts*

subulate. *Flowers* few, $1\frac{1}{2}$ in. long, subsessile. *Calyx* $\frac{3}{4}$ in., woolly; teeth lanceolate. *Corolla* purplish; tube straight, naked within; galea broad, woolly; lateral lobes ovate, entire.—A most remarkable plant.

2. **L. amplexicaule**, *Linn.*; annual, leaves petioled orbicular inciscrenate, whorls distant, calyx small pubescent, teeth equalling the tube converging in fruit, corolla-tube long slender nearly straight. *Wall. Cat.* 2074; *Don Prodr.* 111; *Benth. in DC. Prodr.* xii. 508; *Boiss. Fl. Orient.* iv. 760; *Reichb. Ic. Fl. Germ.* t. 1204, f. 2.

The PANJAB, TEMPERATE HIMALAYA and WESTERN TIBET; in fields, alt. 2–10,000 ft.—*DISTRIB.* N. and W. Asia, Europe, N. Africa.

Hairy or glabrescent, 4–10 in., branched from the base. *Leaves* $\frac{1}{4}$ – $\frac{3}{4}$ in., lower long-petioled, almost lobulate; base rounded or cordate; floral sessile, broader than long. *Corolla* $\frac{3}{4}$ in., or shorter, very slender, rosy, pubescent. *Nutlets* scaly.

3. **L. album**, *Linn.*; perennial, glabrous or hispidly hairy, leaves all petioled ovate-cordate crenate or serrate, upper whorls crowded lower distant, calyx-teeth longer than the tube, points long, corolla-tube curved gibbous at the base below. *Benth. in DC. Prodr.* xii. 510; *Boiss. Fl. Orient.* iv. 763; *Reichb. Ic. Fl. Germ.* t. 1205. *L. petiolatum*, *Royle ex Benth. in Hook. Bot. Misc.* iii. 381, *Lab.* 513, and in *DC. Prodr.* xii. 509.

TEMPERATE WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 5–10,000 ft.—*DISTRIB.* N. and W. Asia, Europe, N. Africa.

Rootstock creeping, stoloniferous; stem 6–18 in., ascending. *Leaves* 1–3 in., lower long-petioled, rarely incised; floral shortly petioled. *Calyx* glabrous or hispid with long hairs; teeth triangular-subulate, ciliate or not. *Corolla* $\frac{3}{4}$ –1 in.; upper lip vaulted, villous; lateral lobes various, with or without a minute basal tooth; ring in the tube oblique, tube constructed below it. *Nutlets* naked.

43. ROYLEA, *Wall.*

A tall hoary undershrub. *Leaves* shortly petioled, deeply crenate-toothed or lobed. *Whorls* all axillary, 6–10-fld.; bracteoles small, subulate. *Calyx* 10-nerved, lobes 5, large, obovate-oblong, obtuse, rigid, reticulate. *Corolla-tube* included, annulate within; upper lip erect, entire; lower spreading, 3-fld, midlobe entire. *Stamens* 4, ascending; anthers conniving, cells diverging. *Style-lobes* subequal. *Nutlets* obovoid-oblong, obtuse, smooth.

R. elegans, *Wall. Pl., As. Rar.* i. 57, t. 74, and *Cat.* 2069; *Benth. Lab.* 601, and in *DC. Prodr.* xii. 516. *Phlomis calycina*, *Roxb. Fl. Ind.* iii. 2. *Ballota cinerea*, *Don Prodr.* 111.

SUBTROPICAL WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 2–5000 ft., *Wallich, &c.*

Much branched, 3–5 ft. high; branches slender, terete, finely tomentose. *Leaves* 1– $1\frac{1}{2}$ in., ovate, tomentose beneath, base cuneate; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Fruiting calyx* $\frac{1}{2}$ – $\frac{3}{4}$ in., tube deeply ribbed, lobes as long. *Corolla* narrow, $\frac{1}{2}$ in., white or pinkish. *Nutlets* $\frac{1}{2}$ in.—Odour of lemons.

44. OTOSTEGIA, *Benth.*

Shrubs. *Whorls* axillary, many-fld.; outer bracteoles often spinescent. *Calyx* 10-nerved; limb dilated, membranous; upper lip very short, 3-angled or -toothed; lower very large, broad, angled or shortly 4-toothed. *Corolla-tube* included, annulate within; upper lip erect, concave, crown villous;

lower spreading, 3-fid, midlobe broad. *Stamens* 4, ascending; anthers conniving, cells at length divaricate. *Style* subequally 2-fid. *Nutlets* obovoid, obtuse.—Species 8, Oriental.

O. limbata, *Benth. mss.*; hoary, leaves subsessile elliptic-lanceolate obtuse quite entire nerveless, bracts spinescent. *Ballota limbata*, *Benth. Lab.* 743, and in *DC. Prodr.* xii. 521.

PANJAB; lower hills in rocky places west of the Jhelum to the Salt range, *Falconer, Jacquemont, &c.*

A small grey spiny bush; branches tomentose, white, terete; spines $\frac{1}{2}$ – $\frac{3}{4}$ in. *Leaves* 1 in., base narrowed, hoary on both surfaces, floral exceeding the calyces. *Whorls* distant; lower bracts spinescent, upper dilated, pungent. *Calyx* villous, throat bearded; flowering $\frac{1}{2}$ in., turbinate, with a broad membranous 5-toothed limb, which in fruit expands into a reticulated 5-angled cup, $\frac{3}{8}$ in. diam., with often toothed margins. *Corolla* $\frac{1}{2}$ in., tube short; upper lip very long, villous. *Stamens* exserted. *Nutlets* $\frac{1}{3}$ in., solitary?, flattened, smooth.

45. **LEUCAS**, *Br.*

Woolly or villous rarely glabrate herbs or undershrubs. *Whorls* axillary, usually distant. *Calyx* 10-nerved, striate; mouth equal or oblique, equally or unequally 6–10-toothed. *Corolla-tube* included, annulate or not within; upper lip erect, concave, crown villous; lower spreading, 3-fid, midlobe very large. *Stamens* 4, ascending; anthers conniving, cells divaricate at length confluent. *Style* subulate, posterior lobe obsolete. *Nutlets* ovoid, triquetrous, obtuse.—Species 50, Asiatic and African.

Sect. 1. **Hemistoma**. *Calyx* membranous, mouth oblique, split above, produced below. *Whorls* dense, many-fid., bracteoles equalling the calyx.

1. **L. urticæfolia**, *Br. Prodr.* 504; annual, leaves ovate coarsely toothed, whorls remote globose, calyx cylindric reticulated $\frac{1}{4}$ – $\frac{1}{2}$ in. pubescent or villous, lower lip truncate, teeth minute. *Benth. in DC. Prodr.* xii. 524; *Wight Ill.* t. 176 b. f. 10, and *Ic.* t. 1451; *Dalz. & Gibs. Bomb. Fl.* 212; *Boiss. Fl. Orient.* iv. 778. *L. membranacea*, *Benth. in Wall. Cat.* 2052. *Phlomis urticæfolia*, *Vahl Symb.* iii. 76; *Roxb. Fl. Ind.* iii. 11.

UPPER GANGETIC PLAIN; from Patna to the Panjab, and southward to SCINDE, COROMANDEL and MALABAR.—DISTRIB. Beluchistan, Arabia, Abyssinia.

Annual. *Stem* 6–18 in., hoary. *Leaves* 2–3 in., petioled, glabrous or hoary. *Whorls* 1 in. diam.; bracts ciliate. *Corolla* white, not annulate.

Sect. 2. **Ortholeucas**. *Calyx* straight, mouth nearly equal, throat naked; teeth 10, triangular, subulate or lanceolate. *Whorls* numerous, axillary; bracts usually minute, setaceous (long in 4. *Helperi*, 13. *marrubioides* and 15. *pubescens*).

* Perennial rooted. Branches terete. *Calyx-teeth* not $\frac{1}{2}$ the length of the tube.

2. **L. teres**, *Benth. in Wall. Pl. As. Rar.* i. 62, *Lab.* 608, and in *DC. Prodr.* xii. 526; shrubby, hoary-pubescent, branches very slender terete, leaves very shortly petioled elliptic obtuse subserrate, whorls few-fid., bracts minute, calyx-teeth minute subulate. *Wall. Cat.* 2060.

BURMA; banks of the Irawaddi, *Wallich*.

Branches long, hairs deflexed. *Leaves* $\frac{1}{2}$ –1 in., scaberulous above, tomentose

beneath; petiole $\frac{1}{2}$ in. Calyx shortly pedicelled, $\frac{1}{8}$ – $\frac{1}{4}$ in. Corolla very small. Nutlets $\frac{1}{16}$ in.

3. **L. nepetæfolia**, Benth. in Wall. Pl. As. Rar. i. 62, Lab. 609, and in DC. Prodr. xii. 527; shrubby, tomentose, branches terete, leaves petioled orbicular-ovate obtuse coarsely crenate, whorls few-fl., bracts setaceous, calyx-teeth triangular. Wall. Cat. 2526.

DECCAN PENINSULA; at Pullejmadam ("in a journey to Hydrabad," ex Rottler mss.).

Branches hoary; hairs spreading, yellow. Leaves 1–1 $\frac{1}{2}$ in., pubescent above, tomentose beneath; petiole $\frac{1}{4}$ in., very slender. Calyx $\frac{1}{8}$ – $\frac{1}{4}$ in., villous; teeth short. Corolla small. Nutlets $\frac{1}{16}$ – $\frac{1}{12}$ in., grey.

4. **L. Helferi**, Hook. f.; floccose with soft spreading white wool or glabrate, stem procumbent very slender flexuous terete, leaves shortly petioled ovate obtuse crenate, whorls few-fl., bracts slender short or long, calyx $\frac{1}{4}$ in. villous, teeth subulate spreading.

TENASSERIM; Helfer.

Stem 1–2 ft., wiry, sparingly branched; wool on branches and leaves very fine and long, easily removed. Leaves $\frac{1}{2}$ –1 in., membranous, sometimes silky beneath; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in., very slender. Corolla very small.—The specimens are far from satisfactory.

** Perennial rooted. Branches 4-angled, hairs on them erect or spreading (not deflexed). Calyx-teeth not $\frac{1}{2}$ the length of the tube.

5. **L. lanata**, Benth. in Wall. Pl. As. Rar. i. 61, Lab. 607, and in DC. Prodr. xii. 525; everywhere densely softly woolly or subsilky, branches stout, their hairs erect, leaves mostly sessile thick ovate or oblong obtuse or acute crenate, whorls many-fl., bracts setaceous, calyx truncate, teeth minute erect. Wall. Cat. 2055. *L. collina*, Dalz. in Hook. Kew Journ. ii. 338; Dalz. & Gibs. Bomb. Fl. 211. *Marrubium mollissimum*, Don Prodr. 112.

WESTERN HIMALAYA, from Kashmir to Kumaon, alt. 3–8000 ft. BANDA; Edgeworth. BEHAR; on Parusnath, J. D. H., &c. DECCAN PENINSULA, dry hills in the west from the Concan to the Nilghiris.—DISTRIB. S. China.

Rootstock stout, woody; stem 2–3 ft., often woody; branches stout, obtusely 4-angled. Leaves 1–3 in., lower shortly petioled, sometimes silky beneath, nerves above impressed. Whorls dense-fl. Calyx-teeth variable, always very short.—Dalzell's *L. collina* is in no point different enough to be a marked variety; some states of it have the leaves beautifully silky beneath. The Parusnath specimens have a smaller calyx and browner more scurfy tomentum on the branches. The hairs of the branches at once distinguish this from *L. montana*. A variety with longer setaceous calyx-teeth and bracts half as long as the calyx, is in Dalzell's Herbarium, marked "*L. zeylanica*."

*** Perennial rooted. Branches 4-angled, hairs on them deflexed (also spreading in *L. pilosa*). Calyx-teeth not $\frac{1}{2}$ the length of the tube.

† Whorls many-fl.; few-fl. in impoverished states and varieties of some.

6. **L. chinensis**, Br. Prodr. 504; densely tomentose, leaves shortly petioled broadly ovate acute or obtuse crenate, whorls few-fl., calyx $\frac{1}{4}$ – $\frac{1}{2}$ in. funnel-shaped, teeth equal spreading broadly triangular, tip spinulose. Benth. in DC. Prodr. xii. 524; Wall. Cat. 2527. *Phlomis chinensis*, Retz Obs. ii. 19.

SOUTH DECCAN; Pulney Hills, *Wight*; Anamallay and Balarangar Hills, *Beddome*.—DISTRIB. China.

Somewhat shrubby, sometimes only hoary. *Leaves* 1-2½ in., membranous or coriaceous, upper sessile; petiole ¼-½ in. *Calyx* pedicelled; bracts setaceous.—*Calyx* of the section *Astrodon*, but the mouth not villous, and the bracts are minute.

VAR. *lanata*; densely clothed with woolly tomentum, calyx-teeth not awned.—Vellyengry Hill, *Wight*.—As densely clothed as *L. lanata*.

7. ***L. montana***, *Spreng. Syst.* ii. 742; shrubby, all over densely softly woolly or tomentose, leaves thick shortly petioled ovate or ovate-rotundate obtuse crenate, whorls many-fld., calyx ¼-½ in. subcylindric, teeth minute erect. *Wall. Cat.* 2056; *Benth. in Wall. Pl. As. Rar.* i. 61, *Lab.* 607, and in *DC. Prodr.* xii. 525. ? *L. Hamiltoniana*, *Benth. ll. c.*; *Wall. Cat.* 2525. *Phlomis montana*, *Roth Nov. Sp.* 263; *Roxb. Fl. Ind.* iii. 8.

DECCAN PENINSULA; *Heyne, Wight*. Pulney Hills and Bellary, *Beddome*. BEHAR; Monghir, *Hamilton*; on Parusnath, alt. 4,5000 ft., *Clarke*.

Lower branches woody, upper 4-gonous, with deflexed hairs. *Leaves* 1-2 in., velvety; petiole 0-½ in. *Calyx* subsessile; bracts minute.—I doubt if it is possible to determine by descriptions what *Roth's Phlomis montana* was. In Rottler's Herbarium there is under this name a mixture of several things. I doubt the species being distinct from *L. mollissima*. *L. Hamiltoniana*, *Benth.*, is I think referable here.

VAR. *Wightii*; calyx ½ in. long. *L. montana*, *Herb. Wt. propr.*

8. ***L. mollissima***, *Wall. Pl. As. Rar.* i. 62, and *Cat.* 2054; slender, much branched, hoary-tomentose, leaves sessile or shortly petioled ovate-lanceolate or ovate acute rarely obtuse serrate, calyx ¼-½ in. tomentose or woolly cylindric straight, teeth very short usually slender. *Benth. Lab.* 607, and in *DC. Prodr.* xii. 525. *L. pilosa*, var. *pubescens*, *Benth. in Wall.* and *DC. ll. c.*

SUBTROPICAL HIMALAYA; Nepal, *Wallich*; Kumaon, *Falconer*, &c. KHASIA MTS., alt. 1-4000 ft., *Griffith*, &c. The CONCAN, *Stocks*, &c. CENTRAL INDIA; Chota Nagpore, *Clarke*. CEYLON; N. of the island, *Gardner*.—DISTRIB. China.

More slender than *L. montana*, and never so densely woolly, with more acute calyx-teeth; but these are sometimes very short and broad.

Bentham describes the flower as "white? but oftener purple."

VAR. *scaberula*; more glabrous, calyx hispid.—Central India and Khasia Mts., *Clarke*.

VAR. *angustifolia*; puberulous, very slender, leaves membranous linear-lanceolate subentire. *L. angustifolia*, *Wall. Pl. As. Rar.* i. 62; *Cat.* 2064; *Benth. in DC. l. c.* 527.—Nepal, *Wallich*.

VAR. *strigosa*; branches very slender and leaves above strigosely pubescent, leaves sessile elliptic- or linear-lanceolate subacute subserrate tomentose beneath, whorls few-fld. *L. strigosa*, *Benth. in Wall. l. c.*, *Lab.* 608, and in *DC. l. c.* 526; *Wall. Cat.* 2059.—Burma; at Prome, *Wallich*. Rangoon, *McClelland*.

9. ***L. ovata***, *Benth. in Wall. Pl. As. Rar.* i. 61, *Lab.* 607, and in *DC. Prodr.* xii. 525; branches long slender tomentose, leaves large sessile broadly ovate-cordate subcrenate, tip rounded, pubescent above, woolly beneath, whorls many-fld., bracts minute, calyx ¼ in. straight villous, teeth minute, tips acicular. *Wall. Cat.* 2057.

BURMA; banks of the Irawaddi, *Wallich*.

This may be another form of *L. mollissima*, but is a very different-looking plant.

Branches 3 ft., 4-angled; hairs deflexed. *Leaves* 3 by 2 in., very obscurely crenate.—Described from a single specimen.

10. **L. pilosa**, *Benth. in Wall. Pl. As. Rar.* i. 62, *Lab.* 609, and in *DC. Prodr.* xii. 526 (excl. var. β); branches very slender with appressed deflexed and long spreading hairs, leaves petioled membranous ovate acuminate coarsely serrate sparsely hairy on both surfaces, upper sessile, whorls few-fld., calyx $\frac{1}{4}$ in. straight hispid, teeth very short, tips acicular. *Wall. Cat.* 2058.

BURMA; banks of the Irawaddi, *Wallich*.

Branches long, leaves and whorls very distant. *Leaves* 3 by $1\frac{1}{2}$ in.; petiole $\frac{1}{2}$ in. —Described from a single specimen; the long spreading hairs are quite unlike those of any other species in this section.

†† *Whorls* 1-2-fld.

11. **L. procumbens**, *Desf. in Mem. Mus.* xi. 7, t. 3; procumbent, nearly glabrous, branches very long and slender, leaves petioled membranous elliptic-ovate or lanceolate acute subserrate, flowers 1-3 pedicelled, bracts minute, calyx $\frac{1}{2}$ in. straight glabrous, teeth short lanceolate acuminate. *Benth. in Wall. Pl. As. Rar.* i. 62, *Lab.* 610, and in *DC. Prodr.* xii. 527, in part. *L. biflora*, *Wall. Cat.* 2063, in part. *Phlomis biflora*, *Roxb. Fl. Ind.* iii. 12, in part.

BENGAL PLAINS; *Roxburgh*, &c. CANARA; *Ritchie*, &c. MYSORE; *Heyne*, &c.

Branches from a woody rootstock, 2-3 ft.; angles and tips puberulous. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., base acute; petiole $\frac{1}{2}$ - $\frac{1}{2}$ in. *Calyx* with the pedicel sometimes half as long as the tube.

**** Perennial rooted. *Calyx-teeth* $\frac{1}{2}$ - $\frac{1}{2}$ the length of the tube.

12. **L. biflora**, *Br. Prodr.* 504; procumbent, pubescent, branches long slender, leaves petioled ovate elliptic or oblong coarsely serrate or crenate, flowers 1-2 subsessile, bracts minute, calyx $\frac{1}{2}$ in. straight hispid, teeth subulate $\frac{1}{2}$ the length of the tube. *Wall. Cat.* 2529; *Benth. in Wall. Pl. As. Rar.* i. 62, *Lab.* 610, and in *DC. Prodr.* xii. 527; *Wight Ic.* t. 866 (bad); *Grah. Cat. Bomb. Pl.* 153; *Dalz. & Gibs. Bomb. Fl.* 211. *L. procumbens*, *Thwaites Enum.* 240. *Phlomis biflora*, *Vahl Symb.* iii. 77; *Roxb. Fl. Ind.* iii. 12. *Nepeta indica*, *Burm. Fl. Ind.* 126, and *Thes. Zeyl.* t. 63, f. 1.

DECCAN PENINSULA, in dry places from the Concan southward. CEYLON; from the sea to 8000 ft., *Thwaites*.

Habit and foliage of *L. procumbens*, distinguished by its pubescence and long calyx-teeth, and native country.

13. **L. marrubioides**, *Desf. in Mem. Mus.* xi. 6, t. 3, f. 1; stem very stout, leaves sessile or shortly petioled thick ovate rounded or broadly ovate-cordate crenate velvety above densely white woolly beneath, whorls densely many-fld., calyx woolly, teeth subulate $\frac{1}{2}$ as long as the tube. *Benth. in Wall. Pl. As. Rar.* i. 61, *Lab.* 611, and in *DC. Prodr.* xii. 528; *Thwaites Enum.* 240.

WEST DECCAN PENINSULA, on the Ghats from the Concan to Travancore. CEYLON, common.

Stem 1-2 ft., simple or sparingly branched, densely white-tomentose with reflexed or spreading hairs. *Leaves* 1-2 in. long and broad, or more ovate, rarely acute, often rugose above, white beneath; petiole $\frac{1}{2}$ - $\frac{1}{2}$ in., stout. *Whorls* very dense and woolly or silky; bracts villous, often equalling the calyx-tube. *Calyx-teeth* very variable in length.

VAR. *pulneyensis*; leaves ovate acute not so thick, calyx less densely tomentose, teeth flexuous as long as the tube.—Pulney Mts., *Wight*.

14. ***L. angularis***, *Benth. in Wall. Pl. As. Rar.* i. 62, *Lab.* 608, and in *DC. Prodr.* xii. 526; pubescent or tomentose, branches long ascending or erect, leaves shortly petioled subacute or obtuse coarsely crenate-serrate or toothed, whorls few- or many-fld., bracts minute, calyx $\frac{1}{2}$ in. hispid, teeth very slender ciliate half as long as the tube. *L. pubescens*, *Thwaites Enum.* 240.

NILGHIRI HILLS; *Wight*, &c. CEYLON; *Walker*, &c.—DISTRIB. Java.

Stem and *branches* rather slender, several feet long, straggling. *Leaves* 1–2 in., pubescent on both surfaces; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Whorls* lax-fld.; flowers shortly pedicelled, bracts subulate.—*L. javanica*, var. *Horsfieldiana*, of Java appears to be this.

15. ***L. pubescens***, *Benth. Lab.* 610, and in *DC. Prodr.* xii. 628; pubescent or tomentose, rather stout, erect, leaves petioled rounded or ovate coarsely crenate-serrate, whorls densely many-fld., bracts linear nearly as long as the calyx or less, calyx $\frac{1}{2}$ in. hispid, teeth subulate ciliate half as long as the tube. *L. marrubioides*, *Wall. Cat.* 2524.

DECCAN PENINSULA; *Wight*. Pulney Hills, *Beddome*.

Differs from *L. angularis* in the stouter erect habit, usually rounder longer-petioled leaves, and especially in the long ciliate bracts.

***** Annuals. *Stem* 4-angled.

16. ***L. flaccida***, *Br. Prodr.* 505; pubescent or tomentose, branched from the base, branches weak, hairs deflexed, leaves membranous long-petioled ovate or oblong obtuse crenate, whorls few-fld., bracts minute, calyx $\frac{1}{4}$ in. hairy or villous, teeth $\frac{1}{2}$ the length of the tube, alternate ones with capillary points. *Benth. Lab.* 609, and in *DC. Prodr.* xii. 526. *L. parviflora*, *Benth. in Wall. Pl. As. Rar. l. c.*; *Wall. Cat.* 2061. *L. melissæfolia*, *Benth. in Wall. l. c.* *L. melissæflora*, *Benth. in Wall. Cat.* 2062. *L. decemdentata*, *Smith in Rees Cyclop.*; *Benth. in DC. l. c.*

BURMA and TENASSERIM; *Wallich*, *Griffith*.—DISTRIB. Siam, Malay and Pacific Islands, Australia, W. Indies (introduced).

A slender flaccid annual; stem 6–8 in.; hairs on stem deflexed. *Leaves* 1–2 in., base cuneate; petiole $\frac{1}{2}$ –1 in., very slender. *Calyx* slightly curved, pedicelled. *Corolla-tube* much exserted.

17. ***L. longifolia***, *Benth. Lab.* 744, and in *DC. Prodr.* xii. 527; erect, branched above, scaberulous or hispid, leaves sessile narrowly linear quite entire, whorls few-fld., bracts minute, calyx $\frac{1}{4}$ in. sessile hispid turbinate truncate, teeth minute. *Grah. Cat. Bomb. Pl.* 153; *Dalz. & Gibs. Bomb. Fl.* 210.

The CONCAN; at Poona, &c., *Jacquemont*, *Stocks*, &c.

A foot high, rigid; stem naked below; hairs erect or spreading. *Leaves* $1\frac{3}{4}$ – $2\frac{1}{4}$ by $\frac{1}{10}$ – $\frac{1}{4}$ in., obtuse or subacute. *Calyx-mouth* villous. *Corolla* $\frac{1}{2}$ in., tube exserted; upper lip very short, lower very much longer and broader.—An unmistakable species.

Sect. 3. ***Astrodon***. *Calyx* straight, mouth equal, throat villous; teeth 10, usually stellately spreading. *Whorls* terminal and axillary, densely many-fld.; bracteoles usually about equalling the calyx (setaceous in *L. suffruticosa*). (See also 28. *L. stricta* and 34. *diffusa*.)

* *Leaves quite entire.*

18. **L. suffruticosa**, *Benth. Lab.* 611, and in *DC. Prodr.* xii. 528; a low shrub, branches densely fulvous-tomentose and hispid, leaves 1 in. sessile coriaceous linear obtuse hispid above white-tomentose beneath, whorls 1-2 terminating very long scapiform branches, calyx $\frac{1}{4}$ in. villous turbinate, teeth spinulose erect. *Wight Ic.* t. 1454.

SOUTH DECCAN; Nilghiri Hills, common in pastures, alt. 7000 ft., *Wight*, &c. Anamallay Hills, *Beddome*.

Rootstock very long and stout; branches ascending, rigid, terete, 4-6 in. (without the scape), appressed hairs erect, bristles spreading. *Leaves* quite entire; margins recurved. *Scapes* 6-10 in., tomentose only. *Whorls* $\frac{1}{2}$ -1 in. diam., with one or a pair of floral leaves; bracts setaceous, half the length of the calyx. *Calyx* sessile, villi of throat shorter than the teeth. *Corolla-tube* included, galea most densely villous. *Nutlets* $\frac{1}{8}$ in., oblong, terete, smooth.

19. **L. rosmarinifolia**, *Benth. in Wall. Pl. As. Rar.* i. 61, *Lab.* 612, and in *DC. Prodr.* xii. 528; a low excessively branched strigosely tomentose shrub, leaves 1 in. sessile fascicled linear obtuse softly villous beneath, whorls 1-2 terminating short scapiform branches, calyx $\frac{1}{4}$ in. turbinate hispidly villous, teeth very minute erect. *Wall. Cat.* 2521; *Wight Ic.* t. 1455.

NILGHIRI MTS.; alt. 7-8000 ft., in any soil, *Wight*, &c.

Stem woody, terete, fastigiately branched, hairs erect. *Leaves* $\frac{1}{10}$ - $\frac{1}{8}$ in. diam., rigid, grey; margins quite entire, revolute. *Whorls* often solitary, $\frac{3}{4}$ 1 in. diam., hemispheric, villous, with a pair of floral leaves; bracts linear, rigid, nearly equalling the calyx. *Calyx* sessile, closing over the fruit, villi of throat white, much exceeding the teeth. *Nutlets* oblong, $\frac{1}{10}$ in., obtusely trigonous.

20. **L. helianthemifolia**, *Desf. in Mem. Mus.* xi. 2, t. 1, f. 1; a low shrub, densely softly subsilkily villous (white or buff) tomentose, leaves opposite and ternate $\frac{3}{4}$ -1 $\frac{1}{4}$ in. sessile coriaceous linear-oblong obtuse, whorls few few-fld., calyx $\frac{1}{4}$ in. turbinate densely woolly, teeth minute erect. *Benth. Lab.* 612, and in *DC. Prodr.* xii. 528. *L. ternifolia*, *Desf. l. c.* t. 1, f. 2; *Bent. ll. c.*; *Wight Ic.* t. 1453.

SOUTH DECCAN; Pulney, Nilghiri and Anamallay Hills, alt. 5-7000 ft., *Wight*, &c.

Stem woody, terete, much branched; branches 6-12 in., rigid, erect; hairs spreading or erect. *Leaves* $\frac{1}{6}$ - $\frac{1}{2}$ in. diam., sometimes narrowed from the middle downwards; margin revolute, quite entire. *Whorls* $\frac{1}{2}$ - $\frac{3}{4}$ in. broad, often crowded, dense-fld.; bracts almost equalling the calyx, subulate, tomentose. *Calyx* sessile, villi of the mouth as long as the teeth. *Corolla* very short. *Nutlets* $\frac{1}{8}$ in., oblong.

21. **L. lanceæfolia**, *Desf. in Mem. Mus.* xi. 5, t. 2, f. 2; tall, erect, shrubby, stem stout rufous-tomentose, leaves 3-4 in. petioled coriaceous lanceolate subacute scaberulous above white-tomentose beneath, nerves distinct, whorls axillary many- and dense-fld., calyx $\frac{1}{4}$ in. campanulate pubescent or tomentose, teeth minute spinulose spreading. *Benth. Lab.* 61, and in *DC. Prodr.* xii. 612; *Wight Ic.* t. 1452. *L. lanciformis*, *Wall. Cat.* 2759.

NILGHIRI MTS., alt. 6-8000 ft., *Wight*, &c., common.

Tall, 6-8 ft., very stout, "forming great clumps" (*Wight*); stem terete, hairs erect. *Leaves* $\frac{1}{2}$ -1 in. diam., subacute, dark above when dry, grey beneath with reddish silky veins; floral similar. *Whorls* 1 in. diam.; bracts linear-lanceolate, shorter than the calyx. *Calyx* sessile, hairs of mouth shorter than the teeth. *Corolla* small, tube included.

** *Leaves more or less serrate or crenate.*

22. **L. stelligera**, *Wall. Pl. As. Rar.* i. 61, and *Cat.* 2049; herbaceous, erect, branched, pubescent or tomentose, leaves 2-4 in. shortly petioled elliptic-lanceolate subacute obtusely serrate, whorls large crowded many- and dense-fl'd., calyx $\frac{1}{4}$ - $\frac{3}{4}$ in. tubular-campanulate scabrid or tomentose, teeth thick triangular subulate spreading and recurved longer than the villi of the mouth. *Benth. Lab.* 61, and in *DC. Prodr.* xii. 529; *Dalz. & Gibs. Bomb. Fl.* 211. *L. hamatula*, *Arn. Pugill. Pl. Ind. Or.* 37; *Benth. in DC. l. c.*

CEYLON; on the Ghats, *Dalzell*; Warree country, *Stocks*; Belgaum, *Ritchie*.

Stem 2-3 ft.; branches obtusely 4-gonous, hairs spreading. *Leaves* $\frac{1}{4}$ - $\frac{3}{4}$ in. diam., green, scaberulous or glabrate above, pubescent beneath, narrowed into the petiole. *Whorls* 1-1 $\frac{1}{2}$ in. diam.; bracts linear-lanceolate, nearly as long as the calyx. *Calyx* very variable in size, fruiting membranous, naked below the middle; teeth rarely spinescent, tomentose. *Nutlets* $\frac{1}{2}$ in., oblong.

23. **L. eriostoma**, *Hook. f.*; suffruticose, hispidly hairy, woolly or tomentose, leaves 1 $\frac{1}{2}$ -4 in. shortly petioled narrowly linear-lanceolate or oblong obtuse obtusely serrate, whorls axillary many- and dense-fl'd., bracts equalling the calyx plumose or ciliate, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. tubular-funnel-shaped villous above the middle, teeth very minute much shorter than the dense ring of white villi in the mouth. *Phlomis eriostoma*, *Heyne mss.*

DECCAN PENINSULA; Western Ghats, from the Concan to the Nilghiris.

Branches 6-10 in., stout, nearly terete. *Leaves* very variable in length, nerves unpressed above. *Whorls* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam. *Calyx* naked below the middle. *Corolla* very small, tube included. *Nutlets* $\frac{1}{10}$ in., oblong.—There are several varieties of this.

VAR. *Heynii*; hispidly hairy on the branches and leaves, hairs spreading, leaves 2-3 in.—Wynad, *Heyne*.

VAR. *longifolia*; hoary-tomentose, leaves 3-4 in. nearly glabrous. *Herb. Wight, &c.*

VAR. *latifolia*; very robust, villously tomentose, leaves broader elliptic oblong or lanceolate, 2-3 by 1-1 $\frac{1}{2}$ in., whorls large globose 1 $\frac{1}{2}$ in. diam. *Herb. Wight.*

VAR. *lanata*; branches clothed with dense long soft white spreading hairs, leaves 1-1 $\frac{1}{2}$ in. oblong lanceolate villous on both surfaces.—Nilghiris and Bababoodan Hills.—*L. lepidstoma*, *Herb. Wight.*

VAR. *Stocksii*; branches densely clothed as in var. *lanata*, but tomentum shorter and whiter, leaves subsilky beneath 1-1 $\frac{1}{2}$ in.

24. **L. lamiifolia**, *Desf. in Mem. Mus.* xi. 4, t. 2, f. 1; tall, shrubby below, branches very stout square and petioles hirsute with long brown hairs, leaves 3-5 in. shortly petioled ovate subacute crenate-serrate villous above densely tomentose beneath, whorls subsolitary subglobose many- and dense-fl'd., calyx $\frac{1}{2}$ in. subcampanulate villous, teeth slender erect longer than the villi of the mouth ciliate, corolla-tube included. *Benth. Lab.* 613, and in *DC. Prodr.* xii. 529.

NILGHIRI HILLS, alt. 6500-7500 ft.; *Wight, &c.*

Much the largest and largest-leaved species, 8 ft. high, branches $\frac{1}{4}$ in. diam. *Leaves* 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ in. broad, base sometimes cordate. *Whorls* terminal, rarely 2 on the same branch, 1 $\frac{1}{2}$ in. diam.; bracts exceeding the calyx, outer linear-lanceolate, inner filiform. *Calyx* membranous, teeth about $\frac{1}{2}$ the length of the tube, villi of the mouth sparse. *Corolla* small. *Nutlets* $\frac{1}{8}$ in. long, oblong.

25. **L. vestita**, *Benth. in Wall. Pl. As. Rar.* i. 61, *Lab.* 613 (*excl. Silhet*), and in *DC. Prodr.* xii. 530; tall, herbaceous, branches square and petioles hirsute, leaves shortly petioled 2-4 in. ovate-lanceolate acute ser-

rate pubescent above tomentose beneath, whorls subsolitary and terminal many- and dense-fld., calyx $\frac{1}{2}$ – $\frac{2}{3}$ in. tubular narrowed below villous, teeth slender erect ciliate longer than the villi of the mouth, corolla large. *Wight Ic. t.* 338.

SOUTH DECCAN PENINSULA; *Wight*. Pulney and Balaramgan Hills (Mysore), *Beddome*.

A more slender plant than *L. lamiifolia*, apparently annual, more sparsely hairy, with narrower leaves, smaller heads, longer calyx and larger corolla.

VAR. *oblongifolia*; shorter, stem woody below, leaves smaller $1\frac{1}{2}$ –2 in. more oblong and villous above.—Courtallam, *Wight*.

VAR. *sericostoma*; branches with soft spreading hairs, leaves silkily villous, calyx-teeth shorter than the long white silky hairs of the mouth.—Anamallay Hills, *Beddome*.

VAR. *angustifolia*; tall, branches with soft spreading hairs, leaves 2–3 by $\frac{1}{2}$ in. elliptic-lanceolate obtuse, calyx-teeth as long as two-thirds of the tube.—Sisparah, *Wight*; Palghat high range, *Beddome*.

26. **L. hirta**, *Spreng. Syst. ii.* 743; villously hirsute or scabrid, stem woody below, leaves 1–2 in. sessile or shortly petioled elliptic or linear oblong obtuse obscurely toothed, whorls solitary terminal, bracts as long as the scabrid turbinate calyx, calyx-teeth recurved equalling or shorter than the copious villi of the mouth. *Benth. Lab.* 613, and in *DC. Prodr.* xii. 530. *L. helianthemifolia*, *Benth. in Wall. Pl. As. Rar.* i. 61; *Wall. Cat.* 2053, *non Desf.* *L. rufescens*, *Benth. in Wall. Cat.* 2053. *Phlomis hirta*, *Heyne in Roth Nov. Sp.* 264.

DECCAN PENINSULA; Bangalore, *Rottler*; Nilghiri, Mysore and Shevaghery Hills, *Wight*.

Probably a dry country or locality form of *L. vestita*, much smaller, more scrubridly hirsute or villous, with very much smaller leaves and calyces and longer villi of the mouth than the latter. The hairs on the branches are deflexed or spreading, rarely appressed.

VAR. *prostrata*; smaller, more slender, branches prostrate or ascending, leaves $\frac{1}{2}$ –1 in. broadly ovate often petioled, villi of calyx-mouth shorter.—Anamallay and Nilghiri Hills, alt. 6–8000 ft.

VAR.? *Beddomei*; erect, softly villous with spreading hairs, leaves 2– $2\frac{1}{2}$ in. linear-oblong subsilkily villous on both surfaces, whorls in several axils, calyx $\frac{1}{2}$ in., teeth very small recurved triangular subulate spinescent longer than the villi of the mouth.—Chambra Peek, Wynaad, alt. 5000 ft., *Beddome*.

27. **L. ciliata**, *Benth. in Wall. Pl. As. Rar.* i. 61, *Lab.* 614, and in *DC. Prodr.* xii. 530; stem and branches hirsute with spreading and deflexed hairs, leaves petioled 2–4 in. ovate or lanceolate coarsely serrate pubescent or glabrate, whorls globose large many- and dense-fld. terminal and axillary, bracts as long as the calyx hirsute, calyx $\frac{1}{2}$ – $\frac{2}{3}$ in. tubular scabrid or villous, teeth long slender patent or recurved, mouth wide naked or ciliate. *Wall. Cat.* 2046; *Dalz. & Gibs. Bomb. Fl.* 211.

TEMPERATE HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 7–9000 ft., *J. D. H.*; Bhotan, *Griffith*. KHASIA MTS., alt. 4–5000 ft.; *Wallich*, &c. DECCAN PENINSULA; on the Ghats, from the Concan to Travancore.

A tall annual? 1–3 ft., stem branched, obtusely 4-angled. *Leaves* membranous, narrowed at the base; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Whorls* 1– $1\frac{1}{2}$ in. diam., ciliate from the slender long bracts and calyx-teeth. *Calyx* very variable in size and hairiness, teeth flexuous, ciliate, in small forms more than half as long as the tube. *Corolla-tube* included. *Nutlets* $\frac{1}{10}$ – $\frac{1}{8}$ in., oblong, smooth.

SECT. 4. **Plagiostoma**. *Bracts* usually as long as the calyx or nearly so. *Calyx* turbinate obconic or tubular, mouth very oblique, the

upper part projecting forwards, throat glabrous or nearly so, teeth erect (mouth straight in *28. stricta*, *34. diffusa*).

* *Annuals. Whorls terminal or axillary. Calyx-teeth long and slender.*

28. *L. stricta*, Benth. in Wall. Pl. As. Rar. i. 61, Lab. 614, and in DC. Prodr. xii. 531; annual, slender, erect, hispidly hairy, leaves oblong-lanceolate or linear, whorls solitary terminal, calyx $\frac{1}{2}$ in. hispid between tubular and funnel-shaped nearly straight, teeth long very slender ciliate. *Wall. Cat. 2045. Phlomis stricta, Heyne mss.*

DECCAN PENINSULA; Pulicat Mts., *Heyne*; Sandstone Hills, N.E. of Belgaum, *Ritchie, &c.*; Bellary, *Beddome*.

Stem 6-10 in., branches acutely 4-gonous. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., obtuse, floral like the cauline, bracts filiform rigid ciliate. *Calyx* slightly hairy within; teeth sometimes nearly as long as the tube, much longer than the villi of the mouth. *Corolla-tube* included, upper lip very short, lower twice as large.

29. *L. Clarkei*, Hook. f.; annual? slender, sparsely appressedly pubescent, branches ascending scabrid, leaves linear or linear-lanceolate entire or subserrate, whorls terminal globose, calyx short $\frac{1}{4}$ in. pubescent turbinate subdecurved, teeth very slender, 3 upper much the longest, mouth laxly hairy.

BEHAR; on Parusnath, alt. 1500 ft., *Clarke*.

Branches 1-2 ft., up-curved, 4-gonous, hairs short deflexed. *Leaves* 1-2 in., obtuse, floral many, like the cauline. *Whorls* subglobose, $\frac{1}{2}$ -1 in. diam.; bracts very slender, ciliate, tips and of calyx-teeth acicular. *Calyx* broad; teeth rather squarrose, scabrid, longer than the villi of the mouth. *Corolla-tube* included, upper lip short, lower $\frac{1}{2}$ in. long, widely spreading.

30. *L. nutans*, Spreng. Syst. ii. 743; annual, dwarf, diffusely branched, laxly hairy, leaves 1-2 in. shortly petioled oblong or linear-oblong obtuse subserrate, whorls terminal and axillary dense-fl'd., calyx $\frac{1}{4}$ in. falcately decurved hispid deeply striate, teeth subequal lanceolate ciliate. *Benth. Lab. 616, and in DC. Prodr. xii. 532. L. decurva, Benth. in Wall. Pl. As. Rar. i. 60, and Cat. 2050. Phlomis nutans, Roth Nov. Sp. 263.*

N. and N.W. INDIA, from the upper Gangetic plain to the Indus. SCINDE; *Stocks*. The DECCAN; *Heyne*. BEHAR; on Parusnath, *Clarke*. BURMA; on the Irawaddi, *Wallich*.

A small often straggling species. *Leaves* sometimes petioled. *Whorls* conspicuous for the sharply decurved calyces, the teeth of which are less slender than in *L. Clarkei* or *martinicensis*. *Bracts* ciliate, very slender. *Calyx* membranous, teeth much longer than the hairs of the mouth. *Corolla* small.

31. *L. martinicensis*, Br. Prodr. 504; annual, tall, stout, scaberrulous, leaves 3-4 in. petioled ovate or ovate-lanceolate obtuse coarsely crenate-serrate, whorls axillary globose, bracts and calyx-teeth spinescent ciliate, calyx $\frac{1}{2}$ - $\frac{3}{4}$ in. pubescent tubular sigmoidly curved, teeth slender, uppermost longest. *Benth. in Wall. Pl. As. Rar. i. 60, Lab. 617, and in DC. Prodr. xii. 533. L. polycephala, Wall. Cat. 2051.*

Sporadic in INDIA, doubtfully indigenous. The DECCAN; from the Concan southwards, *Heyne, &c.* AVA; *Wallich*.—DISTRIB. Tropical Africa and America.

A stout herb, 2-4 ft.; branches 4-gonous, sometimes hispidly hairy. *Leaves* membranous, base cuneate; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in.; floral sessile, more lanceolate. *Whorls* numerous, $\frac{1}{2}$ -1 in. diam.; bracts slender, tips pale, often hooked. *Calyx* much

enlarged in fruit, teeth tipped like the bracts, ciliate, often recurved. *Corolla* small. *Nutlets* $\frac{1}{2}$ in., obovate-oblong, shining.

**** Annuals.** *Whorls* terminal, rarely axillary. *Calyx-teeth* very short.

32. **L. Cephalotes**, *Spreng. Syst.* ii. 743; annual, tall, stout, scabrous, leaves 2-4 in. shortly petioled ovate or ovate-lanceolate subacute crenate-serrate, whorls very large terminal globose, bracts membranous elliptic- or linear-lanceolate awned, calyx $\frac{3}{4}$ in. tubular slightly curved, teeth short subulate scabrid, mouth hairy. *Benth. in Wall. Pl. As. Rar.* i. 60, *Lab.* 616, and in *DC. Prodr.* xii. 532; *Wall. Cat.* 2043; *Wight Ic.* t. 337; *Grah. Cat. Bomb. Pl.* 153; *Dalz. & Gibs. Bomb. Fl.* 211; *Boiss. Fl. Orient.* iv. 779. *L. capitata*, *Desf. in Mem. Mus.* xi. 8, t. 4. *Phlomis Cephalotes*, *Roth Nov. Sp.* 262; *Roxb. Fl. Ind.* iii. 10.

HIMALAYA; from Simla to Bhotan, alt. 2-6000 ft. Plains from CHITTAGONG and ASSAM to the PANJAB, and south through the DECCAN (not in Ceylon).—DISTRIB. Afghanistan.

Stem 2-3 ft., hairs spreading. *Leaves* membranous, more or less pubescent. *Whorls* 1-2 in. diam., surrounded by the imbricating membranous appressed bracts, which are quite unlike those of any other species. *Calyx* usually softly pubescent, membranous; hairs of mouth as long as the teeth.

33. **L. zeylanica**, *Br. Prodr.* 504; annual, erect, pubescent or hispidly hairy, leaves 2-3 in. shortly petioled linear- or elliptic-lanceolate obtuse subserrate, whorls subterminal many-fld., bracts few ciliate, calyx $\frac{1}{4}$ - $\frac{1}{2}$ in. obliquely turbinate glabrous scabrid or sparsely hispid, teeth minute, mouth broad pubescent within. *Benth. in Wall. Pl. As. Rar.* i. 60, *Lab.* 614, and in *DC. Prodr.* xii. 531; *Wight. Ill.* t. 176; *Thwaites Enum.* 240 (*excl. syn.*). *L. involucrata*, *Benth. in Wall. Cat.* 2047. *Phlomis zeylanica*, *Linn. Sp. Pl.* 820. *Leonurus Marrubiastrum*, *Burm. Fl. Ind.* 127, *non Linn.*

ASSAM; *Jenkins*. CACHAR and CHITTAGONG; *Clarke*. MALAY PENINSULA; from Rangoon, *Wallich*, to Singapore, *G. Thomson*. CEYLON, common.—DISTRIB. Malay Islands, China.

Stem 1-3 ft., branched above; hairs spreading, deflexed or appressed. *Leaves* sometimes 1 in. diam. *Whorls* small, $\frac{1}{2}$ - $\frac{2}{3}$ in. diam., rarely axillary; bracts fewer and shorter than in the allies, filiform, ciliate. *Calyx* very constant in size and shape, teeth erect or spreading horizontally.

VAR. *Walkeri*; branches long and strict, hairs appressed or spreading, leaves very narrow 2-3 by $\frac{1}{4}$ - $\frac{1}{2}$ in. *L. Walkeri*, *Benth. in DC. Prodr.* xii. 531. —Ceylon, *Walker, Champion*.—Bentham regards this as near *L. hyssopifolia*. Without knowing whether it is annual or perennial, it is difficult to say whether it is a variety of that plant or of *L. zeylanica*, of which it has the tall habit and solitary terminal whorls.

34. **L. diffusa**, *Benth. Lab.* 615, and in *DC. Prodr.* xii. 531; annual, diffusely branched from the root, branches slender ascending hispid or hirsute, leaves $\frac{1}{2}$ -1 in. linear or linear-oblong obtuse subentire, whorls chiefly solitary and terminal few-fld., calyx $\frac{1}{4}$ in. turbinate curved smooth below ribbed and hispid above, mouth wide truncate, teeth small subulate erect rather longer than the villi. *Phlomis diffusa*, *Herb. Rotter.*

DECCAN PENINSULA; *Heyne, Wight, &c.*

This differs from *L. zeylanica* in the diffuse habit and small leaves. It has been mixed in Wallich's Herbarium with *L. nutans* and *L. dimidiata*, *Benth.* (? of Sprengel), which is the same as *L. aspera*. From the latter the habit, almost entire leaves, smaller fewer-fld. whorls, and much shorter calyx with a wider truncate not oblique mouth abundantly distinguish it.

*** *Annual, except L. hyssopifolia. Whorls terminal and axillary. Calyx-teeth very short.*

35. **L. hyssopifolia**, *Benth. in Wall. Pl. As. Rar.* i. 60, *Lab.* 615, and in *DC. Prodr.* xii. 531; perennial, erect, hispidly hairy, leaves 1-2½ in. linear obtuse, margins recurved entire, whorls terminal and axillary small, bracts few subulate, calyx ¼ in. obconic glabrous, mouth wide truncate glabrous, teeth very minute erect. *Wall. Cat.* 2044.

SUBTROPICAL HIMALAYA and plains at their feet; from Jamu to Sikkim, alt. 1-3000 ft. CHOTA NAGPORE; at Sumbulpore, *Griffith*.

Rootstock stout, woody; branches numerous, 4-8 in. *Leaves* spreading, ½-¾ in. broad, often rigid. *Whorls* ½-¾ in. diam.; bracts very slender. *Calyx* very like *L. zeylanica* and *Wightii*; mouth glabrous within.

36. **L. Wightiana**, *Benth. in Wall. Pl. As. Rar.* i. 60; annual, erect, scabrid, leaves 1-2 in. linear obtuse entire, whorls small axillary and terminal or in dense terminal cylindric spikes, calyx ¼ in. obovoid hispid, mouth wide very oblique villous, teeth irregular triangular, upper longer. *Wall. Cat.* 2520. *L. aspera*, var. *Wightiana*, *Benth. Lab.* 616, and in *DC. Prodr.* xii. 532.

DECCAN PENINSULA; *Wight, G. Thomson*.

Stem 6-10 in., and branches very stout, and leaves grey; hairs minute, deflexed and appressed. *Leaves* ½-¾ in. broad, margins flat or recurved. *Whorls* ½-¾ in.; bracts slender, hispid. *Calyx* membranous below, green and striated above, not contracted at the junction. *Corolla* very small.—The stout scabrid habit, narrow entire leaves, small whorls, and short calyx, not contracted above the nutlets (with, however, similar teeth) distinguish this from *L. aspera*.

37. **L. aspera**, *Spreng. Syst.* ii. 743; annual, erect or diffuse, stem stout hispid or scabrid, leaves 1-3 in. linear or oblong obtuse entire or crenate, whorls large terminal and axillary, bracts long linear and filiform, calyx ⅓-¾ in. tubular curved smooth below green and ribbed and scabrid above contracted above the nutlets, mouth small glabrous very oblique shortly irregularly toothed. *Benth. Lab.* 615, and in *DC. Prodr.* xii. 532; *Grah. Cat. Bomb. Pl.* 153; *Dalz. & Gibs. Bomb. Fl.* 211. *L. Plukenetii*, *Benth. in Wall. Pl. As. Rar.* i. 60 (? *Spreng.*); *Wall. Cat.* 2522. *L. dimidiata*, *Benth. in DC. l. c.* 532 (? of *Spreng.*). *Phlomis aspera*, *Willd. Enum. Hort. Berol.* ii. 621. *P. Plukenetii*, *Roth Nov. Sp.* 261. *P. esculenta*, *Roxb. Fl. Ind.* iii. 10. *P. obliqua*, *Ham. mss.*—*Rheede Hort. Mal.* x. t. 91.

PLAINS OF INDIA; from Sikkim and Behar to the Panjab, and southward to Cape Comorin.—DISTRIB. Mauritius, Java, Philippine Islands.

Very variable. *Stem* erect, usually much diffusely branched from below, the branches 4-6 in., rather leafy, sometimes taller with erect branches and larger leaves ⅔ in. broad. *Whorls* often 1 in. diam., very dense-fld. and hispid. *Calyx* variable, but with always the upper lip produced and with short triangular teeth. *Corolla* small.—Whole plant fragrant and used as a pot-herb, *Roxb.* *Bentham's L. dimidiata*, from Burma (Wallich) is certainly *L. aspera*, and may or may not be Sprengel's plant of that name. A piece of *L. nutans* is on the same sheet.

38. **L. linifolia**, *Spreng. Syst.* ii. 743; annual, erect, smooth or scaberulous, leaves 2-4 in. linear or linear-lanceolate obtuse entire or subserrate, whorls axillary and terminal, bracts few short, calyx ¼-½ in. obovoid glabrous or puberulous, mouth very oblique contracted glabrous within, upper lip projecting acute 3-toothed, lower 2-fld. *Benth. in Wall. Pl. As. Rar.* i. 60, *Lab.* 617, and in *DC. Prodr.* xii. 533; *Wall. Cat.* 2048; *Grah.*

Cat. Bomb. Pl. 153; *Dalz. & Gibs. Bomb. Fl.* 211. *L. lavandulæfolia*, *Sm. in Rees Cyclop.* *Phlomis linifolia*, *Roth Nov. Sp.* 260. *P. zeylanica*, *Roxb. Fl. Ind.* iii. 9; *Jacq. Ic. Pl. Rar.* i. 11, t. 111. *Leonurus indicus*, *Burm. Fl. Ind.* 127.—*Rumph. Herb. Amb.* vi. t. 16, f. 1.

PLAINS of INDIA; from Assam and Bengal and Silhet to Singapore. In the DECCAN; from the Concan to Travancore (not seen from the W. or N.W. Provinces of India, nor from Ceylon).—DISTRIB. Mauritius, Malay Islands.

Stem 2-3 ft., usually stout and much branched above. *Leaves* rarely $\frac{3}{4}$ in. broad; petiole $0-\frac{1}{2}$ in. *Whorls* towards the ends of the branches, $\frac{1}{2}-\frac{3}{4}$ in. diam.; bracts setaceous. *Calyx* pale below, not striate above, toothing variable, sometimes spinescent.

VAR. *decipiens*; hispidly hairy, bracts very many ciliate, tips spinescent, calyx larger hirsute or pubescent, teeth longer spinous, uppermost pungent. *L. aspera*, *Pl. Ind. Or. Hohenack.* n. 1234.—South Deccan; Pycarrah, *Wight*; Nilghiris, *Hohenacker*.—Confounded with *L. aspera* in various collections, with which it agrees in hairiness.

DOUBTFUL SPECIES.

L. DIMIDIATA, *Spreng. Syst.* ii. 743; stem hairy, leaves oblong-lanceolate subserrate hirsute, whorls dimidiate, calyx oblong hairy above, teeth 10 subulate subpungent.—East Indies.—Probably *L. aspera*, to which belongs the specimen referred to this species by Bentham in his "Labiatarum Gen. & Sp.," and which is entirely different from *L. diffusa*.

46. LEONOTIS, Br.

Herbs or shrubs. *Whorls* axillary, densely many-flid.; bracteoles many, slender; flowers scarlet or yellow. *Calyx* 10-nerved, often incurved, mouth oblique; teeth 8-10, rigid, upper largest. *Corolla-tube* exerted; upper lip long, concave, crown villous; lower very small, spreading, concave, midlobe largest. *Stamens* 4, ascending; anthers conniving, cells divaricate. *Disk* equal. *Style* subulate, upper lobe very short. *Nutlets* oblong or ovoid, triquetrous, obtuse or truncate, glabrous.—Species 12, African, one also Indian.

L. nepetæfolia, *Br. Prodr.* 504; herbaceous, leaves membranous ovate crenate, bracts spinescent, calyx $\frac{1}{2}-1$ in., upper lip prominent rigid spinescent, lower with three erect or recurved spinescent teeth. *Benth. in Wall. Pl. As. Rar.* i. 59, *Lab.* 618, and in *DC. Prodr.* xii. 535; *Wall. Cat.* 2042; *Grah. Cat. Bomb. Pl.* 153; *Dalz. & Gibs. Bomb. Fl.* 211; *Wight III.* ii. t. 176 bis, f. 11, and *Ic.* t. 867; *Bot. Reg.* t. 281; *Bot. Mag.* t. 3700. *Phlomis nepetæfolia*, *Linn.*; *Roxb. Fl. Ind.* iii. 8. *Leonurus globosus*, *Moench Meth.* 400.

Throughout hotter India, from the Panjab to Travancore and Singapore, but not very common; cultivated and naturalized, doubtfully indigenous. CEYLON; in the drier parts.—DISTRIB. Tropical Asia, Africa and America.

A tall annual, 4-6 ft.; stem as thick as the finger, 4-angled with concave faces, puberulous. *Leaves* 4-8 by 2-5 in.; floral lanceolate, deflexed; petiole 1-3 in., winged above, slender. *Whorls* distant, globose, 2-3 in. diam., squarrose; bracts slender, linear, deflexed. *Calyx* $\frac{3}{4}$ in. long, ribbed and reticulate, pubescent or villous, tubular, incurved, teeth spinescent, upper $\frac{1}{4}$ in. long; throat glabrous. *Corolla* orange-red, 1 in. long; tube slender, exerted, villous like the upper lip, lower lip minute. *Nutlets* linear-oblong, widening upwards, truncate.

47. PHLOMIS, Linn.

Herbs or shrubs. *Whorls* axillary, dense-flid.; bracteoles many, ovate

lanceolate, or linear; flowers yellow, purple or white. *Calyx* 5- or 10-nerved, usually plicate, mouth equal truncate or 5-toothed. *Corolla-tube* usually annulate within; upper lip concave, crown villous (except *P. rugosa* & *breviflora* ?), lower spreading, 3-fid. *Stamens* 4, ascending, posterior filaments often appendaged at the base; anthers conniving, cells divaricate. *Disk* equal. *Style* 2-fid, upper lobe shortest. *Nutlets* ovoid or obovoid, triquetrous, top glabrous.—Species about 45, Oriental and Temperate Asiatic.

* *Stem and branches terete.*

1. ***P. spectabilis***, *Falc. mss.*; *Benth. in DC. Prodr.* xii. 542; tall, stout, hoary, leaves large broadly ovate-cordate crenate or sublobulate rugose stellately tomentose beneath, tip rounded, whorls many-fld., bracts filiform rigid hispid, calyx $\frac{1}{2}$ – $\frac{3}{4}$ in. pubescent, teeth spiniform $\frac{1}{2}$ shorter than the tube.

WESTERN HIMALAYA; Kashmir and Kishtwar, alt. 3–8000 ft., *Jacquemont, Falconer, &c.*—DISTRIB. Afghanistan.

Stem 4–6 ft., terete, as thick as the little finger, hoary or loosely stellately downy. *Leaves* sometimes a foot broad and not so long, nerves beneath softly hairy; floral small; petiole 6–12 in. *Whorls* $1\frac{1}{2}$ –2 in. diam.; bracts with acicular tips. *Corolla* rose-purple, galea beautifully fringed with silvery hairs. *Nutlets* $\frac{1}{4}$ in. long, linear.—*P. oreophilla*, *Karel. & Kiril.*, from Alatau, is probably a small state of this.

2. ***P. cashmeriana***, *Royle Ill.* 303, t. 75 A; stout, erect, densely clothed with stellate white flocculent wool, leaves linear-oblong obtuse crenate rugose, base cordate, whorls many-fld., bracts filiform tomentose and ciliate, calyx $\frac{1}{2}$ – $\frac{3}{4}$ in. plicate tomentose, teeth spiniform half the length of the tube. *Benth. in Hook. Bot. Misc.* iii. 382, *Lab.* 630, and in *DC. Prodr.* xii. 542; *Bot. Reg.* 1844, t. 22.

WESTERN HIMALAYA; Kashmir, alt. 5–6500 ft., *Royle, Thomson, &c.*—DISTRIB. Afghanistan.

Stems several from the very stout rootstock, 2–3 ft. high, terete. *Radical leaves* long-petioled, 5–9 by 2–4 in., coriaceous, finely pubescent above, nerves reticulate beneath; petiole 4–6 in. *Whorls* 1– $1\frac{1}{2}$ in. diam.; bracts numerous, $\frac{2}{3}$ in., tips acicular. *Corolla* pale purple; galea very large, tomentose, not fringed; lower lip very broad, adze-shaped. *Nutlets* broadly oblong, $\frac{1}{2}$ in. long.

3. ***P. Stewartii***, *Hook. f.*; densely stellately woolly, stem short stout woody branched, leaves shortly petioled linear-lanceolate subulate crenulate rugose above, base attenuate, whorls many-fld., bracts stout narrowly linear acute, calyx $\frac{1}{2}$ in. densely woolly angled, teeth very short triangular recurved.

PANJAB; beyond the Indus, on the Suliman and Salt ranges, alt. 2500–4500 ft., *Stewart, Talbot*.

A low shrub, with spreading terete branches 6–10 in. long; wool flocculent, buff-coloured. *Leaves* 3–5 by $\frac{1}{4}$ – $\frac{3}{4}$ in., very leathery, scaberulous above. *Whorls* 1 in. diam.; bracts as long as the calyx, much thicker than in *P. cashmeriana*. *Corolla* small; galea tomentose, margin not fringed. *Nutlets* (ripe ?) very small.

** *Stem and branches 4-angled.*

4. ***P. macrophylla***, *Wall. Pl. As. Rar.* i. 62, and *Cat.* 2065; stem tall stout hirsute or glabrate, leaves long-petioled broadly ovate or oblong crenate, base broadly cordate, petiole almost as long as the blade, bracts equalling the calyx slender rigid ciliate, tips spinescent, calyx $\frac{1}{2}$ in. sparsely

hairy, teeth spiniform $\frac{1}{2}$ the length of the tube. *Benth. Lab.* 631, and in *DC. Prodr.* xii. 543.

TEMPERATE HIMALAYA; Kumaon, alt. 10,000 ft., *Strachey & Winterbottom, Anderson*; Nepal, *Wallich*; Sikkim, alt. 10–13,000 ft., *J. D. H.*

Stem 5–6 ft., as thick as the little finger. *Leaves* 4–8 by 3–6 in., variable in breadth, base rarely cuneate, pubescent above and beneath; petiole stout. *Whorls* 1–1 $\frac{1}{2}$ in. diam. *Corolla-tube* included, galea villous. *Nutlets* narrowly obcuneate, nearly $\frac{1}{4}$ in. long.

5. *P. breviflora*, *Benth. in Wall. Pl. As. Rar.* i. 62, *Lab.* 631, and in *DC. Prodr.* xii. 543; tall, erect, glabrous or slightly pubescent, leaves long-petioled broadly ovate deeply cordate acuminate crenate, whorls few-fld., bracts slender glabrous, calyx $\frac{1}{4}$ – $\frac{1}{2}$ in. short nearly glabrous, teeth very short. *P. parviflora*, *Benth. in Wall. Cat.* 2066.

EASTERN HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 10–12,000 ft., *J. D. H.*, &c.

Perhaps only a variety of *P. macrophylla*, but the leaves are much more deeply cordate with rounded lobes, and the calyx is very small with minute teeth.

6. *P. setigera*, *Falcon. mss.*; *Benth. in DC. Prodr.* xii. 543; tall, erect, nearly glabrous or sparsely pubescent, leaves short-petioled ovate acuminate crenate, base rounded or cordate, whorls many-fld., bracts short rigid setaceous ciliate, tips spinescent, calyx $\frac{1}{3}$ – $\frac{1}{2}$ in. hairy, teeth erect subulate ciliate $\frac{1}{3}$ the length of the tube.

TEMPERATE HIMALAYA; Kashmir, *Clarke*; Kumaon, *Falconer*; Sikkim, alt. 10–12,000 ft., *J. D. H.*, &c.

Habit of *P. macrophylla*, differing in the short $\frac{1}{2}$ –1 in. petioles, the much shorter bracts, and the nutlets, which are $\frac{1}{6}$ in. long, obovoid, with a truncate top.

? *VAR. occidentalis*, *Clarke mss.*; bracts much longer and less rigid, calyx-teeth longer half the length of the tube.—Kashmir, Palgam, alt. 7000 ft., *Clarke*.

? *VAR. filiformis*; bracts soft filiform flexuous hirsute (not rigid nor spinous-tipped), nutlets $\frac{1}{2}$ in. long oblong.—Sikkim, Jongri and Tungu, alt. 1200–13,000 ft., *J. D. H.*—Of this subalpine plant the specimens are very poor; the bracts are very different from those of *P. setigera*, which, however, *Clarke* gathered at Jongri. It may be a form of *P. bracteosa*.

7. *P. bracteosa*, *Royle mss.*; *Benth. in Hook. Bot. Misc.* iii. 383, *Lab.* 633, and in *DC. Prodr.* xii. 545; hoary pubescent or subtomentose, leaves petioled ovate obtuse crenate, base broadly cordate, whorls many- and dense-fld., bracts ciliate long, outer membranous lanceolate or linear tip not spinous, inner narrower, calyx $\frac{1}{3}$ – $\frac{1}{2}$ in. hispid or glabrate, teeth slender ciliate. *P. lamiifolia*, *latifolia*, *simplex* and *cordata*, *Royle mss.*; *Benth. ll. c.*

WESTERN TEMPERATE HIMALAYA; from Kumaon to Kashmir, alt. 5–11,000 ft.—*DISTRIB.* Afghanistan.

A tall stout herb, stem simple or branched, hairs stellate on the leaves, spreading or deflexed when present on the stem. *Leaves* 2–4 in. long, very variable in breadth and in the base, which is never deeply cordate and is sometimes truncate, tip usually rounded, rarely subacute, both surfaces tomentose or almost silky in *Royle's P. cordata*, finely tomentose in the ordinary form, much more glabrous in *P. lamiifolia*; petiole usually shorter than the blade. *Whorls* $\frac{1}{2}$ –1 in. diam.; bracts usually equalling the calyx, erect. *Calyx-teeth* half the length of the tube or shorter. *Corolla* blue-purple; galea fringed with white hairs. *Nutlets* $\frac{1}{8}$ – $\frac{1}{6}$ in., obovoid, tip rounded.

VAR. longifolia; leaves 6–8 in. ovate-lanceolate acuminate or acute sparsely pubescent.—Kashmir, Tragbol and Shapryon, alt. 7–8500 ft., *Clarke*.

8. *P. rugosa*, *Benth. in Wall. Pl. As. Rar.* i. 63, *Lab.* 634, and in

DC. Prodr. xii. 545; nearly glabrous, leaves long-petioled membranous elliptic or oblong-ovate acuminate minutely toothed, whorls small, bracts filiform, calyx $\frac{1}{2}$ in. obconic-campanulate glabrous or hispid, teeth very slender from a triangular base. *Wall. Cat.* 2067. *Gomphostemma membranifolium*, *Miquel Fl. Ind. Bat.* ii. 988.

SIKKIM HIMALAYA; Pomong, alt. 2-5000 ft., *J. D. H., Clarke*. KHASIA MTS., alt. 5-6000 ft.; *Wallich, &c.* UPPER ASSAM; Mishmi Hills and Patkoye Mts., *Griffith*.—DISTRIB. Java, Philippines.

Stem tall, 2-3 ft., stout or slender, minutely hairy, hairs deflexed. *Leaves* 6-8 by 3-4 in., glabrous or with minute scattered hairs above, base acute or rounded; petiole 3-4 in., very slender. *Whorls* distant, often many below the leaves $\frac{1}{2}$ -1 in. diam. *Calyx* coriaceous, teeth half the length of the tube. *Corolla* faintly pubescent, white or yellowish, upper lip narrow, lower with narrow side-lobes. *Nutlets* very large, $\frac{1}{2}$ in. long, obovoid, base acute, tip rounded.—An anomalous *Phlomis* with the calyx of *P. breviflora*, but very different leaves. The name *rugosa* is wholly inapplicable.

9. ***P. rotata***, *Benth. in Herb. Ind. Or. H. f. & T.*; stemless, leaves large rotately spreading orbicular or reniform coriaceous crenate rugose densely tomentose lacunosely reticulate beneath, whorls in a very short spike or subsessile head, bracts filiform, calyx sparsely hispid, teeth spinous.

ALPINE SIKKIM HIMALAYA; in the inner ranges, alt. 13-16,000 ft., *J. D. H.*

Annual? *Leaves* 3-6 in. diam., very thick, suddenly contracted into a very broad tomentose petiole $\frac{1}{2}$ in. broad; nerves very thick, flabellate; floral 0 or 2 oblong crenate. *Whorls* sometimes on a slender peduncle 2-3 in. long, at others forming a dense head $1\frac{1}{2}$ in. diam. or less in the centre of the leaves; bracts with acicular tips. *Calyx* $\frac{1}{2}$ in., funnel-shaped, rather membranous, teeth short. *Corolla* small; tube included, galea pubescent, densely fringed with white hairs.—A very remarkable plant, with the habit of *Lamium rhomboideum*.

48. **NOTOCHÆTE**, *Benth.*

An erect herb. *Leaves* long-petioled. *Whorls* axillary, globose, densely many-fld.; bracts slender, at length spinous with hooked lips. *Calyx* 5-nerved, membranous; teeth 5, equal, with long hook-tipped spines at the back. *Corolla* very small, tube included, not annulate; upper lip erect, concave; lower spreading, subequally trifid. *Stamens* 4, ascending; anthers conniving, cells divaricate. *Style-lobes* minute, subequal. *Nutlets* narrow oblong, triquetrous, truncate, smooth.

N. hamosa, *Benth. in Wall. Pl. As. Rar.* i. 63, *Lab.* 636, and in *DC. Prodr.* xii. 547; *Wall. Cat.* 2068; *Hook. Ic. Pl.* t. 1217.

CENTRAL AND EASTERN TEMPERATE HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 4-8000 ft., *J. D. H., &c.*

Glabrous or pubescent. *Stem* creeping at the base, 2-4 ft., stout, 4-angled. *Leaves* 5-10 by 3-5 in., membranous, ovate, acuminate, toothed, base acute rounded or subcordate; petiole 2-3 in. *Whorls* 1-1 $\frac{1}{2}$ in. diam., densely spiny, bracts longer than the calyx-tube. *Calyx-tube* $\frac{1}{2}$ - $\frac{1}{2}$ in., slender, villous above the middle, fruiting hard 4-valved; spines at length $\frac{1}{2}$ in. *Corolla* as long as the calyx-spines, galea villous, lower lip as long subequally 3-lobed.

49. **EREMOSTACHYS**, *Bunge.*

Erect herbs. *Leaves*, radical broad, toothed or cut; cauline few, smaller. *Whorls* densely many-fld., axillary and in a terminal spike. *Calyx* subcam-

panulate or upper lip broad membranous; teeth 5, equal, setaceous. *Corolla-tube* included, upper lip erect, hooded, bearded within; lower spreading, 3-lobed, midlobe largest. *Stamens* 4, ascending, upper filaments fimbriate or appendaged at the base; anthers conniving, cells divaricate. *Disk* equal. *Style-lobes* equal or upper shorter. *Nutlets* obovoid, triquetrous, truncate, top densely hairy. Species 27, W. Asiatic.

1. **E. superba**, *Royle mss.*; *Benth. in Hook. Bot. Misc.* iii. 381, *Tab.* 637, and in *DC. Prodr.* xii. 548; root-leaves pinnatisect, segments lobulate, the lower petioled, floral ovate acute, whorls many-fl. crowded in a very stout woolly spike, calyx subcampanulate, mouth truncate shortly broadly 5-lobed. *Royle Ill.* 303, t. 74.

WESTERN HIMALAYA; Gurwhal, on the Kheree Pass, *Royle*. WESTERN PANJAB; Peshawur, *Vicary*.

Stem 2 ft., strict, erect, unbranched, base $\frac{3}{4}$ in. diam., softly hairy. *Leaves*, radical ovate in outline, 8–12 in.; lobes or peduncles broad, obtuse; petiole hirsute; cauline few, small, sessile, pinnatifid. *Spike* 6–10 in.; floral leaves erect, concave, covering the flowers, deciduous. *Calyx* $\frac{3}{4}$ in., woolly. *Corolla-tube* included, galea $\frac{1}{4}$ in., villous; lower lip broad, 3-lobed.

2. **E. Vicaryi**, *Benth. in Aitch. Cat. Pl. Panjab & Scinde*, 119; root-leaves pinnatisect, segments sessile pinnatifid, lower floral sessile oblong lobulate, whorls many-fl., at length distant, calyx campanulate scurfily tomentose, mouth truncate shortly 5-crenate, crenatures apiculate.

WESTERN PANJAB; Peshawur, *Vicary*; Salt range, Jhelum, *Aitchison*.—DISTRIB. Beluchistan.

Stem 3–5 ft., very stout, simple or branched. *Leaves* radical, 12–18 in., ovate in outline, segments or pinnules sessile glabrous; petiole stout, base woolly. *Spikes* 8–10 in., rachis very stout. *Calyx* $\frac{1}{2}$ in. *Corolla* smaller than in *E. superba*, galea villous and fringed with white hairs.

3. **E. acanthocalyx**, *Boiss. Diagn.* 2, iv. 49, and *Fl. Orient.* iv. 795; root-leaves pinnatisect, segments pinnatifid or lobulate, lower petioled, floral short broad, whorls many-fl., bracts linear-lanceolate spinescent, calyx campanulate stellately pubescent, teeth spinescent. *E. laciniata*, *Aitchison Cat. Pl. Panjab & Scinde*, 118 (*not of Bunge*).

WESTERN PANJAB; Peshawur, *Stewart*.—DISTRIB. Beluchistan, Afghanistan.

Stem 3–5 ft., very stout, simple or branched. *Leaves*, radical 6–12 in., oblong-ovate, hispid beneath; floral very broad, sessile, concave, as long as the flowers, deciduous; petiole and rachis hirsute. *Whorls* 1–2 in. diam., lower distant; bracts shorter than the calyx. *Calyx* $\frac{3}{4}$ in., mouth very shortly 5-lobed, lobes with a dorsal spreading spine $\frac{1}{8}$ in. long. *Corolla* 1 in., tube exserted, galea pubescent, fringed with white hairs.

50. **ERIOPHYTON**, *Benth.*

A dwarf thickly woolly herb. *Leaves* rounded or rhomboid, toothed. *Whorls* 6-fl., axillary, crowded or the lower distant, flowers very large, yellow. *Calyx* campanulate, 10-nerved, membranous, 5-lobed to the middle, lobes finely acuminate. *Corolla-tube* included, upper lip very broad, galeate, compressed, arching over the lower, which is small with 3 rounded lobes. *Stamens* 4, posterior filaments thickened at the base; anthers conniving, villous, cells divaricate. *Disk* equal. *Style-arms* subequal. *Nutlets* large, irregularly broadly obovoid and triquetrous, truncate, glabrous.

E. Wallichianum, *Benth. in Wall. Pl. As. Rar.* i. 63 (*Wallichii*). *Lab.* 638, and in *DC. Prodr.* xii. 549; *Wall. Cat.* 2070.

ALPINE CENTRAL HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 15–17,000 ft., *J. D. H.*

Rootstock stout; stem 4–6 in., stout, simple, naked below; wool on leaves, bracts and calyx $\frac{1}{2}$ in. long, white, very soft, hardly silky. *Leaves* very close set, imbricating, spreading or deflexed, $1\frac{1}{2}$ –2 in. diam., base broadly cuneate, nerves flabellate. *Bracts* 1– $1\frac{1}{2}$ in. broad, broadly cuneate, membranous, deeply toothed; bracteoles filiform. *Calyx* hidden amongst the leaves, 1 in. long; lobes triangular, finely pointed. *Corolla* $1\frac{1}{2}$ in., galea pubescent. *Nutlets* $\frac{1}{2}$ in. diam.—A very remarkable Labiate, which should be placed near *Lamium*, from which the broad galea and nutlets distinguish it.

51. **GOMPHOSTEMMA**, *Wall.*

Perennial, stellately pubescent or tomentose herbs; roots often with elongate tubers. *Whorls* 6–8-fid., dense- or lax-fid., axillary or in terminal spikes. *Calyx* 10-nerved, subequally 5-toothed. *Corolla-tube* slender; throat dilated, not annulate; upper lip galeate, lower broadly 3-fid. *Stamens* ascending; anthers conniving, cells parallel, transverse, naked. *Disk* symmetric or produced behind. *Style-lobes* subequal. *Nutlets* (drupes) various, glabrous or pubescent, hilum broad, pericarp thick corky or fleshy. *Cotyledons* often unequal.—Species 16, Indian, Malayan and Chinese.

* *Upper or all the whorls in terminal or axillary spikes.*

1. **G. strobilium**, *Wall. Cat.* 2151; stem scurfily scabrid or tomentose, leaves elliptic-ovate subacute crenate scabrid above densely tomentose beneath, whorls in a dense stout terminal tomentose spike, bracts broadly elliptic-ovate exceeding the calyx, calyx $\frac{1}{2}$ in., lobes triangular acute. *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 647, and in *DC. Prodr.* xii. 550.

BURMA; Prome, Rangoon, &c., *Wallich*, *M'Clelland*.—DISTRIB. Ava.

Leaves 4–10 by 2–6 in., narrowed into a petiole $\frac{1}{2}$ –3 in. *Spike* sometimes 1 ft. and 2 in. broad; bracts 1 in. and under. *Calyx* $\frac{1}{2}$ in. *Corolla* twice as long. *Nutlets* $\frac{1}{2}$ in., turgid.

VAR. *viridis*; leaves more membranous narrowly elliptic-lanceolate finely pubescent beneath, flowers larger. *G. viride*, *Wall. Cat.* 2153; *Benth. ll. c.*—Tenasserim, *Wallich*; Moulmein, *Parish*.

VAR. *Heyneana*; stem petioles spikes and leaves beneath tomentose or densely woolly, “flowers blueish with a purple tinge,” *Wight*. *G. Heyneanum*, *Wall. Cat.* 2152; *Benth. ll. c.*; *Wight Ill.* t. 176 *bis*, f. 9, and *lc.* t. 1456.—Deccan, from the Bababoodan Hills to Travancore.

2. **G. pedunculatum**, *Benth. mss.*; tomentose, leaves long-petioled 3–12 by $1\frac{1}{2}$ –7 in., ovate or elliptic-ovate denticulate pubescent above, whorls crowded in short axillary peduncled oblong heads or spikes, bracts longer than the calyx ovate serrate, calyx $\frac{1}{2}$ in., lobes triangular acute.

KHASIA MTS.; below Nurtiung, *J. D. H. & T. T.*

Stem long, flexuous, prostrate, rooting below. *Leaves* distant. *Spikes* 1–4 in. long, axillary and from below the leaves or even from the rooting portion of the stem; peduncle tomentose, $\frac{1}{4}$ –1 in.; bracts and calyx red-brown. *Corolla* $\frac{2}{3}$ in., glabrous, pale sulphur colour. *Nutlets* $\frac{1}{2}$ in., subglobose, rugose.

3. **G. acaule**, *Kurz mss.*; stemless, densely pubescent, leaves 4–8 by 3– $4\frac{1}{2}$ in. elliptic obtuse crenate, petiole very stout long or short, whorls in a very short velvety terminal sessile spike softly tomentose, bracts much longer than the calyx ovate crenate, calyx $\frac{3}{4}$ in., lobes lanceolate.

ABACAN; on the Mingoo Hill, Boronga Island, *Kurz.*

Leaves spreading from the crown; petiole 1–3 in. *Spike* 2 in. long, 1 in. broad, leafy.

4. *G. nutans*, *Hook. f.*; stem very slender and leaves beneath and spikes softly densely tomentose, leaves 2–3½ in. subsessile ovate acute toothed pubescent above, whorls in a solitary short oblong terminal nodding or drooping spike, bracts longer than the calyx ovate subentire, calyx ¾ in., lobes lanceolate.

KHASIA MTS., *Simons, Lobb*; Nunklow, alt. 3500 ft., *Clarke.*

Stem 12–18 in., erect, much more slender than in any other species. *Leaves* in distant pairs, base acute, petiole ¾–1 in. *Spike* 2 in. long, 1 in. broad. *Corolla* 1–1½ in. long. *Nutlets* rugose.

** *Whorls axillary.*

† *Stem stout.*

5. *G. oblongum*, *Wall. Cat.* 2154; stem-leaves beneath and whorls densely tomentose, leaves shortly petioled 6–10 by 2–3½ in. oblanceolate or acuminate crenate scabrid above, whorls sessile few-fl., bracts small, calyx ½ in. ribbed, teeth linear-lanceolate, corolla 1½ in. pubescent. *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 648, and in *DC. Prodr.* xii. 551.

TENASSERIM; Tavoy and Mergui, *Wallich, &c.*

Stem 2–3 ft., stout, erect. *Leaves* acute at the base; petiole ¼–1 in. *Bracts* variable, shorter than the calyx. *Corolla-tube* far exserted, very slender.

VAB. ? *Helferi*; leaves much broader 8–9 by 4½–5 in. obovate brown tomentose beneath, calyx ¾ in.—Tenasserim, *Helfer.*

6. *G. lucidum*, *Wall. Cat.* 2156; stem-leaves beneath and whorls densely brown woolly or tomentose, leaves short-petioled elliptic acute or oblanceolate acuminate subserrate scabrid above, whorls sessile few-fl., bracts small subulate, calyx ¼ in. ribbed, teeth short triangular, corolla 1½ in. pubescent. *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 648, and in *DC. Prodr.* xii. 551.

KHASIA and JAITEA MTS., alt. 4–5000 ft., common.

Stem very stout. *Leaves* shining above, base narrowed; petiole ¼–1 in. *Bracts* variable. *Calyx* cupular in fruit. *Corolla* as in *G. oblongum*. *Nutlets* ½ in., oblong.

7. *G. niveum*, *Hook. f.*; stem and leaves beneath white-tomentose, leaves sessile or shortly petioled, oblanceolate acuminate serrate glabrous above, whorls sessile many-fl., bracts slender, calyx ½ in., teeth very slender as long as the tube.

EAST BENGAL; *Griffith.*

Stem erect, rather stout. *Leaves* much narrowed downwards either to the stem or into a very stout petiole. *Bracts* membranous, as long as the calyx. *Corolla* unexpanded, ½ in. *Nutlets* ½ in., oblong.

8. *G. parviflorum*, *Wall. Cat.* 2158; stem-leaves beneath and cymes densely softly tomentose, leaves shortly petioled 6–16 by 1–5 in. broadly or narrowly oblanceolate acuminate toothed, cymes peduncled many-fl., bracts slender or broad and leafy, calyx ½ in., teeth very slender as long as the tube, corolla 1 in. glabrate. *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 648, and in *DC. Prodr.* xii. 551. *G. multiflorum*, *Benth. ll. c.*

TROPICAL HIMALAYA; from Nepal to Mishmi, alt. 0–4000 ft. ASSAM, KHASIA MTS., CHITTAGONG and TENASSERIM. PENANG, *Wallich.*

Stem very stout. *Leaves* narrowed into a stout petiole 1-2 in. long. *Cymes* laxly fascicled; peduncle $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; flowers often pedicelled; bracts longer than the calyx, from linear to ovate-lanceolate. *Corolla* very slender, ochreous, throat and limb small. *Nutlets* usually solitary, ellipsoid, rugose.

9. **G. crinitum**, *Wall. Cat.* 2159; stem and leaves beneath finely tomentose, leaves petioled 8-12 by 2 $\frac{1}{2}$ -4 $\frac{1}{2}$ in. elliptic and decurrent on the petiole or oblanceolate subacute entire or toothed, whorls sessile many- and dense-fld., bracts exceeding the calyx long linear, calyx $\frac{1}{2}$ in., teeth capillary exceeding the terete tube. *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 648, and in *DC. Prodr.* xii. 552.

TENASSERIM; Tavoy, *Wallich.* MALACCA, Mount Ophir and Cheboo Forest, *Griffith.*

Stem stout. *Leaves* in Wallich's specimen broad, toothed, suddenly narrowed into a wing, in Griffith's narrow subentire and narrowed into a stout petiole. *Whorls* in Wallich's glabrate, in Griffith's pubescent or villous. *Corolla* $\frac{3}{4}$ in., lemon-coloured, tube very slender, limb subglobose.

10. **G. Thomsoni**, *Benth. in Herb. Ind. Or. Hook. f. & T.*; stem woody, and leaves beneath pubescent or tomentose, leaves long-petioled 6-12 by 2 $\frac{1}{2}$ -8 in. membranous oblong or orbicular ovate acute crenulate pubescent above, whorls in dense crowded masses in the lower axils and on the stem below then sessile very many-fld., bracts as long as the calyx linear and lanceolate, calyx $\frac{1}{2}$ in., tube narrow, teeth subulate as long as the tube, corolla slender, limb small glabrous.

KHASIA MTS.; Churra, alt. 3-5000 ft., *J. D. H. & T. T.*

Stem as thick as the little finger, hoary; wood hard. *Leaves* the largest of the genus, very variable in breadth. *Whorls* in globose or irregular clusters 1 in. long and broad, suberinite from the slender tips of the bracts and the calyx-teeth. *Calyx* small in flower, tube in fruit oblong. *Corolla* glabrous, pale yellow, tube extremely slender, throat hardly inflated; upper lip narrow, lower small. *Nutlets* $\frac{1}{2}$ in., oblong, rugose.

11. **G. eriocarpum**, *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 649, and in *DC. Prodr.* xii. 552; stem rather slender tomentose, leaves 3-5 in. shortly petioled elliptic-oblong or lanceolate acute toothed glabrous above softly tomentose beneath, nerves reticulate, whorls small sessile few-fld., bracts broad and narrow, calyx $\frac{1}{2}$ in., teeth filiform as long as the tube, corolla slender, limb small puberulous, nutlets globose tomentose. *Wall. Cat.* 2710. *G. oblongum*, *Wight Ic.* t. 1457.

SOUTHERN DECCAN; Courtallum, *Wight, &c.*; Anamallays and Tinnevely Hills, *Beddome.*

Stem 2-3 ft., leafy. *Leaves* narrowed into the petiole of 1-2 in. *Whorls* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., suberinite. *Calyx-tube* cupular in fruit, with one globose nutlet $\frac{1}{8}$ in. diam. clothed with grey pubescence.

†† *Stem* very short, or slender prostrate, rooting at the base and ascending above.

12. **G. melissæfolium**, *Wall. Cat.* 2157; puberulous or glabrate, stem slender prostrate, leaves petioled 2-3 $\frac{1}{2}$ in. elliptic acute faintly toothed, whorls 2-5 fld., calyx $\frac{1}{4}$ in. puberulous, teeth lanceolate, corolla very large. *Benth. in Wall. Pl. As. Rar.* ii. 12, *Lab.* 649, and in *DC. Prodr.* xii. 552. *Prasium melissifolium*, *Roxb. Fl. Ind.* iii. 26.

SIKKIM HIMALAYA, alt. 2000 ft.; *J. D. H.* ASSAM, SILHET and CACHAR, *Wallich, &c.*

Stem 2-3 ft., flexuous, rooting for half its length. *Leaves* membranous, sometimes sparsely hairy above, nerves beneath puberulous, base acute; petiole $\frac{1}{2}$ -1 in. *Bracts* ovate or lanceolate. *Corolla* $1\frac{1}{2}$ in. long, pubescent; throat inflated, $\frac{1}{2}$ in. diam. *Nutlets* scarlet.

13. **G. velutinum**, *Benth. in Wall. Pl. As. Rar.* ii. 13, *Lab.* 649, and in *DC. Prodr.* xii. 552; densely velvety-tomentose, stem prostrate rooting below, leaves $1\frac{1}{2}$ -2 in. thick the petioled elliptic subacute crenate, whorls few-fld., bracts equalling the calyx slender, calyx $\frac{1}{2}$ in. villous, teeth lanceolate. *Wall. Cat.* 2709.

ASSAM, SILHET and KHASIA MTS., ascending to 4000 ft.; *Wallich*, &c.

Stem flexuous or tortuous. *Leaves* the smallest of the Indian species, equally velvety on both surfaces; base cuneate; petiole $\frac{1}{2}$ -1 in. *Corolla* 1 in., tube rather short; throat long, moderately inflated.

14. **G. ovatum**, *Wall. Cat.* 2155; stem short suberect, petioles whorls and leaves beneath softly tomentose, leaves 4-6 in. long-petioled broadly elliptic obtuse crenate puberulous above, whorls few-fld., bracts longer than the calyx ovate leafy, calyx $\frac{1}{2}$ in., teeth narrowly lanceolate, corolla $1\frac{1}{2}$ in., tube and throat long.

TROPICAL HIMALAYA; Nepal, *Wallich*; Sikkim, alt. 3-4000 ft., *J. D. H.*

Stem ascending or suberect, not creeping, 10-12 in. *Leaves* membranous, base cuneate; petiole 1-3 in. *Bracts* as in *G. strobilinum*. *Corolla* pale yellow, pubescent, tube gradually dilating into the funnel-shaped throat.

15. **G. Mastersii**, *Benth. in Herb. Ind. Or. H. f. & T.*; stem short ascending and leaves beneath and whorls pubescent or tomentose, leaves petioled 4-8 in. broadly (rarely narrowly) elliptic ovate obtuse toothed or crenate pubescent or setose or subsilky above, whorls few-fld., bracts equaling the calyx lanceolate with filiform points, outer sometimes ovate, calyx $\frac{1}{2}$ - $\frac{3}{4}$ in., teeth lanceolate, points very slender, corolla 2 in., tube long. *G. melissæfolium*, *Wall. Cat.* 2157, *in part.*

SIKKIM HIMALAYA, alt. 3000 ft.; *J. D. H.* ASSAM, KHASIA MTS., ascending to 4000 ft., SILHET and CACHAR; *Wallich*, &c.

A very variable plant, possibly not distinct from *G. ovatum*. *Root-tubers* fusiform, $\frac{1}{2}$ -1 in. long. *Leaves* in some specimens with long spreading hairs on the upper surface, in others with deep irregular crenatures, in others with a rounded or even cordate base; petiole 1-2 $\frac{1}{2}$ in. *Whorls* occasionally shortly peduncled (as in *G. pedunculatum*). *Corolla* pubescent, ochreous, yellow, tube gradually dilating into the throat.

52. **LEUCOSCEPTRUM**, *Smith.*

A tomentose or villous shrub or small tree. *Leaves* large. *Whorls* in dense cylindric terminal spikes, bracts large, transversely-oblong caducous. *Calyx* campanulate decurved, teeth rounded. *Corolla* minute, 5-lobed; lobes rounded, upper largest. *Stamens* very far exserted, filaments very long, straight in flower, diverging, pubescent below; anthers reniform, 1-celled, very short. *Style-arms* minute, subulate. *Nutlets* elongate-cuneate, triquetrous.

L. canum, *Sm. Exot. Bot.* ii. 113, t. 116; *Benth. in Wall. Pl. As. Rar.* i. 58; *Wall. Cat.* 2023. *Teucrium macrostachyum*, *Wall. in Benth. Lab.* 664; *Benth. in DC. Prodr.* xii. 574; *Gamble Ind. Timbers*, 302, and *List of Trees, &c., of Darjeeling*, 62. *Clerodendron Leucosceptrum*, *Don Prodr.* 103. *Buddleia*, *Griff. Notul.* iv. 125; *Itin. Notes*, 107 (n. 94 a),

and *Ic. Pl. Asiat.* t. 422. *Colquhounia* sp., *Clarke in Journ. Linn. Soc. Bot.* xv. 145.

TEMPERATE HIMALAYA; from Kumaon to Bhotan, alt. 2-8000 ft. KHASIA MTS., alt. 4-5000 ft.

Tree, 30 ft., trunk short. *Branches* nearly terete, very stout, and as well as the leaves beneath petioles and spikes densely or laxly tomentose or woolly, rarely glabrate. *Leaves* 6-12 by $2\frac{1}{2}$ - $4\frac{1}{2}$ in., elliptic-lanceolate, acuminate, entire or crenate, glabrous above, beneath with silvery-white or buff or brown tomentum most variable in thickness, rarely green and glabrate; petiole $1-1\frac{1}{2}$ in. *Spikes* 4-6 in., $\frac{3}{4}$ in. diam. (without the stamens); bracts $\frac{1}{2}$ in. broad, subreniform, hoary or tomentose, imbricating and covering the buds when very young, early caducous. *Calyx* $\frac{1}{2}$ in., hoary, sessile or pedicelled. *Corolla* white or pinkish, hoary without. *Stamens* $\frac{1}{2}$ - $\frac{3}{4}$ in., filaments diverging, at length deflexed, stout, yellow; anthers minute.—This seems to me as distinct a genus as any in the Order; the stamens are very characteristic, spreading as in *Satureineæ*, with the anther-cells parallel, not divergent, and the filaments involute in bud.

53. **TEUCRIUM**, Linn.

Herbs or shrubs. *Whorls* in 2-6-fld. axillary or terminal spikes racemes or heads. *Calyx* 10-nerved, teeth 5, equal or the upper larger. *Corolla-tube* not annulate, limb 1-lipped, the 2 upper and lateral lobes cuneate and very short or obsolete, lower lobe very large. *Stamens* 4, exserted; anther reniform, cells short, at length confluent. *Disk* symmetrical. *Style-lobes* subequal. *Nutlets* minute, reticulate, smooth or rugulose; hilum large, oblique or lateral.—Species about 100, chiefly temperate and S. European.

Sect. 1. **Scorodonia**. *Whorls* 2-fld., secund, in terminal racemes. *Calyx* campanulate, declinate, upper tooth largest.

1. **T. tomentosum**, Heyne in *Wall. Cat.* 2025; pubescent tomentose or woolly, leaves ovate serrate toothed or crenate, base cuneate, racemes paniced, calyx $\frac{1}{4}$ in. villous, lower teeth triangular acuminate. *Benth. in Wall. Pl. As. Rar.* i. 58, *Lab.* 674, and in *DC. Prodr.* xii. 582; *Thwaites Enum.* 241. *T. paniculatum*, *Herb. Madr. in Wall. Cat. sub.* 2025.

DECCAN PENINSULA; on the Ghats from the Concan southward, Heyne, &c. CEYLON, alt. 5-7000 ft.; Walker, &c.

An erect copiously flowering herb, 2-3 ft. high. *Leaves* 2-3 in., base rarely rounded or cordate; petiole $\frac{1}{2}$ - $1\frac{1}{2}$ in., slender. *Bracts* lanceolate, usually longer than the pedicels. *Corolla-tube* included, limb small. *Nutlets* minute, globose, granulate.

2. **T. stoloniferum**, Roxb. *Hort. Beng.* 44, and *Fl. Ind.* iii. 3; stoloniferous, glabrous or puberulous, leaves ovate or oblong-ovate subacute deeply crenate or obtusely serrate, base truncate or cuneate, racemes simple or paniced, calyx $\frac{1}{2}$ in. glandular-pubescent, lower teeth short obtuse. *Benth. in Wall. Pl. As. Rar.* i. 58, *Lab.* 674, and in *DC. Prodr.* xii. 583; *Maxim. in Bull. Acad. Petersb., Mel. Biol.* ix. 825. *T. elevatum*, *Benth. in Wall. Cat.* 2026. *T. viscidum*, *Blume Bijdr.* 827.

SIKKIM HIMALAYA, alt. 1-5000 ft.; J. D. H. BENGAL PLAINS, KHASIA MTS., ascending to 4000 ft., and CHITTAGONG.—DISTRIB. Ava, Java, China.

An erect herb, 1-2 ft., stem sometimes woody below. *Leaves* 1-3 in., base rarely cordate. *Racemes* slender; bracts lanceolate, fruiting pedicels usually longer than the shortly campanulate calyx. *Corolla* pink, tube included, limb very small. *Nutlets* enclosed in the globose calyx-tube, nearly smooth.

3. **T. Royleanum**, Wall. *Cat.* 2027; stoloniferous, pubescent, tomen-

tose or villous, leaves petioled ovate or oblong-ovate cordate acute serrate, racemes short, calyx $\frac{1}{2}$ in. villous, upper tooth rounded acute, 2 lower lanceolate acuminate, lateral shorter, corolla-lobe exserted. *Benth. in Wall. Pl. As. Rar.* i. 58, *Lab.* 675, and in *DC. Prodr.* xii. 583.

WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 3-5000 ft., *Royle, &c.*—
DISTRIB. Afghanistan.

Stem prostrate and rooting below, then erect, 12-18 in., rather slender. *Leaves* $1\frac{1}{2}$ -3 in.; petiole $\frac{1}{2}$ -1 in., slender. *Racemes* subsimple, 1-3 in., rarely more; bracts lanceolate, longer than the pedicels. *Calyx* campanulate, upper and 2 lower teeth usually incurved. *Corolla* $\frac{1}{2}$ - $\frac{1}{2}$ in., tube sometimes twice the length of the calyx. *Nutlets* enclosed in the globose calyx-teeth, subrugose.

4. **T. laxum**, *Don Prodr.* 109; stem slender diffusely branched laxly villous or glabrate, leaves petioled ovate acuminate serrate, racemes short often recurved, calyx $\frac{1}{4}$ in. pubescent, upper lip rounded acute, 2 lower lanceolate acute, corolla-tube included. *Benth. Lab.* 675, and in *DC. Prodr.* xii. 583. *Ajuga laxa*, *Ham. mss.*

CENTRAL HIMALAYA; Nepal, *Hamilton*; Kumaon, *Edgeworth*, alt. 8000 ft.; Ramgunga River, alt. 4500 ft., *Strachey & Winterbottom* (*Hedeoma* n. 2).

Stems or branches 10-12 in., rather slender, villous with long sparse spreading hairs in *Edgeworth's* specimen, glabrous in *Strachey's*. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., base rounded, petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Racemes* 1-2 in.; bracts ovate-lanceolate, shorter than the calyx. *Corolla* not twice the length of the calyx.—*Don's* character hardly agrees with the specimens above described in the ventricose calyx.

5. **T. quadrifarium**, *Ham. in Don Prodr.* 108; stout, erect, tomentose or villous, rarely glabrate, leaves sessile or short-petioled ovate or oblong-ovate cordate acute serrate racemes paniced, bracts ovate acute much exceeding the flowers, calyx $\frac{1}{2}$ in., upper lip rounded, 2 lower acute or obtuse, corolla-tube included. *Wall. Cat.* 2024; *Benth. in Wall. Pl. As. Rar.* i. 58, *Lab.* 675, and in *DC. Prodr.* xii. 583; *Maxim. in Bull. Acad. Petersb., Mel. Biol.* ix. 827. *T. Fortunei*, *Benth. in DC. l. c.* (excl. *Perrottet's* plant).

TEMPERATE HIMALAYA; from Kashmir to Sikkim, alt. 4-8000 ft. KHASIA MTS., alt. 4-5500 ft.—DISTRIB. Ava, China.

A stout herb, stem 2-4 ft., almost terete below, sometimes villous with long spreading hairs. *Leaves* 2-3 in., often rugose; petiole usually $\frac{1}{2}$ in., rarely 1 in. *Spikes* 2-6 in., stout, with the bracts on $\frac{3}{4}$ in. diam.; bracts $\frac{1}{2}$ in., broadly ovate, suddenly acuminate, villous near the base, young quadrifarious imbricating and concealing the flowers, often red-purple; flowers sessile or very shortly pedicelled. *Corolla* purple, not twice the length of the calyx. *Style* entire. *Nutlets* subglobose, rugose.

6. **T. Wightii**, *Hook. f.*; very robust, densely villous, leaves short-petioled very thick rugose rounded ovate obtuse toothed, racemes paniced, bracts shorter than the calyx elliptic acute, calyx $\frac{1}{2}$ in. villous, upper tooth rounded apiculate, 2 lower lanceolate, corolla-tube included. *T. quadrifarium*, *Herb. Wight* (*Kew Distrib.* 2168). *T. tomentosum*, *Wight l. c.* t. 1458. *T. n. sp.*, *Benth. Pl. Hohenack.* n. 1396.

NILGHIRI HILLS; in dry rocky places, alt. 7000 ft., *Wight, &c.*

Stem 1-2 ft., obtusely angled; hairs tawny, most dense, spreading. *Leaves* 1-1 $\frac{1}{2}$ in.; petiole stout, $\frac{1}{4}$ in. *Racemes* 3-4 in. *Corolla* purple, $\frac{1}{2}$ in. long. *Style* entire or 2-toothed. *Nutlets* subglobose, glistening, faintly reticulate.—*Wight* represents the leaves acute, which is the case in *T. tomentosum*, but never in this.

7. **T. palmatum**, *Benth. in Herb. Ind. Or. H. f. & T.*; nearly glabrous, slender, stoloniferous, leaves long-petioled 3-foliolate leaflets rhomboid-ovate acuminate coarsely serrate, racemes short puberulous few-fl., calyx $\frac{1}{2}$ in., upper lip of 3 triangular acuminate teeth, corolla-tube included, upper lip oblong.

SIKKIM HIMALAYA; Lachen, alt. 9-10,000 ft., *J. D. H.*

Stem 1-2 ft., weak, erect, puberulous above. *Leaves* membranous, leaflets 2-3 by 1-1 $\frac{1}{4}$ in., base cuneate; petiole 1 $\frac{1}{2}$ -3 in. *Racemes* 1-2 in.; bracts subulate, equalling or shorter than the pedicel. *Corolla* $\frac{1}{2}$ in., upper lip half as long as the lower, concave, obtusely 2-fid, lateral lobes of lower broad, midlobe longest retuse. *Fruiting calyx* membranous reticulate, lips broad gaping. *Nutlets* $\frac{1}{2}$ in. diam., globose, faintly reticulate.

Sect. 2. **Scordium**. *Whorls* 2-6-fl., axillary.

8. **T. Scordium**, *Linn.*; perennial, tomentose or glabrate, leafy, leaves small sessile oblong obtuse coarsely toothed. *Benth. in DC. Prodr.* xii. 586; *Boiss. Fl. Orient.* iv. 812; *Reichb. Ic. Fl. Germ.* t. 1239.

WESTERN HIMALAYA; Kashmir, *Jacquemont*.—DISTRIB. Afghanistan, N. & W. Asia, Europe, N. Africa.

Stoloniferous, foetid and glandular. *Leaves* uniform, $\frac{1}{2}$ -1 $\frac{1}{2}$ in., base cuneate. *Flowers* pedicelled. *Calyx* $\frac{1}{2}$ in., shortly campanulate, base gibbous, teeth triangular subequal. *Corolla* $\frac{1}{2}$ in., rose-purple. *Nutlets* oblong, rugose.

54. **AJUGA**, *Linn.*

Annual or perennial herbs. *Whorls* 2- or more-fl., axillary or in terminal leafy spikes. *Calyx* 10- or more-nerved; teeth 5, subequal. *Corolla-tube* often annulate within, upper lip very short, 2-fid; lower spreading, midlobe usually the largest notched or 2-fid. *Stamens* 4, ascending, exserted or included; anther-cells diverging, distinct or at length confluent. *Disk* symmetric or produced behind. *Ovary* shortly 4-lobed; style-lobes subequal. *Nutlets* obovoid, rugose, hilum lateral.—Species 30, of the temperate Old World.

* *Corolla-tube* straight, base not inflated. *Stamens* exserted.

1. **A. lobata**, *Don Prodr.* 108; softly hairy or glabrate, stems very long and slender prostrate or creeping, leaves long-petioled orbicular or broadly oblong cordate sinuate-lobed, whorls axillary or in short erect axillary spikes. *Wall. Cat.* 2034; *Benth. in Wall. Pl. As. Rar.* i. 58, *Lab.* 692, and in *DC. Prodr.* xii. 595.

CENTRAL and EASTERN HIMALAYA, alt. 8-10,000 ft.; from Nepal, *Wallich*, to Bhotan, *Griffith*. KHASIA MTS., alt. 5-6000 ft.; *J. D. H. & T. T.*, &c.

Stems 1-2 ft., flexuous. *Leaves* distant, 1-2 in. long and broad; petiole as long or longer. *Spike* 1-3 in.; bracts ovate-oblong, toothed; lower whorls distant, 2-fid., upper 6-fl. *Calyx* $\frac{1}{2}$ in.; teeth long, lanceolate. *Corolla* lilac; tube thrice as long as the calyx, slender, laxly pubescent; upper lip very short; lower very large, side lobes linear-oblong, midlobe broadly dilated retuse.

2. **A. bracteosa**, *Wall. Cat.* 2032; softly pubescent villous or glabrate, rarely substrigose or hispid, stolons 0, stems or branches erect or ascending, leaves oblanceolate or subspathulate obtuse sinuate-toothed, whorls axillary or crowded in spikes much shorter than the leafy ovate or cuneate-obovate entire or toothed bracts, calyx-teeth ovate-lanceolate, corolla-tube exserted,

stamens exserted. *Benth. in Wall. Pl. As. Rar.* i. 59, *Lab.* 696, and in *DC. Prodr.* xii. 598; *Maximov. in Bull. Acad. Sc. Petersb., Mel. Biol.* xi. 818. *A. remota*, *Benth. l. c.*; *Maximov. l. c.* 817.

WESTERN HIMALAYA, from Kashmir to Nepal, alt. 1-7000 ft., and in the plains near them from Oudh to Peshawur.—DISTRIB. Afghanistan, China, Japan, Abyssinia.

Stem or branches many from the rootstock, 4-12 in., simple or divided, usually stout, leafy, pubescence most variable. *Leaves* 1-4 in., lower petioled, upper sessile. *Calyx* $\frac{1}{8}$ in., villous; teeth half the length of the tube, ovate-lanceolate, acute. *Corolla* pale blue or lilac, pubescent; tube rarely twice as long as the calyx; upper lip erect, 2-fid; side lobes of lower oblong, midlobe dilated variable in length. *Nutlets* $\frac{1}{10}$ in., ellipsoid, deeply rugosely pitted.—I am quite unable to distinguish Bentham's *A. remota*, which was probably intended to include the form with distant whorls and large floral leaves. Nor can I distinguish a common Japanese plant from *A. bracteosa*.

VAR. densiflora; stem scapiform, radical leaves obovate-oblong obtuse subentire, cauline 0 or oblong sessile, spike 2-3 in. villous, bracts shorter than the flowers, corolla very shortly exserted. *A. densiflora*, *Wall. Cat.* 2031; *Benth. l. c.*—Nepal, *Wallich*.—This looks like a starved *A. bracteosa*, which the form of the calyx, corolla and nutlets entirely resemble.

**** Corolla-tube straight. Stamens included in the tube.**

3. *A. parviflora*, *Benth. in Wall. Pl. As. Rar.* i. 59, *Lab.* 696, and in *DC. Prodr.* xii. 598; softly villous, stems or branches short diffuse ascending, stolons 0, radical leaves sessile or shortly petioled oblanceolate or obovate-spathulate obtuse entire or crenate, whorls in bracteate spikes, calyx-teeth lanceolate, corolla very small, tube exserted. *Maxim. in Bull. Acad. Sc. Petersb., Mel. Biol.* xi. 825; *Wawra Itin. Pr. S. Cob., Bot.* 105. *Teucrium hispidum*, *Wall. Cat.* 2029 (corrected p. 89).

WESTERN HIMALAYA, from Kashmir to Kumaon, alt. 2-7000 ft.—DISTRIB. Afghanistan.

Branches very numerous from the woody rootstock, stout or slender, leafy. *Radical leaves* 2-3 (rarely 5 by 2) in.; cauline smaller, obovate or oblong. *Spike* 1-4 in., whorls generally crowded, lower sometimes distant; bracts ovate or oblong, much longer than the flowers. *Calyx* $\frac{1}{10}$ - $\frac{1}{8}$ in., teeth as long as the tube. *Corolla* blue, tube slender, $\frac{1}{8}$ - $\frac{1}{6}$ in. long, glabrous or hairy; limb very small, upper lip very short 2-lobed, lateral lobes of lower subequal or the midlobe the largest. *Nutlets* $\frac{1}{8}$ in., rugosely pitted.—Very variable in habit and size of leaves.

VAR. depressa; densely villous, branches depressed. *A. depressa*, *Maxim. l. c.* 826.—This is a stunted alpine state from an elevation of 8000 ft. in Kumaon. (*Strachey & Winterbottom*, *Ajuga*, n. 5.)

4. *A. brachystemon*, *Maximov. in Bull. Acad. Imp. Sc. Petersb.* xi. 825; dwarf, villous, stem very short ascending leafy, radical leaves petioled obovate obtuse crenate, cauline sessile, whorls in very short subsessile leafy spikes, shorter than the ovate bracts, calyx-teeth very short rounded, corolla-tube shortly exserted.

WESTERN HIMALAYA; Kumaon, Pindari, alt. 12,500 ft., *Strachey & Winterbottom* (*Ajuga*, n. 4).

Stem 1-2 in. from a small woody rootstock. *Leaves* 1-1 $\frac{1}{2}$ in., radical shortly petioled, crenulate, cauline shorter. *Spike* $\frac{1}{2}$ in. *Calyx* obconic, $\frac{1}{10}$ in. long, teeth ciliate. *Corolla* $\frac{1}{4}$ in., tube straight, upper lip short, 2-lobed; side-lobes of lower linear-oblong, obtuse; midlobe twice as broad, dilated, retuse. *Stamens* wholly included.—This looks like a starved state of something, but I cannot refer it to any described species; the calyx resembles *A. macrosperma* in miniature, but the corolla-tube is straight with included stamens.

*** *Corolla inflated at the base, geniculate above the swelling. Stamens exerted.*

5. **A. macrosperma**, Wall. Cat. 2030; glabrous pubescent or villous, stem or branches decumbent or ascending often stout and tall, leaves petioled ovate-oblong or obovate obtuse sinuate-crenate, whorls villous continuous or interrupted longer than the ovate bracts, calyx-teeth very short obtuse. *Benth. in Wall. Pl. As. Rar.* i. 58, *Lab.* 697, and in *DC. Prodr.* xii. 599; *Maxim. in Bull. Acad. Imp. Sc. Petersb., Mel. Biol.* xi. 823. *A. repens*, *Roxb. Fl. Ind.* iii. 3. *A. geniculata*, *Maxim. l. c.* 821.

TROPICAL and TEMPERATE HIMALAYA, from Kumaon to Bhotan, alt. 1-8000 ft. KHASIA MTS., alt. 1-5000 ft. CHITTAGONG, PEGU.—DISTRIB. Ava.

Very variable; stems or branches 6 in. to 3 ft.; sometimes as thick as a swan's quill, spreading and branching, sometimes rooting, and glabrous or densely pubescent or villous. *Leaves* 1-6 in. long, very variable in breadth, narrowed into the often very long petiole, rarely lobed or cut. *Spikes* 1-8 in., whorls continuous or interrupted, lower bracts leaf-like. *Calyx* short, teeth always obtuse. *Corolla* azure, tube twice as long as the calyx, usually glabrous, limb small; upper lip erect, 2-lobed; lobes of lower subequal or midlobe broadest. *Nutlets* $\frac{1}{12}$ - $\frac{1}{20}$ in. long, deeply rugosely pitted.—A very common species in the hilly countries of N. India, being the largest of the genus; in the low grounds forming a bushy herb sometimes 3 feet high, with widely spreading decumbent branches and abundant spikes of blue flowers. In the higher elevations it assumes a lower and more slender form with smaller leaves (*A. sikkimensis*, Miq.), with the corolla laxly hairy and its tube scarcely exerted. This form has sometimes stems only a few inches high and irregularly toothed leaves. Whether *A. macrosperma*, and any of its states, be the *A. decumbens*, Thunb., of Japan, as would follow from Don's and Bentham's references, is unknown to me, as I have seen no Japanese Ajuga with a geniculate corolla-tube. According to Maximovicz's description of *A. decumbens*, it must differ in the deeper sharper calyx-lobes, the more prominent midlobe of the corolla, and in the minutely reticulate nutlets.

VAR. *Thomsoni*; glabrous, stems slender flaccid rooting prostrate, spikes with a very slender rachis, calyx-teeth very short rounded, corolla glabrous, tube exerted. *A. Thomsoni*, *Maxim. l. c.* 821.—Sikkim, alt. 6-9000 ft., *J. D. H. & T. T.*—This is certainly only an upland state of *A. macrosperma*. However unlike the extreme low-land form, it is united by intermediates collected near to it at lower elevations.

VAR. *breviflora*; smaller, branches more slender than the type 4 in.-2 ft., corolla-tube shorter sometimes quite included often hairy. *A. decumbens*, *Don Prodr.* 108; *Benth. in DC. l. c.* 598 (? of Thunberg). *A. sikkimensis*, *Miq. Prolus. Fl. Jap.* 46; *Maxim. l. c.* 822.—Higher parts of the Khasia Mts., ascending to 10,000 ft. in Sikkim. Behar; top of Parusnath, *J. D. H.*—Perhaps all the Himalayan forms of *A. macrosperma* should be referred to this, but I can find no definite characters for them.

UNKNOWN SPECIES.

A. ? OVATA, Wall. Cat. 2036, from Ava, is indeterminable, having no flower or fruit.

55. CYMARIA, Benth.

Shrubs. *Flowers* small, in lax many-fl. axillary peduncled cymes, ebracteate or crowded in a terminal thyrses. *Calyx* erect, 10-nerved, 5-toothed, fruiting-tube globose, throat naked. *Corolla-tube* straight; lips subequal, upper arched, erect; lower spreading, 3-fl. midlobe largest. *Stamens* 4, ascending; anthers conniving, cells divaricate. *Disk* symmetric. *Ovary* shortly 4-lobed; upper style-lobe very short. *Nutlets* subglobose or obovoid, rugosely pitted; hilum lateral.—Species 3, Burman and Malayan.

1. **C. dichotoma**, *Benth. in Wall. Pl. As. Rar. i. 64, Lab. 705*, and in *DC. Prodr. xii. 603*; branches petioles cymes and leaves beneath finely pubescent, leaves ovate or rhomboid subacute faintly crenate, cymes axillary long-peduncled lax-fl'd. *Wall. Cat. 2080*.

BURMA; at Taong-dong, *Wallich*.

Stem terete, woody; branches strict, slender, obtusely 4-angled. *Leaves* 3-4 by $1\frac{1}{2}$ -2 in., membranous, base cuneate; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Peduncle* $\frac{1}{2}$ -2 in., slender. *Calyx* $\frac{1}{8}$ in., teeth triangular acute, as long as the tube. *Corolla* minute, tube hardly exserted. *Stamens* included. *Nutlets* $\frac{3}{16}$ in.

2. **C. elongata**, *Benth. in Wall. Pl. As. Rar. i. 64, Lab. 705*, and in *DC. Prodr. xii. 603*; branches petioles leaves beneath and cymes densely tomentose, leaves sessile ovate obtuse subcrenate, cymes short-peduncled dense-fl'd. in a long terminal leafy raceme. *Wall. Cat. 2079*.

BURMA; at Taong-dong, *Wallich*.

Branches long, robust. *Leaves* $1\frac{1}{2}$ -3 in., thick, finely tomentose above. *Peduncle* $\frac{1}{4}$ - $\frac{1}{2}$ in., and pedicels stout. *Calyx* $\frac{1}{8}$ in., as in *C. dichotoma*, but tomentose. *Nutlets* $\frac{1}{4}$ in., obovoid.

ORDER CXIII. PLANTAGINÆ.

Scapigerous herbs. *Leaves* usually radical. *Scapes* axillary. *Flowers* small, greenish, spicate, often dimorphic. *Sepals* 4, imbricate in bud, persistent. *Corolla* hypogynous, salver-shaped, scarious; lobes 4, imbricate in bud. *Stamens* 4, inserted on the corolla-tube; filaments capillary, inflexed in bud, persistent; anthers large, pendulous, versatile. *Ovary* free, 2-4-celled; style filiform with 2 lines of stigmatic hairs; ovules 1 basal in each cell, or several peltately attached to the septum. *Capsule* 1-4-celled, circumsciss, membranous, 1- or more-seeded, septum free. *Seed* usually peltate, testa thin, mucilaginous, albumen fleshy; embryo cylindric, transverse, radicle inferior.—Genera 3, species about 50.—The above character does not include the anomalous monotypic genera *Littorella* and *Bougueria*.

Plantago, *Linn.*

Characters of the Order.

Sect. 1. **Euplantago**, *Boiss.* Leaves all radical.

* *Corolla* glabrous. *Capsule* 2-celled, cells 4-8-seeded. *Seeds* angular.

1. **P. major**, *Linn.*; perennial, leaves petioled oblong or oblong-ovate subentire or toothed 3-7-ribbed, scape short, spike very long and slender. *Boiss. Fl. Orient. iv. 878*; *Dcne. in DC. Prodr. xii. 1, 696*; *Theaites Enum. 245*. *P. erosa*, *Wall. in Roxb. Fl. Ind., Ed. Carey & Wall. i. 423*, and *Cat. 6412*; *Don Prodr. 77*; *Dcne. l. c.* *P. asiatica*, *Linn. Sp. Pl. 163*, *Dcne. l. c. 695*; *Wight Ill. t. 177*. *P. longiscapa*, *Jacquem. mss.*

TEMPERATE and ALPINE HIMALAYA; from Peshawur and Kashmir to Bhotan, alt. 2-8000 ft., and WESTERN TIBET, alt. 10-12,000 ft. ASSAM, *Griffith*. KHASIA Mts., alt 4-5000 ft. BURMA and MALACCA, *Griffith*. SINGAPORE or PENANG, *Walker*. BOMBAY, *Stocks*. NILGHIRI HILLS, *Foulkes*, &c. CEYLON; higher parts of the island, *Walker*, &c.—DISTRIB. Malay Islands; Afghanistan and westwards to the Atlantic; wild or introduced, in these and many other countries.

Glabrous or hairy; rootstock stout, truncate. *Leaves* 2-5 in., variable in breadth, toothed irregular; petiole sometimes 4 in. *Spike* 3-6 in.; flowers scattered or crowded; bracts equalling the calyx. *Sepals* glabrous, $\frac{1}{2}$ in. long, margins broadly scarious, obtusely keeled. *Filaments* short. *Seeds* very minute, black.

** *Corolla* glabrous. *Capsule* 2-celled, cells 1-2-seeded.

2. ***P. lanceolata***, Linn.; perennial, leaves shortly petioled lanceolate entire or toothed 3-5-ribbed, axils woolly, scape long deeply furrowed, spike very short. *Boiss. Fl. Orient.* iv. 881; *Don Prodr.* 77; *Thwaites Enum.* 245; *Dcne. in DC. Prodr.* xiii. 1, 714. *P. attenuata*, Wall. in *Roxb. Fl. Ind.*, Ed. Carey & Wall. i. 422, and *Cat.* 6413.

WESTERN HIMALAYA; from Kashmir to Simla, *Royle, Thomson, &c.* Salt range, *Aitchison*. Waziristan, alt. 5-8000 ft., *Stewart*. (NEPAL and CEYLON introduced.)—DISTRIB. Europe and N. Asia; introduced into many countries.

Very variable in size. *Rootstock* tapering. *Leaves* 1-12 in. *Scape* as long or longer. *Spike* $\frac{1}{2}$ -3 in., ovoid, subglobose or cylindric; bracts acuminate. *Sepals* usually ciliate. *Filaments* long. *Seeds* oblong, concavo-convex, black.

3. ***P. tibetica***, *Herb. Ind. Or. Hook. f. & T.*; perennial, glabrous or nearly so, leaves sessile or petioled elliptic or elliptic-lanceolate entire or toothed 5-ribbed, axils glabrous, scape grooved, spike slender.

WESTERN HIMALAYA; Kashmir, alt. 4-11,000 ft., *Stewart*. WESTERN TIBET; common, alt. 10-13,000 ft., *Thomson, Henderson*.

Rootstock short, stout. *Leaves* 2-4 in., variable in width, subacute. *Scapes* glabrous or puberulous. *Spikes* 1-6 in.; flowers very pale; bracts oblong, obtuse, equalling the calyx. *Sepals* broadly oblong, scarious, midrib green. *Corolla* very small, lobes acute. *Capsule* twice as long as the calyx, very pale.—Some specimens of apparently first year's plants from wet places have oblong membranous leaves 4 in. long or petioles as long, and very slender scapes and spikes.

4. ***P. brachyphylla***, *Edgew. mss.*; *Dcne. in DC. Prodr.* xiii. 1, 696; perennial, glabrous, leaves elliptic-ovate subsessile or petioled 3-5-ribbed, axils glabrous, scapes stout glabrous longer than the leaves and cylindric spikes. *P. gentianoides*, *Dcne. l. c.* 721 (the Himalayan plant).

WESTERN HIMALAYA; from Kumaon to Kashmir, alt. 9-13,000 ft., *Edgeworth, &c.* WESTERN TIBET, alt. 11-14,000 ft.; *Thomson*.—DISTRIB. Afghanistan.

Much resembling a small state of *P. major*, but the seeds are 1-2 in each cell, oblong and plano-convex.

5. ***P. Stocksii***, *Boiss. in DC. Prodr.* xiii. 1, 720, and *Fl. Orient.* iv. 882; annual or perennial, cobwebby or subsilky, leaves shortly petioled lanceolate long-acuminate entire 3-nerved, scape slender longer than the leaves, spike short and few-fl. or long with many distant flowers, corolla-lobes acute. *P. remotiflora*, *Stocks in Hook. Kew Journ. Bot.* iv. 179.

N.W. INDIA; Waziristan, alt. 3-5000 ft., *Stewart*.—DISTRIB. Afghanistan and Beluchistan, Persia.

Root fusiform. *Leaves* 2-4 in. *Spikes* sometimes 5 in. long, at others only $\frac{1}{2}$ in.; bracts rather shorter than the calyx, obtuse, hairy or glabrate, margin membranous, back green. *Sepals* subsimilar, ovate-oblong, obtuse. *Seeds* large, narrowly oblong, boat-shaped, black.—Waziristan is just beyond the British frontier, but as the species will probably occur on this side of it, I have thought it right to introduce the description.

6. ***P. amplexicaulis***, *Cav. Ic.* ii. 22, t. 125; annual or perennial, stemless or subcaulescent, sparsely hairy or glabrate, leaves long very narrowly lanceolate finely acuminate 5-nerved, base sheathing, scapes axillary terete equalling or exceeding the leaves, spikes ovoid, corolla-lobes ovate acute. *Boiss. Fl. Orient.* iv. 883; *Dcne. in DC. Prodr.* xiii. 1, 719. *P. Bauphula*, *Edgew. in Hook. Journ. Bot.* ii. 285 (1840); *Dcne. l. c.* *P. salina*, *Dcne. l. c.* 720. *P. lagopoides*, *Desf. Fl. Atlant.* i. 135, t. 39.

PANJAB PLAINS; from the Sutlej westwards, *Falconer, &c.* MALWA, *Edgeworth.* SCINDE; on the Boogta Hills, *Vicary.*—DISTRIB. Westwards to Greece and Egypt.

Stem 0, or branched from the base, and 2–4 in. high, bearing leaves and axillary scapes. *Leaves* 3–6 in., rarely 2 in. diam.; margin entire or very sparingly toothed. *Scapes* very numerous, stout, glabrous. *Spikes* $\frac{1}{2}$ –1 $\frac{1}{2}$ in.; flowers large; bracts cupular, glabrous, membranous except the green midrib. *Sepals* rounded, outer with a green keel, inner all membranous. *Seeds* $\frac{1}{8}$ in., boat-shaped, brown; septum $\frac{1}{4}$ in. long, oblong, thickened, black.

7. ***P. ovata*, Forsk. Fl. Æg. Arab.** 31; annual, stemless or subcaulescent, sparsely or thickly villous, leaves narrow-linear or filiform finely acuminate, scapes longer or shorter than the leaves, spikes ovoid or cylindric, corolla-lobes rounded concave obtuse. *Boiss. Fl. Orient.* iv. 885; *Dcne. in DC. Prodr.* xiii. 1, 706. *P. decumbens*, *Forsk. l. c.*; *Dcne. l. c.* *P. Ispaghul*, *Roxb. Fl. Ind.* i. 404, and *Ed. Carey & Wgll. l. c.* 421; *Fleming in As. Research.* xi. 174; *Royle Ill.* 312; *Dcne. l. c.* (*Ispaghula*); *Bentl. & Trim. Med. Bot.* t. 211. *P. argentea*, *Desf. Fl. Atlant.* ii. 136. *P. lanata*, *Wall. Cat.* 6414.

PANJAB PLAINS and low HILLS; from the Sutlej westwards. SCINDE, *Stocks.*—DISTRIB. Westwards to Spain and the Canaries.

Stem rarely branched, as in *P. amplexicaulis*. *Leaves* 3–9 in., rarely $\frac{1}{2}$ in. diam., usually 3-nerved, entire or distantly toothed. *Scapes* glabrous or pubescent. *Spikes* $\frac{1}{2}$ –1 $\frac{1}{2}$ in.; bracts with broad scarious margins, ovate-oblong, obtuse, glabrous. *Sepals* subsimilar, glabrous or pubescent. *Seeds* cymbiform.

*** *Corolla-lobes hirsute. Capsule 2-celled, cells 1-seeded.*

8. ***P. ciliata*, Desf. Fl. Atlant.** i. 137, t. 39; annual or perennial, stemless or subcaulescent, densely silky or woolly, leaves long- or short-petioled oblanceolate acuminate, scapes stout longer or shorter than the leaves, spikes oblong or cylindric, bracts sepals and acuminate corolla-lobes villous. *Dcne. in DC. Prodr.* xiii. 1, 708; *Boiss. Fl. Orient.* iv. 887. *P. eriantha*, *Dcne. l. c.* 707.

The PANJAB HILLS, west of the Jhelum; Salt range, *Fleming*; Peshawur, *Vicary, &c.*—DISTRIB. Westwards to Arabia and Egypt.

Usually a dwarf species, with broadly oblanceolate apiculate leaves 1–4 in. long, but sometimes caulescent with narrow leaves 6 in. long. *Scapes* numerous. *Spikes* stout, 1–2 in.; bracts ovate, obtuse, broadly membranous, back green. *Sepals* membranous. *Seeds* boat-shaped.

Sect. 2. ***Psyllium*.** *Stem* leafy. *Leaves* opposite.

9. ***P. Psyllium*, Linn.**; annual, erect, strict, glandular-pubescent, leaves linear or linear-lanceolate flat obtuse, peduncles in the upper axils, spikes ovoid, bracts acute, lower elongate. *Boiss. Fl. Orient.* iv. 891; *Dcne. in DC. Prodr.* xiii. 1, 734; *Sibth. Fl. Græc.* t. 149; *Reichb. Ic. Fl. Germ.* t. 84. *P. arenaria*, *Dcne. l. c.* 735 (the Indian plant).

NORTH-WESTERN PANJAB; Peshawur and South of Brumoo, *Stewart*; Tarki, N. of Indus, alt. 2800 ft., *Aitchison.*—DISTRIB. Westwards to Greece and Egypt.

Stem 4–8 in. *Leaves* 1–1 $\frac{1}{2}$ in., with fascicles in their axils, hence appearing whorled, margin entire with a very few glandular tubercles, bases ciliate. *Scapes* usually shorter than the leaves. *Spikes* $\frac{1}{2}$ – $\frac{3}{4}$ in.; lower bracts sometimes spreading, hispid. *Sepals* oblong, subacute. *Corolla* very small.

10. ***P. pumila*, Willd. Enum. Hort. Berol.** i. 162; stem ascending

flexuous glabrous or puberulous, leaves filiform, margins revolute, peduncles in the upper axils, spikes ovoid or subglobose puberulous, bracts all longer than the calyx, lower equalling the spike, corolla lobes finely acuminate. *Dcne. in DC. Prodr.* xiii. 1, 735; *Boiss. Fl. Orient.* iv. 891. *Plantago*, *Griff. It. Notes*, 214, n. 84, and *Notulæ*, iv. 213; and *Ic. Pl. Asiat.* t. 462.

NORTH-WEST INDIA; *Royle* (raised from seed bought in Bazaar).—DISTRIB. Afghanistan, Egypt.

This is, I think, a form of *P. Psyllium*, or of *P. stricta*, Schousb. *Royle's* only specimen is very small, 6 in. high and slender, but *Griffith's* from Afghanistan is a foot high with a very robust stem.—*Boissier* doubtfully refers *P. indica*, L., to this.

ORDER CXIV. NYCTAGINEÆ.

Herbs, shrubs or trees. *Leaves* usually opposite, quite entire, exstipulate. *Inflorescence* various, flowers often involucre. *Perianth* petaloid, monopetalous; tube persistent, enveloping the fruit; limb 3-5-lobed, plaited in bud: *Stamens* 8-20, hypogynous, sometimes unilateral, filaments usually unequal, inflexed in bud; anthers didymous. *Ovary* free, 1-celled; style involute in bud, stigma simple or multifid; ovule 1, erect. *Fruit* membranous, enclosed in the hardened perianth-tube. *Seed* erect, testa adherent, albumen floury or soft; embryo curved, coiled or with folded cotyledons, radicle inferior.—Genera 23, species 215, chiefly tropical American.

TRIBE I. **Mirabilieæ.** *Embryo* hooked, radicle long.

Flowers involucre 1. OXYBAPHUS.
Flowers not involucre 2. BOERHAAVIA.

TRIBE II. **Pisonieæ.** *Embryo* straight, radicle short.

3. PISONIA.

1. OXYBAPHUS, Vahl.

Herbs. *Leaves* opposite. *Involucre* 1-5-fld. *Perianth-tube* short, limb deciduous. *Stamens* 2-5, filaments connate below. *Fruit* small.—Species about 20, all but the following American.

O. himalaicus, *Edgew. in Trans. Linn. Soc.* xx. 87; glandular-pubescent, viscid, leaves petioled ovate or ovate-cordate, flowers solitary in each involucre. *Chois. in DC. Prodr.* xiii. 2, 430.

WESTERN HIMALAYA; from Kulu to Gurwhal, alt. 6-9000 ft., *Edgeworth, &c.*

Stem 2-4 ft., branched, terete, brittle. *Leaves* 2-3 by $1\frac{1}{2}$ -2 $\frac{1}{2}$ in., acute, ciliolate; petiole $\frac{1}{2}$ -1 in. *Flowers* paniced, involucre $\frac{1}{4}$ in., campanulate, 5-toothed, viscid. *Perianth* included, rosy, contracted above the ovary, limb spreading. *Stamens* 4, included. *Fruit* $\frac{1}{2}$ in. long, ellipsoid or ovoid, rough, black.

2. BOERHAAVIA, Linn.

Herbs. *Leaves* opposite. *Flowers* minute or small, paniced umbelled or capitate, jointed on the pedicel; bracteoles small, rarely forming a minute involucre. *Perianth-tube* long or short; limb funnel-shaped, 5-lobed. *Stamens* 1-5, exserted. *Ovary* oblique, stipitate, stigma peltate. *Fruit* small, glandular. *Cotyledons* broad, thin, enclosing a soft scanty albumen.—Species 30, tropical and subtropical.

* *Flowers capitate.*

1. **B. repens**, *Linn.*; diffusely branched, leaves linear ovate oblong or rounded obtuse or acute, base rounded or cordate, heads small in terminal or axillary panicles, flowers minute capitate, fruit $\frac{1}{2}$ in. long shortly clavate 5-ribbed viscid all over, top rounded. *Boiss. Fl. Orient.* iv. 1045; *Dalz. & Gibs. Bomb. Fl.* 213.

Throughout INDIA; from the Panjab to Assam and south to Travancore and Singapore; ascends in the hot Himalayan valleys to 7000 ft. CEYLON.—DISTRIB. Tropical and subtropical Asia, Africa and America.

Root fusiform, very stout; rootstock woody; branches 6–24 in., glabrous or pubescent. *Leaves* $\frac{1}{2}$ –2 in., thick, usually white beneath; petiole as long as the blade or shorter. *Panicle* with very slender branches. *Perianth* red. *Stamens* 2–3.—I have refrained from quoting any but Indian authorities for this plant, the whole genus appearing to me to be in a state of utter confusion. *B. ascendens*, Willd.; *hirsuta*, Willd., and *viscosa*, Lag., are probably the same as this. I am further unable to draw any line between the following forms, two of which are characterized by Boissier.

B. repens proper; small, branches 6–10 in. not very stout appressedly pubescent, leaves small ovate or oblong often acute rarely cordate green above white beneath.—*B. repens*, *Delile Fl. Eg.* t. 3, f. 1.

VAR. *procumbens*; branches 2–3 ft. usually slender glabrous, leaves larger broader often rounded white beneath, inflorescence paniced. *B. procumbens*, *Herb. Banks in Roxb. Fl. Ind.* i. 146; *Wight Ic.* t. 874; *Grah. Cat. Bomb. Pl.* 167.

VAR. *diffusa*; more robust, branches long stout glabrous pubescent or viscons, leaves 1–2 in. ovate obtuse or acute usually cordate green beneath, inflorescence chiefly axillary. *B. diffusa*, *Linn. Sp. Pl.* 3; *Wall. Cat.* 6770; *Boiss. l. c.* 1045. *B. repanda*, *Wall. Cat.* 6769, in part.—*Rheede Hort. Mal.* vii. t. 56.

2. **B. crispa**, *Heyne in Wall. Cat.* 6771; stout, erect, scaberulously pubescent, stem subsimple, leaves shortly petioled oblong or ovate-oblong rounded at both ends coriaceous scabrid on both surfaces, nerves very numerous and strong beneath, flowers few capitate in a laxly branched panicle with capillary peduncles, fruit $\frac{1}{2}$ in. long clavate 5-ribbed glandular, top rounded. *B. rugosa*, *Rottler mss.*

DECCAN-PENINSULA; *Heyne*.

A robust species. *Leaves* 1–1 $\frac{1}{2}$ in., very thick and hard, margin crisped; petiole stout, $\frac{1}{2}$ – $\frac{1}{4}$ in. *Panicles* with decurved branches.—The specimens of this very distinct-looking plant are in fruit only.

** *Flowers umbelled or whorled.*

3. **B. repanda**, *Willd. Sp. Pl.* i. 22; subscaudent, branches long pale, leaves triangular-ovate or -cordate acute or acuminate repand-sinuate, umbels long-peduncled axillary and terminal few-fld., pedicels long slender, fruit $\frac{1}{2}$ in. long slender glandular. *Chois. in DC. Prodr.* xiii. 1, 455; *Wall. Cat.* 6769, excl. part of *B*; *Wight Ic.* t. 1766; *Dalz. & Gibs. Bomb. Fl.* 213. *B. umbellata*, *Wight mss.* *Valeriana chinensis*, *Burm. Fl. Ind.* 15, t. 6, f. 3.

UPPER GANGETIC PLAIN and ROHILKUND, *Wallich, Edgeworth, &c.* The CONCAN, *Stocks*. MYSORE, TRAVANCORE and the CAENATIC, *Wight, &c.* PEGU and BURMA, *Wallich*.—DISTRIB. Beluchistan.

Branches diffuse, subscaudent, glabrous or pubescent, 6 ft. long. *Leaves* 1–3 in., base usually truncate or cordate; petiole slender, $\frac{1}{2}$ –1 $\frac{1}{2}$ in. *Peduncles* 1–2 in., very slender, 2–6 fld.; pedicels $\frac{1}{4}$ –1 in., capillary. *Perianth* pink, tube $\frac{1}{2}$ in. long; limb $\frac{1}{2}$ in. diam. *Stamens* far exerted. *Fruit* slightly clavate, covered with large glands,

obscurely ribbed.—This closely resembles the American *B. scandens*, but the flower is much larger and the stamens are far exserted.

4. ***B. verticillata***, Poir. *Dict.* v. 56; branches long pale, leaves broadly ovate or rounded rarely oblong obtuse sinuate, umbels long-peduncled axillary and paniced few-fl. often superposed, pedicels long slender, fruit $\frac{1}{2}$ in. clavate with large semi-globose glands round the crown. *Chois. in DC. Prodr.* xiii. 1, 454; *Wall. Cat.* 6772; *Boiss. Fl. Orient.* iv. 1044. *B. stellata*, Wight *Ic. t.* 875; *Chois. l. c.*; *Dalz. & Gibs. Bomb. Fl.* 213. *B. scandens*, *Gibs. Cat. Bomb. Pl.* 167; *Wall. Cat.* 6773.

WESTERN PANJAB; Salt range, Mt. Tilla, *Aitchison*. The CONCAN, KATTYWAR and SCINDE, *Dalzell, Stocks, &c.* GOOJERAT, *Gibson*. MYSORE, at Hyderabad, *Heyne*. TRAVANCORE and the CARNATIC, *Wight*.—DISTRIB. Afghanistan, Beluchistan, and westward to Syria and Tropical Africa.

Habit, foliage and inflorescence much as in *B. repanda*, but leaves usually obtuse; flowers smaller, white or pink, and fruit very different.

5. ***B. fruticosa***, *Dalz. in Dalz. & Gibs. Bomb. Fl.* 213; "erect, shrubby, viscidly tomentose, leaves ovate or triangular acuminate much wrinkled beneath, base truncate, peduncles axillary, pedicels slender, flowers umbelled small pink, fruit linear-oblong sulcate pubescent, ribs tubercled."

The CONCAN; Ghats east of Bombay and Sewnere forts, *Dalzell*.

Stem 2 in. diam.; branches very stout. *Leaves* 1–2 in.; petiole short, stout. *Peduncles* as long as the leaves, stout; umbels sometimes superposed; pedicels stout, $\frac{1}{4}$ – $\frac{1}{2}$ in. *Perianth* $\frac{1}{2}$ in. diam. *Fruit* not seen.—Probably an African species. It resembles *B. grandiflora*, A. Rich, a good deal.

*** *Flowers in di-tri-chotomous cymes; pedicels very long, capillary.*

6. ***B. elegans***, *Chois. in DC. Prodr.* xiii. 2, 453; shrubby below, branches erect, leaves sessile linear oblong or oblong-lanceolate obtuse or apiculate fleshy pruinose, flowers in a very large excessively di-tri-chotomously branched panicle with very long capillary peduncles and pedicels, fruit $\frac{1}{2}$ in. long narrowly ellipsoid or clavate strongly ribbed perfectly smooth. *Boiss. Fl. Orient.* iv. 1045.

The PANJAB; at Sandal bar, *Edgeworth*. SCINDE, *Stocks*.—DISTRIB. Beluchistan, S. Arabia.

Stock woody, much divided; branches erect, 1–2 ft., glaucous below. *Leaves* few, 1–1 $\frac{1}{2}$ in., curiously mottled with white when dry. *Peduncles* or branches of panicle divaricate; pedicels 1–2 in.; bracts (if present) setaceous. *Flowers* minute. *Fruit* narrowed at both ends, minutely hairy between the ribs.—Schimper's No. 744 from Arabia, which Steudel has named *B. rubicunda*, and which is referred here by Choisy and Boissier, is perhaps a different species, having broader petioled leaves (of the same texture however) and fruit twice as large; it is No. 159 of Fischer's, and No. 98 of Schwenfurth's Arabian collections.—Seeds eaten, *Edgew.*

3. **PISONIA**, Linn.

Trees or shrubs, sometimes spinous. *Leaves* opposite or alternate. *Flowers* in corymbose cymes, not involucrate. *Flowers* usually dioecious, 2–3-bracteolate. *Perianth* 5–10-toothed, of male flower funnel-shaped, of female tubular. *Stamens* 6–10, exserted. *Ovary* sessile, oblique; stigma capitate or feathery. *Fruit* large or small. *Cotyledons* crumpled, enclosing a scanty soft albumen.—Species 60, all tropical, one only African.

1. **P. aculeata**, Linn.; a tall woody climber with axillary recurved prickles, cymes dense-fld., fruit narrowly oblong or clavate 5-ribbed, ribs muricate with several rows of glands. *Chois. in DC. Prodr.* xiii. 1, 440; *Lamk. Ill.* t. 861; *Gaertn. Fruct.* i. t. 76; *Roxb. Fl. Ind.* ii. 217; *Wight Ic.* t. 1763-4; *Grah. Cat. Bomb. Pl.* 167; *Kurz For. Fl.* ii. 279; *Bedd. Sylv. Madr.* 175, t. 22, f. 3. *P. Georgiua*, Wall. *Cat.* 6768. *P. villosa*, Poir. *Diet.* v. 347; *Chois. l. c.* *Tragularia horrida*, Koen. *mss.*

SOUTH CONCAN, and elsewhere in the DECCAN PENINSULA, Heyne, &c. CEYLON, Walker, &c. BURMA, Wallich.—DISTRIB. Tropical Asia, Africa, Australia and America.

Trunk very short; branches subopposite, horizontal. *Leaves* 2-3 in., elliptic, obtuse, entire, base cuneate; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Flowers* in dense axillary and terminal corymbose cymes, greenish-white. *Male flower* $\frac{1}{2}$ in. long, campanulate, pedicelled, 5-toothed. *Stamens* 7-8. *Female flower* ovoid, obscurely toothed; stigma lacerate. *Fruit* long-pedicelled, $\frac{1}{2}$ – $\frac{3}{4}$ in.

2. **P. alba**, *Spanoghe in Linnæa*, 1841, 342; unarmed, arboreous, leaves large, fruit narrow club-shaped 5-angled, angles with one row of prickles. *Kurz For. Fl.* ii. 279; *Wight Ic.* t. 1765; *Miq. Fl. Ind. Bat.* i. 1, 990; *Chois. in DC. Prodr.* xiii. 2, 446. ? *P. inermis*, Forst. *Prodr.* 397. *P. morindæfolia*, Br. in Wall. *Cat.* 7130; *Chois. l. c.* 447. ? *P. malabarica*, Poir. *Encycl. Suppl.* ? *P. mitis*, Linn. *Sp. Pl.* 1511; *Burm. Fl. Ind.* 224 (excl. citation of Rheede).

ANDAMAN ISLANDS; beach forests rare, *Kurz*; cultivated in India and Ceylon.—DISTRIB. Malay Islands.

A tree, 30-40 ft., glabrous except the inflorescence; branches stout. *Leaves* 6-10 in., oblong-ovate or oblong, acute or acuminate; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. *Flowers* in dense corymbose terminal cymes. *Male flower* $\frac{1}{2}$ in. long, tubular-campanulate, pedicelled, 5-toothed; stamens 8. *Female flower* much smaller; stigma penicellate. *Fruit* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, long-pedicelled.—It is very doubtful what name this should bear; it may probably be identified with *P. inermis*, Forst., of the Pacific Islands.

3. **P. excelsa**, *Blume Bijl.* 735; unarmed, arboreous, leaves large petioled opposite alternate or 3-nately whorled, fruit elongate linear truncate 5-angled, angles smooth viscid. *Chois. in DC. Prodr.* xiii. 2, 441; *Hassk. Pl. Jav. Rar.* 227; *Spanoghe in Linnæa*, 1841, 342; *Miquel Fl. Ind. Bat.* i. 1, 990. *P. umbellifera*, Seem. ex *Kurz For. Fl.* ii. 280. *P. macrocarpa*, Presl *Symb.* t. 56.

ANDAMAN ISLANDS; forests along the coast, *Kurz*.—DISTRIB. Malay Islands.

A tree, 30-50 ft., glabrous except the puberulous shoots. *Leaves* $1\frac{1}{2}$ –1 ft. glossy; petiole $\frac{1}{2}$ –1 in. *Flowers* small, cymose or umbellate; peduncles sparingly tomentose or glabrescent. *Perianth* nearly glabrous. *Fruit* $1\frac{1}{2}$ in. or less, glabrous.—*Kurz* has referred this to Seemann's *P. umbellifera*, which Bentham affirms (*Fl. Austral.* v. 281) to be Blume's *P. excelsa*. I have seen only leaf and fruit, the rest of the above description being from *Kurz*.

EXCLUDED SPECIES.—*P. racemosa*, Wall. *Cat.* 7296, is *Petunga longifolia*, DC. (See v. iii. 120).

ORDER CXV. ILLECEBRACEÆ.

Herbs, usually small and tufted. *Leaves* opposite or alternate; stipules scarious. *Flowers* cymose, minute. *Sepals* 4-5, persistent, closing over the fruit. *Petals* minute or 0. *Stamens* hypogynous or perigynous; filaments short; anthers didymous. *Ovary* free, 1-celled; style 2-3-fld, stigmas decurrent; ovule 1, erect or pendulous from a basal funicle. *Utricle* enclosed in the perianth. *Seed* globose lenticular or reniform, testa smooth, albumen floury; embryo straight curved or annular.—Genera 17, species 70, most warm dry regions.

Gymnocarpus fruticosus, Pers., is in the Genera Plantarum (iii. 17) erroneously stated to be a native of Scinde, owing to a misstatement in the Herbarium; it has not been found further east than Beluchistan.

TRIBE I. **Paronychieæ**. *Flowers* clustered, all perfect and similar. *Embryo* annular.

Sepals 5, obtuse. Style 2-fid 1. HERNIARIA.

TRIBE II. **Pteranthææ**. *Flowers* 3-nate, surrounded by squarrose bracts, the centre one of the 3 alone perfect. *Embryo* nearly straight.

Floral leaves pinnatifid 2. COMETES.

1. **HERNIARIA**, Linn.

Tufted prostrate small herbs. *Leaves* opposite or the upper alternate, narrow. *Flowers* minute, in green axillary clusters. *Sepals* 4-5, obtuse, connate below. *Petals* 4-5, minute, setaceous or 0. *Disk* annular. *Stamens* 4-5. *Utricle* indehiscent; style 2-fid; ovule erect. *Seed* subglobose or reniform, testa crustaceous shining; embryo annular.—Species 8 or 10, Europe, N. and S. Africa, W. and Central Asia.

H. hirsuta, Linn.; strigosely hirsute, leaves elliptic- or linear-oblong, sepals 5 not so broad as the rigid hairs are long, stigmas very short subsessile.

WESTERN HIMALAYA; from Kashmir to Kunawur, alt. 4-8000 ft., Royle, &c. The PANJAB, from the Sutlej to Peshawur.—DISTRIB. Westward to the Atlantic and the Canary Islands.

Branches 2-8 in. long, densely tufted, internodes long or short. *Leaves* $\frac{1}{10}$ - $\frac{1}{2}$ in., acute or obtuse, base acute. *Flowers* $\frac{1}{16}$ - $\frac{1}{12}$ in. long. *Capsule* as long as the sepals. —I am quite unable to discriminate between the species of *Herniaria*, or to refer this to any descriptions of Boissier. There is plenty of it under several forms in Griffith's Afghan collections, and these Boissier alludes to under both *H. incana*, Lamk., and *H. cinerea*, DC. (Fl. Orient. i. 739). The *incana* form looks at first sight very distinct, but there appear to me to be many intermediates.

VAR. *incana*; hoary, most densely matted, leaves densely crowded $\frac{1}{10}$ in. long, flowers many in a cluster $\frac{1}{10}$ in. long. *H. incana*, Lamk. Dict. iii. 124; Boiss. Fl. Orient. i. 741. *H. macrocarpa*, Sibth. Fl. Græc. t. 252. *H. Besseri*, Fisch. in Hornem. Suppl. Hort. Bot. Hafn. 127.

2. **COMETES**, Linn.

Annual branched herbs. *Leaves* opposite, mucronate; stipules setaceous. *Flowers* 3 together, surrounded by feathery at length squarrose bracts, centre flower only perfect. *Sepals* 5, erect, linear-oblong, awned behind. *Stamens* 5, subperigynous, alternating and united with 5 membranous staminodes forming a cup below. *Ovary* narrow; style filiform, stigma 3-toothed; ovule erect. *Utricle* obovoid. *Seed* obovoid, erect, testa membranous; embryo large, on one side of a scanty albumen; cotyledons oblong, plano-convex.—Species 2, N. African and Oriental.

C. surattensis, Burm. Fl. Ind. 39, t. 15, f. 5; leaves petioled elliptic acute at both ends, stamens longer than the staminodes. Boiss. Fl. Orient. i. 753; Wall. Pl. As. Rar. i. 17, t. 17; Cat. 810. *C. apiculata*, DCne. in Ann. Sc. Nat. Ser. 2, ii. 244. *Ceratonychia Nidus*, Edgew. in Journ. As. Soc. Beng. xvi. 1215.

SCINDE, *Vicary, Stocks*.—DISTRIB. Beluchistan, Waziristan, and westward to S. Arabia.

Stem woody below; branches 4–10 in., very numerous, stout, erect, terete, dichotomous. *Leaves* $\frac{1}{2}$ –1 in., elliptic, acute at both ends, variable in width; petiole short. *Heads* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., including the feathery rusty appendages which close over the fruit to prevent the escape of the seed, which germinates in the head. *Sepals* with the dorsal awn variable in length. *Stamens* and *staminodes* variable in length.

ORDER CXVI. AMARANTACEÆ.

Herbs, rarely shrubs. *Leaves* opposite or alternate, exstipulate. *Flowers* usually in terminal simple or paniced spikes, cymes or clusters (outer in the cluster sometimes deformed); bracts and 2 bracteoles scarious. *Sepals* 5, rigid or scarious, persistent, imbricate in bud. *Stamens* 1–5, opposite the sepals, filaments free or connate below or united with intervening membranous staminodes into a hypogynous cup; anthers 1- or 2-celled. *Ovary* 1-celled; styles 1–3; ovules 1 or more, basal, panicle capillary. *Fruit* a utricle, rarely a berry or capsule, enclosed in or resting on the persistent perianth. *Seed* erect, orbicular or ovate, compressed, testa crustaceous; embryo horseshoe-shaped or annular, surrounding a mealy albumen.—Genera 48, species 480, tropical and subtropical.

TRIBE I. **Celosieæ**. *Leaves* alternate. *Anthers* 2-celled. *Ovary* 2–∞-ovuled.

Fruit a berry. A shrub 1. DEERINGIA.
Fruit membranous. Herbs 2. CELOSIA.

TRIBE II. **Amaranteæ**. *Anthers* 2-celled. *Ovary* 1-ovuled.

* Ovule erect. *Leaves* alternate.

Sepals spreading under the fruit 3. BOSIA.
Sepals erect, enclosing the fruit.
Flowers paniced, 2-sexual. Utricle indehiscent 4. BANALIA.
Flowers capitate, 2-sexual. Utricle circumsciss 5. ALLMANIA.
Flowers spicate, 2-sexual. Nut crustaceous 6. DIGERA.
Flowers unisexual 7. AMARANTUS.

** Ovule suspended from a basal funicle.

† *Flowers clustered*, 1–3 perfect surrounded by deformed ones. *Leaves* opposite.

Stamens with interposed staminodes 8. CYATHULA.
Stamens without staminodes 9. PUPALIA.

†† *Flowers all perfect*. *Staminodes* 0.

Outer sepals 3-ribbed. Stamens 5. Spikes axillary 10. PSILOTRICHUM.
Outer sepals 3-ribbed. Stamens 5. Spikes paniced 11. PSILOSTACHYS.
Sepals all hyaline. Stamens 1 or 2 12. NOTHERUA.

††† *Flowers all perfect*. *Stamens with interposed staminodes*.

Sepals hyaline, woolly. Staminodes short 13. ERUA.
Sepals scarious, tipped with wool. Staminodes long 14. STILBANTHUS.
Sepals spinescent 15. ACHYRANTHUS.

TRIBE III. **Gomphreneæ**. *Anthers* 1-celled. *Ovary* 1-ovuled; ovule suspended from a basal funicle. *Leaves* opposite.

Staminal tube very short. Stigma subsessile, capitate . . . 16. ALTERNANTHERA.
Staminal tube long. Style long. Stigma 2-fid 17. GOMPHRENA.

1. **DEERINGIA**, Br.

Rambling or climbing shrubs. *Leaves* alternate, petioled. *Flowers* small, in simple or paniced spikes, 1-2-sexual. *Sepals* 5, oblong, spreading in fruit. *Stamens* 4-5; anthers 2-celled; staminodes 0. *Ovary* ovoid or subglobose; stigmas 2-4, subulate; ovules few or many, funicle long. *Fruit* a globose berry or circumsciss utricule, seated on the spreading perianth. *Seeds* few or many; radicle descending.—Species 5-6, Asiatic, Australian and Pacific.

D. celosioides, Br. *Prodr.* 413; leaves ovate or ovate-lanceolate acuminate, racemes long paniced. *Roxb. Fl. Ind.* i. 682, and *Ed. Wall. & Carey*, ii. 511; *Wight Ic.* t. 728; *Wall. Cat.* 6888; *Dalz. & Gibs. Bomb. Fl.* 214; *Bot. Mag.* t. 2717; *Endl. Iconogr.* t. 62. *D. baccata*, Moq. in *DC. Prodr.* xiii. 236. *D. indica*, Retz. in *Blume Bijl.* 542; *Spreng. Syst.* i. 816. *Celosia baccata*, Retz. *Obs.* v. 23. *Cladostachys frutescens*, Don *Prodr.* 76, excl. syn.—*Blitum frutescens*, Rumph. *Herb. Amb.* v. t. 83, f. 2.

SUBTROPICAL HIMALAYA; from Simla to Bhotam, alt. 1-5000 ft. ASSAM, SILHET, KHASIA MTS., alt. 0-4000 ft. CHITTAGONG and LOWER BENGAL; at Pubna, J. D. H. & T. T. BEHAR; Monghir, Hamilton; and Rotas, J. D. H. PEGU, Wallich. The CONCAN, Dalz. & Gibs. (I have seen no specimen).—DISTRIB. Malay Islands, China, Australia.

Blackish or dark green when dry, subscandent, sometimes climbing 18 ft. high; branches long, arching. *Leaves* 2-4 in., base rounded or acute, rarely cordate; petiole $\frac{1}{4}$ -1 in. *Spikes* 4-10 in. *Flowers* greenish-white, $\frac{1}{8}$ in. diam.; pedicels short; bracts acute. *Berry* globose, $\frac{1}{8}$ - $\frac{1}{4}$ in. diam., scarlet.

2. **CELOSIA**, Linn.

Usually annual herbs. *Leaves* alternate. *Flowers* clustered or spicate, white or pink, shining. *Sepals* scarious, striate or ribbed. *Stamens* 5, united below into a cup; anthers 2-celled; staminodes 0. *Utricle* circumsciss, sometimes corky or thickened. *Seeds* erect, testa crustaceous, radicle inferior or ascending.—Species 30, tropical Asiatic, African and American.

* *Spikes very stout; flowers densely imbricate. Utricle acute; style filiform, lengthening after flowering.*

1. **C. argentea**, Linn.; annual, glabrous, erect, leaves linear or lanceolate, spikes long-peduncled cylindric or oblong or ovoid, flowers $\frac{1}{2}$ - $\frac{1}{2}$ in., style filiform. Moq. in *DC. Prodr.* xiii. 2, 242; *Roxb. Fl. Ind.* i. 678, and *Ed. Carey & Wall.* ii. 507; *Grah. Cat. Bomb. Pl.* 167; *Dalz. & Gibs. Bomb. Fl.* 215; *Wight Ic.* t. 1767; *Wall. Cat.* 6916; *Boiss. Fl. Orient.* iv. 987. *C. linearis*, Sweet *Hort. Brit.* 569. *C. margaritacea*, L., *Wall. Cat.* 6917; *Don Prodr.* 76.—*Rheede Hort. Mal.* x. t. 38, 39.

Throughout INDIA and CEYLON in fields, ascending the hills to 4000 ft. (nowhere really indigenous).—DISTRIB. Trop. Asia, Africa, America, cultivated or introduced.

Stem 1–3 ft., stout or slender, simple or branched. *Leaves* 1–6 in., narrow. *Spikes* solitary, few or many, 1–8 by $\frac{1}{4}$ –1 in.; peduncle slender; flowers white, glistening; bracts much shorter than the acute sepals.—The top of the spike sometimes branches out in a cock's-comb form.

2. **C. cristata**, Linn.; annual, glabrous, erect, leaves from linear to ovate acute or acuminate, spikes cylindric, flowers $\frac{1}{4}$ – $\frac{1}{2}$ in., style filiform. *Moq. in DC. Prodr.* xiii. 2, 242; *Roxb. Fl. Ind.* i. 679, and *Ed. Wall. & Carey*, ii. 508; *Wall. Cat.* 6918; *Grah. Cat. Bomb. Pl.* 168; *Dalz. & Gibs. Bomb. Fl.* 215. *C. cernua*, *Roxb. l. c.* 680, and *Ed. Carey & Wall.* 509; *Wall. Cat.* 6919; *Wight Ic.* 730. *C. cristata*, Linn.; *Lamk. Ill.* t. 168; *Wall. Cat.* 6918. *C. coccinea*, Linn.; *Bot. Reg. t.* 1834. *C. comosa*, *Retz. Obs.* vi. 26; *Andr. Bot. Rep. t.* 635. *C. pyramidalis*, *Burm. Fl. Ind.* 65, t. 25.

Throughout INDIA, cultivated and as an escape.—DISTRIB. Tropical Asia, Africa and America.

Usually a tall branching plant, with broad ovate-lanceolate leaves, sometimes 9 in. long and 3 broad, and much smaller flowers than *C. cristata*, but narrow-leaved forms are difficult to distinguish. Roxburgh's *C. cernua* is only a very narrow-leaved strict form; I doubt its being indigenous in the Rajmahal hills, where, as Dr. King informs me, there are traces of very old cultivations.—The sportiveness of this species under cultivation, and its tendency to produce cock's-comb crests and feathery branched yellow pink or rose fasciated ends of the spikes, have resulted in the creation of many spurious species. Its native country, like that of *C. argentea*, of which it is no doubt a form, is unknown. Burmann's *C. pyramidalis* is referred by Moquin to *Chamissoa* (Allmania), but the habit is totally dissimilar to that of an *Allmania*, and quite that of *C. cristata*.

** *Spikes very slender, flowers in distant clusters. Utricle obtuse, top thickened; style short, stigmas 2–3 recurved. Seeds minute reniform.*

3. **C. pulchella**, *Moq. in DC. Prodr.* xiii. 2, 238; glabrous, leaves petioled ovate acute. *Wight Ic.* t. 1768. *C. polygonoides*, *Wall. Cat.* 6913.

NILGIRI HILLS; in moist soil, *Wight*, &c. CEYLON, *Walker*, &c.; in hot drier parts of the island, *Thwaites*.

Slender, 2–3 ft. high, diffusely branched. *Leaves* $1\frac{1}{2}$ –2 in., membranous, base cuneate truncate or subcordate; petiole slender, $1\frac{1}{2}$ in. *Spikes* 4–10 in., very slender; clusters few-fl.; flowers $\frac{1}{10}$ in. long, white. *Sepals* ovate-oblong, acute. *Utricle* flask-shaped, exserted. *Seeds* minute, reniform, black, opaque.

4. **C. polygonoides**, *Retz. Obs.* ii. 12; branches glabrous or hispidulous, leaves petioled rounded-ovate or -cordate obtuse. *Celosia trigyna*, *Willd.*; *Wall. Cat.* 6915.

DECCAN PENINSULA; in sandy soil, Mysore and the Carnatic, &c., *Heyne*, &c. CEYLON; north part of the island, *Gardner*.

Slender, 6–10 in. high; stem woody below, diffusely branched. *Leaves* $\frac{3}{4}$ – $1\frac{1}{2}$ in. long, often as broad, glabrous or very sparsely hairy, rarely cordate, tip rounded or apiculate; petiole as long as the blade. *Spikes* 3–5 in.; clusters few-fl.; flowers $\frac{1}{10}$ in. long, white. *Sepals* ovate-oblong, acute. *Utricle* flask-shaped, with a very thick exserted head.—Very near the tropical African species.

UNDETERMINABLE SPECIES.

C. ALLMANOIDES, *Moq. in DC. Prodr.* xiii. 2, 243, from Ava, *Wallich*, is possibly an *Allmania*.

C. EXSTIPULATA, *Hornem. in Schrank Syllog. Ratisb.* i. 202; *Moq. l. c.* 244.—Nepal.

C. PATULA, Willd. in *Act. Berol.* vi. 198; *Moq. l. c.* (*C. glauca*, Rottl. & Willd. in *Nov. Act. Nat. Cur.* iv. 1803).—Mountains of Madras.

C. SANGUINEA, Hoffmann *Verz.* ii. 85; *Moq. l. c.*—East Indies.

3. **BOSIA**, Linn. (BOSEA.)

Erect, stout, glabrous, nauseous shrubs. *Leaves* alternate, persistent. *Flowers* small, 2-4-bracteolate, green, spicate or racemose, often polygamous. *Sepals* 5, herbaceous, rounded, concave. *Stamens* 5, inserted on a hypogynous 10-lobed disk; anthers 2-celled. *Ovary* ovoid; stigmas 2-3, sessile, recurved; ovule erect, funicle short. *Berry* globose. *Seed* subglobose, testa crustaceous, albumen fleshy; embryo annular, cotyledons broad.—Species 3, Canaries, Mediterranean, N.W. India.

Bosea trinervia, Roxb. *Fl. Ind.* ii. 87, is no doubt, as Dr. King informs me, *Celtis Wightii*, Planch.

B. Amherstiana, Hook. f.; leaves ovate acute or acuminate, flowers spicate, bracteoles 2-4. *Rodetia Amherstiana*, *Moq. in DC. Prodr.* xiii. 2, 323; *Gamble Man. Ind. Timb.* 302; *Deeringia Amherstiana*, Wall. *Cat.* 6889.

WESTERN TEMPERATE HIMALAYA, alt. 4-7000 ft.; from Kumaon, *Amherst, Govan*, to Kashmir, *Thomson*.

Quite glabrous. *Leaves* 3-7 by 1-4 in.; base acute or rounded; blade narrowed into a petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Spikes* shorter than the leaves. *Flowers* $\frac{1}{2}$ in. diam.; bracts and bracteoles rounded, closely imbricated, green with white margins. *Berries* $\frac{1}{2}$ in. diam.—*Rodetia* differs from the original *Bosia Yerva-Mora* only in the pedicelled flowers and fewer bracts and dioecious flowers, but the flowers are really only polygamous, and the *Bosia cyprica* of Boissier (from Cyprus) has sessile flowers and bracts imbricating as in *Rodetia*.

4. **BANALIA**, Moq.

An erect, glabrous, branching herb. *Leaves* alternate, membranous. *Flowers* in axillary and terminal paniced spikes. *Sepals* 5, membranous, linear-oblong, acute, 3-nerved. *Stamens* 5, united below into a cup, anthers 2-celled. *Ovary* ovoid, compressed; style erect, stigmas 2 linear; ovule erect. *Utricle* subglobose, indehiscent. *Seed* orbicular, testa black crustaceous; embryo annular.

B. thyrsiflora, *Moq. in DC. Prodr.* xiii. 2, 278; *Wight Ic.* t. 1774. *Celosia thyrsiflora*, and *C. missionis*, Wall. *Cat.* 6914, 6915 A. B. *Achyranthes thyrsiflora* & *polygonata*, *Herb. Heyne*.

NILGHIRI MTS., alt. 4-7000 ft.; *Heyne*, &c.

A tall very slender herb, branches angular. *Leaves* 3-4 in., ovate or ovate-lanceolate, acuminate. *Flowers* in large thyrsoid white panicles, sessile, $\frac{1}{2}$ in. long.

5. **ALLMANIA**, Br.

Herbs. *Leaves* alternate, narrow. *Flowers* in axillary and terminal globose or ovoid heads. *Sepals* 5, scarious, acuminate, striate. *Stamens* 5, united below into a cup; anthers 2-celled; staminodes 0. *Ovary* ovoid; style slender, stigma capitate; ovule 1, erect. *Utricle* circumsciss. *Seed* erect, aril cupular, testa crustaceous; embryo annular, cotyledons linear flat.—Species 2 or 3, tropical Asiatic.

1. **A. nodiflora**, Br. in Wall. *Cat.* 6890, excl. B; annual, diffusely

dichotomously branched, leaves short or long from linear or oblong to spatulate and orbicular, heads sessile axillary and terminal globose.

SIKKIM TERAI, *Clarke*. MYSORE and the CARNATIC, MALACCA, SINGAPORE and CEYLON.—DISTRIB. China, Malay Islands.

Rootstock sometimes woody; branches rigid or flaccid, 6–12 in., glabrous or hispidly hairy. *Leaves* excessively variable, membranous or rigid. *Heads* $\frac{1}{4}$ –1 in. diam. white or brown. *Seeds* turgidly lenticular, opaque or shining.—The following forms are certainly varieties of no great constancy.

VAR. *angustifolia*; glabrous, rarely with a few scattered hairs, often tall, leaves 1–3 in. oblong or linear-oblong or elongate obovate-oblong obtuse or acute, heads usually large. A. nodiflora, *Wall. Cat.* 6980 A. C. E. in part. *Chamissoa angustifolia*, *Herb. Ham.* C. javanica, *Hassk. Pl. Jar. Rar.* 434.—Mysore, Ceylon, widely diffused. Java, Sumatra.—A tall slender unbranched form of this occurs, apparently drawn up amongst grass, &c.

VAR. *dichotoma*; glabrous or nearly so, leaves shortly petioled $\frac{3}{4}$ –1½ in. elliptic acute, heads $\frac{1}{4}$ –½ in. A. nodiflora, *Wall. Cat.* 6890 E. in part. A. dichotoma, *Wight Ic. t.* 1771. *Celosia dichotoma*, *Heyne in Roth Nov. Sp.* 172.—Courtallum, *Wight*.

VAR. *Roxburghii*; glabrous or pubescent, leaves 1–2 in. spatulate or orbicular-spatulate often apiculate. A. nodiflora, *Wight in Hook. Journ. Bot. i.* (1834). 226, t. 128; *Wall. Cat.* 6890 E. in part. *Achyranthes nodiflora*, *Roxb. Fl. Ind. i.* 678. *Celosia nodiflora*, *Linn. Sp. Pl.* 205; *Roth Nov. Sp.* 17; *Burm. Fl. Zeyl.* 16, t. 5, f. 2.—Mysore, the Carnatic and Ceylon.

VAR. *aspera*; hispidly hairy, other characters of Var. *angustifolia*. A. aspera, *Wight Ic. t.* 1770. *Celosia aspera*, *Roth Nov. Sp.* 173; *Moq. l. c.* 241. *Chamissoa dichotoma*, *Moq. l. c.* 249.—Corn-fields, Coimbatore and Mysore.

VAR. *procumbens*; diffuse, branches prostrate often several feet long from a slender or stout (perennial?) woody branched stock, glabrous or scabrid, leaves small $\frac{1}{2}$ –¾ in. spatulate or linear mucronate, heads small $\frac{1}{4}$ –½ in. *Wall. Cat.* 6980 E. in part. A. procumbens, *Wight mss.* A. nodiflora, *Wight Ic. t.* 1770.—Sands and Red Hill at Madras.—DISTRIB. Java.

VAR. *esculenta*; flaccid, glabrous, leaves 1–2 in. very narrow linear, heads usually small sometimes pedicelled. A. esculenta, *Br. in Wall. Cat.* 6892; *Moq. l. c.* 249. *Chamissoa Brownii*, *Steudel Nomencl. Ecl. i.* 344.—Malacca and Singapore.

2. **A. albida**, *Br. in Wall. Cat.* 6981; annual, erect or suberect, leaves short or long from linear to spatulate or obovate, heads ovoid or oblong rarely globose peduncled. *Chamissoa albida*, *Mart. Beitr. Amarant.* 79; *Wight Ic. t.* 1769. C. pyramidalis, *Moq. l. c.* *Celosia pyramidalis*, *Burm. Fl. Ind.* 65, t. 25. C. albida, *Willd. Sp. Pl. i.* 1197. C. nodiflora, *Wall. Cat.* 6890 B.

The CARNATIC; in sandy soil near the coast, *Wight*, &c. CEYLON, common.—Java, Philippines.

Usually tall, erect, 1–2 ft. high, with erect branches, and foliage simulating many of the forms of A. nodiflora, of which Thwaites regards it as a form, but I can scarcely agree with him.

6. DIGERA, *Forsk.*

An annual herb. *Leaves* alternate. *Flowers* spicate, 3-nate, the 2 outer reduced to crested scales. *Sepals* 4–5, oblong, outer larger 5–9-nerved, inner 2–4-nerved. *Stamens* 5, free; anthers 2-celled; staminodes 0. *Ovary* oblong, truncate; style filiform, stigmas 2 recurved; ovule 1, erect. *Nut* subglobose, compressed, rugulose. *Seed* globose, erect, testa thin crustaceous, adhering to the albumen; embryo annular, cotyledons linear.

D. arvensis, *Forsk. Fl. Æg. Arab.* 65; *Moq. in DC. Prodr.* vol. 2.

324; *Griff. Notul.* iv. 343, and *Ic. Pl. Asiat.* t. 527; *Dalz. & Gibs. Bomb. Fl.* 218, f. 2. *D. muricata* & *ciliata*, *Mart. Beitr. Amaranth.* 77; *Wall. Cat.* 6886, 6887. *D. ciliata*, *Mog. l. c.* *D. Forskalii*, *Blume Bijl.* 542. *D. alternifolia*, *Aschers. in Schweinf. Beitr.* 180; *Boiss. Fl. Orient.* iv. 994. *Desmochete alternifolia*, *DC. Cat. Hort. Monsp.* (1813), 103. *D. muricata*, *Wight Ic. t.* 732. *D. ciliata*, *Roem. & Sch. Syst.* v. 553; *Mart. l. c.* 113; *Wall. Cat.* 6887. *Achyranthes polygonoides Retz. Obs.* ii. 12 (not of *Heyne*). *A. Digera*, *Poir. Dict. Suppl.* i. 2, 11. *A. alternifolia*, *Linn. Mant.* 50, 341; *Roeb. Fl. Ind.* i. 674, and *Ed. Carey & Wall.* ii. 500. *A. muricata*, β , *Willd. Sp. Pl.* i. 1193. *Chamissoa arabica*, *ciliata*, *commutata* & *muricata*, *Spreng. Syst.* i. 815. *Cladostachys alternifolia*, *Sweet Hort. Brit. Ed.* 3, 570. *C. muricata*, *Mog. l. c.* 235.

BENGAL and N.W. INDIA in the plains to Peshawur and the Salt range. *PEGU, Wallich.* SOUTH DECCAN; the Concan, Mysore, and the Carnatic, *Heyne, &c.* CEYLON, N. part of the island.—*DISTRIB.* Java, Afghanistan and Beluchistan to Arabia and N. Africa.

A glabrous or ciliate slender annual, 1–2 ft. high, becoming perennial, with spreading branches, prostrate below. *Leaves* very variable, membranous, $\frac{1}{2}$ –3 in., ovate and acute or elliptic or rounded, base rounded or cuneate; petiole $\frac{1}{2}$ –2 in., slender. *Spikes* 1–3 in., slender, axillary, long or short peduncled; bracts subulate, persistent; flowers $\frac{1}{4}$ in. in distant clusters, greenish. *Seeds* pale.

7. AMARANTUS, Linn.

Annuals. *Leaves* alternate. *Flowers* unisexual, small, in axillary clusters, or in panicle erect or drooping densely or laxly spiked clusters. *Sepals* 5 or 1–3, ovate oblong linear lanceolate or aristate. *Stamens* 1–5, free; anthers 2-celled; staminodes 0. *Ovary* compressed; style short or 0, stigmas 2–3 filiform or subulate; ovule 1, erect. *Utricle* compressed, indehiscent or circumsciss, tip entire or 2–3-toothed. *Seed* orbicular, compressed, testa crustaceous; embryo annular, cotyledons linear.—Species undetermined, tropical and subtropical, a large proportion known only in cultivation.

* *Bracts* setaceous or awned, exceeding the 5 sepals. *Stamens* 5. *Utricle* circumsciss, top 2–3-fid.

1. **A. spinosus**, Linn.; erect, glabrous, stem terete, leaf-axils with 5 spines, leaves long-petioled ovate or oblong obtuse, flowers in axillary clusters and long dense- or lax-fid. spikes, bracts setaceous equalling or exceeding the sepals, stamens 5, utricle rugose nearly equalling the sepals. *Mog. in DC. Prodr.* xii. 2, 260; *Willd. Amarant. t.* 4, f. 8; *Roeb. Fl. Ind.* iii. 611; *Grah. Cat. Bomb. Pl.* 169; *Dalz. & Gibs. Bomb. Fl.* 216; *Wight Ic. t.* 513; *Wall. Cat.* 6894.

Throughout INDIA and CEYLON, in waste places, fields and gardens.—*DISTRIB.* Various tropical countries.

Stem 1–2 ft., hard; spines straight, $\frac{3}{4}$ in. and under. *Leaves* $1\frac{1}{2}$ –4 by $\frac{3}{4}$ –2 in., base cuneate; petiole slender, equalling the blade or shorter. *Flowers* $\frac{1}{4}$ in. long. *Sepals* of male acuminate, of female obtuse apiculate. *Stigmas* 2. *Utricle* with a thickened top. *Seeds* $\frac{1}{30}$ in. diam., black, shining, border obtuse not thickened.—The plant varies in colour from green to red and purple.

2. **A. paniculatus**, Linn. *Sp. Pl. Ed.* 2, 1406; tall, robust, stem striate, leaves long-petioled elliptic- or ovate-lanceolate acute or finely acuminate, spikes in dense thyrses squarrose from the long recurved bracts, centre one

longest, bracts acicular recurved very much longer than the oblong-lanceolate acuminate sepals. *Moq. in DC. Prodr.* xiii. 2, 257; *Willd. Amarant.* 32, t. 2, f. 4; *Wall. Cat.* 6904, excl. F; *Dalz. & Gibs. Bomb. Fl.* 215. *A. speciosus*, *Sims Bot. Mag.* t. 2227; *Don Prodr.* 75. *A. sanguineus* *Linn.*; *Willd. l. c. t.* 2, f. 3; *Mill. Icon.* t. 22. *A. strictus*, *Willd. l. c. t.* 1, f. 5. *A. frumentaceus*, *Ham. in Roxb. Fl. Ind.* iii. 610; *Moq. l. c.* 265; *Wight Ic.* t. 720. *A. farinaceus*, *Herb. Roxb.* *A. Anacardana*, *Ham. in Wall. Cat.* 6903; *Moq. l. c.* 256. *A. flavus*, var. δ . *bracteatus*, *Linn.*; *Moq. l. c.* 258.

Cultivated throughout INDIA and CEYLON, and up to 9000 ft. in the HIMALAYA.—DISTRIB. Cultivated or an escape in E. and W. Asia, and Africa.

Stem 4–5 ft., sometimes thicker than the thumb, glabrous or puberulous. *Leaves* 2–6 by 1–3 in., base cuneate; petiole as long. *Spikes* suberect, red, green or yellow. *Seeds* $\frac{1}{10}$ in. diam., either yellowish-white or pitchy black with a thickened rounded border, or pitchy with a narrow thin border.—I follow Moquin, Wallich, &c., in referring this to *paniculatus* of Linnæus with some doubt, and I am still more perplexed about the synonyms I have cited, some of which may belong to the following species. Boissier says of *A. paniculatus* that it is an introduction from America, whereas this has been cultivated in India from time immemorial. Like the following, of which it may be a form, the seeds vary extraordinarily in size, form and colour.

3. ***A. caudatus***, *Linn. Sp. Pl.* 990; tall, robust, stem striate, leaves long-petioled elliptic- or ovate-lanceolate, tip obtuse, spikes in dense soft thyrses hardly squarrose, centre one and often the lateral usually very long and pendulous, bracts acicular longer than the obovate mucronate sepals. *Moq. in DC. Prodr.* xiii. 2, 255; *Wall. Cat.* 6907; *Boiss. Fl. Orient.* iv. 988. *A. paniculatus*, *Wall. Cat.* 6904 F. *A. cruentus*, *Willd., Roxb. l. c.* 610. *A. caudatus* and *A. Alopecurus*, *Hochst.*; *Bouché & Braun in Append. Obs. Bot. ad Ind. Sem. Hort. Berol.* 1872, 1.

Cultivated in various parts of INDIA.—DISTRIB. Various hot countries, wild or cultivated.

I find it very difficult to distinguish some states of this from *A. paniculatus*. In its typical state it is a smaller plant with the leaves obtuse at the tip, more globose softer masses of smaller red green or white flowers on the thyrse, the terminal spike of which is very long, thick and drooping; the acicular bracts are shorter and not squarrose, the sepals shorter, broader, more obtuse and usually obovate-oblong, and the utricle and seeds are smaller; the latter present the same variations as in *A. paniculatus*. Bouché and Braun, from an examination of Abyssinian specimens cultivated at Berlin, point out the remarkable distinction between the two forms of seeds that this and the foregoing species produce, one white or yellow with a very thick rounded border (the true *caudatus* of old authors); the other lenticular and pitch-black with a compressed border (*A. alopecurus*, *Hochst.*). The plants which bear them, however, present no other differences, and I have seen the black seed with the thick border.

*** Bracts subulate, equalling or exceeding the 3 lanceolate sepals and utricle. Stamens 3. Utricle circumsciss.*

4. ***A. gangeticus***, *Linn.*; *Moq. in DC. Prodr.* xiii. 2, 261; erect, glabrous, leaves long-petioled ovate oblong or lanceolate obtuse or emarginate, clusters crowded in the lower axils and forming a long terminal spike, bracts awned, sepals long-awned much longer than the utricle. *Willd. Amarant.* t. 6, f. 11; *Roxb. Fl. Ind.* iii. 606; *Wall. Cat.* 6896, excl. C. *A. tricolor*, *Linn. Sp. Pl.* 989; *Roxb. l. c.* 608, and *Wall. Cat.* 6902. *A. lanceolatus*, *Roxb. l. c.* 607; *Wall. Cat.* 6895. *A. tristis*, *Linn. Sp. Pl.* 989?; *Roxb. l. c.* 604; *Wall. Cat.* 6905, A. C; *Grah. Cat. Bomb. Pl.* 169; *Wight Ic.* t. 713; *Dalz. & Gibs. Bomb. Fl.* 215. *A. oleraceus*, *Roxb. l. c.* 605; *Grah. l. c.*; *Wight Ic.* t. 715, and *Thwaites Enum.* 247, not of Linnæus.

A. polygamus, *Roxb. l. c.*; *Wall. Cat.* 6899, *excl. D.* and *Wight Ic.* 714, *not of Linn.* *A. lividus*, *Roxb. l. c.*; *Wall. Cat.* 6896 C. *A. amboinicus*, *Herb. Ham. in Wall. Cat.* 6897. *A. inamœnus*, *Willd. Amarant. t.* 7, f. 14. *A. melancholicus*, *Linn. Sp. Pl.* 989; *Roxb. l. c.* 608.

Throughout INDIA and CEYLON, cultivated and in cultivated ground.—DISTRIB. Tropical Asia, Africa, and America.

An erect, stout, handsome species, 2–3 ft., leafy, green, pink, rufous, liver-coloured or bright red. *Leaves* 2–5 in., very variable, from linear-lanceolate to rounded oval and 3 in. diam., or deltoid ovate; tip rounded or long and slender but always obtuse and often notched, base elongate cuneate; petiole equalling the blade. *Clusters* squarrose, bracts $\frac{1}{6}$ in. long. *Seeds* lenticular, pitch-black, $\frac{1}{30}$ in. diam.; border acute.—This is Roxburgh's *A. tristis*, and possibly that of Linnæus, but the latter describes the leaves as ovate-cordate, which these are not. Roxburgh says that his *gangeticus* and *oleraceus* differ from his *polygamus* and *tristis* and their varieties in not admitting of being cut for successive crops, but being hence unrooted for market. I have not cited Boissier, who says his *A. gangeticus* is always pentamerous. Of *A. melancholicus* Roxburgh says that it differs from *tricolor* in being 6–12 ft. high, ramous, pyramidal, with more remote broader rarely more than 2-coloured (dull livid purple and bright crimson) leaves, whereas *tricolor* in the same soil is 3–4 ft. with simple erect stem, many numerous variegated leaves, and long axillary clusters of flowers. *A. inamœnus*, *Wall. Cat.* 6905 C, is a curious small state, 6 in. high, erect, strict, with rhomboid leaves and long spikes; it is the *A. tristis*, *Herb. Rottler and Heyne*.

5. ***A. mangostanus***, *Linn. Amœn. Acad.* iv. 294; branches diffuse, leaves small long-petioled ovate elliptic or deltoid-ovate obtuse emarginate, clusters green all axillary, bracts awned, sepals lanceolate awned longer than the utricle. *Moq. in DC. Prodr.* xiii. 2, 261; *Willd. Amarant. t.* 12, f. 23. *A. polygamus*, *Thwaites Enum.* 247. *A. tristis*, *Wall. Cat.* 6905 B.

Throughout INDIA and CEYLON in cultivated ground.

This, as Thwaites observes, is extremely near and perhaps a form of *A. gangeticus*, of smaller size and procumbent habit; he refers it to Roxburgh's *A. polygamus*, but I think that the want of a terminal spike is against this. A specimen from Roxburgh, marked *A. mangostanus*, precisely accords with Willdenow's figure. To me it looks like a starved or stunted form of *gangeticus*; the perianth and seeds are the same in both. It is *A. mucronatus*, *Hort. Petrop.*

6. ***A. Caturus***, *Heyne in Wall. Cat.* 6900; tall, glabrous, leaves long-petioled elliptic-lanceolate acuminate thin, nerves very slender, clusters small globose soft green in very long and very slender axillary simple and terminal paniced spikes, the upper confluent, bracts equalling or longer than the lanceolate aristate sepals, ovary elongate.

DECCAN PENINSULA, *Heyne*.

Stem 2–3 ft., very slender. *Leaves* 6 by 2 in., decurrent on the equally long slender petiole, tip apiculate. *Spikes* 6–10 in. long. *Clusters* $\frac{1}{4}$ – $\frac{1}{2}$ in. diam., the lower axillary; the lowest on the rachis remote. *Flowers* $\frac{1}{2}$ in. long; sepals transparent with a green rib and short awn. *Stamens* 3, anthers linear. *Young utricle* with a rather longer neck and 3 slender styles.—I know of no species at all like this; none has such slender spikes.

*** *Bracts usually shorter than the 2 or 3 sepals and utricle. Stamens 2 or 3. Utricle indehiscent or circumsciss.*

7. ***A. viridis***, *Linn. Sp. Pl.* 1405; erect, glabrous, leaves long-petioled ovate, tip rounded or notched, base truncate or cuneate, clusters very small green in axillary and terminal paniced slender spikes, sepals 3, utricle rugose acute indehiscent. *Roxb. Fl. Ind.* iii. 605; *Grah. Cat. Bomb. Pl.* 169. *A. polystachyus*, *Ham. in Wall. Cat.* 6901. *A. fasciatus*, *Roxb. l. c.* 609;

Wight Ic. t. 717 (bad); *Euxolus caudatus*, *Moq. in DC. Prodr. xiii. 2, 274*; *Wight Ic. t. 1773*. *Albersia caudata*, *Boiss. Fl. Orient. iv. 992*. *Chenopodium caudatum*, *Jacq. Ic. Rar. t. 344*.

Throughout INDIA, in waste places.—DISTRIB. All tropical and warm countries.

Stem 1–2 ft., rarely decumbent below. *Leaves* 1–2 in., variable in breadth; petiole equalling the blade or shorter. *Clusters* lax, on slender branches; flowers $\frac{1}{2}$ in. long; bracts and sepals ovate-oblong, acute, membranous with a green keel. *Styles* 2–3. *Seed* $\frac{3}{16}$ in diam., pitchy black, border obtuse.—This is the *A. viridis* of *Herb. Linn.* *A. fasciatus*, *Roxb.*, is a sport with a pale crescentic band across the leaf.—Eaten, but not cultivated (*Roxb.*).

8. **A. Blitum**, *Linn. Sp. Pl. 990*; annual, erect or decumbent, glabrous, leaves long-petioled oblong-ovate or rounded obtuse retuse or 2-lobed, base acute, clusters all axillary or the upper in a dense or lax spike, sepals 3 shorter than the utricle linear-oblong or -lanceolate obtuse and apiculate or acute, utricle orbicular or broadly ovate membranous dehiscent or not.

Waste places throughout INDIA and CEYLON.—DISTRIB. temperate and tropical regions.

I find it impossible satisfactorily to discriminate the Indian forms of this variable weed from one another, and from *A. polygamus*; I recognize the following varieties as more or less constant.

A. Blitum, *Linn. Herb.*; procumbent, leaves small 2-lobed, sepals oblong obtuse apiculate, clusters small all axillary, utricle indehiscent (*A. Blitum*, *Herb. Fries e Scania*). *A. tristis*, *Wall. Cat. 6905 D.*—A weed, not cultivated.

VAR. A. oleraceus, *Linn. Sp. Pl. 1403*; tall, succulent, usually erect, leaves ovate oblong or rounded, top rounded or 2-lobed, clusters axillary and in terminal simple or lobed spikes, sepals linear-oblong obtuse or acute, utricle indehiscent. *Willd. Amarant. t. 5, f. 9*. *A. adscendens*, *Reichb. Ic. Crit. v. t. 472 (by error spicatus)*. *A. gangeticus*, *Wall. Cat. 6896 C.* *A. polygamus*, *Wall. Cat. 6899 D.* *Euxolus oleraceus*, *lividus & viridis*, *Moq. in DC. Prodr. xiii. 273*. *E. oleraceus*, *Dalz. & Gibs. Bomb. Fl. 216*. *Albersia oleracea & livida*, *Kunth Fl. Berol. ii. 144*. *Pxydium oleraceum*, *lividum & viride*, *Moench Meth. 359*.—Cultivated in India and elsewhere.—I find this in the Kew Herbarium as *A. Blitum*, Japan (*Maximov.*); Geneva (*Herb. Boiss.*); *A. lividus*, *Hort. Petrop.*; *A. adscendens*, *Hort. Petrop. and Herb. Requien*; *A. Blitum*, *var. adscendens*, *Herb. Gay*; and *A. miniatus*, *Hort. Avignon and Monsp.*

VAR. A. sylvestris, *Desf. Cat. Hort. Par. 41*; erect, simple or branched, leaves oblong or obovate-oblong obtuse, clusters all axillary sessile, sepals linear keeled mucronate, utricle rugose or smooth circumscrib. *Boiss. Fl. Orient. iv. 990*. *A. Blitum*, *var. sylvestris*, *Moq. l. c. 263*.—Kashmir, alt. 4–6000 ft., *Thomson* (*Europ. Asiatic*).

9. **A. polygamus**, *Linn. Amœn. Acad. iv. 294 (not of Roxb.)*; stem prostrate or ascending, leaves small obovate oblong or ovate obtuse rarely retuse or 2-lobed, often rigid and apiculate, clusters all axillary, sepals 3 as long as the utricle or shorter subulate acuminate, utricle ovoid rugose dehiscent or not. *Thwaites Enum. 247*. *A. polygonoides*, *Roxb. Fl. Ind. iii. 602*; *Wight Ic. t. 512, 719*; *Wall. Cat. 6906*. *A. Blitum*, *var. polygonoides*, *Moq. in DC. Prodr. xiii. 2, 263*. *A. tenuifolius*, *Wall. Cat. 6893 E.* *Amblogyna polygonoides*, *Dalz. & Gibs. Bomb. Fl. 219*. *Albersia polygama*, *Boiss. Fl. Orient. iv. 991*. *Euxolus polygamus*, *Moq. in DC. Prodr. l. c. 272*; *Thwaites Enum. 248*, *excl. syn. Amblogyne*.

Throughout INDIA and CEYLON, abundant.—DISTRIB. All hot countries.

I believe that this can only be ranked as a form of *A. Blitum* (the Linnean form), with small usually obovate apiculate leaves, fewer flowers in a cluster, often larger more subulate sepals and smaller more acute utricles.

VAR. angustifolia; stems and branches angled grooved rigid erect or ascending, leaves linear or linear-oblong more rigid.—The Panjab, *Thomson*. Mooltan, *Edge*.

worth. The Carnatic *Perrottet*.—This is almost identical with *A. græcizans*, Linn. (*A. Blitum*, var. *græcizans*, Moq. ; *A. sylvestris*, var. *græcizans*, Boiss.).

10. **A. tenuifolius**, Willd. *Sp. Pl.* iv. 381 ; glabrous, branches many spreading from the root prostrate or ascending, leaves small petioled linear-oblong or widened to the rounded obtuse or 2-lobed tip, clusters minute all axillary, sepals 2 oblong concave nearly as long as the orbicular compressed membranous indehiscent utricle. *Roxb. Fl. Ind.* iii. 602 ; *Wight Ic.* t. 718 ; *Wall. Cat.* 6893, excl. *E.* *A. angustifolius*, *Roxb. mss.* *Mengea tenuifolia*, Moq. in *DC. Prodr.* xiii. 2, 271 ; *Dalz. & Gibs. Bomb. Fl.* 218.

BENGAL, the GANGETIC VALLEY and PANJAB.—DISTRIB. Tropical Africa.

Branches slender, 6–18 in., leafy. Leaves very variable, $\frac{1}{2}$ –1 in. long, narrowed into the petiole. Clusters smaller than in any other species, green. Stamens 2. Utricle plicate when dry. Seed $\frac{1}{15}$ in. diam., brown, lenticular, border obtuse.

DOUBTFUL SPECIES.

A. ATROPURPUREUS, *Roxb. Fl. Ind.* 688, is a garden plant, possibly a form of *A. oleraceus*.

A. CAMPESTRIS, Willd. *Sp. Pl.* iv. 382 ; Moq. in *DC. Prodr.* xiii. 2, 264, is undeterminable.

A. RUBRICAULIS, *Page Hort. Angl.* (fid. Moq. l. c. 267) name only, is indeterminate.

8. **CYATHULA**, Lour.

Herbs or undershrubs. Leaves opposite. Flowers clustered, clusters solitary spicate and reflexed in fruit, or in dense globose solitary or spicate heads ; perfect flowers 1–2 in each cluster, surrounded by imperfect ones reduced to sepals with rigid hooked awns. Sepals 5, scarious, 1-nerved, acuminate or with hooked rigid awns. Stamens 5, connate, united below with the linear lacerate or 2-fid staminodes into a cup ; anthers 2-celled. Ovary obovoid ; style filiform stigma capitellate ; ovule 1, pendulous from a long basal funicle. Utricle ovoid, indehiscent, top areolate. Seed inverse, oblong, testa coriaceous ; embryo annular, cotyledons linear flat.—Species 10, tropical Asia, Africa and America.

* Clusters of flowers in large globose heads.

1. **C. tomentosa**, Moq. in *DC. Prodr.* xiii. 2, 327 ; densely tomentose or woolly, leaves short-petioled elliptic acute or acuminate, base acute, heads globose spicate. *C. Sequax*, Moq. mss. *Achyranthes tomentosa*, *Roth Nov. Sp.* 167 ; *Wight Ic.* t. 1781. *A. Sequax*, *Wall. in Roxb. Fl. Ind.*, *Ed. Carey & Wall.* ii. 506. *Desmocharta tomentosa*, *Roem. & Sch. Syst. v.* 554. *Polyscelis Sequax*, *Wall. Cat.* 6939.

TEMPERATE HIMALAYA ; from Dalhousie to Bhotan, alt. 2–6500 ft., *Wallich*, &c. KHASIA MTS., alt. 2–5000 ft.

A straggling undershrub, variable in density of tomentum ; branches strict, obtusely 4-angled. Leaves 2–10 in., rarely orbicular or elliptic-lanceolate, pubescent or glabrate above, often velvety or subsilky beneath ; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. Spikes 2–6 in. long peduncled ; heads close or distant, 1–1 $\frac{1}{2}$ in. diam., white, glistening ; bracts ovate below, back hairy. Sepals $\frac{1}{4}$ – $\frac{1}{2}$ in., linear-lanceolate, 2 or all ending in hooked awns, lengthening in age. Staminodes fimbriate. Anthers linear. “Utricle 2-nerved ; seed ovate shining,” *Wallich*.—I find no seed in any of the numerous specimens.

2. **C. capitata**, Moq. in *DC. Prodr.* xiii. 2, 329 ; sparsely hairy, leaves short-petioled elliptic subcaudate-acuminate, base acute, heads globose sub-

solitary peduncled bracteate or not. *Wight Ic. t.* 1782. *Polyscelis capitata*, *Wall. Cat.* 6940.

TEMPERATE HIMALAYA; from Dalhousie to Sikkim, alt. 6-9000 ft.

More herbaceous and slender than *C. tomentosa*. *Leaves* 2-5 in., membranous; petiole $\frac{1}{4}$ -1 in. *Heads* 1-1 $\frac{1}{4}$ in diam., white, glistening; flowers as in *C. tomentosa*.

3. ***C. ceylanica***, *Hook. f.*; erect, tomentose, leaves subsessile elliptic subacute, heads globose solitary. *C. capitata*, *Thwaites Enum.* 249.

CEYLON; near Kandy, *Thwaites*.

Branches slender, terete. *Leaves* 1 $\frac{1}{2}$ -2 in., pubescent above, tomentose beneath. *Heads* 1 in. diam. *Sepals* villous.—The specimens are very indifferent. The leaves resemble those of the African *C. globulifera*, *Moq.*, but the branches are more slender and the leaves almost sessile.

** *Clusters of flowers small, solitary, spicate, reflexed.*

4. ***C. prostrata***, *Blume Bijl.* 549; annual, stem creeping below, branches erect or ascending, leaves subsessile elliptic rhomboid-oblong or subpanduriform obtuse, spikes very slender terminal peduncled. *Moq. in DC. Prodr.* xiii. 2, 326; *Dalz. & Gibs. Bomb. Fl.* 219. *C. repens*, *Moq. l. c.* 330. *Achyranthes prostrata*, *Linn.*; *Roxb. Fl. Ind. i.* 674, and *Ed. Carey & Wall.*, ii. 501; *Grah. Cat. Bomb. Pl.* 168. *A. repens*, *Heyne in Roth Nov. Sp.* 167. *A. debilis*, *Poir. Dict. Suppl. i.* 2, 10. *Desmochæta prostrata* & *micrantha*, *DC. Cat. Hort. Monsp.* 1813, 102. *D. prostrata*, *Wight Ic. t.* 733. *D. patula*? *Wall. Cat.* 6937. *D. repens*, *Roem. & Sch. Syst. v.* 552; *Wall. Cat.* 6938. *Pupalia prostrata*, *Mart. Beitr. Amarant.* 113.—*Rheede Hort. Mal. x. t.* 79.

BENGAL, SIKKIM, KHASIA MTS., CHITTAGONG to MALACCA, the DECCAN PENINSULA, BURMA, and CEYLON.—DISTRIB. Tropical Asia, Africa, Australasia, Oceania, and America.

Very slender, 1-2 ft. high, glabrous or scaberulous. *Leaves* 1-2 in., base narrowed often suddenly from below the middle. *Spikes* 4-6 in., rarely paniculately branched. *Clusters of flowers* $\frac{1}{2}$ in. long, ovoid, blueish. *Sepals* oblong, pubescent, outer (of imperfect flowers) as long as the perfect. *Staminodes* 2-fid or retuse. *Seeds* ovoid-oblong.—*Roxburgh* believes this to have been introduced into Bengal from the Moluccas.

9. **PUPALIA**, *Juss.*

Herbs or undershrubs. *Leaves* opposite. *Flowers* in spicate clusters, perfect and imperfect; the imperfect reduced to awns bearing stellately spreading hooked bristles. *Sepals* 5, herbaceous, acuminate, 3-5-nerved. *S. mens* 5, nearly free below; anthers 2-celled; staminodes 0. *Ovary* ovoid; style slender, stigma capitellate; ovule 1, pendulous from a long basal funicle. *Utricle* ovoid, compressed, indehiscent, top areolate.—Species 3, Asiatic and African.

1. ***P. atropurpurea***, *Moq. in DC. Prodr.* xiii. 2, 331; slender, erect, leaves petioled ovate or elliptic acute or acuminate, spikes long, rachis slender, clusters remote bracteate woolly, sepals broadly 3-nerved, laxly villous. *Dalz. & Gibs. Bomb. Fl.* 219; *Miq. Fl. Ind. Bat.* i. 1046. *Achyranthes lappacea*, *Linn. Sp. Pl. Ed.* 2, 95 (*excl. syn. Ed.* 1); *Roxb. Fl. Ind. i.* 673, and in *Ed. Carey & Wall.* ii. 500. *A. atropurpurea*, *Lamk. Dict. i.* 546. *Desmochæta atropurpurea*, *DC. Cat. Hort. Monsp.* 102; *Wall. Cat.* 6933, *excl. K*; *Wight Ic. t.* 731; *Grah. Cat. Bomb. Pl.* 1230.—*Burm. Fl. Zeyl. t.* 18, f. 1; *Rheede Hort. Mal. x. t.* 59.

NEPAL, *Wallich*. BENGAL; Maldah, *Clarke*. DECCAN PENINSULA, from Guzerat southward, Singapore and Penang, *Wallich*. CEYLON.—DISTRIB. Java, Madagascar, S. Africa, Philippines.

Biennial or annual, 2–5 ft.; branches long, straggling, glabrous. *Leaves* 1–5 in., membranous, narrowed into the ($\frac{3}{4}$ –1 in.) petiole. *Spikes* 1–10 in.; rachis sparsely pubescent; clusters sessile, flowering $\frac{1}{4}$ in., fruiting rarely $\frac{1}{2}$ in. diam.; bracts broadly ovate, pungent. *Sepals* ovate-lanceolate, woolly. *Awns* often purplish.

2. **P. orbiculata**, *Wight Ic.* t. 1783; sparsely pubescent, robust, leaves short-petioled orbicular very broadly ovate or elliptic obtuse or retuse nearly glabrous, spikes stout, clusters distant woolly. *Dalz. & Gibs. Bomb. Fl.* 219. *Cyathula orbiculata*, *Moq. in DC. Prodr.* xiii. 2, 330. *Achyranthes orbiculata*, *Heyne in Roxb. Fl. Ind., Ed. Carey & Wall.* ii. 507. *A. rotundifolia*, *Klein. mss.* *Desmochæta orbiculata*, *Wall. Cat.* 6936.

CONCAN GHATS (*Dalzell*). The CAERNATIC; in sandy soil near the sea, *Heyne, &c.* CEYLON; Jaffna, *Moon*.

Stem stout, erect from a woody stock, terete, glabrate or hispidulous, rarely tomentose. *Leaves* 1–1 $\frac{1}{2}$ in. diam., rigid and brown when dry, suddenly narrowed into the flattened petiole. *Spikes* 4–8 in., rachis stout, sparsely hairy or pubescent; when flowering clusters $\frac{1}{4}$ in. long, fruiting $\frac{3}{8}$ in., spines pale; outer bract short with a long spine, inner narrow.

3. **P. lappacea**, *Moq. in DC. Prodr.* xiii. 2, 331; shrubby below, tomentose, leaves short-petioled from broadly ovate to lanceolate acute or subacute, clusters remote or approximate, outermost bract very broad membranous, sepals 3-nerved, densely woolly. *Dalz. & Gibs. Bomb. Fl.* 219; *Miquel Fl. Ind. Bat.* i. 1046. *Achyranthes lappacea*, *Linn. Sp. Pl. Ed. i.* 204. *A. echinata*, *Retz. Obs.* ii. 12. *A. patula*, *Linn. Suppl.* 160. *A. lappacea*, *echinata & patula*, *Willd. Sp. Pl.* i. 1192, 1193. *A. styracifolia*, *Lamk. Dict.* i. 546, *encl. syn.* *Desmochæta flavescens*, *DC. Cat. Hort. Monsp.* 102; *Wall. Cat.* 6934. *D. patula*, *Roem. & Schult. Syst.* v. 550. *Amarantus arctioideus*, *Perrottet Pl. Exsic.* No. 94.

UPPER GANGETIC VALLEY and PANJAB. WESTERN TROPICAL HIMALAYA, alt. 1–3000 ft., from Kashmir to Kumaon. BEHAR, SCINDE, GUZERAT and the DECCAN PENINSULA.—DISTRIB. Tropical Asia and Africa.

A large straggling undershrub; branches terete. *Leaves* 2–4 in., base acute; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Flowering clusters* $\frac{1}{4}$ in. long, fruiting $\frac{1}{2}$ in. diam.

VAR. *velutina*; erect, subsimple, densely villously tomentose, leaves $\frac{1}{2}$ –1 in., shortly petioled orbicular. *Desmochæta velutina*, *Wall. Cat.* 6935; *Moq. l. c.* 332. *Ærua velutina*, *Moq. l. c.* 301.—Deccan Peninsula, *Wight in Herb. Wall.* Burma, at Lounggee Yenong and Pagham on the Irawaddi, *Wallich*.—Moquin has described Wallich's 6935 under both *Desmochæta* and *Ærua*, quoting the same number in each case.

10. **PSILOTRICHUM**, *Blume*.

Herbs or shrubs. *Leaves* opposite. *Flowers* white or greenish, in solitary or panicked dense clusters or spikes. *Sepals* 5, hard; outer boat-shaped, gibbous below, ribbed. *Stamens* 5, unequal, connate below into a cup; anthers 2-celled; staminodes 0. *Ovary* oblong or subglobose; style slender, stigma capitate or 2-fid; ovule 1, pendulous from a long basal funicle. *Utricle* globose or compressed, indehiscent. *Seed* inverse, lenticular, testa coriaceous or crustaceous; embryo annular.—Species 10, Asiatic, African and Pacific.

* *Shrubs or undershrubs with woody stocks and lower branches.*

1. **P. nudum**, *Moq. in DC. Prodr.* xiii. 2, 280; shrubby, branches

divaricate glabrous, leaves petioled ovate-lanceolate acute glabrous, spikes sessile many-fl'd., bracts lanceolate, sepals $\frac{1}{4}$ in. deeply grooved hairy. *Achyranthes nuda*, *Herb. Heyne in Roxb. Fl. Ind., Ed. Carey & Wall.* ii. 507; *Wall. Cat.* 6926. *A. montana*, *Klein mss.* *A. polygonoides*, var. *Herb. Heyne.*

DECCAN PENINSULA; *Heyne, G. Thomson.*

Branches many from the woody stock, 2-3 ft., terete, woody, tips only hairy. Leaves $1\frac{1}{2}$ -3 in., glabrous, narrowed into a short petiole, nerves faint. Spikes $\frac{1}{2}$ -1 $\frac{1}{2}$ in., strict, hairy, 6- or many-fl'd.; bracts persistent, acuminate. Sepals pubescent, deeply grooved, rigid, acuminate.—Very near a S.E. Tropical African species.

2. ***P. scleranthum***, *Thwaites Enum.* 248; an undershrub, branches divaricate tomentose, leaves subsessile ovate-lanceolate acute scaberulous, spikes terminal peduncled 3-nate, bracts broadly ovate, sepals $\frac{1}{4}$ in. obscurely grooved hairy.

CEYLON; at Anooradhapoor, *Gardner.*

Habit of *P. nudum*, but branches tomentose, leaves scaberulous on both surfaces and inflorescence branched. The 3 terminal spikes are sessile on the top of a tomentose peduncle $\frac{1}{2}$ in. long, are dense-fl'd., oblong, the middle one $\frac{1}{2}$ in. erect, the lateral horizontal and shorter. Sepals pubescent, pungent.—Described from a single specimen.

3. ***P. calceolatum***, *Moq. in DC. Prodr.* xiii. 2, 280; a small undershrub, branches divaricate pubescent or glabrate, leaves subsessile ovate or elliptic acute glabrous sparsely hairy, spikes axillary sessile or peduncled short few-fl'd., bracts cymbiform acute, sepals $\frac{1}{2}$ in. oblong acute ribbed villous. *P. nudum*, *Wight Ic.* t. 1775. *Achyranthes calceolata*, *Herb. Russel in Wall. Cat.* 6927. *A. glauca*, *Herb. Heyne.* *Ptilotus ovatus*, *Moq. l. c.* 281.

DECCAN PENINSULA, *Heyne*, in jungles on the hills, *Wight*. CEYLON; in the hotter parts of the island, *Moon*, &c.

Habit of *P. nudum* (sometimes subscent, *Wight*), but much smaller and more slender. Leaves $\frac{1}{2}$ -1 $\frac{1}{2}$ in. Spikes 4-6-fl'd., sometimes peduncled by being terminal on a leafless axillary branch, at others the peduncle itself lengthens.—A Natal species hardly differs.

VAR. *tomentosa*; leaves pubescent above tomentose beneath.—Scraps of this are on sheets of 6926 A and 6927 B in *Herb. Wall.*

** *Annuals.*

4. ***P. trichotomum***, *Blume Bijl.* 545; annual, slender, glabrous, branches erect, leaves petioled elliptic- or elliptic-lanceolate acute, spikes terminal and in the forks sessile or peduncled, bracts lanceolate, sepals $\frac{1}{2}$ in. deeply grooved acuminate glabrous. *Moq. in DC. Prodr.* xiii. 2, 280. *Achyranthes* ? *carnosa*, *Wall. Cat.* 6931. *Leiospermum ferrugineum*, *Wight Ic.* t. 721.

ASSAM, *Griffith.* SILHET, at Terrya Ghat, *H. f. & T. PEGU, McClelland.*—DISTRIB. Java, Borneo, Philippines.

Flaccid, 12-18 in. high, decumbent. Leaves 1-2 $\frac{1}{2}$ in., rarely obovate, thin, narrowed into a very short petiole. Spikes $\frac{1}{2}$ - $\frac{3}{4}$ in., green, terminal, sometimes 3-nate; flowers crowded. Sepals narrow.

5. ***P. ferrugineum***, *Moq. in DC. Prodr.* xiii. 2, 279; annual, glabrous, branches prostrate, leaves linear- or obovate-oblong, spikes terminal and in the forks sessile or peduncled, bracts subulate-lanceolate, sepals $\frac{1}{2}$ in. deeply grooved glabrous, outer obtuse. *Achyranthes ferruginea*, *Roxb. Fl. Ind.* i.

675, and *Ed. Carey & Wall.*, ii. 502. *Leiospermum ferrugineum*, *Wall. Cat.* 6923.

BENGAL; a weed in the gardens and cultivated lands of Calcutta, *Roxburgh*.

Wallich's specimen forms an excessively branched prostrate mass 9 in. diam., with divaricate branches and linear-oblong leaves 1-1½ in. long. *Spikes* ½ in. long, dense-fld., yellow when dry.—*Roxburgh's* description applies more nearly to *P. trichotomum* in the form of the leaves, and *Wight's* figure, copied from *Roxburgh's* drawing, and which shows acuminate sepals, is, I think, certainly taken from the latter plant. There are no indications in Wallich's specimens gathered in the Calcutta Garden of the rust-coloured stem, reddish leaves and dull red flowers described by *Roxburgh*.

11. **PSILOSTACHYS**, *Hochst.*

Slender dichotomous herbs. *Leaves* opposite. *Flowers* minute, spicate at the tips of the filiform branches of a lax panicle. *Sepals* 5, 2-3 outer convex, strongly 3-nerved, inner narrower. *Stamens* 5, free; anthers 2-celled; staminodes 0. *Ovary* rounded or ovoid, compressed; style slender? stigma capitellate. *Utricle* indehiscent. *Seed* inverse, testa coriaceous; embryo hooked, cotyledons slender.—Species 3, Indian, Arabian and African.

P. sericea, *Hook. f. in Gen. Plant.* iii. 32; stem erect, villous with long hairs, leaves orbicular-ovate acute densely villous above silky beneath, peduncles very long axillary filiform, pedicels capillary, spikes 4-6 fld. *Achyranthes sericea*, *Koen. in Roxb. Fl. Ind.* iii. 675, and *Ed. Carey & Wall.* ii. 502; *Moq. in DC. Prodr.* xiii. 2, 318; *Wight Ic.* 726; *Wall. Cat.* 6930. *Psilotrichum sericeum*, *Dalz. in Dalz. & Gibs. Bomb. Fl.* 216.

GOOZERAT; sandy hills on the coast of Kattiarwar, *Dalzell* (and *Koenig*?).

Annual? *Stem* stout, hard, terete; hairs patent, ¼ in. long, flexuous, terminating in a lax panicle of erecto-patent opposite branches 2 in. long, which divide at the tip into capillary pedicels bearing the spikes. *Leaves* 1 in., thick, base rounded or cordate; petiole very short. *Spikes* ¼-½ in., rachis capillary zigzag; flowers ⅓ in. long. *Sepals* ovate-lanceolate; outer pungent, deeply ribbed, silky.—A very beautiful plant; it is not known where *Koenig* procured it, if indeed he did himself procure it. The specimen in the Wallichian Herbarium is marked "Herb. Koenig."

12. **NOTHOSÆRUA**, *Wight.*

An annual with opposite spreading branches. *Leaves* opposite. *Flowers* most minute, woolly, in axillary solitary or clustered spikelets. *Sepals* 3-5, hyaline, obtuse, 1-nerved. *Stamens* 1-2, free; anthers 2-celled; staminodes 0. *Ovary* oblong, compressed; stigma subsessile, capitellate; ovule 1, pendulous from a long basal funicle. *Utricle* oblong, compressed, indehiscent. *Seed* inverse, lenticular, testa crustaceous; embryo hooked, cotyledons linear.

N. brachiata, *Wight Ic.* vi. 1. *Pseudanthus brachiatus*, *Wight l. c. t.* 1776, *excl. analyses*, and v. 3, t. 1776 *bis*, B. *Ærua brachiata*, *Mart. Beitr. Amarant.* 83, n. 3; *Moq. in DC. Prodr.* xiii. 2, 304 (*incorrect as to staminodes*); *Dalz. & Gibs. Bomb. Fl.* 217. *Æ. chenopodiifolia*, *Bojer Hort. Maurit.* 268. *Achyranthes brachiata*, *Linn. Mant.* 50; *Roth Nov. Sp.* 169. *Illecebrum brachiatum*, *Linn. Mant.* 23. *Amarantus minutus*, *Lesschen. mss.*

UPPER GANGETIC VALLEY and the PANJAB, from Moradabad north-eastward.

SCINDE and the CONCAN, *Stocks*, &c. MAISOR and the CARNATIC. BURMA, *Wallich*. CEYLON, common.—DISTRIB. Mauritius, E. and W. tropical Africa.

Erect, 1–2 ft., branched from the base; branches puberulous, spreading. *Leaves* 1–2 in., ovate elliptic or subovate, obtuse or subacute, membranous, green; petiole $0\frac{1}{4}$ in. *Spikes* very numerous, sessile, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, cylindric, white, dense-fld., bracts broadly ovate, hyaline, persistent. *Sepals* $\frac{1}{10}$ in. long, silkily villous.—One of the smallest flowered plants provided with a regular perianth. Moquin has probably confounded this with the very similar *Ærua lanata* (as did Wight), to which the latter part of his description applies.

13. *ÆRUA*, Forsk.

Woolly herbs or undershrubs. *Leaves* alternate or opposite. *Flowers* small or minute, in solitary or paniced spikes, often polygamous. *Sepals* 4–5, short, membranous, all or the inner only woolly. *Stamens* 4–5, connate below with interposed linear staminodes into a cup; anthers 2-celled. *Ovary* ovoid or subglobose; style long or short, stigma capitate or 2-fid; ovule 1, pendulous from a long basal funicle. *Utricle* indehiscent, or the coriaceous crown circumsciss. *Seed* inverse, testa coriaceous; embryo annular.—Species 10, tropical Asiatic and African.

* *Spikes axillary and in terminal panicles. Leaves opposite or alternate.*

1. *Æ. javanica*, *Juss. in Ann. Mus.* xi. 131; hoary-tomentose, shrubby below, leaves from linear to oblanceolate or oblong acute obtuse or retuse, spikes elongate densely woolly not glistening, style elongate, stigmas long. *Wall. Cat.* 6908; *Wight Ic.* t. 876; *Moq. in DC. Prodr.* xiii. 2, 299; *Dalz. & Gibs. Bomb. Fl.* 216; *Boiss. Fl. Orient.* iv. 992. *Æ. Wallichii*, *Moq. l. c.* 300. *Æ. tomentosa*, *Forsk. Fl. Æg. Arab.* 122; *Lamk. Dict.* i. 46. *Æ. ægyptiaca*, *Gmel. Syst.* 1026. *Æ. Bovii*, *Edgew. in Journ. Linn. Soc.* vi. 206. *Æ. incana*, *Mart. in Nov. Act. Acad. Nat. Cur.* xii. (1826), 291. *Achyranthes alopecuroides*, *Lamk. l. c.* 548. *A. javanica*, *Pers. Syn.* i. 259. *A. incana*, *Roxb. Fl. Ind.* i. 671, and *Ed. Carey & Wall.* ii. 495. *Illecebrum javanicum*, *Ait. Hort. Kew.* 289. *Iresine javanica* & *persica*, *Burm. Fl. Ind.* 212 (by error 312), t. 65. *Celosia lanata*, *Linn. Sp. Pl.* 298.

From the OUDH TERAI, *Wallich*, to the PANJAB, *Royle*, &c. SCINDE, *Stocks*. CENTRAL INDIA, *Clarke*. The DECCAN from the CONCAN southward. BURMA, *Wallich*. CEYLON; N. of the island, *Gardner*.—DISTRIB. Westward to Arabia, E. and W. tropical Africa, and the Cape Verde Islands. Java?

Diœcious. *Stem* terete, 2–3 ft., branched, as thick as a goose-quill. *Leaves* alternate, 1–4 in., flat or with recurved margins, sessile or narrowed into a petiole; nerves distinct. *Spikes* often in large panicles, sessile, erect or nodding, 1–6 in. long. *Flowers* $\frac{1}{10}$ in. long, enveloped in long wool, males very rare.—*Edgeworth* (*Fl. Mall.* l. c.) insists that the narrow-leaved form is a distinct species, and is odorous, which *Æ. javanica* (which grows with it) is not. *Boissier* makes a variety of it; local botanists should see to this.

2. *Æ. scandens*, *Wall. Cat.* 6911, *excl. M*; a climbing undershrub, branches hoary-tomentose, leaves ovate elliptic oblong or lanceolate obtuse or acute glabrous or hoary, spikes globose ovoid or shortly cylindric woolly shining, sepals lanceolate acuminate, stigmas very short. *Moq. in DC. Prodr.* xiii. 2, 302; *Wight Ic.* t. 724 (utricle and seed wrong); *Dalz. & Gibs. Bomb. Fl.* 217. *Achyranthes scandens*, *Roxb. Fl. Ind.* i. 676, and *Ed. Carey & Wall.*, ii. 503.

Plains of BENGAL, and from ASSAM to the PANJAB; ascending the HIMALAYA to 5000 ft. from Kumaon to Bhotan. CENTRAL INDIA and BEHAR, and summit of Parusnath. CONCAN, *Stocks*. PEGU, *M'Clelland*. BURMA, *Wallich*, &c.—DISTRIB. China, Malay Islands, Philippines, E. and W. tropical Africa.

Stem woody below; branches straggling, several feet long. *Leaves* opposite and alternate, soft, green, 1–4 in. long, sometimes almost rounded; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Spikes* sessile, rarely peduncled, $\frac{1}{4}$ –1 in. *Sepals* $\frac{1}{10}$ in. long, lanceolate.—Wight has erroneously figured the utricle as circumsciss and seed horizontal. I doubt if *Æ. sanguinolenta*, Blume, and *Æ. timorensis*, Moq., differ from this.

VAR. ? *subglobosa*; branches glabrous, spikes large subovoid or globose, $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., on slender peduncles.—Mergui, *Griffith* (in *Herb. Wight*).—This resembles very indifferent specimens of *Æ. scandens* (*Æ. velutina*, Moq.) from the Philippines (Cuming, No. 1635), but the spikes are larger.

3. *Æ. glabrata*, *Hook. f.*; minutely hairy, leaves elliptic-ovate subacute, spikes small cylindric paniced or fascicled towards the ends of the branches glistening, bracts ovate equalling the very minute flowers, sepals broadly oblong-ovate obtuse or apiculate sparingly hairy.

BURMA or MALAY PENINSULA, *Griffith*.

Habit of *Æ. scandens*, but the flowers are very minute, about $\frac{1}{8}$ in. long, with very broad short and sparsely hairy bracts and sepals, the latter with usually a very broad green midrib. Hance's *A. scandens*, var. from Canton, may be the same, but the spikes are too young for comparison.

** *Spikes all axillary sessile. Leaves alternate.*

4. *Æ. lanata*, *Juss. in Ann. Mus.* xi. 131; erect or prostrate, branched from the base, hoary tomentose, leaves small petioled elliptic orbicular-ovate or orbicular obtuse or acute, spikes small very numerous oblong or subcylindric densely woolly not glistening. *Moq. in DC. Prodr.* xiii. 2, 303; *Wall. Cat.* 6909; *Wight Ic.* t. 723; *Grah. Cat. Bomb. Pl.* 168; *Dalz. & Gibs. Bomb. Fl.* 217; *Boiss. Fl. Orient.* iv. 993. *Æ. floribunda*, *Wight Ic.* t. 1776, the analysis only, and vol. v. t. 1776 bis, f. A. *Achyranthes villosa*, *Forsk. Fl. Æg. Arab.* 48. A. *lanata*, *Linn. Sp. Pl.* 296; *Roxb. Fl. Ind.* i. 676, and *Ed. Carey & Wall.* ii. 503. *Illecebrum lanatum*, *Linn. Mant.* 344.—*Rheede Hort. Mal.* x. t. 29; *Burm. Fl. Zeyl.* t. 60, f. 1.

Plains of BENGAL from Dacca and Behar westward to the Indus. The CONCAN, CENTRAL INDIA, and throughout the DECCAN. CEYLON abundant.—DISTRIB. Westward to Arabia and tropical and S. Africa, Java, Philippines.

Branches many, 6–10 in., from a woody stock, simple or divided, woolly. *Leaves* $\frac{1}{2}$ –1 in., woolly or glabrate. *Spikes* $\frac{1}{4}$ – $\frac{1}{2}$ in., sometimes excessively crowded and forming subglobose clusters. *Sepals* obtuse.—Wight's t. 723 is probably *A. scandens*.

5. *Æ. Wightii*, *Hook. f.*; branches short woody and leaves beneath densely woolly, leaves small broadly ovate or elliptic obtuse thick, clusters all axillary sessile shortly oblong or globose densely woolly not glistening, outer sepals linear-oblong aristate, inner obtuse.

TRAVANCORE; at Courtallum, *Wight*.

A low-growing bushy plant, 6–12 in. high, with many stiff branches as thick as a crow-quill, from a stout woody tap-root. *Leaves* 1 in. long, narrowed into a short petiole. *Clusters* $\frac{1}{4}$ – $\frac{1}{3}$ in. long, with the acicular tips of the bracts and outer sepals a little longer than the wool; flowers $\frac{1}{12}$ in. long.

*** *Spikes peduncled. Sepals 4. Leaves filiform in opposite fascicles.*

6. *Æ. Monsonia*, *Mart. Beitr. Amarant.* 83; stem hoary-tomentose

or woolly trichotomously branched angled and grooved, spikes cylindric on opposite strict horizontal peduncles or branches glistening, sepals lanceolate acuminate, utricle oblong, top circumsciss. *Moq. in DC. Prodr.* xiii. 2. 305; *Wall. Cat.* 6912; *Dalz. & Gibs. Bomb. Fl.* 217. *Æ. ? setacea, Mart. l. c.*; *Moq. l. c.* Achyranthes Monsonia, *Pers. Syn.* i. 258; *Roxb. Fl. Ind.* i. 673, and *Ed. Carey & Wall.* ii. 499; *Wight Ic.* t. 725. *A. setacea, Roth Nov. Sp.* 168. *A. pungens, Lamk. Dict.* i. 546. *Celosia Monsonia, Retz Obs.* ii. 13. *Illecebrum Monsonium, Linn. f. Suppl.* 161.

BENGAL, *Roxburgh*. CENTRAL INDIA; Sumbulpore, *Griffith*. BURMA; at Yenongheum, *Wallich*. THE CONCAN and DECCAN PENINSULA; abundant in dry places.

Branches many, prostrate or ascending from a very long flexuous woody tap-root, 1-3 ft., with numerous woolly nodes, and opposite or 3-nately whorled fascicles of leaves and peduncled spikes or branches. *Leaves* $\frac{1}{2}$ -1 in., exceedingly slender, woolly. *Spikes* as long, with densely imbricating rose-coloured flowers, solitary or subpanicled; bracts many, lanceolate. *Sepals* 4, subulate-lanceolate, acuminate, $\frac{1}{2}$ in. long. *Utricle* enclosed in the large staminal cup; stigma capitate, subsessile.

DOUBTFUL SPECIES.

Æ. RADICANS, Mart. Beitr. Amarant. 83 (*Moq. in DC. Prodr.* xiii. 2. 302. *Achyranthes radicans, Heyne in Roth Nov. Sp.* 170), is undetermined.

Æ. ? NERVOSA, Mart. l. c. (*Moq. l. c.* 306, *Achyranthes nervosa, Roth l. c.*), and *A. PUBESCENS, Mart. l. c.* (*Moq. l. c.*, *Achyranthes pubescens, Roth l. c.* 171; *Illecebrum pubescens, Willd. Enum. Hort. Berol.* i. 271) are both indeterminable.

14. STILBANTHUS, Hook. f.

A climbing tree with pendulous branches. *Leaves* opposite. *Flowers* large, white, shining, in paniced pubescent spikes. *Sepals* 5, hard and scarious, narrowly ovate-lanceolate, acute, tips bearded at the back, outer broader. *Stamens* 5, filaments shortly connate below, with long ligulate lacerate staminodes; anthers 2-celled. *Ovary* oblong, compressed, tip penicillate; style filiform, stigma capitate; ovule 1, pendulous from a long basal funicle. *Utricle* oblong, top villous, indehiscent. *Seed* inverse, testa coriaceous; embryo annular.

S. scandens, Hook. f. in Hook. Ic. Pl. t. 1286. *Ærua scandens, Gamble, Trees, &c., of Darjeeling, not of Wallich.*

EASTERN BENGAL, *Herb. Griffith*. SIKKIM HIMALAYA, alt. 5-7000 ft., *J. D. H.*

Trunk as thick as the thigh, "reaching the tops of tall trees, which it covers with masses of handsome flowers and soft whitish leaves." *Gamble. Branches* soft, herbaceous, obtusely 4-angled, terminal silkily hairy, bases of internodes and of petioles contracting when dry. *Leaves* 4-6 by 2-3 in., elliptic, acuminate at both ends, finely pointed, sparsely pubescent above, villous or glabrate beneath; petiole $\frac{1}{2}$ -1 in., villous. *Spikes* 1-3 in. long, in terminal spreading trichotomously branched panicles, sessile or peduncled, cylindric; peduncles and pedicels villous. *Flowers* spreading, $\frac{1}{2}$ in. long, white, shining; bracts short, ovate, apiculate; bracteoles rather longer. *Sepals* striate. *Filaments* very slender, hairy, shorter than the filiform staminodes; anthers oblong.—The most gigantic Asiatic plant of the Order.

15. ACHYRANTHES, Linn.

Herbs. *Leaves* opposite. *Flowers* in slender simple or paniced spikes, soon deflexed; bracts and bracteoles spinescent. *Sepals* 4-5, subulate-lanceolate, aristate, shining, at length hardened and strongly ribbed. *Stamens* 2-5, filaments connate at the base with as many square staminodes, each of which is toothed or has a toothed scale at its back; anthers 2-celled.

Ovary oblong, subcompressed; style filiform, stigma capitate; ovule 1, pendulous from a long basal funicle. *Utricle* oblong or ovoid, indehiscent, top areolate or rounded. *Seed* inverse, oblong, testa coriaceous; embryo annular.—Species 12, all tropical or subtropical.

* *Outer sepal longest.*

1. **A. aquatica**, *Br. Prodr.* 417; tall, stout, finely pubescent, leaves elliptic-lanceolate acuminate, spikes elongate, rachis villous or pubescent, flowers $\frac{1}{2}$ in. long, bracts small scarious, bracteoles orbicular, sepals rigid glabrous, outer longer pungent. *Roxb. Fl. Ind.* i. 673, and *Ed. Carey & Wall.* ii. 497. *A. natans*, *Ham. in Wall. Cat.* *A. trichotoma*, *Perrott. Herb. Seneg.* n. 180. *Centrostachys aquatica*, *Wall. Cat.* 6932; *Moq. in DC. Prodr.* xiii. 2, 321; *Endl. Iconog.* t. 20. *Celosia spinescens*, *Herb. Russel.*

NEPAL TERAI, *Wallich.* ASSAM and SILHET, *Griffith, De Silva.* TENASSERIM; at Moulmein, *Wallich.* CIRCARS and COROMANDEL, *Roxburgh.*—DISTRIB. Tropical Africa.

Stem 2–4 ft., as thick as the thumb below, straggling in the water and rooting along the banks of rivers, &c., branched. *Leaves* 3–6 in., narrowed into a petiole, $\frac{1}{2}$ –1 in. *Spikes* 3–18 in.; bracts small, membranous, concave, long-acuminate from an ovate base; bracteoles membranous, embracing the thickened perianth base. *Perianth* shining, very variable in size and thickness, base much thickened.

** *Sepals subequal.*

2. **A. aspera**, *Linn. Sp. Pl.* 204; leaves orbicular obovate or elliptic, spikes rigid, bracteoles ovate half as long as their spine or longer, stamens 5, staminodes fimbriate. *Moq. in DC. Prodr.* xiii. 2, 314; *Boiss. Fl. Orient.* iv. 993; *Roxb. Fl. Ind.* i. 672, and *Ed. Carey & Wall.* ii. 496; *Dalz. & Gibs. Bomb. Fl.* 218; *Wight Ic.* 1780; *Wall. Cat.* 6924, excl. H.

Throughout INDIA and CEYLON; an abundant weed in dry places.—DISTRIB. Tropical Asia, Africa, Australia and America.

Stem 1–3 ft., simple or branched. *Leaves* 1–5 in., extremely variable, generally thick, pubescent tomentose or velvety, rarely glabrate; petiole short. *Spikes* usually with a robust rachis that rapidly lengthens, sometimes to a foot long. *Flowers* $\frac{1}{2}$ – $\frac{1}{4}$ in., longer than the bracteoles. *Staminodes* fimbriate from the margin or from an appendage below the margin behind.

VAR. rubro-fusca; leaves elliptic-ovate acute brown when dry. *A. rubro-fusca*, *Wight Ic.* t. 1778 (*A. viridis*).—Nilghiris, *Wight.* Ceylon.

VAR. porphyristachya; much larger, 4–6 ft., diffusely branched, leaves 3–10 in. broadly elliptic acuminate glabrous or pubescent, membranous, spikes with a more slender rachis. *A. porphyristachya*, *Wall. Cat.* 6925; *Moq. l. c.* 316. ? *A. argentea*, *Thwaites Enum.* 249.—In moister climates than *A. aspera* proper. Sikkim Himalaya, alt. 2–5000 ft. Chittagong, *J. D. H. & T. T. Nilghiris, Wight, &c. Ava, Wallich.*

VAR. argentea; leaves silverily silky beneath. *A. argentea*, *Thwaites Enum.* 249; *Lamk. Dict.* i. 545.—Thwaites mentions this as found at Caltura by Moon, but I have seen no specimens; he includes under it *A. porphyristachya* and *rubro-fusca*, which makes me doubt his being Lamarck's plant, which is an European, Arabian and African one.

3. **A. bidentata**, *Blume Bijd.* 545; branches slender rambling, leaves from elliptic to linear lanceolate acuminate glabrous or pubescent membranous, spikes very slender, bracteoles usually reduced to a spine minutely 2-auricled at the base, stamens 5, staminodes toothed. *Moq. in DC. Prodr.*

xiii. 2, 312; *Wight Ic.* t. 1779. *A. Wightiana* and *A. lanceolata*, *Wall. Cat.* 6928, 6929. *A. aspera*, *Wall. Cat.* 6924 H.

TEMPERATE and SUBTROPICAL HIMALAYA; from Kishtwar, *Clarke*, to Sikkim, alt. 4-6000 ft., *J. D. H.* KHASIA MTS., alt. 4-6000 ft. BEHAR; top of Paruanath, *Thomson*. THE CONCAN, NILGHIRI and TRAVANCORE MTS., *Wight*, &c. CEYLON, abundant.—DISTRIB. China, Java, Japan.

Habit of *A. aspera*, var. *porphyristachya*, and leaves often as large, but the bracteoles are reduced to spines with scarcely a blade, or with a minute auricle on each side of the base, and the staminodes are not fringed. It may prove a form of that plant. Some Nynee-tal specimens, collected by Col. Davidson, almost with the blade of the bracteoles half as long as the spine, unite them in this respect. The very narrow-leaved forms (*Wallichiana* and *lanceolata*) occur in the Khasia and Himalaya along with the more typical, as they do in the Deccan hills.

4. *A. diandra*, *Roxb. Fl. Ind.* i. 504; stem slender diffusely branched, leaves linear-lanceolate or linear glabrous or nearly so, spikes very slender pubescent, bracteoles of a spine as long as the sepals 2-auricled at the base, stamens 2, staminodes fimbriate. *Centrostachys diandra*, *Wall. in Roxb. Fl. Ind.*, *Ed. Carey & Wall.* ii. 504; *Moq. in DC. Prodr.* xiii. 2, 322; *Wight Ic.* t. 722.

CEYLON; common in the warmer districts, *Thwaites*.

Annual or biennial, 12-18 in. high, very much more slender than any other species. *Leaves* 2-4 by $\frac{1}{4}$ - $\frac{3}{8}$ in., membranous, green. *Spikes* 3-6 in.; flowers distant, $\frac{1}{8}$ in. long, very slender.

UNDETERMINABLE SPECIES.

A. BENGALENSIS, *Lamk. Dict.* i. 459; *Moq. in DC. Prodr.* xiii. 2, 317. *Paronychia bengalensis*, *Roem. & Schultes Syst.* v. 521, not of *Juss.* *Illecebrum bengalense*, *Linn. Mant.* 213.

A. SARMENTOSA, *Vahl Symb.* ii. 44; *Moq. l. c.* 318.

16. *ALTERNANTHERA*, *Forsk.*

Herbs, usually prostrate. *Leaves* opposite. *Flowers* small, white, capitate; heads axillary, often clustered. *Sepals* unequal, anterior and 2 posterior flattened; 2 lateral innermost, concave. *Stamens* 2-5, filaments short, connate into a short cup with or without interposed staminodes; anthers 1-celled. *Ovary* orbicular or ovoid; stigma subsessile, capitate (rarely 2-fid); ovule 1, pendulous from a long basal funicle. *Utricle* compressed, ovoid orbicular or obcordate, margins often winged or thickened. *Seed* inverse, lenticular, testa coriaceous; embryo annular, cotyledons narrow.—Species about 16, tropical and subtropical.

1. *A. sessilis*, *Br. Prodr.* 417; branches many from the root prostrate or ascending, leaves linear oblong lanceolate or elliptic obtuse or subacute, sepals glabrous rigid acute, anthers 2-3, utricle obcordate. *Moq. in DC. Prodr.* xiii. 2, 357. *Boiss. Fl. Orient.* iv. 996; *Dalz. & Gibs. Bomb. Fl.* 220; *Wight Ic.* t. 727; *Wall. Cat.* 6921. *A. denticulata*, *Wall. Cat.* 6922. *A. prostrata*, *Don Prodr.* 86; *Moq. l. c.* 360, for the most part. *Achyranthes triandra*, *Roxb. Fl. Ind.* i. 678, and *Ed. Carey & Wall.* ii. 505. *Gomphrena sessilis*, *Linn. Sp. Pl.* 225.—*Rheede Hort. Mal.* x. t. 11.

Throughout hotter INDIA and CEYLON in damp places, ascending the HIMALAYA to 4000 ft.—DISTRIB. All warm countries.

Branches 3-18 in. long, glabrous, the ultimate with 2 lines of hairs; nodes often villous. *Leaves* 1-3 in., in watery places even longer (4 by 1 in.), rather fleshy, sometimes obscurely denticulate. *Clusters* $\frac{1}{8}$ - $\frac{1}{2}$ in. long, white, hardly glistening; flowers $\frac{1}{8}$ - $\frac{1}{2}$ in. long. *Utricle* usually broader than the perianth, very broadly

obcordate, rarely exceeding the sepals, wings often corky.—Wallich's *A. sessilis* & *denticulata* are all *sessilis* except Sheet 6921 F, of which all but the left-hand specimens are as *nodiflora*.

2. ***A. nodiflora***, Br. Prodr. 417; branches prostrate or ascending, leaves linear linear-oblong or lanceolate obtuse or subacute, sepals glabrous hyaline finely acuminate, anthers 3, utricles much shorter than the sepals obcordate. Moq. in DC. Prodr. xiii. 2, 356; Benth. Fl. Austral. v. 249. *A. denticulata*, Br. l. c.

SILHET, Wallich. TENASSERIM, at Mergui, Griffith.—DISTRIB. Tropical Asia, Australia, Polynesia and Africa, Japan.

Often very difficult to distinguish from *A. sessilis*, heads often in great clusters (not seen in Indian specimen), sepals thinner, much more pointed, and utricles smaller and not so broad.—This would seem to be the most abundant African and Australian plant, though scarce in India proper. Benth's *A. denticulata* (Fl. Austral. v. 249) is, I think, *A. sessilis*; he mentions the difficulty of distinguishing it from *nodiflora*, but says nothing about *sessilis*. Boissier (Fl. Orient. iv. 996) considers *nodiflora* and *denticulata* to be one and the same, and different from *sessilis*.

17. **GOMPHRENA**, Linn.

Herbs, hirsute or villous, with usually thickened nodes. Leaves opposite. Flowers capitate or spicate, white or coloured. Sepals 5, lanceolate, acuminate. Stamens 5, filaments linear united below into a long tube cleft at the top, with a one-celled anther in each cleft, usually without interposed staminodes. Ovary subglobose or turbinate; style short or long, stigmas 2; ovules 1, pendulous from a long basal funicle. Utricle compressed, indehiscent. Seed inverse, lenticular, testa coriaceous; embryo annular.—Species 70, S. American and Australian, of which one is also Asiatic.

Gomphrena hispida, Linn. Sp. Pl. Ed. 2, i. 326 (Moq. in DC. Prodr. xiii. 1, 411), is founded on a plate in Hortus Malabaricus (ix. t. 72) which is quite unworthy of notice. It represents a plant with the habit of *G. globosa*, but with serrated leaves. *G. angustifolia*, Vahl Symb. iii. 45 (Moq. l. c. 417), stated to be a native of the East Indies (Koenig) and Guinea (Schumacher), is probably some garden escape of which nothing is known.

G. globosa, Linn. Sp. Pl. 224; erect, branched, hairy or silky, leaves shortly petioled elliptic or obovate-oblong acute or obtuse, heads large globose with 2 leafy bracts, bracteoles pinkish purple, lateral with a cristate dorsal wing, sepals densely woolly. Moq. in DC. Prodr. xiii. 2, 409; Roxb. Fl. Ind. ii. 63; Griseb. Cat. Bomb. Pl. 169; Dalz. & Gibs. Bomb. Fl., Suppl. 72; Wight Ic. 1784; Bot. Mag. t. 2815.—Rheede Hort. Mal. x. t. 37.

An escape from gardens in various parts of INDIA; cultivated in all countries—probably originating in America.

A tall dichotomously branched annual, branches stout obscurely 4-angled. Leaves 2–4 in., scaberrulous, pale green; petiole 0–1 in. Heads 1–1½ in. diam., peduncled, terminating the branches; bracts under the head ½–1 in.; flowers densely imbricate; branches ½–¾ in., scarious, lanceolate, much longer than the perianth. Sepals lanceolate, densely woolly, shorter than the staminal tube.

ADDITIONS AND CORRECTIONS, VOL. IV.

P. 7. *Uleria salicifolia*, Beddome; add *Hook. f. Ic. Pl. t. 1432*.

P. 8. *Atherolepis Wallichii*, Hook. f.; add *Hook. f. Ic. Pl. t. 1433*.

P. 33. At end of *Gymnema* add:—

G. ? *MACRANTHUM*, *Hook. f. Ic. Pl. t. 1436*; stem robust, leaves elliptic-ovate acuminate glabrous, cymes corymbose or subumbellate puberulous, peduncles stout, flowers large ebracteolate, sepals elliptic-oblong obtuse, corolla-tube equalling the sepals, lobes pubescent within, coronal processes of the corolla small villous inserted at the mouth of the corolla alternating with its lobes.

SIKKIM HIMALAYAS, *King*.

Stem terete. Leaves 3–5 in., distant, base rounded or cordate, nerves 3–4 pair; petiole $1\frac{1}{2}$ –2 in. *Peduncles* 2–3 in., stout, often decurved; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. *Sepals* $\frac{1}{4}$ in. *Corolla* $\frac{1}{4}$ in. diam., thick, tube glabrous within. *Column* large, stoutly stipitate; scales of the staminal corona adnate to the backs of the anthers, obtuse; anther-tips large, ovate-oblong, obtuse, membranous; pollen-masses shortly stipitate, oblong-reniform, corpuscle elongate erect. *Stigma* thick, obtuse, exserted.—A doubtful *Gymnema*, larger and more robust than any other Indian species, with singularly stout peduncles. The corolline coronal scales are almost reduced to tufts of hairs; the staminal scales resemble those of a *Marsdenia*.

P. 41. To section ** of *Tylophora* add:—

T. *MICROSTACHYS*, *Hook. f. Ic. Pl. t. 1450*; quite glabrous, leaves shortly petioled linear-lanceolate acuminate, cymes reduced to very short axillary sessile racemes, bracts minute setaceous, flowers minute shortly pedicelled, sepals setaceous equalling the corolla, staminal column subovoid, coronal processes obscure, follicles elongate poignard-shaped, tips elongate.

TENASSERIM; Moulmein, *Falconer in Herb. Calcutta*.

Stem very slender, twining. *Leaves* 2–3 by $\frac{1}{4}$ – $\frac{1}{2}$ in., subcoriaceous, midrib stout, nerves obscure. *Racemes* $\frac{1}{4}$ – $\frac{1}{2}$ in., oblong. *Flowers* $\frac{1}{2}$ in. diam. *Corolla-lobes* ovate. *Column* rather large, tips of anthers rounded. *Follicles* 2–4 in., thinly coriaceous. *Seeds* $\frac{1}{2}$ in. long, oblong-ovoid, concavo-convex, brown, hairs $\frac{1}{2}$ in. long.

P. 97. *Exacum zeylanicum*, Roxb.; add *Wawra It. Pr. S. Cob. Bot. t. 112*.

P. 112. *Gentiana argentea*, Royle; add *Wawra l. c. t. 113*.

P. 114. To *Gentiana* add:—

G. (*Chondrophyllum*) *LODERI*, *Hook. f. Ic. Pl. t. 1440 A*; quite glabrous, perennial, branches prostrate leafy, leaves subsessile broadly elliptic obtuse 3-nerved, flowers terminal solitary sessile, calyx campanulate, lobes equalling the tube spatulate spreading and recurved, corolla tubular-campanulate blue, lobes 5 rounded ovate, scales erect fimbriate, style slender.

KASHMIR, in the Sind or Lidar Valley? *Mrs. C. Radcliffe*.

Branches 2–3 in. *Leaves* $\frac{1}{2}$ in. long and broad, spreading, coriaceous, green or purplish-brown; floral hardly smaller. *Calyx* $\frac{1}{2}$ in., tube purplish; lobes green, coriaceous. *Corolla-limb* 1 in. diam.—I am indebted to E. G. Loder, Esq., for a specimen of this pretty species, which is quite unlike any other Indian one. It was brought to him by his friend the finder, who is uncertain as to its exact locality in the Kashmir Valley where she gathered it.

G. (*Chondrophyllum*) *TIBETICA*, *King in Hook. f. Ic. Pl. t. 1441*; stem very stout erect, stem-leaves 6 in. lanceolate connate at the base in a cylindric sheath, uppermost sessile whorled, flowers crowded in the uppermost axils sessile, calyx tubular membranous truncate split on one side, mouth minutely 5-toothed, corolla twice as long tubular-funnel-shaped, lobes 5 triangular with a triangular fold in each sinus, capsule included, seeds ellipsoid, testa reticulated.

EASTERN HIMALAYA; Chumbi (between Sikkim and Bhotan), alt. 11,000 ft. (*Herb. Calcutta*).

Stem 18 in. high, erect, as stout as a goose-quill, simple. *Cauline leaves* 5-7 by 1-1½ in., upper broader, uppermost spreading, forming an involucre to the flowers. *Corolla* nearly 1 in. long, not spotted, rather inflated in the middle. *Ovary* sessile; style short, stigma 2-lobed. *Capsule* sessile, linear-oblong, dehiscing at the tip by recurved valves.—The calyx and broader leaves distinguish this from the following.

G. (*Chondrophyllum*) *ROBUSTA*, *King mss.*; stem ascending robust simple, cauline leaves narrowly linear connate at the base in a tubular sheath, upper crowded, flowers sessile axillary and in a dense terminal involucre head, calyx spathaceous membranous half as long as the corolla 5-toothed, teeth short subulate, corolla tubular-campanulate, lobes short triangular with a triangular fold in each sinus.

EASTERN HIMALAYA with *T. tibetica* (Herb. Calcutta).

Stem 8-12 in. *Cauline leaves* 10-12 by 1 in., thickly coriaceous, nerves obscure near the midrib; floral shorter, broader at the base. *Calyx* split to the base, teeth setaceous, and usually longer than the others. *Corolla* 1¼-1½ in. long, not spotted, rather inflated in the middle.—This may prove a variety of *G. tibetica*.

P. 118. 35 *G. detonsa*, Fries. Asa Gray has shown that *G. serrata*, Gunner, is the earlier name for this species.

P. 123. 7 *Swertia bimaculata*, H. f. & T.—The anthers of this species become hastate in age.

P. 128. To subgenus *Euswertia* of *Swertia* add:—

S. KINGII, *Hook. f. in Ic. Pl.* t. 1442; perennial-rooted, stem tall erect robust simple, leaves opposite, radical broad elliptic subacute narrowed into a broad petiole, cauline oblong-ovate ½-amplexicaul, cymes axillary and in a terminal thyrses, sepals lanceolate quite entire, corolla 2 in. diam., petals oblong obtuse with two basal pits, margins fimbriate with long hairs, filaments with a fimbriate scale at the base behind.

SIKKIM HIMALAYA; at Na Tung (Herb. Calcutta).

Rootstock crowned with long fibrous remains of old leaves. *Stem* 2 ft. high, as thick as the thumb below. *Lower leaves* 3-6 by 2-4 in., many-nerved; petiole 2-3 in., semi-amplexicaul. *Flowers* greenish-white, pedicels sometimes umbellate. *Sepals* ¾ in., one-third shorter than the corolla-lobes. *Filaments* subulate-filiform. *Ovary* narrowly oblong, stigma sessile.—Most nearly allied to *S. petiolata*, Royle.

P. 133. Order *Polemoniaceæ*; in description for ovules many, read few or many; and for capsule *septicidal*, read *loculicidal*.

P. 135. Remove 19 *Bothriospermum* from **, and place it after 16 *Rochelia* in *.

P. 167. 19 *Bothriospermum*, Bunge. In 7th line of description after scar insert basal, and erase the 4 following words. In 8th line erase large.

P. 168. Line 7th from top, erase scar, &c.

P. 176. Under *A. Griffithii*, Boiss., erase *A. echiioides*, Hook. Bot. Mag. t. 4409, not of l. c.

P. 207. For *Ipomæa Stocksii*, Clarke, read *I. Clarkei*, Hook. f.

P. 220. Under *Evolvulus* insert "*E. numularius*, Linn., is getting common about Calcutta," King.

P. 248. 37 *Wulfenia*, for stamens 4, read 2.

P. 249. Under *Phtheirospermum* erase *reticulate*. Erase 50 *Emmenospermum* and the rest of the line.

P. 250. Before 4 *Linaria* insert Tribe III. *Antirrhineæ*.

P. 253. Before 7 *Scrophularia* insert Tribe IV. *Cheloneæ*.

P. 275. In description of *Torenia*, in 6th line after appendaged insert or not.

P. 277. 5 *T. asiatica*, var. *concolor*.—This I have since seen growing, and think it may be a different species; see Bot. Mag. t. 6797 A; it is *T. rubens*, Benth. Fl. Hongk., and a native of China.

FLORA OF BRITISH INDIA.

ORDER CXVII. **CHENOPODIACEÆ.**

Herbs or shrubs. *Leaves* simple, alternate, exstipulate. *Flowers* 1-2-sexual, small, usually regular, often dimorphic; bracts 1-3, or 0. *Calyx* inferior, of 3-5 free or connate sepals, imbricate in bud. *Petals* 0. *Stamens* usually 5, opposite the sepals, perigynous or hypogynous; anthers 2-celled. *Ovary* ovoid, globose or depressed, 1-celled; stigma 2-4; ovule solitary, basal or lateral, campylotropous. *Fruit* usually a utricle enclosed in the often enlarged fleshy calyx. *Seeds* horizontal or vertical, testa crustaceous, coriaceous or membranous; albumen floury fleshy or 0; embryo curved, annular or spiral.—Genera 80; species about 520, natives of all climates.

Three genera of the Tribe *Camphorosmeæ* are so characteristic of Afghan or Soongarian vegetation, that they may be expected to occur within the Indian frontier; they are *Camphorosma*, with an unequally 3-5-toothed compressed not tubercled perianth; *Panderia*, with an equally 5-lobed tubercled perianth; and *Kirilovia* with an equally 5-toothed smooth perianth.

Suborder I. CHENOPODIÆ. *Stem* not twining. *Bracteoles* free from the perianth. *Anthers* erect or incurved in bud.

Series 1. CYCLOLOBÆ. *Embryo* annular or horseshoe-like; albumen copious (0 in *Salicornia*).

Tribe I. **Euchenopodiæ.** *Stem* not jointed. *Flowers* clustered, all similar. *Leaves* flat. *Stamens* perigynous. *Embryo* usually annular.

Utricle circumsciss	1. ACROGLOCHIN.
Utricle indehiscent. Perianth 5-partite	2. CHENOPODIUM.
Utricle indehiscent. Perianth 5-lobed, base thickened	3. BETA.

Tribe 2. **Atriplicæ.** *Stem* not jointed. *Flowers* dimorphic; ♂ ebracteolate, 3-5-lobed or parted; ♀ usually without perianth and enclosed in 2 free or connate bracts, except *Spinacia*. *Stamens* perigynous. *Testa* crustaceous or coriaceous; embryo annular.

Fl. ♀ ebracteolate. Perianth 3-4-toothed	4. SPINACIA.
Fl. ♀ bracteoles flat, edges united or not	5. ATRIPLEX.
Fl. ♀ bracteoles conduplicate, edges united	6. EUROTIA.

Tribe 3. **Camphorosmeæ.** *Stem* not jointed. *Flowers* all similar or perianth in ♀ 0. *Stamens* hypogynous. *Utricle* naked or enclosed in the unchanged perianth. *Testa* membranous, adhering to the copious albumen; embryo horseshoe-formed.

Sepals 3-5. Utricle crested above	7. AXYSIS.
Sepals 3-5, united, of ♀ 0. Utricle crested above	8. MICROGYNÆCIUM.

VOL. V.

B

D. H. HILL LIBRARY
North Carolina State College

Tribe 4. **Corispermæ.** *Stem* not jointed. *Flowers* 2-sexual. *Fruit* exserted from the perianth. *Seed* erect, compressed; testa membranous, adhering to the copious albumen; embryo annular.

Fruit unarmed, hidden by the large bracts 9. CORISPERMUM.

Tribe 5. **Chenoleæ.** *Stem* not jointed. *Flowers* all similar. *Utricle* included in the usually enlarged perianth. *Stamens* hypogynous. *Seed* usually horizontal; testa membranous or coriaceous, adhering to the scanty albumen; embryo annular.

Fruiting perianth with simple or spinescent lobes 10. CHENOLEA.

Fruiting perianth with transverse wings 11. KOCHIA.

Tribe 6. **Salicorniæ.** *Stem* fleshy, usually jointed. *Flowers* 2-sexual, immersed in cavities of the joints or between the scales of a fleshy cone. *Testa* crustaceous, fleshy or membranous.

Seed with fleshy albumen; embryo semi-annular 12. ARTHROCNEMUM.

Seed exalbuminous; embryo conduplicate 13. SALICORNIA.

Series 2. **Spirolobeæ.** *Embryo* spiral; albumen scanty or 0.

Tribe 7. **Suædæ.** *Utricle* enclosed in the simply enlarged perianth. *Stem* not jointed.

Perianth 5-lobed. Leaves linear fleshy 14. SUEDA.

Tribe 8. **Salsolæ.** *Utricle* enclosed in the transversely winged perianth. *Stem* jointed or not.

* *Seed* horizontal. *Sepals* dorsally winged.

Stem jointed 15. HALOXYLON.

Stem not jointed 16. SALSOLA.

** *Seed* vertical. *Sepals* dorsally winged or not.

Seed dorsally compressed. Stem jointed 17. ANABASIS.

Seed laterally compressed. Sepals not winged. Anthers appendaged 18. HALOCHARIS.

Seed laterally compressed. Sepals winged. Anthers simple 19. HALOGETON.

Suborder II. **Baselleæ.** *Stem* twining. *Bracteoles* 2, broad, adnate to the face of the perianth. *Filaments* straight or recurved in bud.

Filaments straight in bud. Embryo spiral 20. BASELLA.

1. **ACROGLOCHIN**, Schrad.

An erect, strict, glabrous annual. *Leaves* alternate. *Flowers* minute, sessile, clustered in the axils of short axillary cymes, subtended by needle-like flowerless branches; bracts and bracteoles 0. *Sepals* 5, subacute, green. *Stamens* 1-3, filaments dilated below. *Ovary* depressed; style short, stigmas 2 subulate; ovule erect. *Utricle* disciform, depressed, circumsciss. *Seed* horizontal, testa black shining, albumen floury; embryo annular.

A. chenopodioides, Schrad. *Cat. Hort. Gött.* 1824. A. Schradenianus, *Schultes Herb.* A. persicarioides, *Moq. in DC. Prodr.* xiii. 2. 254.

Amarantus persicarioides, Poir. *Dict. Suppl.* i. 311. *A. cauliflorus*, Link *Enum. Hort. Berol.* ii. 389. *A. diandrus*, Spreng. *Neue Entd.* iii. 20. *A. persicarioides* and *A. acroglöchin*, Spreng. *Syst.* i. 927. *Lecanocarpus cauliflorus* Nees *Pl. Hort. Bonn.* 4, t. 2. *L. nepalensis*, Fisch. *ms.* *Blitanthus nepalensis*, Reichb. *Cat. Hort. Dresd.* 1824.

WESTERN HIMALAYA; from Kashmir, alt. 8-5000 ft., to Kumaon and ? Nepal. KHASIA MTS., alt. 5-6000 ft., J. D. H. & T. T.—DISTRIB. Yunnan.

Stem 1-2 ft.; branches 0 or short, erecto-patent, strict. *Leaves* 1-2½ in., obtuse or acute, lobulate and erose; petiole ¼-1 in. *Cymes* shorter than the leaves, ½ in. long and broad, branches rigid spreading. *Flowers* about ⅙ in. diam., green.

2. CHENOPODIUM, Linn.

Erect or prostrate herbs. *Stem* angled. *Leaves* alternate, entire lobed or toothed. *Flowers* minute, 2-sexual, in axillary clusters or cymes. *Sepals* 3-5. *Stamens* 1-5. *Disk* 0. *Ovary* free, depressed or compressed; styles 2-3. *Utricle* membranous, included in the perianth. *Seed* horizontal or vertical, testa crustaceous, albumen floury; embryo annular.—Species about 50, all climates.

* *Scentless or fœtid herbs. Sepals* 5, herbaceous (not succulent in fruit). *Embryo* perfectly annular.

1. **C. album**, Linn. *Sp. Pl.* 219; erect or ascending, mealy or green, leaves rhombic deltoid or lanceolate acute or obtuse, entire toothed or irregularly lobulate, upper narrower more entire, sepals keeled covering the utricule, seed smooth keeled. *Moq. in DC. Prodr.* xiii. 2. 70; *Boiss. Fl. Orient.* iv. 901; *Wall. Cat.* 6952 (excl. most of *C.* (= *Amarantus viridis*). *C. giganteum*, Don *Prodr.* 74; *Moq. l. c.* *C. nepalense*, Hort. *Monsp.* *C. album*, Linn. *C. viride*, Linn., and *C. laciniatum*, Linn.; *Roxb. Fl. Ind.* ii. 58, 59. *C. purpurascens*, Ham., in *Wall. Cat.* 6955. ? *C. vulpinum*, *Wall. Cat.* 6954 A.

TROPICAL and TEMPERATE HIMALAYA; from Kashmir to Sikkim, ascending to 12,000 ft. (wild and cultivated), and in WESTERN TIBET to 14,000 ft. Plains of HENGAL, the GANGETIC VALLEY and the PANJAB, KHASIA MTS., cult. DECCAN PENINSULA.—DISTRIB. Ubiquitous.

Stem 1-10 ft., rarely slender or decumbent, angled, often striped green, red or purple. *Leaves* extremely variable, in the cult. forms 4-6 in. long, with the petiole sometimes as long or longer. *Clusters* in compact or lax paniced spikes, which in cult. forms become thyrsoid. *Seeds* rarely vertical.—The cultivated forms vary from green to red.

2. **C. opulifolium**, Schrad. in *DC. Fl. Franc.* v. 372; erect or ascending, mealy, leaves broadly rhombic obtuse or acute sinuate-lobed upper similar, cymes axillary lax-fld, usually shorter than the leaves, sepals keeled partially covering the utricule, seed punctulate margin rounded. *Moq. in DC. Prodr.* xiii. 2. 67; *Boiss. Fl. Orient.* iv. 901.

CENTRAL and WESTERN HIMALAYA; Nepal, Wallich; Garwhal ?, Edgeworth; Kashmir and Lahore, alt. 6-8000 ft., Clarke. WESTERN TIBET, alt. 10-14,000 ft., Thomson.—DISTRIB. Europe, N. and W. Asia.

Very near *C. album*, and not easily distinguished in the small acute-leaved form except by the seed. In the ordinary state with broad openly sinuate obtuse leaves it is distinct enough.

3. **C. hybridum**, Linn. *Sp. Pl.* 219; erect, nearly glabrous, leaves large broadly triangular ovate long acuminate with 2-4 broad acute lobes

on each side, clusters in lax axillary and terminal almost leafless corymbose panicles, sepals obtusely keeled spreading in fruit, seed horizontal large opaque pitted hardly keeled. *Boiss. Fl. Orient.* iv. 902; *Moq. in DC. Prodr.* xiii. 2. 68; *Fl. Dan.* t. 2049.

WESTERN TIBET; Ladak, alt. 12,000 ft., *Thomson*. PESHAWUR; *Stewart*.—DISTRIB. Europe, N. Africa, N. Asia, N. America (introduced).

Stout or slender, with spreading branches, 1–3 ft. high, odour heavy. *Leaves* 3–5 in., almost shining, broadly ovate, pale green, thin, 3–5-nerved from near the usually cordate base. *Clusters* large or small.

4. **C. murale**, *Linn. Sp. Pl.* 219; nearly glabrous, leaves bright-green rhombic or deltoid-ovate acute sides lobed and sharply toothed base cuneate, clusters in lax or dense axillary divaricate cymes, sepals obtusely keeled incurved in fruit, seed horizontal dotted acutely keeled opaque. *Boiss. Fl. Orient.* iv. 902; *Moq. in DC. Prodr.* xiii. 2. 69; *Fl. Dan.* t. 2048. *C. Gandhium*, *Ham.* (& *Chamrium*, *Ham.*), *Wall. Cat.* 6953. *C. Hookerianum*, *Moq. in DC. Prodr.* xii. 2. 68.

UPPER GANGETIC VALLEY and the PANJAB; *Royle, &c.* KUMAON and NEPAL; *Hamilton, &c.* DECCAN PENINSULA; at Bangalore, Coimbatore and elsewhere. CEYLON; at Trincomalee, *Glenie*.—DISTRIB. Ubiquitous.

Rather fœtid. *Stem* 6–14 in., stout or slender, erect or ascending; branches decumbent. *Leaves* $\frac{3}{4}$ –3 in. broad, rather shining; petiole long or short. *Spikes* sometimes very slender.

5. **C. glaucum**, *Linn. Sp. Pl.* 220; branches decumbent or prostrate, leaves oblong or ovate-oblong sinuate-lobed or -toothed very mealy beneath, clusters in short dense axillary spikes, sepals keeled nearly covering the utricle. *Boiss. Fl. Orient.* iv. 333; *Moq. in DC. Prodr.* xiii. 2. 72.

WESTERN TIBET; Ladak, alt. 12–14,000 ft., *Thomson*.—DISTRIB. Europe, N. and W. Asia, N. America, S. Chili, Australasia.

Much and widely branched, often succulent; stem 6–18 in., shining. *Leaves* $\frac{1}{2}$ –1 in., tip obtuse or rounded, base cuneate. *Spikes* $\frac{1}{4}$ –1 in., simple or compound; lateral flowers usually 2–4-merous, with a vertical very small seed; terminal 5-merous, with a larger often horizontal seed.

**** Strongly aromatic glandular herbs. Embryo incompletely annular.**

6. **C. Botrys**, *Linn. Sp. Pl.* 219; erect, glandular-pubescent, branches and cymes spreading and recurved, lower leaves petioled ovate or oblong deeply sinuate or lobulate upper oblanceolate more entire, cymes short axillary and in long terminal racemes, sepals glandular-pubescent enclosing the utricle, seed horizontal subglobose smooth margin obtuse. *Moq. in DC. Prodr.* xiii. 2. 75; *Boiss. Fl. Orient.* iv. 903; *Sibth. Fl. Græc.* t. 253. *C. ilicifolium*, *Griff. Notul.* iv. 337, and *Ic. Pl. Asiat.* t. 521. *C. nepalense*, *Hort. Monsp.* *Ambrosia Botrys*, *Moq. Chenop. Enum.* 37; *Dalz. & Gibs. Bomb. Fl. Suppl.* 73.

TEMPERATE HIMALAYA; from Kashmir to Sikkim, alt. 4–10,000 ft. PESHAWUR; *Stewart*. WESTERN TIBET; alt. 11–14,000 ft., a weed in fields.—DISTRIB. Europe, N. and W. Asia, N. Africa, introduced into America.

Very aromatic. *Stem* grooved and ribbed, 6–18 in. high, stout or slender. *Leaves* 1–3 in., usually oak-like, very obtuse; petiole variable. *Cymes* short, branched, flowers solitary or clustered, minute.

7. **C. ambrosioides**, *Linn. Sp. Pl.* 219; erect, puberulous and glandular, branches strict, leaves shortly petioled oblong or lanceolate obtuse

sinuate-toothed upper entire, clusters in slender axillary and terminal simple or paniced spikes, sepals enclosing the utricle, seed horizontal smooth shining margin obtuse. *Wall. Cat.* t. 6956; *Moq. in DC. Prodr.* xiii. 2. 72; *Boiss. Fl. Orient.* iv. 904; *Wight Ic.* t. 1786; *Dalz. & Gibs. Bomb. Fl. Suppl.* 73. *C. vulpinum*, *Wall. Cat.* 6954 B.

BENGAL, SILHET and the DECCAN; *Wallich, Heyne, &c.*—DISTRIB. Widely spread in the Old World, introduced into America.

Usually a tall rank aromatic much-branched plant, easily distinguished by the long slender spikes of small clusters. Wight remarks that the flowers are polygamous at Coimbatore.

*** *Scentless herbs.* *Sepals* 1-3, *succulent, baccate in fruit.* *Embryo imperfectly annular.*

8. **C. Blitum**, *Hook. f. in Gen. Plant.* 52; glabrous, erect or ascending, leaves petioled triangular hastate or deltoid and cordate acuminate deeply acutely unequally toothed, clusters sessile axillary and in terminal leafy spikes, perianth baccate not enclosing the utricle, seed vertical smooth margin obtuse. *Blitum virgatum*, *Linn. Sp. Pl.* 4; *Boiss. Fl. Orient.* iv. 905; *Moq. in DC. Prodr.* xiii. 2. 83; *Lamk. Ill.* t. 5; *Bot. Mag.* t. 276.

N.W. INDIA; Kashmir, alt. 8500 ft. WESTERN TIBET, alt. 12-14,000 ft., *Thomson, &c.*—DISTRIB. Europe, N. and W. Asia, N. Africa.

Stem 1-3 ft., rather stout, white. *Leaves* 1-3 in., bright green; petiole slender, shorter or longer than the blade. *Clusters* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. *Stamen* 1. *Seed* opaque.

3. **BETA**, *Linn.*

Succulent herbs. *Leaves* alternate, subentire. *Flowers* 2-sexual, solitary or in axillary spiked or cymose clusters. *Perianth* urceolate, 5-lobed, cohering in fruit by their enlarged hardened bases. *Stamens* 5. *Disk* fleshy, annular. *Ovary* depressed, sunk in the disk; style short, stigmas 2-4 subulate. *Utricle* adnate to the disk and base of perianth. *Seed* horizontal, testa thin, albumen floury; embryo annular.—Species 2 (or 6-8), N. Asiatic and European.

B. vulgaris, *Linn. Sp. Pl.* 222; annual or perennial, glabrous, root-leaves ovate or oblong obtuse base cuneate or cordate cauline rhombic ovate oblong obovate or lanceolate, spikes slender paniced, flowers sessile solitary or 2-3-nate, bracts narrow acute, sepals oblong obtuse thickened at the base in fruit. *Moq. in DC. Prodr.* xiii. 2. 55; *Boiss. Fl. Orient.* iv. 898; *Lamk. Encycl.* t. 182; *Grah. Cat. Bomb. Pl.* 171; *Dalz. & Gibs. Bomb. Fl. Suppl.* 73. *B. benghalensis*, *Roxb. Fl. Ind.* ii. 59; *Wall. Cat.* 6948. *B. orientalis*, *Roth Nov. Sp.* 181.

Cultivated in various parts of INDIA.

Stem 1-3 ft., erect, furrowed. Lower *leaves* 1-10 in., often trowel-shaped, base decurrent on the petiole, margin waved, upper short incurved. *Spikes* 6-18 in. slender; clusters remote. *Sepals* with membranous margins.—*Beet.*

4. **SPINACIA**, *Linn.*

Annual herbs. *Leaves* attenuate. *Flowers* diœcious, ebracteate, males in terminal leafless spikes; females in axillary clusters. MALE fl. *Sepals* 4-5, herbaceous, simple. *Stamens* 4-5, filaments capillary. FEM. fl.

Perianth subglobose, 2-4-toothed; fruiting enclosing the utricle, coriaceous, unarmed or with 2-3 dorsal spines. *Stigmas* long, filiform, connate below. *Utricle* hard, compressed, adnate to the perianth. *Seed* vertical, testa thin, albumen floury; embryo annular.—Species 4, Oriental, 2 of them extensively cultivated.

S. oleracea, Linn. *Sp. Pl.* 1027; erect, leaves deltoid ovate acuminate acutely broadly pinnatifidly lobed, fruiting perianths free. 2-spinous. *Moq. in DC. Prodr.* xiii. 2. 118; *Lamk. Encycl.* t. 814; *Grah. Cat. Bomb. Pl.* 171; *Dalz. & Gibs. Suppl.* 23. *S. tetrandra*, Roxb. *Fl. Ind.* iii. 771; *Wight Ic.* t. 818; *Wall. Cat.* 6949.

Cultivated throughout INDIA.—Native country unknown.

The *S. tetrandra* of Roxburgh is not the plant of Stevens, as M. de Candolle assumes it to be ("Origine des Plantes Cultivée," 79), but the common *S. oleracea*—which, as Boissier points out, is distinguished from *S. tetrandra* by the free fruiting perianths. Nevertheless De Candolle's suggestion that the cultivated *S. oleracea* is a derivative from the *S. tetrandra*, Stev., which is indigenous in the Caucasus, is a very reasonable one.—*Spinach*.

5. **ATRIPLEX**, Linn.

Herbs or shrubs, usually mealy. *Leaves* rarely opposite. *Flowers* monœcious or dicœcious. MALE fl. ebracteate. *Sepals* 3-5, oblong, obtuse. *Stamens* 3-5. FEM. fl. 2-bracteate; bracts flat, accrescent, dilated in fruit and forming a 2-valved covering to the utricle. *Perianth* 0. *Utricle* at the base of the greatly enlarged and hardened bracts; stigmas 2. *Seed* erect, or inverse and suspended from the funicle, rarely horizontal, testa various, albumen floury; embryo annular.—Species about 100, all temperate, cool and tropical regions.

* *Flowers* polygamous. *Seed* of the female fl. vertical, of the bisexual horizontal.

1. **A. hortensis**, Linn. *Sp. Pl.* 1053; annual, stout, erect, leaves not mealy triangular-cordate upper ovate-lanceolate, spikes axillary and in terminal panicles, fruiting bracts nearly free thin orbicular or elliptic reticulate obtuse or mucronate. *Moq. in DC. Prodr.* xiii. 2. 91; *Boiss. Fl. Orient.* iv. 907; *Grah. Cat. Bomb. Pl.* 171; *Dalz. & Gibs. Bomb. Fl. Suppl.* 73. *A. virgata*, Roth Nov. Sp. 377; *Moq. l. c.* 97. *A. bengalensis*, Lamk. *Dict.* i. 276. *A. heterantha*, Wight *Ic.* t. 1787.

Cultivated in many parts of BENGAL, the DECCAN, N.W. INDIA and up to 12,000 ft. in the WESTERN HIMALAYA and TIBET.—DISTRIB. Cultivated in Europe and N. and W. Asia.

This, the Arroche, Orache or Mountain Spinach of the French, is of unknown origin, being found only under cultivation or in cultivated ground.—A specimen of this from Heyne, in Rottler's Herbarium, bears the name *A. virgata*, thus identifying that obscure plant, which Roth described from very young individuals.

** *Annuals*, with monœcious flowers.

2. **A. crassifolia**, C. A. Mey. in Ledeb. *Fl. Alt.* iv. 309; green and hoary, erect or ascending and diffuse, branches white, leaves petioled oblong or ovate-oblong or hastately ovate obtuse entire or sinuate-toothed upper entire often acute, male clusters in slender leafless interrupted spikes, fruiting bracts rhombic-ovate or orbicular herbaceous entire or toothed with a very thick white convex smooth disk and base. *Moq. in DC. Prodr.* xiii.

2. 93; *Boiss. Fl. Orient.* iv. 909; *Lédeb. Ic. Fl. Alt.* t. 42. *A. laciniata*, *Aitchison Cat. Panjab Pl.* 125, and *Herb. Ind. Or. H. f. & T.*

N.W. INDIA and the PANJAB; from the Jumna westward. KUNAWUR and WESTERN TIBET, alt. 8–12,000 ft., *Falcener, Thomson*.—DISTRIB. Afghanistan, Turkestan, Soongaria, Altai Mts.

Branched from the root; branches firm, 1–2 ft., *Leaves* usually small, 1–1½ in., pale; petiole slender. *Fruiting-bracts* very variable, from ovate with a cuneate base to orbicular, ½–½ in. long.—I fear that this is only a dry country form of *A. laciniata*, L., with white stems, small leaves, and hardened disk of the bracts, which Boissier describes as smooth or tubercled (they are quite smooth in the Indian plant). The name seems a singularly inappropriate one.

3. *A. rosea*, Linn. ? *Sp. Pl. Ed.* 2, 1493; green, mealy, branches very many diffuse slender ascending, leaves small petioled rhombic-ovate with obtuse sides and tips entire or subsinuate, male clusters in short axillary spikes, fruiting bracts small broadly triangular-hastate or flabelliform crenate thin disk coarsely reticulate or rugose. *Schkuhr Handb.* t. 350; *Fl. Dan.* 1284; *Boiss. Fl. Orient.* iv. 911. ? *A. tartarica* β *virgata*, *Boiss l. c.* 910.

WESTERN TIBET; banks of Salt Lakes, alt. 12–14,000 ft., in Sassar, Hanle, &c., *Thomson*.—DISTRIB. (of *A. rosea*) Westward to the Atlantic.

A very slender plant; branches 4–6 in., greenish-white. *Leaves* ½–½ in., base canescent. *Bracts* about ½ in. broad or long, sometimes sinuate-lobed, sessile or contracted into a hardened pedicel.—An obscure plant.

*** *Perennials, with monœcious flowers.*

4. *A. repens*, Roth *Nov. Sp.* 377; shrubby, white, stem woody prostrate rooting, leaves small petioled oblong elliptic or suborbicular obtuse, male clusters in short branched spikes, fruiting bracts united into a thick corky obovate or orbicular turgid pouch with thin free tips contracted at the base into a stout cylindric pedicel, disk smooth or rugose. *Moq. in DC. Prodr.* xiii. 2. 99. *A. Kœnigii*, Wall. *Cat.* 6951. *A. cristata*, *Kœnig mss.* *A. Belangeri*, *Boiss. Fl. Orient.* iv. 913. *Obione Belangeri*, *Moq. l. c.* 108. *O. nummularia*, *Moq. Enum. Chenopod.* 72. *O. Kœnigii*, *Moq. l. c.* 109; *Wight Ic.* t. 1790.

DECCAN PENINSULA, *Kœnig*; Tuticoreen in Tinnevely, *Wight*. CEYLON, *Thwaites*.—DISTRIB. ? Afghanistan, Persia.

Branches woody, 1–2 ft. long, straggling or tufted and short. *Leaves* ½–1 in. long, thick, tip rounded or retuse, base cuneate; petiole very short. *Fruiting-bracts* very variable, ¼–½ in. long or broad, sometimes compressed, smooth, at others almost globose with thick processes on the surface, lips very short crenate. *Radicle* pointing upwards.—The Afghan plant has smaller bracts, but of the same corky character, and with thick cylindric pedicels.

5. *A. Stocksii*, *Boiss. Diagn. Ser.* iv. 73; shrubby, white, branches woody prostrate or suberect, leaves small petioled oblong elliptic or suborbicular obtuse, male clusters axillary or in short leafy spikes, fruiting bracts cuneate at the base only orbicular or broadly ovate and suddenly contracted into a short pedicel disk small, lips broad quite entire thin reticulate. *A. Griffithii*, var. *Stocksii*, *Boiss. Fl. Orient.* iv. 916. *A. repens*, *Aitchison Cat. Pl. Panjab* 125. *Obione Stocksii*, *Wight Ic.* t. 1789; *Dalz. & Gibs. Bomb. Fl.* 212.

SCINDE; salt marshes at Kurrachee, *Stocks, Vicary*. GUZERAT; common, *Dalz. & Gibs.*

Habit and foliage very much like *A. repens*, but leaves often larger and fruiting-bracts very different.—Boissier has made this a variety of *A. Griffithii*, which appears

to me to differ in its much larger orbicular sinuate thin leaves, and rhombic fruiting-bracts, which are corky throughout, united to the middle, and perfectly smooth. This is Moquin's type of *Griffithii*, so named by himself. Another plant of Griffith also numbered 1751 has very large orbicular fruiting-bracts nearly $\frac{3}{4}$ in. diam., with a woody veined disk, the thin margins united all round (like an *Alyssum* fruit). As for Moquin's description, it agrees with neither of these plants, and it is difficult to account for this, and for his suggestion that *A. Griffithii* may be a var. of the Australian *A. Lindleyi*.

6. **EUROTIA**, *Adeus*.

Herbs or undershrubs, woolly or tomentose. *Leaves* small, alternate, entire. *Flowers* minute, 1-sexual. MALE fl. spicate, ebracteate. *Sepals* 4, obovate, obtuse. *Stamens* 4, filaments filiform. FEM. fl. axillary, 2-bracteate; bracts conduplicate, connate with free lips, at length closing over the utricle, becoming coriaceous, veined, villous, 2-beaked, and at length splitting into 4 valves. *Perianth* 0. *Utricle* ellipsoid, compressed, membranous; stigmas 2, filiform. *Seed* sessile, free, obovoid, beaked below, testa membranous, albumen floury; embryo horseshoe-shaped.

E. ceratoides, *C. A. Meyer in Led. Fl. Alt.* iv. 239; shrubby, hoary with stellate hairs, leaves linear-oblong or lanceolate obtuse floral narrower, fruiting bracts urceolate silkily villous with long reddish hairs. *Boiss. Fl. Orient.* iv. 917; *Moq. in DC. Prodr.* xiii. 2. 120. *Axyris ceratoides*, *Linn. Sp. Pl.* *Achyranthes papposa*, *Jacq. Ic. Rar.* t. 189. *A. Moorcroftiana*, *Brown in Wall. Cat.* 6950; *Moq. l. c.* 117.

WESTERN HIMALAYA; in the drier regions from Kunawur westward, and in WESTERN TIBET, alt. 8-14,000 ft., *Moorcroft*, &c.—DISTRIB. Central Europe from Spain eastward, Afghanistan, Central Asia, Siberia, Mongolia, N.W. America.

A bush, 2-4 ft. high, stunted and dwarf at high and dry elevations; branches strict, slender, leafy, glabrous or tomentose. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., rarely ovate or elliptic, margin often recurved; petiole very short; upper sessile. *Fruiting-bracts* crowded along the upper parts of the branches conspicuous for their long silky red-brown hairs $\frac{1}{2}$ in. long.

7. **AXYRIS**, *Linn.*

Annual, stellately hairy or glabrate herbs. *Leaves* small, alternate, entire. *Flowers* minute, monœcious, ebracteate. MALE fl. in terminal clusters with 3-5 hyaline sepals, often irregularly placed, and 2-5 slender stamens. FEM. fl. axillary, solitary or mixed with the males. *Sepals* 3-4, unequal, at length scarious. *Utricle* membranous, embraced by the sepals, obovoid, compressed or spherical, tip shortly winged crested or 2-auricled, stigmas capillary very long. *Seed* erect, obovoid, adhering to the utricle, testa membranous marked with concentric lines, albumen granular; embryo horseshoe-shaped.—Species 5 or 6, N. and Central Asia, N.W. America.

A. amaranthoides, *Linn. Sp. Pl.* 979; erect, branched from the base, leaves ovate or oblong obtuse or acute. *Moq. in DC. Prodr.* xiii. 2. 116; *Lamk. Encycl.* t. 753; *Schkuhr Handb.* 285^b. *A. hybrida*, *Linn.*; *Moq. l. c.*; *Schkuhr l. c.*

WESTERN HIMALAYA; in the drier regions from Lahul to Kumaon, alt. 8-13,000 ft., and in WESTERN TIBET, alt. 10-14,000 ft., *Jacquemont*, *Strachey & Winterbottom*, *Thomson*, &c.—DISTRIB. Turkestan, Ssongaria, the Altai, Siberia, N. China.

Very variable in size, 4-10 in. high; stem stout or slender. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in.,

pale-yellowish or reddish-brown when dry; nerves faint; petiole short, slender. *A. hybrida* is, I think, only the longer branched state of *A. amaranthoides*.

Var. *humifusa*, Moq. l. c.; very small, procumbent.—Western Tibet, Thomson, Clarke. Topedunga (with *Microgynæcium*), Strachey & Winterbottom.—I suspect that the *A. prostrata* does not differ from this.

There is a fragment of an *Axyris* gathered in Lahul by the Rev. H. Jaeschke, and described as a garden weed, which has ovate obtuse leaves 1 in. long, on petioles of the same length.

8. MICROGYNÆCIUM, Hook. f., Gen. Plant. iii. 56.

A small diffuse prostrate puberulous or glabrous annual. *Leaves* alternate, petioled, ovate, entire. *Flowers* monœcious, very minute, clustered, hidden amongst the leaves. MALE fl. ebracteate. *Perianth* hyaline, 5-lobed. *Stamens* 1-4, filaments very long. FEM. fl. 2-bracteate, solitary or crowded, bracts unchanged in fruit. *Perianth* 0. *Utricle* hyaline, obliquely ovoid, turgid, compressed, covered with scattered processes, and 1-2-auricled at the top; stigmas capillary. *Seed* erect, testa coriaceous, albumen granular; embryo horseshoe-shaped.

M. tibeticum, Hook. f. l. c.

WESTERN TIBET; Topedunga, north of Kumaon, Strachey & Winterbottom. SIKKIM; at Tungu, alt. 12-14,000 ft., J. D. H.

Stem branched from the base, branches 1-2 in., slender. *Leaves* $\frac{1}{4}$ - $\frac{3}{4}$ in., green, rather fleshy, nerves indistinct; petiole half as long. *Flowers* microscopic.—A very inconspicuous plant.

9. CORISPERMUM, Linn.

Annual stiff herbs. *Leaves* alternate, rigid, 1-nerved, narrow, floral margined with white, hiding the short spikes. *Flowers* 2-sexual, ebracteolate. *Sepals* 1-3, unequal, scarious. *Stamens* 1-5, unequal. *Utricle* exerted, orbicular or oblong, compressed, hardened, margined or winged; stigmas subulate, recurved. *Seed* erect, adherent to the pericarp, testa coriaceous, albumen floury; embryo annular.—Species 8, S. Europe, N. and W. Asia, China, N.W. America.

C. hyssopifolium, Linn.; Boiss. *Fl. Orient.* iv. 930; glabrous or softly hairy, diffusely branched from the base, leaves linear or narrowly linear-obovate obtuse, spikes axillary and terminal dense or lax, bracts linear oblong green or margin white. Moq. in DC. *Prodr.* xiii. 2. 140; Sibth. *Fl. Græc.* t. 1.

WESTERN TIBET; alt. 10-15,000 ft., Falconer, Thomson.—DISTRIB. S. France, Caucasus, Soongaria to China.

Branches 6-10 in., rigid, stout or slender. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., thick, green, usually obtuse and apiculate. *Spikes* 3-6 in., continuous with the branches; bracts laxly or closely imbricate, $\frac{3}{4}$ -1 in. long, oblong-lanceolate, acute, coriaceous. *Utricle* oblong, shining, winged all round.

10. CHENOLEA, Thunb.

Tomentose, silky or villous herbs or shrubs. *Leaves* alternate, narrow, entire. *Flowers* minute, axillary, 2-sexual and female, immersed in wool, ebracteate. *Perianth* with 5 incurved lobes, at length closing over the utricle, with the lobes usually tubercled or spinous at the back. *Stamens* 5. *Utricle* membranous, included in the crustaceous or coriaceous perianth; stigmas 2-3, capillary. *Seed* orbicular, horizontal, testa thin, albumen

scanty; embryo annular.—Species 20, S. Europe, N. Africa, Temp. Asia, Australia, with one N. American and one S. African.

1. ***C. divaricata***, *Hook. f.*; annual, erect, excessively branched from the base and upwards, softly rufous villous, leaves linear obtuse, fruiting perianth with 5 acute dorsal straight spines about as long as the diameter of the disk. *Echinopsilon divaricatus*, *Kar. & Kiril. in Bull. Soc. Hist. Nat. Mosq.* 736. *E. tibeticus*, *Herb. Ind. Or. H. f. & Thoms.*

WESTERN TIBET; alt. 11–14,000 ft., *Thomson, &c.*—DISTRIB. Soongaria, W. China.

Whole plant clothed with long soft spreading hairs. *Stem* 4–15 in., stout, straight in well-developed specimens, sometimes as thick as a goose-quill, very leafy, striped green and white; branches innumerable, forming a pyramidal mass. *Leaves* $\frac{1}{2}$ –1 $\frac{1}{2}$ in. long, soft, mottled green and white (when freed of hairs). *Clusters* of flowers axillary. *Perianth* minute; sepals short, villous. *Stamens* as long as the sepals. *Utricle* depressed; styles 2, filiform.

2. ***C. ? sedoides***, *Hook. f.*; annual, tall, slender, erect, hoary-tomentose or glabrate, branches ascending very slender, leaves fleshy semiterete green some filiform others oblong and minute glabrous or the upper villous, clusters 2–3 fld. in long slender spikes shorter than the floral leaves, perianth villous, fruiting with conical spines equalling the diameter of the disk or shorter often unequal. *Kochia sedoides*, *Schrad. Neue Journ.* 1809, 86; *Boiss. Fl. Orient.* iv. 926. *Echinopsilon sedoides*, *Mog. in Ann. Sc. Nat. Ser.* 2. 127, and in *DC. Prodr.* xiii. 2. 136. *Salsola sedoides*, *Pall. Voy.* 280, t. 41, f. 2. *S. cinerea*, *Waldst. & Kit. Pl. Hung.* ii. 110, t. 106. *Suaeda sedifolia*, *Pall. Illust.* t. 32, 33, 34.

SCINDE, *Stocks*.—DISTRIB. Siberia, Soongaria, Caucasus to Bulgaria.

The specimens are flowerless, but seem to belong to this species. *Stem* white. *Leaves* $\frac{1}{5}$ – $\frac{1}{4}$ in., often gibbous at the base below, then at the tips of the branches longer and villous with tawny hairs, but for which the plant might be taken for a *Suaeda*.

11. **KOCHIA**, *Roth.*

Villous or pubescent rarely glabrous undershrubs or herbs. *Leaves* alternate, sessile, narrow, entire. *Flowers* minute, 2-sexual and female, axillary, ebracteate. *Perianth* subglobose, lobes 5 incurved, fruiting closing over the utricle coriaceous girt by 5 free or confluent horizontal wings. *Stamens* 5; anthers large, exserted. *Utricle* depressed, membranous; style slender, stigmas 2–3 capillary. *Seed* orbicular, horizontal, testa membranous, albumen scanty; embryo annular.—Species 20, S. Europe, Temp. Asia, N. and S. Africa, Australia, N.W. America.

* *Perennials*:

1. ***K. prostrata***, *Schrad. Neue Journ.* 1809, 85; a villously pubescent low undershrub with a very stout woody rootstock, branches slender erect or spreading, leaves flat linear subacute, clusters in long leafy spikes, wings of fruiting perianth subquadrate hard and scarious strongly nerved crenate about equalling the diameter of the disk. *Boiss. Fl. Orient.* iv. 923; *Mog. in DC. Prodr.* xiii. 2. 132. *Salsola prostrata*, *Linn.*; *Jacq. Fl. Austr.* t. 294. *Chenopodium Augustanum*, *All. Fl. Pedem.* ii. 198, t. 38, f. 4.

WESTERN HIMALAYA; in the dry regions of Kunawur and Zanskar; and in WESTERN TIBET, alt. 10–14,000 ft., *Thomson, &c.*—DISTRIB. Westwards to Spain and N. Africa, Siberia, Central Asia.

Rootstock as thick as the thumb; branches very numerous, 6-10 in., as well as the leaves and flowers densely fulvous-villous. *Leaves* $\frac{1}{2}$ - $\frac{1}{4}$ in., nerveless. *Spikes* slender. *Fruiting-calyx* $\frac{1}{2}$ - $\frac{1}{4}$ in. diam., margins of adjacent wings approximate.

** *Annuals* (always?).

2. ***K. odontoptera***, Schrenk in *Bull. Acad. Petersb.* i. 361 (1843); annual, diffusely branched from the base, densely tomentose, leaves small short flat linear acute, clusters in long or short simple or branched leafy spikes, wings of fruiting perianth cuneate or flabellate scarious strongly nerved crenate-lobed about equalling the diameter of the disk. *Boiss. Fl. Orient.* iv. 924. *K. stellaris*, *Belang. Voy. Or. Ic. ined.* *K. odontoptera* & *K. stellaris*, *Moq. Enum. Chenopod.* 93, and in *DC. Prodr.* xiii. 132. *Panderia pilosa*, *Herb. Ind. Or. H. f. & T. in part.*

WESTERN TIBET, alt. 8-12,000 ft., Thomson.—DISTRIB. Afghanistan, Turkestan, Persia.

Root sometimes as thick as the finger and possibly perennial; branches long or short, slender; pubescence closer and paler than in *K. prostrata*; leaves much shorter, $\frac{1}{2}$ - $\frac{1}{4}$ in. long; wings of fruiting perianth narrower, contracted at the base, the margins of adjacent ones distant.—I follow Boissier in identifying this with Schrenk's *K. odontoptera*.

3. ***K. scoparia***, Schrad. *Neue. Journ.* 1809, 85; annual, glabrous or pubescent, strict, erect, leaves green linear-lanceolate acute, clusters in leafy-panicked spikes, wings of the fruiting perianth short semicircular scarious nerved entire shorter than the diameter of the disk. *Boiss. Fl. Orient.* iv. 925; *Moq. in DC. Prodr.* xiii. 2. 130. *Chenopodium scoparia*, *Linn.*

NORTH-WEST INDIA, Royle, Jacquemont.—DISTRIB. N. and Central Asia to Japan and westward to Spain.

A tall herb, 3-5 ft.; branches erect and stem white smooth, usually glabrous, the ultimate twigs pilose or villous. *Leaves* 1-1 $\frac{1}{2}$ in., midrib distinct. *Fruiting-perianth* described as being very variable.—The characters given above apply to the only Indian specimen I have seen; it is Royle's, and without particular locality; others have the wings reduced to a short acute tubercle, or are quite simple.

4. ***K. indica***, Wight *Ic. t.* 1791; annual? softly villous, diffusely branched from the base, branchlets divaricate long, leaves small elliptic or linear-oblong acute, wings of fruiting perianth short broadly triangular-ovate obtuse thick nerveless much shorter than the diameter of the disk. K. Griffithii, Bunge in *Boiss. Fl. Orient.* xiii. 2. 924. *Panderia pilosa*, *Herb. Ind. Or. H. f. & T. in part.*

NORTH-WEST INDIA, from Delhi to the Indus, common. DECCAN PENINSULA salt soils at Coimbatore, Wight.—DISTRIB. Afghanistan.

Branches of this closely resemble long ones of *K. prostrata* in hairiness, &c., but the habit is much more straggling, the plant is apparently annual, and the wings of the fruiting perianth are very different. Wight states that the flowers are sometimes male only, and I think it probable that fertile males are on different plants from the female or hermaphrodite. Boissier observed that Wight's plant is the same as *Griffithii*, but was unaware that Wight had published it. The Panjab plant distributed under "*Herb. Ind. Or. H. f. & T.*" as *K. scoparia*, is, I think, rather referable to *K. indica*.

XII. **ARTHROCNEUM**, Moq.

Fleshy leafless jointed shrubs or herbs. *Flowers* minute, 2-sexual, 2-3 together in the axils of the scales of sessile cone-like spikes, 2-bracteate.

Perianth obpyramidal, 3-4-gonous. *Stamen* 1. *Utricle* compressed, membranous; stigmas 2-3. *Seed* inverse, compressed, testa membranous, albumen fleshy; embryo dorsal, comma-shaped, radicle stout inferior.—Species 7 or 8, of temperate and tropical saline places.

1. **A. indicum**, *Moq. Chenopod. Enum.* 113, and in *DC. Prodr.* xiii. 2. 151; stem prostrate woody, branches short diffuse ascending, joints $\frac{1}{4}$ – $\frac{1}{3}$ in. diam., spikes cylindric broader than the joints, floral joints very short hardly 2-lipped concealing the flowers. *Ung. Sternb. in Atti Bot. Congr. Firenz.* 1874, 282; *Dalz. & Gibs. Bomb. Fl.* 212. *Salicornia indica*, *Willd. in Nov. Act. Hist. Nat.* ii. 3, ex *Vahl Enum.* i. 10; *Wight Ic.* t. 737; *Roxb. Fl. Ind.* 185, and *Ed. Carey & Wall.* i. 84; *Grah. Cat. Bomb. Pl.* 171.

BENGAL; in salt marshes, *Roxburgh*. NORTHERN CERCARS, *Wight*. BOMBAY, *Graham*, &c.—DISTRIB. Trop. Africa.

Stems several feet long, branches opposite and alternate, 1-3 in. high; joints $\frac{1}{6}$ – $\frac{1}{3}$ in. long, mouth slightly dilated. *Spikes* $\frac{1}{2}$ –1 in. long, joints $\frac{1}{6}$ in. deep, cup-shaped, closely imbricate, fruiting very spongy with thin margins. *Fruiting-perianths* 3 together, shorter than the cup-shaped joints, closely appressed, laterally compressed spongy, gibbous towards the axis of the spike, flat towards the cup; top broadly truncate with a minute hole for the protrusion of the stigmas. *Stamens* not seen. *Utricle* adnate to the perianth, ovoid, compressed, indurated. *Seed* free, erect, orbicular, testa membranous; embryo and albumen of the genus.

2. **A. ?glaucum**, *Ung. Sternb. in Atti Bot. Congr. Firenz.* 1874, 283; shrubby, densely branched, joints $\frac{1}{6}$ – $\frac{1}{8}$ in. diam., spikes hardly stouter than the branches, floral joints not closely imbricate, fruit exposed. *Boiss. Fl. Orient.* iv. 932. A fruticosum, *var. glaucum*, *Moq. in DC. Prodr.* xiii. 2. 151.

DECCAN PENINSULA, *Herb. Wight (Kew Distrib. No. 2474, 2475)*. CEYLON, *Thwaites*.—DISTRIB. Mediterranean, W. Asia, Trop. Africa.

Apparently tall, stem below as thick as the little finger; branches many, erect or ascending, slender. *Male flowers* (in threes, consisting of 3 stamens each in a membranous perianth?). *Female spikes* about as long as broad, obscurely 2-lipped. *Utricle* flagon-shaped, enclosed in the broadly ovoid spongy perianth, which has a minute hole for the protrusion of the stigmas. *Seeds* orbicular, testa black thinly crustaceous; embryo and albumen of the genus.—I am not quite sure as to the structure, &c., of the male flowers (No. 2474), and am doubtful as to its distinctness from *A. fruticosum*. It is, I think, monœcious.

XIII. **SALICORNIA**, Linn.

Herbs or shrubs with the habit of *Arthrocnemum*, but with the flowers sunk in cavities of the joints. *Perianth* obpyramidal, 3-4-toothed, fruiting spongy. *Stamens* 1-2. *Utricle* included in the spongy perianth, membranous; stigmas subulate. *Seed* erect, compressed, testa hispid with hooked hairs, albumen 0; embryo conduplicate, radicle inferior parallel to the folds of the cotyledons.—Species 8, temperate and tropical.

S. brachiata, *Roxb. Fl. Ind.* i. 84, and *Ed. Wall. & Carey*, i. 82; perennial erect with diffuse opposite rather slender branches, joints stout shortly bifid, lobes rounded, spikes slender cylindric. *Wall. Cat.* 6941; *Wight Ic.* t. 738; *Moq. in DC. Prodr.* xiii. 2. 145; *Ung. Sternb. in Atti Bot. Congr. Firenz.* 1874, 304. *Arthrocnemum indicum*, *Thwaites Enum.* 246.

BENGAL; in salt marshes, *Roxburgh*. TANJORE, *Wight*. CEYLON, north of the island, *Thwaites*.

Stem woody, 12-18 in., thick at the base, much branched; branches about $\frac{1}{2}$ - $\frac{1}{4}$ in. diam.; lobes of joints with (when dry) membranous margins. *Flowers* 3-nate. *Stamen* 1. *Utricle* ovoid, subacute, styles distinct. *Testa* thinly coriaceous; embryo hooked, both ends pointing downwards.—Moquin erroneously cites Nepal as a habitat, and suggests its not being distinct from *S. herbacea*, which it does not resemble. Roxburgh describes the perianths as flask-like, fleshy, with a longitudinal slit for the exertion of stamens and styles, and as adhering together firmly and to the joints till the seed is ripe.

XIV. **SUÆDA**, Forsk.

Herbs or shrubs. *Leaves* fleshy, terete, rarely flattish. *Flowers* minute, axillary, usually 2-sexual, bracteate and 2-bracteolate. *Perianth* short, 5-lobed or -partite; lobes or segments equal or unequal, simple or gibbous or subwinged. *Stamens* 5, short. *Utricle* included, membranous or spongy; stigmas 2-5, minute, subulate, recurved. *Seed* erect, oblique or horizontal, testa crustaceous or coriaceous, albumen scanty or 0; embryo plano-spiral.—Species about 40, in saline shores and deserts.

Many annual species have dimorphic flowers; viz. summer ones with albuminous seeds and crustaceous testa, and autumnal ones with larger almost exalbuminous seeds and a membranous testa. I am far from sure that I have correctly determined the names and synonymy of the Indian species.

* *Perennials*. *Styles* usually 3-5, rarely 2.

1. ***S. fruticosa***, Forsk. *Fl. Æg. Arab.* 70; suberect or decumbent, branches erect or divaricate, leaves $\frac{1}{2}$ -terete linear or ellipsoid obtuse floral very short, spikes slender leafy, flowers axillary solitary or 2-3-nate, 2-sexual, fruiting perianth subglobose segments obtuse incurved, styles 3 short, seed vertical or horizontal, testa black shining. *Boiss. Fl. Orient.* iv. 939; *Moq. in DC. Prodr.* xiii. 2. *Salsola fruticosa*, Linn.; *Grah. Cat. Bomb. Pl.* 17; *Engl. Bot. t.* 635; *Cav. Ic. t.* 285; *Sibth. Fl. Græc. t.* 255. *S. indica*, Wall. *Cat.* 6946 C. *S. Lana*, Edgew. in *Hook. Journ. Bot.* ii. (1840) 286; *Moq. l. c.* 190.

NORTH-WEST INDIA; from Delhi, and throughout the Panjab, westward to the Indus, common in the plains.—DISTRIB. Westward to the Atlantic, Africa and America.

Stem and branches usually slender. *Leaves* very variable, $\frac{1}{2}$ - $\frac{1}{4}$ in. long.—I have seen no specimen of Edgeworth's *Salsola Lana*, which I assume from his description and locality to be *S. fruticosa*. Bunge, according to Boissier (*Fl. Or.* iv. 950, under *Haloxylon recurvum*) refers it to *Schoberia indica*.

2. ***S. monoica***, Forsk. *Fl. Æg. Arab.* 70; shrubby, branches suberect, leaves linear flattish obtuse, spikes leafy paniced, flowers axillary 2-3-nate polygamous, bracts minute scarious entire, fruiting perianth obovate-oblong lobes obtuse incurved, styles 2-5 short, seed vertical, testa black shining. *Boiss. Fl. Orient.* iv. 940; *Moq. in DC. Prodr.* xiii. 2. 156; *Wight Ic. t.* 1792. *S. nudiflora*, Thwaites *Enum.* 246.

SOUTH DECCAN; on the sea coast at TINNEVELLY, and Tuticorin, *Wight*. CEYLON, *Moon*, &c.—DISTRIB. Arabia, Trop. Africa.

I am in great doubt about this Indian plant, which in a dry state is difficult to distinguish from *S. fruticosa* and *vermiculata*. Boissier, l. c. 940, says that Thwaites' *S. indica* is *S. monoica*, but Thwaites quotes *Wight Ic. t.* 1796, which has densely crowded flowers (not 2-3 together as Boissier describes). Boissier (under *S. fruticosa*) further says that all the specimens he has seen of *S. indica*, Willd., are referable to *S. fruticosa* or *monoica*. The plant I have here called *monoica* is *Wight's t.* 1792;

it has a longer fruiting-perianth than *S. fruticosa*, which is very shortly lobed, and the bracts are smaller and more entire; it is also more erect.

3. *S. nudiflora*, *Mog. in Ann. Sc. Nat. Ser. xxiii.* 316, and in *DC. Prodr.* xiii. 2. 155; stem woody diffusely branched, leaves semiterete obtuse ellipsoid or the lower linear or obovate-oblong, bracts hyaline toothed often forming persistent stellate tufts, flowers crowded in dense globose clusters forming leafless spikes polygamous, fruiting perianth obovoid lobes short, styles 3, seed erect, testa crustaceous black. *Dalz. & Gibs. Bomb. Fl.* 213. *S. indica*, *Mog. l. c.*; *Wight Ic. t.* 1796; *Thwaites Enum.* 246; *Dalz. & Gibs. l. c.* *Wall. Cat.* 6946 A. *Salsola nudiflora*; *Willd. Sp. Pl.* ii. 1313; *Roxb. Fl. Ind.* ii. 60; *Grah. Cat. Bomb. Pl.* 270. *S. fruticosa*? *Wall. Cat.* 6944. *S. elata*, *Wight in Wall. Cat. l. c.* *Chenopodium prostratum*, *Roxb. mss.*

On the sea coast; BENGAL, BOMBAY, the DECCAN and CEYLON.

I retain this species with much hesitation, suspecting that it is a form of *S. monoica*, Forsk., or *S. vermiculata*, Forsk. It is evidently a common coast plant; and there is a good figure of it in Roxburgh's *Icones*, with the mss. name of *Chenopodium prostratum*, by which it is by inadvertence alluded to (under *S. indica*) in Roxburgh's *Flora* (ii. 62). The stellate tuft of toothed bracts left at the axils of leaves after the fruiting perianths have fallen away, is often a very-marked character, as are the leafless spikes of confluent globose many-fl. clusters.

** *Annuals. Styles 2.*

4. *S. maritima*, *Dumort. Fl. Belg.* 22; erect, glaucous green, glaucous, branched usually from the base, leaves linear or filiform semiterete floral very small, clusters of flowers minute in very slender spikes, fruiting perianth depressed lobes rounded covering the utricle, styles long slender, seed usually horizontal. *Boiss. Fl. Orient.* iv. 941; *Trimen in Journ. Bot.* xxiii. (1885) 173. *S. nudiflora*, *Mog. in DC. Prodr.* xiii. 2. 155. *Chenopodium maritimum*, *Linn.*; *Engl. Bot. t.* 633; *Fl. Dan.* t. 489. *Schoberia maritima*, *C. A. Mey. in Ledeb. Fl. Alt.* i. 400. *Chenopodium maritima*, *Mog. l. c.* 161. *C. indica*, *Wight l. c. t.* 1793. *Salsola salsa*, *Jacq. Hort. Vind.* iii. 44, t. 83. *S. indica*, *Willd. Sp. Pl.* i. 1317, ex *Roxb. Fl. Ind.* ii. 62; *Wall. Cat.* 6946 F; *Grah. Cat. Bomb. Pl.* 170. *S. nudiflora*, *Wall. Cat.* 6945. *S. sativa*, *Wight in Wall. Cat. l. c.*

UPPER GANGETIC PLAINS; Delhi, *Clarke*. Sea coast of BENGAL, BOMBAY, the DECCAN and CEYLON.—DISTRIB. Siam, Europe, N. Africa, N. and W. Asia, N. America.

This appears to be the European plant, though apparently sometimes becoming woody, if not shrubby. Roxburgh indeed describes it as a perennial, but his figure is that of an annual. Graham states that it is universally eaten and an essential article of food during famines. Wallich's (not Willdenow's) *Salsola nudiflora* is a common state with the floral leaves shorter than the clusters. *Trimen* (l. c.) describes as an erect variety of *S. maritima*, a plant with slender ascending branches and very short leafy bracts, which is found in salt pans in Ceylon with *S. nudiflora* & *indica*, adding that it is not the *S. indica* of *Wight Ic. t.* 1793. I have no material for ascertaining what it is.

5. *S. corniculata*, *Hook. f. in Gen. Pl.* iii. 67; slender, small, diffusely branched from the base, leaves $\frac{1}{4}$ in. oblong or linear-oblong obtuse floral ovate, flowers very minute 2-3-nate axillary unisexual?, perianth turbinate fleshy lobes gibbous behind or two produced into rounded vertical wings, utricle orbicular membranous adherent to the perianth, seed vertical or horizontal not or hardly beaked some subglobose with thinly coriaceous pale testa, others lenticular with black crustaceous testa. *Schoberia corniculata*,

C. A. Mey. in Ledeb. Fl. Alt. i. 399, and Ic. Fl. Ross. t. 195; Moq. in DC. Prodr. xiii. 2. 166.

WESTERN TIBET; Parang Valley and Hanle Plains, alt. 14–15,000 ft., Thomson.—DISTRIB. Soongaria, Siberia.

Glaucous; branches 4–8 in., spreading and ascending, white. *Leaves* scattered or crowded, pale when dry. *Bracts* microscopic, jagged. *Flowers* extremely minute; perianth fleshy but thin.—The black seeds occur indiscriminately amongst the pale.

6. ***S. microsperma***, *Ledeb. Fl. Ross. iii. 785*; diffusely branched from the base, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. linear-oblong obtuse flattish floral oblong, flowers very minute 2–5-nate axillary 2-sexual, perianth subglobose lobes equal rounded obscurely tubercled in fruit, utricle orbicular membranous adherent to the perianth, seed vertical or horizontal orbicular with a long beak, testa thinly coriaceous pale. *Boiss. Fl. Orient. iv. 943.* *Schoberia microsperma*, *C. A. Mey. in Eichw. Pl. Casp. Cauc. 14, t. 13.* *Chenopodina prostrata & parviflora*, *Moq. in DC. Prodr. xiii. 2. 163, 165.* *C. pygmæa*, *Moq. ? Herb. Ind. Or. H. f. & T.*

WESTERN TIBET; banks of the Indus, and of Lake Thogji Chumo, alt. 13–15,500 ft., Thomson; Lake Pangong, *H. Strachey*.—DISTRIB. Siberia, Lake Aral, Soongaria.

This appears to me to be very near *S. corniculata*, having the same structure and minute size of perianth seed, &c., but the perianth is globose without the gibbosities of that plant, and the seed has the radicular end produced into a long beak. *S. microsperma* is described as having a black shining testa, which I do not find in either the Tibetan or Soongarian specimens, and it is reasonable to suppose that the seeds are dimorphic in this as in *S. corniculata*.

15. **HALOXYLON**, Bunge.

Shrubs or small trees with opposite jointed branches. *Leaves* opposite, triangular and very short, or longer and terete. *Flowers* small solitary or spicate, axillary, 2-sexual; 2-bracteolate. *Sepals* 5, concave, accrescent and horizontally winged. *Stamens* 5 or fewer, on the margin or base of a cupular disk with alternating rounded or square staminodes. *Utricle* globose or depressed, enclosed in the perianth; stigma 2-lobed or stigmas 3–4 recurved. *Seed* horizontal, testa membranous, albumen 0; embryo plano-spiral.—Species 8–10, S. Europe, W. and Central Asia, Indian.

This genus might be united to *Anabasis*, differing only in the position of the seed.

* *Leaves distinct.*

1. ***H. recurvum***, *Bunge in Boiss. Fl. Orient. iv. 949*; tall, glabrous, pruinose, dark brown, paniculately branched, branches divaricate, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. trigonous or semiterete ovate-subulate or ellipsoid obtuse or acute, floral about equalling the axillary flowers, stigma obtuse or obscurely 2-lobed, fruiting sepals with large erect ovate obtuse lips and orbicular erose scarious wings. *H. recurvum* & *H. Stocksii*, *Hook. f. in Gen. Pl. iii. 70.* *Caroxylon recurvum*, *Moq. in DC. Prodr. xiii. 2. 175.* *C. indicum*, *Wight Ic. t. 1794.* *Salsola Stocksii*, *Boiss. Diagn. Ser. 2. iv. 75.* *S. Lana*, *Stocks mss.* *S. recurva*, *Wall. Cat. 6943.*

The WESTERN PANJAB PLAINS and SALT RANGE, ascending to 2500 ft., *Edgeworth, Stewart.* SCINDE, *Stocks.* SOUTH DECCAN PENINSULA; Coimbatore, *Wight.* BURMA; banks of the Irawaddi, *Wallich.*—DISTRIB. Afghanistan, Yunnan.

A straggling bush, blackish when dry, several feet high with long spreading

strict or recurved branches a foot long or less, ending in strict spikes 2-6 in. long; joints of stem $\frac{1}{2}$ - $\frac{3}{4}$ in. apart, of spikes $\frac{1}{2}$ in. or less. *Sepals* obtuse; fruiting perianth $\frac{1}{2}$ in. diam. *Style* elongate. *Staminodes* rounded.—The Scinde specimens have more fleshy and obtuse leaves; most of the Coimbatore and all the Panjab ones are very robust with strict branches; the Burmese ones and one of the Coimbatore are much more slender with recurved branches. In the "Genera Plantarum" I proposed the name *S. Stocksii* for the Scinde specimens, regarding them as distinct from the Burmese by their much stouter habit and thicker obtuse leaves, but more copious specimens from all the localities have convinced me that all are forms of one variable plant. Boissier gives Beluchistan as the locality for Stocks's specimens, but those in the Kew and Wight's Herbaria are from Scinde.

2. **H. Thomsoni**, *Bunge in Boiss. Fl. Orient.* iv. 950; a dwarf hoary pale puberulous much-branched shrub, leaves $\frac{1}{2}$ - $\frac{1}{3}$ in. linear terete obtuse floral shorter and small rounded bracteoles villous in the axils, flowers often densely crowded, fruiting sepals with very short rounded tips and orbicular or subreniform scarious entire wings, stigmas 2 linear-oblong. *H. Griffithii*?, *Herb. Ind. Or. H. f. & T.* (not of Boissier).

WESTERN TIBET; alt. 10-14,000 ft., *Falconer, Thomson*. Shigar Valley, alt. 7-8000 ft., *Clarke, Bellew*.

Rootstock short, stout, woody, sending up many branches 4-10 in. high; branches woody below, rather slender, glaucous; branchlets divaricate, rather slender, joints 1 in. or less. *Flowers* 2-3-nate or in globose clusters which are broader than the floral leaves. *Perianth* $\frac{1}{10}$ in. long in flower, in fruit $\frac{1}{2}$ in., wings brown. *Ovary* laxly woolly.—Very near *C. Griffithii*, but the leaves are always developed, and there are only 2 stigmas.

Var. gracillima; 12-18 in. high, extremely slender, paniculately branched, flowers more distant subsolitary.—*Iskardo*, alt. 8000 ft., *Clarke*. In flower only.—Habit much more slender, but the flowers are identical.

** *Leaves reduced to the dilated tips of the joints.*

3. **H. salicornicum**, *Bunge in Boiss. Fl. Orient.* iv. 949; a low erect strict pale almost leafless shrub, joints produced into two very short triangular points woolly within, spikes long erect, bracteoles ovate axils woolly, fruiting sepals with very short obtuse tips and flabelliform scarious white crenate wings, stigmas subclavate. *Caroxylon salicornicum*, *Moq. in DC. Prodr.* xiii. 2. 174.

SCINDE; *Stocks* (in *Herb. Dalzell*).—DISTRIB. Beluchistan, Afghanistan.

Stem woody, 1-2 ft. high; branches erect or ascending, terete; joints of stem $\frac{1}{2}$ in., of branches about $\frac{1}{4}$ in., of spikes shorter. *Fruiting-perianth* about $\frac{1}{2}$ in. diam., tips of sepals with membranous margins, wings often irregularly developed.—Possibly the specimen in Dalzell's Herbarium is from Beluchistan, though marked Scinde; it is in flower only.

4. **H. multiflorum**, *Bunge in Boiss. Fl. Orient.* ix. 949; a low erect pale much-branched almost leafless shrub, joints produced into two very short rounded tips, spikes short, bracteoles orbicular concave, sepals very short obtuse, fruiting sepals with very short obtuse tips and orbicular cordate or flabellate scarious wings, stigmas lanceolate. *Anabasis multiflora*, *Moq. in DC. Prodr.* xiii. 2. 212.

NORTH-WESTERN PANJAB PLAINS, and the SALT RANGE, ascending to 2000 ft., *Stewart*.—DISTRIB. Afghanistan.

Closely allied to *H. salicornicum*, but much lower, 4-6 in. high, with a very stout woody stem and almost fascicled branches; the leaves and bracteoles are much broader, not woolly, the spikes shorter, and fruiting perianth larger, $\frac{1}{2}$ in. diam.

16. **SALSOLA**, Linn.

Herbs or shrubs; branches not jointed. *Leaves* usually alternate, sessile, often short and pungent. *Flowers* small, solitary or fascicled, axillary, 2-sexual, 2-bracteolate. *Sepals* 4-5, concave, fruiting accrescent usually horizontally and broadly winged above the middle, completely embracing the utricle. *Stamens* 5 or fewer, usually hypogynous. *Utricle* ovoid or orbicular, fleshy or membranous; stigmas 2-3, subulate or linear. *Seed* usually horizontal, testa membranous, albumen 0; embryo spiral.—Species 40, Europe, N. and S. Africa, Temp. Asia, Australia, N. America.

* *Annual spinescent herbs. Leaves ovate-subulate or linear.*

1. **S. Kali**, Linn.; Boiss. *Fl. Orient.* iv. 954; pubescent, scabrid or glabrous, diffusely branched from the base, branches stout rigid, leaves short subulate-lanceolate from a $\frac{1}{2}$ -amplexicaul base thick rigid pungent, flowers 1-3 together axillary or subspicate, bracts and sepals subequal pungent, fruiting perianth cartilaginous base rounded, wings obovate orbicular or reniform scarious sometimes obsolete. *Moq. in DC. Prodr.* xiii. 2. 187. ? *S. Jacquemontii*, *Moq. l. c.* 188.

NORTH-WESTERN PANJAB; Peshawur, Stewart. WESTERN TIBET, alt. 12-14,000 ft., Thomson, &c.—DISTRIB. Westward to the Atlantic, N. Asia, N. and S. Africa, Australia, N. America.

Usually glaucous; stem 6-18 in. rarely erect, and branches soft and pithy within, striped green and white. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., spreading and recurved. *Fruiting-perianth* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., transparent, often rose-coloured. *Seed* adherent to the utricle.

2. **L. collina**, C. A. Mey. in Led. *Fl. Alt.* i. 393; erect or decumbent, simple or branched, protean in habit and foliage, glabrous or hispid, leaves ovate rigid or broadly subulate or linear and flaccid tip pungent base $\frac{1}{2}$ -amplexicaul, floral similar much longer than the bracts, flowers 1-3 axillary, perianth membranous, sepals lanceolate equal or unequal, fruiting dimorphic, either little changed and adnate below to and enclosed within the hardened and thickened bases of the floral leaf, bracts and bracteoles, or with the the bracts, &c., unchanged and the sepals becoming broadly equally or unequally winged. *Moq. in DC. Prodr.* xiii. 2. 188; *Pall. Ill. Pl.* 34, t. 26; *Ledeb. Fl. Ross.* iii. 800.

KUNAWUR, Herb. Royle. WESTERN TIBET, alt. 12-15,000 ft., common, Thomson, Clarke.—DISTRIB. S. Russia; Siberia, Soongaria.

A most puzzling plant, usually smaller in all its parts than *L. Kali*, so variable in habit that it is difficult to believe that the various Tibetan forms are referable to one species. The originally described form, well figured by Pallas, has diffuse stiff branches uniformly clothed throughout with imbricating ovate-lanceolate appressed coriaceous green leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. long, with white margins and 1-2 flowers in the axils of each, with ovate erect pungent bract and bracteole; its exact counterpart occurs in Tibet. The greatest contrast to this is a strict erect simple or branched form, with scattered distant spreading cylindric or filiform flaccid leaves an inch long, and axillary flowers sunk in the hardened nut-like connate bases of the leaf bracts and bracteoles. Another form is 6-14 in. high, erect, with green striped stout stem and branches, and rigid-spreading or recurved or flexuous spinescent linear or lanceolate leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. long. Another has stout branches spreading on the ground, with filiform leaves $1\frac{1}{2}$ in. long. Another form has dense squarrose tufts of branches beset closely with rigid subulate recurved imbricating leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. long. The perianth is as variable as the habit and foliage: when the perianth becomes winged, it is rarely regularly so; when the bases of the bracts, &c., become indurated round the flower, the sepals rarely

become winged; their indurated bases vary from $\frac{1}{2}$ – $\frac{1}{4}$ in. long, are pale and smooth, rounded and often gibbous, or bigibbous below; they are very thick and woody; they occur on the same plant with the normal fruiting-bracts. Ledebour notices a similar condition of *S. Kali* as *lusus nodiflora* (Fl. Ross. iii. 799). He regards *collina* as a species between *S. Kali* & *tamariscinum*, differing from *Kali* in the bracts being never rigidly spinescent, and the fruiting perianth being always membranous below, and from both in the minute perianth wings: these distinctions altogether break down in Tibetan and other examples of *S. collina*.

** *Unarmed shrubs. Leaves minute subglobose.*

3. *S. foetida*, Del. Fl. Ægypt. 57; a stout hoary pale excessively branched shrub with stout stem and filiform crowded branchlets clothed with uniformly minute subglobose fleshy leaves, floral leaves imbricate rather longer, forming short spikes, bracteoles like the leaves, fruiting perianth minute ($\frac{1}{5}$ in. diam.) silvery-white, wings symmetrical rounded margins often overlapping, stigmas 2 recurved. Boiss. Fl. Orient. iv. 961. *S. Moorcroftiana*, Wall. Cat. 6947 (and misspelt *S. Marosteum* by Moq. in DC. Prodr. xiii. 2. 191). *S. indica*, Herb. Royle. *S. spinescens*, Wight Ic. t. 1795. *Caroxylon foetidum*, Moq. in l. c. 178.

PANJAB PLAINS, UPPER GANGETIC PLAIN, from Delhi, *Moorcroft*, westwards, *Royle*, *Edgeworth*, &c. SCINDE, *Stocks*.—DISTRIB. Beluchistan, Persia, Arabia, N. Africa.

A large shrub, stinking of rotten fish (in Egypt, not hitherto observed in India), forming dense masses of filiform twigs and minute leaves, amongst which the little perianths shine like silver stars.—The branchlets often bear globose villous galls, $\frac{1}{4}$ – $\frac{1}{2}$ in. diam., beset with linear leaves, and caused by insect-puncture.

4. *S. verrucosa*, M. Bieb. in Mem. Soc. Hist. Nat. Mosq., i. 141; a stout hoary shrub or tree with the habit and leaves of *S. foetida*, but flowers in dense clusters and spikes, and fruiting perianth $\frac{1}{4}$ – $\frac{1}{2}$ in. diam. dark brown. Boiss. Fl. Orient. iv. 961; Moq. in DC. Prodr. xiii. 2. 180. *S. dendroides*, Pall. Ill. Pl. t. 14 (with the leaves too thick, according to Boiss.). *S. georgica*, Bunge in Ledeb. Fl.-Ross. iii. 814.

NORTH-WESTERN PANJAB; lower hills and the Peshawur Valley, *Stewart*. DISTRIB. Siberia, Persia, Armenia, the Caucasus, S. Russia.

Boissier says that this differs from *S. foetida* in the lower leaves being filiform, 1–1½ lines long, and the others he describes as “ $\frac{1}{2}$ -terete filiform slender;” but this does not at all agree with any of the numerous specimens in Herb. Kew, except one of a var. *glabrescens* (Caucasus, *Hohenacker*). Some specimens have smaller and white fruiting-perianth, approaching those of *S. foetida*.—This plant is (like *S. foetida*) infested with galls.

17. ANABASIS, Linn.

Perennial herbs or shrubs, branches jointed. Leaves opposite, fleshy or obsolete. Flowers small, solitary or clustered, axillary, 2-sexual, female minutely 2-bracteolate. Sepals 5, scarious, fruiting winged or not. Stamens 5, on a short disk, alternating with 5 staminodes. Utricle included or exerted, subglobose, dorsally compressed, dry or fleshy; style short, stigmas 2 subulate. Seed erect, orbicular, compressed, testa membranous or coriaceous, albumen 0; embryo spiral.—Species 15, S. Europe, N. Africa, W. and Central Asia.

1. *A. phyllophora*, Kar. & Kir. in Bull. Soc. Nat. Mosq. 1840; a dwarf glabrous pale leafless shrub, stems many erect from a woody stock, joints long terminating in two triangular acute teeth (leaves), flowers soli-

tary in opposite axils spicate, staminodes ciliolate, fruiting perianth with 3 conniving wings the posterior largest. *Boiss. Fl. Orient.* iv. 970 (*from which the above character is taken*).

The PANJAB; by the Jhelum River, *Aitchison*.—DISTRIB. Soongaria, Turkestan, Altai.

The only specimen is not in flower; but it precisely accords with the Soongarian plant. I have refrained from quoting the synonyms that Boissier (on Bunge's authority) gives, because I suspect some confusion to exist. *Anabasis intermedia*, Moq. and *A. subulifolia*, Schrenk, must, according to the characters attributed to them, differ much from this. Nor do I see why this, all the specimens of which are as leafless as a *Salicornia*, should be called *phyllophora*.—Boissier gives Damascus as the locality for his plant, and speaks doubtfully of its identity with the Soongarian.

2. *A. setifera*, *Moq. in Chenop. Enum.* 164, and in *DC. Prodr.* xiii. 2. 214; a dwarf leafless glaucous pale shrub, stem rough when dry, leaves short oblong thick fleshy semiterete obtuse with a deciduous bristle, axils woolly, flowers crowded in the upper axils, floral leaf oblong or rounded, bracts minute linear membranous ciliate, staminodes subquadrate, fruiting perianth $\frac{1}{2}$ in. diam., wings 3-5 obovate or orbicular-cordate hyaline not nerved, stigma obscurely 2-lobed. *Boiss. Fl. Orient.* iv. 970.

The PANJAB; on the Salt Range, *Stewart*.—DISTRIB. Persia, Arabia, Egypt.

The solitary specimen precisely accords with the *A. subulifolia*, Schrenk, of Haussknecht's *Iter Orientale* from Persia, which differs altogether from Schrenk's character of that species and from *A. phyllophora*, with which Boissier unites *subulifolia*. It agrees with the characters of *A. setifera* in everything but having only 3 winged sepals instead of 5, and, as I find 3 and 4 in some of Bunge's specimens gathered and named by himself, this character is evidently of no value.

18. HALOCHARIS, Moq.

Hispidulous annuals, branches often whorled. *Leaves* alternate, sessile, fleshy, tipped with rigid hairs. *Flowers* axillary, solitary, 2-sexual, 2-bracteolate. *Sepals* 5, lanceolate, hyaline. *Stamens* 5, on a fleshy disk; anthers linear, cells narrow parallel separate, connective inflated; staminodes 0. *Utricle* included, ovoid or orbicular, compressed, membranous, rugulose; stigmas 2, slender. *Seed* suspended, inverse, lenticular, laterally compressed, testa membranous, albumen 0; embryo plano-spiral.—Species 5, Persia, Affghanistan and Central Asia.

1. *H. violacea*, *Bunge Anabas. Revis.* 63, t. 1, f. 3; a small sparsely hispid prostrate diffusely branched annual, hairs very long, leaves linear subtriquetrous obtuse floral oblong equalling or exceeding the bracteoles, spikes subcapitate, perianth squarrosely hispid with very long hairs, connective produced into an obovoid violet appendage longer and broader than the anther-cells. *Boiss. Fl. Orient.* iv. 975.

WESTERN PANJAB PLAINS, the SALT RANGE, alt. 2000 ft., and PESHAWUR VALLEY, common, *Stewart*.—DISTRIB. Affghanistan, Beluchistan, S.E. Persia.

Branched from the base; branches slender, 3-6 in., tips ascending. *Leaves* scattered, $\frac{1}{4}$ - $\frac{1}{2}$ in. *Flowers* minute, concealed by the long bristles.

2. ? *H. sulphurea*, *Moq. in DC. Prodr.* xiii. 2. 201, *in part*; erect, hispid with long bristles, leaves linear subtrigonal obtuse floral oblong about equalling the lanceolate hirsute bracteoles, flowers in capitate clusters which are spicate on terminal short branches, outer sepals villous, connective produced into a sessile elongate ellipsoid yellow appendage

much longer and broader than the anther-cells. *Bunge Anab. Revis.* 63, t. 1, f. 2; *Boiss. Fl. Orient.* iv. 975. *Halimocnemis sulphurea*, *Moq. Chenop. Enum.* 152.

The PANJAB; west of the Indus, *T. W. H. Tolbert*.—DISTRIB. Assyria, Persia.

A much larger and stouter plant than *H. violacea*, with capitate clusters of leaves and flowers $\frac{1}{2}$ in. diam., forming long interrupted spikes. I have seen but one specimen, which differs from the only authentic one I have seen of *H. sulphurea* in the larger more globose heads, and longer appendage of the anthers.

19. **HALOGETON**, *C. A. Meyer*.

Annuals. *Leaves* alternate, sessile, fleshy, obtuse or tipped with a long bristle. *Flowers* minute, axillary, clustered, polygamous, immersed in wool, 2-bracteolate. *Sepals* 5, 2 outermost winged or gibbous, hyaline. *Stamens* 5 or fewer, filaments linear, anthers simple; staminodes 0 or 5, lingulate. *Utricle* included, ovoid, membranous; stigmas 2, filiform. *Seed* usually inverse, laterally compressed, rostellate, testa membranous or subcoriaceous, albumen 0; embryo spiral.—Species 5, Spain, N. Africa, West and Central Asia.

This genus would perhaps be better united with *Salsola*. There are in Falconer's and Thomson's Tibetan collections flowerless specimens of what is probably another species, with more or less woolly stems, leaves cylindric $\frac{1}{4}$ – $\frac{3}{8}$ in. long, terminated by a very long stout pale-brown bristle.

H. glomeratus, *C. A. Mey. in Ledeb. Fl. Alt.* i. 378; and *Ik. Ross.* t. 40; a much-branched soft glaucous or hoary erect or ascending leafy green herb, leaves minute cylindrical ellipsoid or obovate often tipped with a fugacious bristle axils glabrous or woolly, floral and bracteoles similar, flowers very minute solitary or clustered, sepals 4–5 hyaline lanceolate fruiting with long claws and fan-shaped or orbicular white pink or brownish hyaline veined wings. *Boiss. Fl. Orient.* iv. 985; *Moq. in DC. Prodr.* xiii. 2. 206. *Anabasis glomerata*, *M. Bieb. in Act. Mosq.* i. 110, and iv. 19. *H. tibeticus*, *Bunge mss.*

WESTERN TIBET; alt. 12–14,000 ft., abundant, *Falconer, Thomson, &c.*—DISTRIB. Siberia, Soongaria, Turkestan, Afghanistan.

Branched from the base; primary branches 2–10 in. long, white, as thick as a goose-quill or less. *Leaves* often in clusters (arrested branches) $\frac{1}{8}$ – $\frac{1}{4}$ in. long, green, the larger with membranous basal auricles. *Fruiting-perianths* densely crowded, $\frac{1}{4}$ – $\frac{1}{2}$ in. diam.—Bunge (in lett.) regards the Tibetan plant as different from the Soongarian, but I can find no character; both are very variable in the size of the leaves and of the fruiting perianth. Boissier describes the flowers as clustered, the outer in each cluster female, the rest 2-sexual and diandrous.

20. **BASELLA**, *Linn.*

A much-branched twining fleshy herb. *Leaves* alternate, broad, entire. *Flowers* spicate, sessile, 2-sexual, white red or violet; bract minute, caducous; bracteoles 2, united into a 2-lipped cup and adnate to the perianth. *Perianth* fleshy, 5-fid, at length baccate, lobes short incurved. *Stamens* 5, on the mouth of the tube, filaments short, erect in bud; anthers versatile. *Utricle* globose, included, thin, adhering to the seed; stigmas 3, linear-clavate. *Seed* erect, subglobose, testa crustaceous, albumen scanty; embryo plano-spiral, cotyledons large thin involute.

B. rubra, *Linn.*; *Moq. in DC. Prodr.* xiii. 2. 223; *Lamk. Ill.*

t. 215, f. 1; *Gærtn. Carp.* t. 126. *B. alba*, *Linn.*; *Roxb. Fl. Ind.* ii. 104; *Wall. Cat.* 6960; *Wight Ic.* t. 896; *Grah. Cat. Bomb. Pl.* 170; *Dalz. & Gibs. Bomb. Fl. Suppl.* 73. *B. canalifolia*, *Ham.*; *Wall. Cat.* 6961. *B. alba*, *L.*, *nigra*, *Lour.*, *cordifolia*, *Lamk.*, *ramosa*, *Jacq.*, *japonica*, *Burm.*, and *lucida*, *L.*, *Moq. l. c.* 223, 224. *B. ramosa*, *Jacq. f. Eclog.* ii. 10, t. 161; *Reichb. Hort.* t. 61. *B. crassifolia*, *Wight mss.*—*Rheede Hort. Mal.* vii. t. 24.

Throughout INDIA, wild or cultivated, and in CEYLON.—DISTRIB. Trop. Asia and Africa.

Glabrous. *Leaves* petioled, broadly ovate or cordate or orbicular, 2-7 in. diam., narrowed into the petioles. *Spikes* 1-6 in., axillary, peduncled, simple or branched, flowers white or red. *Fruit* size of a pea, red white or black.—Roxburgh regards two varieties of this, a red- and a green-stemmed one, as wild in India, and adds three cultivated sorts, a red- and a white-stemmed that are raised from seed, and differ only in luxuriance from the corresponding wild forms; and lastly a large sort (*B. lucida*, *L.*, and *cordifolia*, *Lamk.*), which is the most cultivated, and is always increased by slips; it is the largest form, covering trellises and native houses, and is the most succulent, and more used as a pot-herb than the others.

ORDER CXVIII. PHYTOLACCÆÆ.

Glabrous trees shrubs or herbs. *Leaves* alternate, quite entire; stipules small or 0. *Flowers* racemed, bracteate and 2-bracteolate. *Sepals* 4-5, imbricate in bud. *Petals* 0. *Stamens* 4, alternate with the petals, or more and irregularly inserted; filaments usually persistent and anthers deciduous. *Carpels* 1 or more, superior, free or connate, 1-ovuled; stigmas usually sessile and recurved; ovules amphitropous or campylotropous. *Ripe carpels* dry or fleshy. *Seeds* erect, often arillate; albumen fleshy or floury; embryo peripheric.—Genera 20, species about 60, tropical and temperate.

Rivina Latbenia, *Ham. in Wall. Cat.* 6952, from Patna, erroneously cited by Moquin under his *Pircunia Latbenia*, is the common South American *Rivina lavis*, *L.* (*R. orientalis*, *Moq.*), or an allied plant, no doubt cultivated at Patna. *Mohlana nemoralis*, *Mart.*, a Brazilian and African undershrub with reticulate fruit, is naturalized in several parts of Ceylon (Trimen in *Lond. Journ. Bot.* xxiii. (1885) 173).

PHYTOLACCA, *Linn.*

Shrubs or herbs, rarely trees. *Leaves* exstipulate. *Flowers* 1-2-sexual. *Sepals* 4, oblong, obtuse. *Stamens* 5-25. *Carpels* 5-10, free or connate, fleshy in fruit. *Seeds* reniform, compressed, exarillate, albumen floury; embryo annular, cotyledons slender, radicle ascending.—Species 10, tropical and subtropical.

P. acinosa, *Roxb. Fl. Ind.* ii. 458; quite glabrous or puberulous, leaves elliptic-ovate or lanceolate acuminate narrowed into the stout petiole, racemes shortly peduncled. *Wall. Cat.* 1598. *P. decandra*, *var. β. acinosa*, *Moq. in DC. Prodr.* xiii. 2. 33. *P. Kæmpferi*, *A. Gray in Mem. Amer. Acad. N. S.* vi. 404. *Pircunia Latbenia*, *Moq. l. c.* 29, *excl. syn. Wall. Cat.*

TEMPERATE HIMALAYA, wild or cultivated, from Hazara and Kashmir to Bhotan, alt. 5-9000 ft.—DISTRIB. China, Japan.

Stems 3-5 ft., stout, herbaceous, succulent. *Leaves* 6-10 by 2½-4 in., green, thinly succulent. *Racemes* 2-6 in., erect, many-fl., rachis stout; bracts linear-lanceolate, membranous; pedicels ½ in. *Flowers* ½ in. diam. *Sepals* broadly oblong,

obtuse. *Ripe carpels* about 10, nearly free, blue-black.—The Japanese specimens have broader leaves than the Himalayan. The leaves are eaten cooked.

ORDER CXIX. POLYGONACEÆ.

Herbs, rarely shrubs. *Leaves* rarely opposite, entire or serrulate; stipules (ochrææ) scarious or membranous, usually sheathing the stem. *Flowers* usually 2-sexual, jointed on the pedicel. *Perianth* of 3-6, free or connate, persistent sepals, imbricate in bud. *Stamens* 5-8, rarely more or fewer, opposite the sepals. *Disk* annular glandular or 0. *Ovary* free, 2-4-gonous; styles 1-3, stigmas various; ovule 1, basilar, orthotropous. *Nut* hard, usually enclosed in the calyx. *Seed* erect, testa membranous, albumen floury or horny; embryo various, radicle superior.—Genera 30, species about 600, chiefly temperate.

Polygonear. familiæ sedifolia, Wall. Cat. 6286, from the mountains of Nepal, is a remarkable plant, which being without flower or fruit I fail to refer to its genus, or even order. It is prostrate, hirsute, consisting of creeping interlaced stems and branches as thick as a sparrow's quill, the terminal ones bearing imbricate membranous short cup-shaped ochrææ with oblique entire ciliate mouths, and fleshy linear-oblong obtuse subsessile leaves $\frac{1}{2}$ – $\frac{1}{2}$ in. long, and hirsute on both surfaces; filiform simple root fibres are given off from the stem, and these also are hirsutely fibrillose. A solitary rigid peduncle, $\frac{1}{2}$ – $\frac{1}{2}$ in. long, terminates some of the branches, and this bears a small short cupular ochrea. The whole plant much resembles (superficially) a small creeping hirsute *Æschynanthus*.

Tribe 1. **Eupolygoneæ.** *Perianth* 3-5-cleft. *Stamens* 1-8, rarely more. *Stigmas* 2-3, capitate, rarely fimbriate.

* Shrubs.

Stamens 12-18. Styles 4 1. CALLIGONUM.
Stamens 8. Styles 3 2. PTEROPYRUM.

** Herbs or undershrubs.

Stamens 8 or fewer. Cotyledons flat 3. POLYGONUM.
Stamens 8. Cotyledons plaited 4. FAGOPYRUM.

Tribe 2. **Rumiceæ.** *Perianth* 4-6-cleft. *Stamens* 9, rarely 6. *Stigmas* fimbriate, peltate or horseshoe-shaped.

Sepals 6, unchanged in fruit. Nut 3-winged 5. RHEUM.
Sepals 4, unchanged in fruit. Nut 2-winged 6. OXYRIA.
Sepals 6, 3 inner enlarged in fruit (except *R. acetosella*) 7. RUMEX.

See *Königia* under *Polygonum*.

1. CALLIGONUM, Linn.

Rigid much-branched shrubs. *Leaves* alternate, linear subulate or obsolete, ochrea short. *Flowers* solitary or few, loosely clustered, ochreate, 2-sexual. *Sepals* 5, flat. *Stamens* 12-18. *Ovary* 4-angled. *Nut* exserted, 4-angled, angles variously crested winged echinate or setose. *Seed* oblong, terete or 4-angled; embryo central, straight, cotyledons narrow.—Species 20, in deserts of W. and Central Asia and Africa.

C. polygonoides, Linn.; Meissn. in DC. Prodr. xiv. 1. 29; an almost leafless shrub or small tree with terete pale flexuous branches and

very slender branchlets, leaves most minute bristles at the distant nodes, nuts oblong hard densely clothed with many series of branching intricate rigid red-brown flexuous bristles. *Boiss. Fl. Orient.* iv. 1000.

The PANJAB, *Edgeworth, Talbart*; Salt Range, alt. 2000 ft., *Stewart*. SCINDE, *Stocks*; Boogtee Hills, *Vicary*.—DISTRIB. Persia, Armenia, Syria.

Flowering branches about as thick as a crow-quill or less, internodes 1-1½ in. long; pedicels ½-¾ in.; sepals about as long. *Fruit* ½-1 in. diam. including the shaggy branched bristles, nucleus about ¼ in.

2. **PTEROPYRUM**, *Jaub. & Spach.*

Rigid shrubs. *Leaves* small, alternate or fascicled, linear or spatulate; ochrea very short or obsolete. *Flowers* small, ochreate, 2-sexual. *Sepals* 5, subequal. *Stamens* 8. *Ovary* 3-angled, acuminate; styles 3. *Nut* broadly 3-winged, beaked. *Seed* beaked, base broad; embryo eccentric, cotyledons oblong, short.—Species 5-6, Western Asiatic.

P. Oliveri, *Jaub. & Spach. Ill. Plant. Orient.* ii. 9, t. 108; leaves fascicled thick glaucous obovate oblong spatulate or linear-oblong obtuse nerveless, nut broadly 6-winged in two superposed series of wings, the lower wings broadest. *Meissn. in DC. Prodr.* xiv. 1. 31; *Boiss. Fl. Orient.* iv. 1002; *Wight Ic.* t. 1809. *P. Griffithii*, *Meissn. l. c.* *Atraphaxis* sp., *Aitchison Cat. Pl. Panjab.* 125.

SCINDE, *Vicary, Stocks*.—DISTRIB. Afghanistan, Persia.

An excessively branched shrub, branchlets white. *Leaves* ½-¾ in., margins often recurved. *Clusters* many-fl., sessile; flowers shortly pedicelled. *Fruit* ¼ in. diam., nearly circular in outline; each angle of the nut with 2 superposed wings brought about by the 3-gonous nucleus twisting as the wings grow, the effect of which is that each vertical wing is as it were cut in two in the middle, and the upper half of the wing of one angle alternates with the lower half of the wing of another angle.

3. **POLYGONUM**, *Linn.*

Herbs, rarely undershrubs. *Leaves* alternate, entire, rarely lobed; stipules tubular, membranous, rarely minute and 2-fid. *Flowers* 2-sexual, small or minute, clustered; clusters axillary or terminal, bracteate and bracteolate, axillary and sessile, or in spiciform capitate or paniced racemes; pedicel short usually jointed under the perianth; bracts and bracteoles membranous, ochreate. *Disk* glandular or 0. *Perianth* 4-5, rarely 3-cleft, 2 outer sepals usually smallest. *Stamens* 5-8, rarely 1-4, perigynous. *Ovary* compressed or 3-gonous; styles 2 or 3, free or combined below, stigmas usually capitellate. *Nut* included in the more or less enlarged (rarely fleshy) perianth, trigonous or biconvex. *Seed* albuminous; embryo lateral, radicle long, cotyledons small (rarely large), flat, accumbent, rarely incumbent.—Species about 150, in all latitudes.

A very troublesome genus, the Indian species of which have been much confused, and I cannot hope that I have finally settled the limits of those especially of the *Persicaria* and *Avicularia* sections. *Kænigia* is regarded as a section of *Polygonum*.

KEY TO THE SECTIONS.

A. *Stipules* minute 2-partite.

Sect. 1. **KÆNIGIA**. A minute annual. Flowers in terminal clusters. Stigmas subsessile. Nut subterete.—Sp. 1.

Sect. 2. ELEUTHEROSPERMA. Slender annuals. Flowers in terminal and axillary clusters. Styles minute free. Seed loose in the triquetrous nut.

B. *Stipules tubular elongate*.—Sp. 2-3.

Sect. 3. AVICULARIA. Herbs. Leaves small; stipules hyaline, cleft or torn. Flowers axillary. Styles minute free. Albumen horny.—Sp. 4-11.

Sect. 4. AMBLYGONON. Perennial-rooted herbs. Flowers in spiciform racemes; bracts tubular, truncate. Nut orbicular; *cotyledons incumbent*.—Sp. 12-14.

Sect. 5. TOVARA. A perennial-rooted tall herb. Leaves broad. Flowers distant in very slender racemes; bracts tubular. Nut flattened with 2 rigid persistent hooked styles.—Sp. 15.

Sect. 6. BISTORTA. Erect or prostrate annual or perennial-rooted herbs. Flowers in spiciform racemes; bracts hyaline, ovate or lanceolate not tubular.—Sp. 16-23.

Sect. 7. PERSICARIA. Erect or decumbent unarmed often glandular annuals or perennials. Leaves narrow. Flowers in slender or dense spiciform racemes; bracts tubular.—Sp. 24-38.

Sect. 8. CEPHALOPHILON. Erect or prostrate unarmed annuals rarely perennials or shrubs. Leaves broad, sometimes lobed or auricled. Flowers capitate; bracts not tubular.—Sp. 39-48.

Sect. 9. ECHINOCAULON. Erect or ascending usually prickly annuals. Leaves usually broad, often hastate. Flowers capitate or racemose, bracts tubular. (Hardly distinct from *Cephalophilon*.)—Sp. 49-55.

Sect. 10. ACONOGONON. Erect shrubs, rarely herbs. Flowers in branched panicles; bracts open or very shortly tubular.—Sp. 56-67.

Sect. 11. TINIARIA. Twining herbs. Leaves broad, hastate or cordate. Flowers in axillary clusters or slender racemes; bracts not tubular.—Sp. 68-70.

Sect. I. KÆNIGIA, *Hook. f.* A minute annual. Leaves often opposite; stipules short 2-lobed or partite. Flowers in terminal and axillary clusters or heads; bracts not tubular or sheathing. Perianth 3-5-cleft. Stamens 1-5 without interposed glands. Stigmas 2-3, subsessile. Nut subterete or compressed; cotyledons accumbent.

1. **P. islandicum**, *Hook. f.*; glabrous, leaves obovate, flowers very minute. *Kœnigia islandica*, *Linn.*; *Meissn. in DC. Prodr.* xiv. 1. 83; *Lamk. Ill.* t. 51; *Fl. Dan.* t. 418. *K. monandra*, *Decne. in Jacq. Voy. Bot.* 142, t. 147; *Meissn. l. c.*

ALPINE WESTERN HIMALAYA; in marshy places from Kashmir to Kumaon, alt. 12,000 ft. WESTERN TIBET, alt. 11-14,000 ft.—DISTRIB. Arctic and subarctic regions and Altai Mts.

Stems very slender, succulent, forming tufts 1-6 in. high with matted roots. *Leaves* $\frac{3}{8}$ — $\frac{1}{2}$ in., petioled, obtuse. *Flowers* 2-sexual or female. *Perianth-lobes* equal or unequal. *Stamen* usually solitary (rarely 2) in the Indian plant. *Nut* rather longer than the perianth.—*Maximovicz* (*Mel. Biol.* xi. 309) doubts the validity of *Kœnigia* as a genus.

Sect. II. ELEUTHEROSPERMA, *Hook. f.* Slender annuals. Leaves small, broad; stipules 2-partite. Flowers in axillary and terminal clusters. Perianth 5-cleft; bracts not tubular or sheathing. Stamens 2-4. Styles minute, free. Seed loose in the acutely triquetrous nut; cotyledons accumbent.

2. **P. delicatulum**, *Meissn. in DC. Prodr.* xiv. 1. 127; quite glabrous, stem filiform, leaves sessile or subsessile $\frac{1}{8}$ — $\frac{1}{4}$ in. elliptic ovate or ovate-cordate acute, flowers minute in axillary clusters scarcely exceeding

the bracts, stamens 2-3, nut 3-quetrous usually much longer than the perianth. *Kœnigia*, No. 3 & 4 *Herb. Ind. Or. H. f. & T.*

ALPINE HIMALAYA; on wet rocks, alt. 10-16,000 ft., from Sikkim to Kashmir, *Wallich*, &c.

Annual, 4-12 in., tuited, flaccid. *Leaves* distant, nerves obscure; petiole rarely $\frac{1}{10}$ in.; stipular segments acute or obtuse, entire or crenate. *Perianth* very minute, $\frac{1}{10}$ in. long, segments obtuse or acute, 2 outer smaller. *Stamens* very short. *Nut* very variable in size, ovate-lanceolate, twice or thrice as long as the perianth, pale, coriaceous, angles very prominent, faces concave. *Seed* loose.

3. ***P. filicaule***, *Wall. Cat.* 1694; sparingly strigose, stem very slender, leaves petioled $\frac{1}{2}$ - $\frac{2}{3}$ in. ovate or ovate-lanceolate obtuse or acute, flowers in axillary and terminal sessile clusters pedicelled, stamens 3-4, nut trigonous slightly longer than the perianth. *Meissn. in Wall. Pl. As. Rar.* iii. 59, and in *DC. Prodr.* xiv. 1. 127; *Bab. in Trans. Linn. Soc.* xviii. 104; *Gercke in Bot. Reis. Pr. Waldem.* 136. *P. alpestre*, *Wall. Cat.* 1725. *P. microphyllum*, *Klotzsch mss.* *Kœnigia nepalensis*, *Don Prodr.* 74. *Kœnigia*, No. 2 *Herb. Ind. Or. H. f. & T.*

SUBALPINE and ALPINE HIMALAYA; in woods, &c., alt. 9-16,000 ft., from Sikkim to Kashmir. WESTERN TIBET; Ladak, alt. 11-12,000 ft., *Stewart*.

Annual, 4-18 in., flaccid, tuited, rather succulent; stem with often a few reflexed hairs below the nodes. *Leaves* distant, rarely 1 in., soft, most strigose beneath; stipular lobes glabrous or hairy, acute or obtuse. *Perianth* $\frac{1}{10}$ in. long, white; segments rounded, 2 outer smaller. *Filaments* very short. *Nut* ellipsoid; pale, coriaceous, angles very prominent, faces concave. *Seed* loose.—*Meissner* and *Babington* describe 8 stamens. I find only 3-4. *P. alpestre*, *Wall.*, is the fully developed state; vars. *cœspitosum* and *extenuatum* of *Meissner* are more Alpine forms.

Sect. III. AVICULARIA, *Meissn.* Erect or prostrate herbs, rarely undershrubs. *Leaves* small; stipules tubular hyaline, cleft or torn. *Flowers* in axillary clusters; bracts tubular. *Perianth* 4-5-cleft. *Stamens* 3-8, very short. *Styles* 3, minute, free. *Nut* 3-gonous. *Albumen* horny, cotyledons incumbent.

* *Root* perennial, branches herbaceous (shrubby in 7. *P. salicornioides*).—See also *P. plebejum*.

4. ***P. recumbens***, *Royle mss.*; *Bab. in Trans. Linn. Soc.* xviii. 116; puberulous or scaberulous, stems long stout woody much-branched grooved prostrate and ascending, leaves $\frac{1}{2}$ - $\frac{2}{3}$ in. petioled broadly elliptic flat obtuse or acute nerves obscure, stipules ovate-lanceolate tumid with a strong excurrent nerve on each side, pedicels short jointed at the tip, fruiting perianth obvoid 5-partite. *Meissn. in DC. Prodr.* xiv. 1. 96.

WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 4500-8000 ft., *Royle*, &c.

Rootstock stout; branches many, 1-2 ft., as thick as a crow-quill and more, rooting at the base. *Leaves* close set; stipules $\frac{1}{2}$ - $\frac{1}{2}$ in., lanceolate and acuminate or truncate and lacerate, nerves variable, longer than the pedicels. *Nuts* $\frac{1}{16}$ in., long, broadest below the middle, black, shining.

5. ***P. cognatum***, *Meissn. Polyg. Prodr.* 91, and in *DC. Prodr.* xiv. 1. 96; glabrous or nearly so, stems short subsimple prostrate and ascending angled, leaves $\frac{1}{2}$ - $\frac{1}{2}$ in. petioled elliptic obtuse or acute thick nerveless, stipules ovate tumid hyaline subentire nerves 2 short included, pedicels crowded short jointed at the tip, fruiting perianth very thick urceolate tube twice as long as the orbicular lobes. *P. alpestre*, *C. A. Meyer Enum. Pl. Cauc.* 157; *Boiss. Fl. Orient.* iv. 1037; *Jaub. & Sp. Ic. Pl. Orient.* t. 118.

P. rupestre, Karel & Kiril. *En. Plant. Alt.* 789. *P. confertum*, Royle mss.; *Bab. in Trans. Linn. Soc.* xviii. 116; *Meissn. l. c.* *P. ammannioides*, Jaub. & Sp. l. c. t. 119. *P. affine*, Stephan. mss.; *Spreng. Syst.* ii. 256, not of Don.

WESTERN HIMALAYA; from Kashmir to Garwhal, alt. 11,000–14,500 ft., Royle, &c. WESTERN TIBET; ascending to 16,500 ft., Thomson, Stewart, &c.—DISTRIB. Soongaria, Persia, Syria, Asia Minor, Caucasus.

Branches many, stout, flexuous, 2–6 in., from a woody stock, scaly at the base, but not rooting. Leaves rarely 1 in., elliptic-lanceolate, almost succulent; stipules silvery, obtuse, acute or acuminate. Perianth very thick, lobes with white margins. Nut $\frac{1}{10}$ in. long, ovate, compressed or obtusely trigonous, black, shining, usually compressed and obtuse in Indian examples.—Boissier adopts the later name of *P. alpestre* for this, because Meissner described his *cognatum* from a variety (*P. rupestre*, Kar. and Kiril.) with longer pedicels. He further refers the Himalayan plant to Meissner's var. *ammannioides*, a Persian form with shorter internodes, and smaller narrower leaves; but the majority of Indian specimens do not differ from the common form.

6. *P. paronychioides*, C. A. Mey. *En. Pl. Talysch.* 20; rootstock very stout woody, branches short tufted erect and ascending scaberulous young concealed by the stipules, internodes very short, leaves linear with a deciduous mucro margins recurved, stipules large hyaline lanceolate tumid 2-nerved tip lacerate, pedicels short jointed at the tip, fruiting perianth urceolate lobes rounded shorter than the tube 2 outer awned at the back. Boiss. *Fl. Orient.* iv. 1040; *Meissn. in DC. Prodr.* xiv. 1. 89. *P. Paronychia*, C. A. Mey. *Enum. Pl. Cauc.* 158 (not of Cham. & Schl.). *P. Meyeri*, Steud. *Nomencl.* *P. mucronatum*, Royle mss.; *Bab. in Trans. Linn. Soc.* xviii. 115.

WESTERN HIMALAYA, in the drier regions; Kunawur to Zanskar, alt. 8–12,000 ft., Royle, &c.—DISTRIB. Afghanistan, Persia.

Root or rootstock often as thick as the middle finger, tortuous, woody, with chestnut scaling back. Stem 1–4 in., fragile, white or red-brown, not grooved. Leaves $\frac{1}{2}$ in., nerveless, glabrous or scaberulous; stipules in young plants concealing both leaves and stem, lower with often two very faint included nerves, upper with two strong exerted ones. *Fruiting-perianth* as in *P. cognatum*, but shorter. Nut $\frac{1}{2}$ in., broadest in the middle, black, smooth.—The character of the dorsally mucronate outer sepals appears pretty constant, though not referred to by authors.

7. *P. salicornioides*, Jaub. & Spach. *Ill. Pl. Orient.* t. 123; shrubby, scaberulous, branches stout divaricate grooved at length spinescent and leafless, internodes crowded, leaves minute fleshy linear ovate or oblong rigid 1-nerved margin revolute, stipules short hyaline lacerate, perianth rosy, nut large thick opaque punctate. *Meissn. in DC. Prodr.* xiv. 1. 90; *Boiss. Fl. Orient.* iv. 1042.

SCINDE, Vicary.—DISTRIB. Persia.

The specimen is very imperfect, and I have taken much of the specific character from Boissier.

** Root mostly annual (except some forms of *P. plebejum*).

8. *P. aviculare*, Linn.; *Boiss. Fl. Orient.* iv. 1036; glabrous, branches procumbent or ascending grooved leafy, leaves elliptic or elliptic-oblong or lanceolate obtuse flat nerveless, stipules shorter than the internodes hyaline lacerate many-nerved, flowers axillary, pedicel short jointed at the tip, perianth obovoid cleft to near the base, nut ovoid obtusely 3-gonous minutely rugosely striolate. *Bab. in Trans. Linn. Soc.* xviii. 114. *P. aviculare* γ. *diffusum*, *Meissn. in DC. Prodr.* xiv. 1. 97.

WESTERN HIMALAYA; from Kashmir to Kumaon, alt. 6-10,000 ft., *Royle, &c.*; Rawul Pindee, *Aitchison*. WESTERN TIBET, alt. 10-12,000 ft., *Thomson, &c.*—DISTRIB. Widely dispersed, indigenous in Europe and N. Asia, probably a colonist elsewhere.

The Himalayan and Tibetan specimens are intermediate in several points between *P. aviculare* and *P. Bellardi*, as these are defined by Boissier; the leaves are not veined as he describes them in *aviculare*, nor are they acute as they should be in *P. Bellardi*; and though the branches sometimes run out into a subsperate inflorescence, this is not so slender and interrupted as in true *Bellardi*. Boissier gives "*India borealis*" as a habitat for the latter plant; but I have seen no specimens.

9. ***P. tubulosum***, *Boiss. Diagn. Ser. i. 83*, and *Fl. Orient. iv. 1032*; glabrous, branches short prostrate or ascending leafy angular not grooved internodes very short, leaves linear acute or obtuse margins recurved, stipules hyaline subentire lacerate or fimbriate faintly 1-2-nerved, flowers axillary sessile, perianth ovoid tube much longer than the small rounded white or pink lobes, nut rhomboid triquetrous smooth shining. *Meissn. in DC. Prodr. xiv. 1. 91*. *P. rottboellioides*, *Jaub. & Sp. Ill. Pl. Ori. t. 122*; *Meissn. l. c. 92*. ? *P. Olivieri*, *Meissn. l. c. 92, in part*.

NORTH-WESTERN HIMALAYA; Kunawur and Lahul, alt. 6-7000 ft., *Royle, Thomson, Stewart*. WESTERN TIBET, alt. 10-11,000 ft., *Thomson*.—DISTRIB. Afghanistan, Persian Alps.

A small annual, with sometimes rosy flowers, crowded leaves and hyaline stipules, $\frac{1}{8}$ in. long, very different from *P. aviculare* in the sessile perianth cleft at the top only, and in the small broad short shining nut.—Meissner has cited "Kumaon, Strachey and Winterbottom, No. 49," as a locality for *P. Olivieri*, *Jaub. and Spach*. I have seen no specimens, and suspect some error. The calyx-lobes of *P. Olivieri* (which is a synonym of *P. polycnemoides*) equal the tube.

Var. *tibetica*; branches very slender much longer, leaves usually acute or acuminate. —Western Tibet; Karakoram, alt. 12,000 ft., *Clarke*; Lahul, *Jaeschke*; Chamba, *Ellis*.

10. ***P. mollisforme***, *Boiss. Diagn. Ser. i. 7. 84*, and *Fl. Orient. iv. 1043*; very small and slender, stems short dichotomous bearing axillary clusters of stipules and flowers; leaves spreading linear setaceous apiculate 3-5-nerved margins recurved, stipules ventricose hyaline white 1-2-nerved split to the middle into several lanceolate segments, perianth sessile concealed by the stipules cleft to below the middle, nut ovoid acute obtusely 3-gonous. *Meissn. in DC. Prodr. xiv. 1. 91*.

WESTERN TIBET; Nubra, alt. 14-16,000 ft., *Thomson*.—DISTRIB. Persia.

Root almost capillary. Stems spreading, 1-2 in., filiform, rigidly flexuous, red. Leaves very narrow, $\frac{1}{4}$ - $\frac{1}{2}$ in. long; stipules large for the size of the plant. Flowers minute. Perianth hyaline.—This curious little species resembles a seedling state of *P. paronychioides*, but differs in the perianth: Boissier describes the stipules as nerveless, but I find 1 or 2 nerves, one always exerted, in both Persian and Tibetan specimens.

11. ***P. plebejum***, *Br. Prodr. 420*; diffusely branched, prostrate, smooth or minutely scaberulous, branches terete grooved, internodes usually shorter than the leaves, stipules hyaline short lacerate to the middle and fimbriate nerve unilateral excurrent (rarely 2 or more or 0), flowers 1-3-nate, pedicels 0 or short, perianth $\frac{1}{10}$ in. or less cleft to near the base, nut rhomboid 3-gonous smooth and shining. *Meissn. in DC. Prodr. xiv. 1. 94*. *P. Dryandri*, *Spr. Syst. Veg. ii. 255*; *Wall. Cat. 1691*; *Meissn. Polyg. Prodr. 88*. *P. aviculare*, *Don Prodr. 72*. *P. herniarioides*, *Del. Fl. Egypt. 13*; *Meissn. l. c. 94*, and in *Wall. Pl. As. Rar. iii. 62*. *P. Roxburghii*, *Meissn. l. c.*; *Miquel Fl. Ind. Bat. i. 997*.

Throughout TROPICAL INDIA; and (but rarely) ascending the HIMALAYA to

7000 ft., from Bhotan to Kashmir (absent in Ceylon).—DISTRIB. Afghanistan, Tropical Asia, Java, Philippines, Australia, Madagascar, Egypt, Tropical and S. Africa.

If (following Wallich's example for most of them) I am right in bringing all the following forms under one species, this is a far more protean plant than *P. aviculare*, with which it is generally compared, but from which it differs entirely in habit, in the few-nerved stipules, and rhombic smooth nut. I have spent some days in analyzing the flowers and fruit of the vast number of specimens of it at my disposal, in the vain attempt to discover constant even varietal characters amongst them. The utmost I can effect is to select eleven forms, the extremes of which differ so much from one another that I have described them as varieties, though there is not one of these that does not seem to pass insensibly into two or more others, and I regard my work as provisional only. If any one is specifically distinct, it is var. *Miqueliana*, with its larger flowers and all the sepals acute; I have, however, seen no other specimens than Hohenacker's; and the shape of the sepals is so variable with age in other species, that much importance must not be attached to them. Var. *micranthema*, with nuts sometimes only $\frac{1}{15}$ in. long, at first sight appears very distinct, but there are transitions of all its characters (nuts included) into those of the commoner forms. For the rest I must leave the further elucidation of this aggregate species to local botanists working on fresh specimens. In the matter of the citation of published works and Herbarium numbers, &c., I have been very sparing, because I cannot reconcile in several cases Meissner's descriptions and references with the specimens of Wallich, and with other authors' writings; and the diagnoses of the earlier authors are vague and incomplete. Though described as annual, the root is so often woody, that I think it must be at times biennial or even perennial.

P. plebejum proper; branches stout or slender, stipules rather short lower internodes often longer than the leaves upper shorter or very short, leaves $\frac{1}{2}$ to $\frac{3}{4}$ in. upper often much shorter oblong or linear obtuse margin often recurved, flowers sunk amongst the stipules rarely exserted, sepals short broad rounded. *P. illecebroides*, Meissn. l. c. 94. *P. cliffortioides*, Meissn. l. c., and in Wall. *Pl. As. Rar.* iii. 62. *P. berniarioides*, Herb. Strach. & Winterb. 23. *P. Roxburghii*, var. *brevifolia* & pedicellaris, Meissn. l. c. 93.

Common from Assam to the N.W. Provinces and on the lower hills.—This is intended to include all the forms known to me that do not better agree with the diagnosis of the following ones. It is a common African and Australian plant. To it I should refer Wallich's 1691/1, 1691/3, 1691/4, the lower left-hand specimen, 1691/5, except the *Prome specimen*, and 1691 G, I, K.

Var. *effusa*; lax, slender, flaccid, internodes longer, leaves narrowly linear or dilated upwards from a very narrow base tip rounded, flowers all or most pedicelled, sepals short broad. *P. effusum*, Meissn. l. c. 93, in part.—Bengal to Bombay, Guzerat and N.W. India; Kumaon, Herb. Strach. & Winterb. 22.—Probably a native of wet places, whence its characters. Strachey and Winterbottom's specimens are characteristic, but Wallich's 1691/3 from Oude appears to me to be nothing but common *plebejum*.

Var. *indica*; branches uniformly spreading all round from the crown and leafy, internodes short, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. uniformly spreading horizontally linear- or obovate-oblong flat obtuse or apiculate, stipules very short, flowers crowded in the axils, pedicels shorter than the perianth or 0, sepals broad 2 outer acute, nut $\frac{1}{15}$ in. *P. indicum* (& ? *P. linifolium*), Heyne in Roth Nov. Sp. 208; Wight Ic. t. 1808; Dalz. & Gibs. Bomb. Fl. 214. *P. Roxburghii*, var. *a. longifolium* & *γ. spatulatum*, Meissn. l. c. 93. *P. Dryandri*, Wall. Cat. 1691 H, L.—The common Mysore and Carnatic form, also occurring in Bombay. When more irregular in development of leaves and branches not distinguishable from *P. plebejum proper*. Both habit and locality point to its being *P. indicum* of Roth, who describes the occasional scabridity of the end of the leaf as serrulation, and suspects its identity with *P. plebejum*. It is a common Australian and African form.

Var. *brevifolia*; rootstock very woody, branches very stout grooved often 1–2 ft. dark brown, internodes of branchlets very short concealed by the leaves and stipules which latter show as a continuous white villous band on the underside of the branchlets, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. obovate acute or apiculate flat coriaceous dark brown when dry,

flowers sessile almost concealed by the stipules, sepals narrower outer acute, nut $\frac{1}{10}$ – $\frac{1}{12}$ in. *P. Dryandri*, *Wall. Cat.* 1691/5, from *Prome*.—From Bengal (Griffith, *Kew Distrib.* 4098) to Garwhal, Banda, Bombay, Scinde, Guzerat and *Prome*. Also in Africa.—This is a short crowded leaved form allied to *indica*, and differs from *Griffithii* in its stoutness and narrower longer leaves, which are not so covered by the stipules.

Var. *Griffithii*; branches excessively numerous from the root very slender flexuous and quite naked below, branchlets very slender with the internodes so close that they look woolly from the crowded fimbriate and crinite stipules, leaves shorter than the stipules $\frac{1}{10}$ – $\frac{1}{8}$ in. orbicular or broadly obovate flat apiculate, flowers subsessile minute hidden amongst the stipules, sepals rounded 2 outer apiculate, nut not seen.—East Bengal, *Griffith (Kew Distrib.* 4099, 4101); plains of N.W. India, *Falconer (Kew Distrib.* 268).—A very singular form, probably a modification of var. *brevifolia*, with the bases of the branches buried in soil, and hence leafless and very slender.

VAR. *scindica*; branches rather stout flexuous pale red brown with scattered leaves below, branchlets slender, internodes very short woolly from the crinite stipules, leaves $\frac{1}{10}$ – $\frac{1}{8}$ in. elliptic-oblong pale obtuse margins strongly recurved, flowers very minute sessile sunk amongst the stipules, sepals narrow obtuse, nut half the length of the perianth $\frac{1}{10}$ in. long black.—Scinde, *Stocks*.—This has much the habit of some common forms of the species, but the branchlets are crinite as in *Griffithii*, and the nut very minute. No doubt it is only one of many forms to be found in Scinde.

Var. *elegans*; black when dry, branches stout grooved smooth or scaberulous, internodes longer or shorter than the leaves, stipules brownish fimbriate, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. upper as long as the lower linear-lanceolate acute or acuminate rarely obtuse margins flat or revolute, flowers sessile or shortly pedicelled, sepals narrow 2 outer acute. *P. elegans*, *Roxb. Hort. Beng.* 29, and *Fl. Ind.* ii. 291. - *P. prostratum*, *Roxb. mss.* *P. ciliosum*, *Meissn. l. c.* 95. - *P. Dryandri*, *Wall. Cat.* 1691/2.—From Bengal, Assam and Bhotan to Nepal, Belgaum, Chittagong and Tenasserim.—Usually rather a large form, passing into *plebejum* proper by insensible transitions. The dark colour when dry, long narrow acuminate leaves and narrow sepals distinguish typical specimens. It is well described by Roxburgh and figured in his unpublished *Icones* (as *P. prostratum*). It occurs in Australia.

Var. *micranthema*; small, branches 2–8 in. very slender, stipules short, leaves $\frac{1}{4}$ – $\frac{1}{2}$ in. linear or linear-oblong obtuse base narrowed flat, upper crowded as long as the often distant lower, flowers very minute pedicelled crowded in the upper axils, pedicel often as long as the perianth, sepals narrow obtuse, nut $\frac{1}{30}$ – $\frac{1}{20}$ in. *P. Dryandri Wall. Cat.* 1691/4, the upper left-hand specimen from Kumaon. *P. micranthemum*, *Franchet mss.*—Birma, *Griffith*; Bengal and Silhet, *Clarke*; Soane River sands, *J. D. H.*; Kumaon.—This is only a small state of *plebejum*, into which it passes by insensible gradations. *Franchet* named it as above from Mongolian specimens.

Var. *Miqueliana*; branches rather stout flexuous straggling dark when dry, internodes longer than the leaves, stipules short 2-nerved, leaves $\frac{1}{2}$ in. obovate or oblong-obovate or linear-oblong obtuse flat, flowers 1–2 in the axils, pedicels slender longer than the perianth jointed towards the base, sepals narrow all acute, nut $\frac{1}{10}$ in. *P. Miquelianum*, *Meissn. Pl. Hohenack.*, No. 1613, and in *DC. l. c.* 92.—Canara; near Mangalor.—A very distinct variety, but more material is wanted to judge of its constancy. *Meissner* describes the stipules as 6-nerved, and the margins of the leaves as revolute, neither of which is the case in my specimens. Nor do I know of many-nerved stipules in any Indian form of *P. plebejum* except the following, which singularly enough comes from Mangalor, has revolute leaf-margins, and all the sepals acute.

Var. *polyneura*; branches straggling dark when dry, internodes longer or shorter than the leaves, stipules 4–6-nerved, leaves $\frac{1}{2}$ in. linear oblong acute or obtuse margins recurved, flowers 1–2 in the axils, pedicels as long as the perianth jointed at the base, sepals narrow acute, nut $\frac{1}{10}$ in. *P. elegans*, *Miquel in Herb. Hohenacker*, No. 19 (not of *Roxb.*). *P. Roxburghii*, var. *longifolia*, *Meissn. l. c.* 93.—Canara; near Mangalor.

Sect. IV. AMBLYGONON, *Meissn.* Erect or ascending herbs. Leaves large; stipules with often a dilated mouth. Flowers in cylindric spikes or

racemes; bracts tubular. *Perianth* 4-5-partite. *Stamens* 5-8, alternating with glands. *Styles* 2-3, short, stigmas capitate. *Nut* orbicular, compressed; embryo slender, cotyledons narrow incumbent.

12. **P. orientale**, Linn.; Meissn. *Monog. Polyg.* 53, t. 1, f. 30-35, and t. 3, and in *DC. Prodr.* xiv. 1. 123; tall, branched, softly pubescent or silkily villous, leaves long-petioled ovate or ovate-cordate acuminate, stipules short strigose and ciliate, racemes cylindric laxly paniced, bracts close 3-6-fld. *Bot. Mag.* t. 213; *Gärtn. Fruct.* ii. t. 119, f. 5; *Miquel Fl. Ind. Bat.* i. 1005; *Bab. in Trans. Linn. Soc.* xviii. 99. *P. altissimum*, Mæneh. *Meth.* 630. *P. amœnum*, *Bl. Bijd.* 531. *P. pilosum*, Roxb. *Hort. Beng.* 20, and *Fl. Ind.* ii. 286; *Wall. Cat.* 1710, excl. C. *P. cochinchinense*, Meissn. *Monog. Polyg.* 55. *P. torquatum*, De Bruyn in *Pl. Jungh.* 303. *Lagunea cochinchinensis*, Lour. *Fl. Coch.* i. 271.—*Rheede Hort. Mal.* xii. t. 76.

Wet places from ASSAM and SILHET westwards to OUDE and JAMU; ascending the Himalaya to 5000 ft.—*DISTRIB.* Siam, Java, Borneo; China, Japan, Turkestan (often cultivated).

A branching annual, 3-10 ft.; branches hollow. *Leaves* 6-9 by 2-5 in., grey with hairs; nerves very numerous; petiole 1-4 in.; stipules short, hirsute, truncate, mouth membranous or dilated herbaceous and recurved. *Racemes* 3-5 in., on long stout strict peduncles and pedicels, erect or cernuous; bracts crowded strigosely tomentose and ciliate; flowers large, white red or green. *Stamens* 7-8, included. *Styles* connate below, stigmas capitate. *Nuts* $\frac{1}{2}$ in. diam., orbicular, flattened with rounded margins and rather concave faces, black, shiny, pericarp very thick. *Cotyledons* incumbent.—Roxburgh remarks that the ends of the branches when moistened become thickly glutinous.

Var. *glabrata*; very sparsely pubescent or glabrate, petiole narrowly winged.—Kashmir, Thomson; Saharunpore Bot. Garden, Royle, Falconer.

Var. *parvifolia*; sparingly pubescent, leaves 2-3 $\frac{1}{2}$ in. elliptic acuminate membranous, petiole winged, stipules very short, mouth herbaceous. *Wall. Cat.* 1709/2 (under *P. tomentosum*).—Silhet, De Silva.—I have seen no other specimen. A note on the specimen says the shoots are eaten and have a sour taste.

13. **P. tomentosum**, Willd. *Sp. Pl.* ii. 447; stem simple very stout erect pubescent or glabrous, leaves 4-8 in. shortly petioled lanceolate finely acuminate silky beneath rarely glabrate, stipules strigose truncate mouth erect with rigid bristles half their length or less, racemes stoutly peduncled paniced, bracts crowded hispid and ciliate. Meissn. in *DC. Prodr.* xiv. 1. 124, excl. var. β ; Roxb. *Hort. Beng.* 29, and *Fl. Ind.* ii. 287; *Miquel Fl. Ind. Bat.* i. 1006; *Wall. Cat.* 1709, excl. B, E, G, H, and part of D. *P. orientale*, *Wall. Cat.* 1710 C. *P. ochreatum*, Houtt. *Pfl. Syst.* vi. 442, t. 49, f. 1. *P. pulchrum*, Blume *Bijd.* 530.

In ditches, &c., from BENGAL, ASSAM and CACHAR, southwards to MALACCA; and from BOMBAY to MALABAR and CEYLON.—*DISTRIB.* Java, Philippines, Trop. and S. Africa.

Stems one or more from a prostrate rooting annual stock, 2-4 ft., often as thick as the finger. *Leaves* 1-1 $\frac{1}{2}$ in. diam., usually pubescent or subsilky above; petiole rarely $\frac{1}{2}$ in.; stipules $\frac{1}{2}$ -1 in., membranous. *Racemes* 2-4 in., always erect, strict; bracts 6-8-fld.; flowers large, white. *Stamens* 7-8. *Nut* large, $\frac{1}{2}$ in. diam., orbicular flattened with rounded margin and convex faces; pericarp very thick, crustaceous, black, shining; cotyledons incumbent.—This is apt to be confounded with *P. barbatum*. Meissner quotes *Wall. Cat.* 1708 A, and 1708 G, I, for this, but the first and last are certainly *barbatum*, and only one piece of G appears to be *tomentosum*.

14. **P. limbatum**, Meissn. in *DC. Prodr.* xiv. 1. 123; stem simple

very stout erect, leaves 4-8 in. shortly petioled lanceolate acuminate scaberrulous on both surfaces, stipules strigose truncate mouth with a spreading or recurved herbaceous scabrid ciliate limb, racemes stoutly peduncled paniced, bracts crowded hispid. *Boiss. Fl. Orient.* iv. 1031.

BENGAL; in the Jheels, *J. D. H. & T. T.*; Maldah, *Clarke*. UPPER GANGETIC PLAIN, *Thomson*. GARHWAL, *Edgeworth*. CONCAN, *Law*.—DISTRIB. Egypt, Trop. Africa.

Habit, inflorescence and nut of *P. tomentosum*, but the leaves in all the specimens are minutely scabrid on both surfaces, and the stipules have constantly a herbaceous limb. Fruit and pericarp as in *P. tomentosum*, and cotyledons incumbent.

Sect. V. TOVARA, *A. Gray*. A tall herb with perennial root. *Leaves* broad; stipules tubular. *Flowers* in a very slender raceme; bracts tubular. *Perianth* 4-partite. *Stamens* 5, alternating with glands. *Styles* 2, long, rigid, hooked, persistent, stigmas simple. *Nut* flattened; cotyledons accumbent.

15. *P. virginianum*, *Linn.*; *Meissn. Monog. Polyg.* 81, t. 1 I, f. 27-29, t. 3 N, and in *DC. Prodr.* xiv. 1. 112; sparsely hispid, leaves 4-10 in. short-petioled elliptic or elliptic-lanceolate, stipules short hispid, racemes 6-16 in., bracts distant 2-fld. *P. filiforme*, *Thunb. Fl. Jap.* 163; *Meissn. Monog.* 75, and in *DC. l. c.* *P. muticum*, *Mæsch Suppl.* 266. *Persicaria virginiana*, *Gærtn. Fruct.* ii. t. 119, f. 3.

TEMPERATE HIMALAYA, very rare, *Falconer*; Kashmir, on the Jhelum River, alt. 2-4000 ft., and Pir Panjal, alt. 7-10,500 ft., *Stewart*; Sikkim, on the Balesun River, alt. 7-8000 ft., *King*.—DISTRIB. China, Japan, Eastern United States.

Stem 5 ft. and upwards, branches hollow. *Leaves* thin, base acute, nerves many, slender; petiole $\frac{1}{2}$ -1 in.; stipules $\frac{1}{4}$ - $\frac{1}{2}$ in., mouth truncate and ciliate. *Racemes* long-peduncled, very long and slender; bracts ciliate, $\frac{1}{4}$ -1 in. apart; bracteoles narrow, hyaline; pedicels $\frac{1}{2}$ in., rigid, stout in fruit. *Perianth* eglandular, thin. *Fruit* ellipsoid, flattened, pale brown, as long as the persistent styles.—The long hooked persistent style free to the base, serving to attach the fruit to foreign bodies, is unique in the genus, and indicates that the species should form a separate section (it is singular that though provided with so obvious a means of transport the species should be so rare in India). I find no difference between the Himalayan and East American plants; the W. Asiatic and some American have shorter and blunter leaves. The Sikkim specimen has leaves sparsely strigillose on both surfaces, as in some American ones, others of both countries are nearly glabrous.

Sect. VI. BISTORTA, *Tourn.* Perennial eglandular herbs, erect with simple stems from a woody rootstock, or with branching prostrate stems and erect leafy scapes. *Leaves* broad or narrow; stipules tubular, eciliate. *Flowers* in spiciform racemes, eglandular; bracts membranous, ovate or lanceolate, open not tubular nor truncate. *Perianth* 4-5-partite, not enlarged in fruit. *Stamens* 4-10. *Styles* 2-3, long, slender, free; stigma simple. *Nut* trigonous or biconvex; cotyledons accumbent.

* *Stem* solitary, simple, erect from a woody rootstock.

16. *P. viviparum*, *Linn.*; *Boiss. Fl. Orient.* iv. 2027; root-leaves long-petioled linear or linear-oblong acute or obtuse crenulate base acute obtuse or cordate, spikes solitary erect slender, flowers suberect pink, the lower replaced by bulbils. *Meissn. in Wall. Pl. As. Rar.* iii. 53, and in *DC. Prodr.* xiv. 1. 124; *Fl. Dan.* t. 13. *P. angustifolium*, *Don Prodr.* 70. *P. bracteatum*, *Spreng. Cur. post.* 154. *P. bulbiferum*, *Royle mss.*; *Bab. in Trans. Linn. Soc.* xviii. 94; *Meissn. in DC. l. c.* 125. *P. affine*,

Wall. Cat. 1683/3, not of Don. *P. bistorta*, Gærcke in Bot. Reis. Pr. Waldem. 135.

ALPINE and SUBALPINE HIMALAYA, from Kashmir to Sikkim, &c. WESTERN TIBET, alt. 9–15,000 ft.—DISTRIB. Alpine North and Arctic Europe, Asia and America.

Rootstock woody, as thick as the thumb or less; stem 4–12 in., slender. *Leaves* very variable, 1–6 in., coriaceous, sometimes pubescent or even tomentose beneath; cauline sessile, erect. *Spikes* 1–4 in. long; bracts ovate, acuminate. *Perianth* very variable in size. *Stamens* included or exserted. *Styles* filiform, slender, free and included or greatly lengthened and connate below. *Nut* very small, trigonous or biconvex.—Probably an Alpine state of *P. bistorta*.

17. *P. sphærostachyum*, Meissn. Monog. Polyg. 53, and in Wall. Pl. As. Rar. iii. 52, and in DC. Prodr. xiv. 1. 125; root-leaves long-petioled linear or linear-oblong acute or obtuse crenulate base acute or obtuse, spikes solitary erect stout cylindric or capitate very dense-fl., flowers crimson drooping. Bot. Mag. t. 6847. *P. macrophyllum*, Don Prodr. 70; Bab. in Trans. Linn. Soc. xviii. 95. *P. gracillimum*, Spreng. Cur. post. 154. *P. tenue*, Don l. c. *P. stenophyllum*, Meissn. in DC. l. c. *P. splendens*, Klotzsch in Bot. Reis. Pr. Wald. t. 88. *P. affine*, var. *angustifolium*, Wall. Cat. 1683.

TEMPERATE and SUBALPINE HIMALAYA; from Scinde to Sikkim, alt. 11–15,000 ft. WESTERN TIBET, Heyde.

The dense spike of brilliantly coloured drooping flowers is the best character for this beautiful plant; I am very doubtful about some of the synonyms cited for it and for *P. viviparum*, especially as to Don's *angustifolium*, *tenue* & *gracillimum*.

18. *P. perpusillum*, Hook. f. Ic. Pl. t. 1490 A; very dwarf, glabrous, radical leaves subsessile narrowly linear obtuse margins recurved quite entire, scape very slender 1-leaved, flowers few capitate pendulous, sepals 4 unequal, stamens 1–3 perfect, nut trigonous or biconvex.

ALPINE HIMALAYA, alt. 12–15,000 ft.; Sikkim, J. D. H.; Kumaon and Garwhal, Strachey & Winterbottom (Polyg. No. 39), Duthie.

Subcæspitose; rootstock stout, clothed with membranous torn stipules. *Leaves* $4\frac{1}{2}$ by $\frac{1}{10}$ in., spreading; stipules 2-fid. *Scape* $1\frac{1}{2}$ in., erect; head $\frac{1}{2}$ – $\frac{1}{4}$ in. diam.; flowers $\frac{1}{10}$ in. long, white or pink; bracts crowded, obtuse; pedicel short, jointed at the top. *Sepals* broad, obtuse, very unequal, inner orbicular or oblong. *Styles* 2–3, nearly free, stigmas capitate. *Nut* pale, smooth.—A very singular little species, allied to *P. sphærostachyum*; variable in number of stamens, some of which are reduced to capitellate filaments, and in the form of the sepals and fruit.

19. *P. paleaceum*, Wall. Cat. 1684; root-leaves long-petioled linear-oblong or -lanceolate crenulate base very narrow, spike solitary erect stout cylindric, flowers crowded suberect pink. *P. confusum*, Meissn. in Wall. Pl. As. Rar. iii. 53. *P. carneum*, C. Koch in Linnæa, xxii. 197.

KHASIA Mts.; alt. 4–6000 ft., abundant.

Rootstock as thick as the thumb; stem 6–16 in., slender. *Leaves* 3–9 in., very variable in breadth, obtuse or acute, base always narrowed into the slender petiole. *Spikes* 1–2 in., flowers crowded; bracts ovate, acuminate, scarious.—Very nearly allied to *P. bistorta*, but the leaves are always very gradually narrowed to the base, not forming broad wings below the base as usual in the European plants. This species is omitted by Meissner in the Prodromus.

** *Perennial herbs with tufted or creeping branched rootstocks and erect simple rarely branched flowering stems bearing erect spikes.*

20. *P. amplexicaule*, Don Prodr. 70; glabrous, densely tufted,

flowering stems 2-3 ft. very slender, leaves large long-petioled ovate-cordate caudate-acuminate crenulate upper amplexicaul, racemes very long-peduncled erect, bracts ovate, styles free slender. *Meissn. in Wall. Pl. As. Rar.* iii. 54, and in *DC. Prodr.* xiv. 1. 126; *Bab. in Trans. Linn. Soc.* xviii. 96; *Bot. Reg.* 1839, t. 46; *Bot. Mag.* t. 6500. *P. oxyphyllum*, *Wall. Cat.* 1715; *Meissn. ll. c.* *P. ambiguum*, *Meissn. ll. c.*; *Wight Ic.* t. 1797. *P. petiolatum*, *Don l. c. fid. Bab.*

TEMPERATE HIMALAYA; from Murree, alt. 6-8000 ft., to Sikkim, alt. 9-13,000 ft.

Rootstock stout, woody, branched. *Stems* 2-3 ft., green, sparingly leafy. *Lower leaves* 3-6 in. long, minutely papillose beneath, especially on the nerves; stipules 1-2 in., narrow, tips torn. *Racemes* 1-2, 2-6 in. long. *Flowers* red, white or greenish-white, $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. *Stamens* 8, anthers exserted. *Ovary* 3-gonous.

Var. speciosa; flowers larger, $\frac{1}{2}$ in. diam., deep purplish-red or claret-coloured. *P. speciosum*, *Wall. Cat.* 1716; *Meissn. ll. c.*—Occurs throughout the range of the species, and is the only form found hitherto in Sikkim, the specimens from whence are very stout. In Nepal it occurs in a large branched form.

21. ***P. affine***, *Don Prodr.* 70, *excl. syn.*; glabrous, densely tufted, flowering stems 4-12 in., leaves sessile or shortly petioled linear- or elliptic-lanceolate or oblanceolate acute or obtuse crenulate glaucous beneath cauline few, racemes shortly peduncled stout erect, flowers suberect, styles free slender. *Meissn. Monog. Polyg.* 52, and in *DC. Prodr.* xiv. 1. 126; *Bab. in Trans. Linn. Soc.* xviii. 97; *Bot. Mag.* t. 6472. *P. Brunonis*, *Wall. Cat.* 1692; *Royle Ill.* 317, t. 80, f. 3; *Meissn. in Wall. Pl. As. Rar.* iii. 54; *Lindl. & Paxt. Fl. Gard.* ii. t. 37; *Lemaire Jard. Fleur.* t. 117. *P. Donianum*, *Spreng. Syst. Cur. post.* 154.

ALPINE and SUBALPINE HIMALAYA; from Kashmir, alt. 8-14,000 ft., eastward Kumaon, alt. 11-13,000 ft. WESTERN TIBET.

Rootstock woolly, long, branched, often tortuous, and 4-8 in. long; crown clothed with scarios old stipules. *Leaves* chiefly radical, 2-4 in., narrowed into the petiole, finely reticulate, margins recurved; stipules $\frac{1}{2}$ -1 in., entire or split, many-nerved, brown. *Peduncles* 3-8 in., usually stout. *Racemes* 2-3 in., obtuse, flowers crowded, rosy, $\frac{1}{2}$ - $\frac{1}{4}$ in. diam. *Sepals* elliptic-oblong. *Nut* 3-gonous.—Iskardo and Kashmir specimens attain 16 in. in height.

22. ***P. vacciniifolium***, *Wall. Cat.* 1695; tufted, glabrous, branches trailing and creeping, leaves shortly petioled small orbicular or elliptic acute at both ends or acuminate quite entire, stipules rigid lacinate with many long strong excurrent nerves, racemes subsessile, styles filiform free. *Meissn. in Wall. Pl. As. Rar.* iii. 54, and in *DC. Prodr.* xiv. 1. 126; *Royle Ill.* 317, t. 80, f. 2; *Bab. in Trans. Linn. Soc.* xviii. 96; *Lindl. & Paxt. Fl. Gard.* ii. 37; *Bot. Mag.* t. 4622.

TEMPERATE and SUBALPINE HIMALAYA; from Kashmir to Bhotan, alt. 9-14,000 ft. WESTERN TIBET; Ladak, alt. 14-16,500 ft. *Stewart.*

Rootstock sometimes as thick as the little finger and twisted, usually longer more slender and much branched; branches leafy. *Leaves* $\frac{1}{2}$ - $\frac{3}{4}$ in., rather glaucous beneath; stipules $\frac{1}{2}$ - $\frac{3}{4}$ in., brown, giving a crinite appearance to the tips of the young branches. *Racemes* $\frac{1}{2}$ -3 in.; bracts acuminate; flowers rose-red, $\frac{1}{2}$ in. diam. *Stamens* at length exserted.—*Meissner's* vars. *obtusifolium*, *medium*, and *flagelliforme*, are not sufficiently distinguishable.

23. ***P. emodi***, *Meissn. in Wall. Pl. As. Rar.* iii. 51, 54, t. 287, and in *DC. Prodr.* xiv. 1. 127; glabrous, rootstock elongate, branches trailing and creeping, leaves subsessile rigid linear-lanceolate acuminate at both ends quite entire striate-nerved, stipules long membranous acuminate many-nerved, racemes peduncled, stamens included, flowers pedicelled, styles free

filiform. *Bab. in Trans. Linn. Soc.* xviii. 98. *P. Meissneri*, *Wall. Cat.* 1693.

TEMPERATE HIMALAYA; from Dalhousie to Bhotan, alt. 8–11,000 ft.

Rootstock as thick as a goose-quill; branches 6–10 in., internodes often 1–1½ in., with short ascending leafy branches. *Leaves* 1½–2 in., margins recurved; stipules 1 in. *Racemes* 1–1½ in., few-fl'd.; bracts acuminate; flowers red. *Perianth* ¼ in. long. *Stamens* 8. *Nut* ellipsoidly rhombic, angles very obtuse.

Sect. VII. *PERSICARIA*, *Meissn.* Erect or decumbent annual or perennial herbs. *Leaves* usually narrow; stipules tubular, often ciliate. *Flowers* in spiciform racemes, often glandular; bracts more or less tubular, usually truncate, often ciliate. *Perianth* 4–5-partite, not enlarged in fruit. *Stamens* 4–8, often alternating with glands. *Styles* 2–3, free or connate below, stigmas usually capitate. *Nut* trigonous or biconvex, cotyledons accumbent.

* *Styles* 2, rarely 3; *nut* biconvex. (See also *P. Hydropiper*.)

24. *P. glabrum*, *Willd. Sp. Pl.* ii. 447; glabrous, leaves 4–8 in. petioled lanceolate or linear-lanceolate finely acuminate glandular or not, stipules membranous eciliate glabrous, racemes slender paniced, peduncles usually quite glabrous, bracts rarely ciliolate. *Meissn. in DC. Prodr.* xiv. 1. 115, and in *Mart. Fl. Bras.* v. 1, t. 14; *Roxb. Fl. Ind.* ii. 287; *Bab. in Trans. Linn. Soc.* xviii. 102; *Wight Ic.* t. 1799; *Wall. Cat.* 1711; *Grah. Cat. Bomb. Pl.* 172; *Dalz. & Gibs. Bomb. Fl.* 214. *P. Poirerii*, *Meissn. in Wall. Cat.* 1712, &c. *P. Persicaria*, *Wall. Cat.* 1720.—*Rheede Hort. Mal.* xii. t. 77.

In ditches, &c., from ASSAM, SILHET and BENGAL westward to the INDUS and SCINDE, and southward to BURMA, ascending the HIMALAYA to 6400 ft. in GARHWAL. CEYLON, common.—DISTRIB. Tropical Asia, Africa and America.

Stem 2–4 ft., sometimes as thick as the finger, rarely diffusely branched, often red. *Leaves* usually dark brown and shining when dry; stipules rarely with a few short cilia. *Racemes* 2–4 in., very slender; bracts truncate, tip oblong or rounded, few-fl'd. *Perianth* very variable in size, white or rosy. *Stamens* 6–8. *Nut* orbicular, biconvex, black, shining.—It is difficult to separate this from smooth forms of *P. Persicaria*, of which it is the tropical representative; it is, however, much larger, less branched, with more attenuate leaves brown when dry, and normally eciliate bracts and stipules. *Meissner* doubtfully cites under his var. *obscurum* (which is the common state of the plant in India) *Roxburgh's P. tenellum*, on the faith of a note of Wallich's in *Herb. DC.*; but the published *tenellum* of *Roxburgh* has filiform racemes and trigonous nuts, and is what I suppose to be *P. flaccidum*. *Boissier* points out (under *P. senegalense*) that the Afghan habitat attributed to this by *Meissner* is a mistake for *Loodiana*. Var. *glandulosissima*, *Meissn. in Wall. Pl. As. Rar.* iii. 57, and in *DC. l. c.*, is the glandular-leaved state of the plant, and is the *P. fluviatile*, *Herb. Ham. and Wall. Cat.* 1711 E; the nut is trigonous in *Hamilton's* specimen.

Var. *scabrinervis*; peduncles often glandular above, leaves glandular, midrib beneath scabrid. *P. scabrinerve*, *Royle mss.*; *Meissn. l. c.* 121, in part; *Bab. l. c.* 101. *P. quadrifidum*, *Ham. in Wall. Cat.* 1711 F.—N.W. India, *Royle*; Soane River, *J. D. H.*; Bengal; Burma; Ceylon.—*Hamilton's* specimens have a deceased inflorescence.

Var. ? *macrantha*; leaves densely gland-dotted, midrib beneath scabrid, racemes very stout, bracts oblong, flowers nearly ¼ in. diam. rose-cold., styles 2 or 3.—Silhet station, *Clarke*.—The specimens are very indifferent, but I think referable to *P. glabrum*. It must be a handsome plant.

25. *P. amphibium*, *Linn.*; *Boiss. Fl. Orient.* iv. 1028; perennial, leaves usually floating oblong or lanceolate, stipules truncate ciliate or not, racemes solitary dense-fl'd., peduncles hairy, bracts eciliate, perianth

eglandular, fruit ovoid faces convex. *Meissn. in DC. Prodr.* xiv. 1. 115; *Fl. Dan.* t. 282.

WESTERN HIMALAYA, *Falconer*; Kumaon, alt. 6400 ft., *Strachey & Winterbottom*; Kashmir, *Thomson*.—DISTRIB. Westward to the Atlantic, N. Asia and America.

Rootstock creeping, woody. *Leaves* long petioled and floating, or subsessile and aerial, obtuse or acute, serrulate or ciliate, eglandular; stipules glabrous or hispid. *Racemes* very stout, 1–2 in. long; peduncle stout; bracts acute obtuse or cuspidate. *Sepals* $\frac{1}{2}$ in., not nerved, bright red, much longer than the shining nut.

26. ***P. lanigerum***, *Br. Prodr.* 419; much branched, clothed with snow-white cottony tomentum, leaves petioled or sessile narrowly lanceolate acuminate rarely glabrous above, stipules short truncate eciliate, racemes 1–2 in. slender, bracts small crowded glabrous or tomentose eciliate. *Meissn. in Wall. Pl. As. Rar.* iii. 55, and in *DC. Prodr.* xiv. 1. 117; *Benth. Fl. Austral.* v. 271; *Boiss. Fl. Orient.* iv. 1030; *Wall. Cat.* 1714. *P. lanatum*, *Roxb. Hort. Beng.* 29, and *Fl. Ind.* ii. 285. *P. arachnoideum*, *Klotzsch mss.*

In ditches, &c.; BENGAL, *Roxburgh*, ROHILKUND, *Wallich*, *Thomson*, and along the lower HIMALAYA from Sikkim to the Beas River; Belgaum, *Herb. Wight*.—DISTRIB. Java, Philippines, Egypt, Tropical and S. Africa and America, Australia.

Stem 2–5 ft., procumbent and creeping below, sometimes much thicker than the thumb; branches slender, much divided, divaricating, white, “deep red within, especially at the joints,” *Roxb.* *Leaves* 4–8 in., finely acuminate, thickly cottony beneath; stipules membranous, mouth unequal. *Racemes* in slender divaricate cottony peduncles; bracts very small, obtuse or acute, and small red or white perianth eglandular. *Stamens* 6. *Nut* orbicular, small, flat, black, shining.—*Roxburgh* describes this as annual, *Bossier* calls it annual in his *clavis* and perennial in his description, others say perennial; the great size of the rooting base of the stem would indicate the latter.

Var. *glutinosa*; peduncles and perianth glandular. *P. glutinosum*, *Wall. Cat.* 1717; *Meissn. in Wall. Pl. As. Rar.* iii. 55, and in *DC. l. c.* 120.—Banks of the Irawaddy, *Wallich*.—This appears to me a form of *P. lanigerum* growing in dry places. The root is annual. S. Africa.

27. ***P. lapathifolium***, *Linn.*; *Boiss. Fl. Orient.* iv. 1030; annual, erect, branched, leaves subsessile elliptic-ovate or lanceolate glandular beneath ciliolate, stipules sparingly ciliate, racemes dense-fld. erect or nodding, bracts eciliate, pedicels usually glandular, perianth greenish glandular nerves strong, stamens usually 6. *Meissn. in DC. Prodr.* xiv. 1. 119; *Reichb. Ic. Crit.* v. t. 495; *Engl. Bot.* t. 1382.

Plains of N. INDIA; var. *nodosa* from Lahore westwards to Kashmir, ascending the Himalaya to 7000 ft.; var. *laxa* from BENGAL to the Sutlej, ascending the Himalaya to 6000 ft. The CONCAN.—DISTRIB. W. and N. Asia, Europe, Africa, and America.

I am indebted to Mr. Baker for identifying the Indian forms of this and the following species, which present a series of varieties more or less representing the European ones described above, but none of them conforming to the typical *P. lapathifolium*. The var. *nodosa* is, he informs me, often very difficult to distinguish from *P. Persicaria*.

Var. *nodosa*; taller, more branched, spikes oblong, perianth reddish not so strongly veined, nut smaller. *P. nodosum*, *Pers.*; *Meissn. in DC. l. c.* 118. *P. maculatum*, *Dyer & Trimen*.

Var. *laxa*; spikes laxer cylindric. *P. laxum*, *Reichb. Ic. Crit.* v. 56, t. 492. *P. nutans*, *Roxb. Fl. Ind.* ii. 285. *P. quadrifidum*, *Herb. Strachey & Winterbottom, Polyg.* 24.

28. ***P. Persicaria***, *Linn.*; *Boiss. Fl. Orient.* iv. 1030; annual, erect

or ascending, leaves subsessile elliptic-oblong or lanceolate eglandular, stipules usually hirsute and ciliate, racemes oblong dense-fl., bracts ciliate, pedicels glabrous, perianth red eglandular nerves slender, stamens usually 6. *Meissn. in DC. Prodr.* xiv. 1. 117; *Reichb. Ic. Crit.* v. 55; t. 491; *Engl. Bot.* t. 756.

WESTERN HIMALAYA; Kashmir, *Falconer*, &c. WESTERN TIBET, alt. 9-14,000 ft., *Thomson*, &c.—DISTRIB. N. and W. Asia, Europe, Africa, N. America.

Under *P. lapathifolium* I have alluded to the difficulty of distinguishing this plant from its var. *nodosa*, in India at any rate. I must leave a further study of the forms of both to Indian botanists, with living specimens to work upon.

29. ***P. minus***, *Huds.*; *Meissn. in DC. Prodr.* xiv. 1. 111; slender, erect or ascending, glabrous, leaves sessile linear- or oblong-lanceolate subacute, stipules sparsely strigose truncate ciliate cilia much shorter than the tube, racemes erect filiform, bracts close rarely interrupted glabrous ciliate, perianth eglandular, nut polished. *Boiss. Fl. Orient.* iv. 1029; *Miquel Fl. Ind. Bat.* i. 1002. *P. Posumbu*, *Wall. Cat.* 1722 (not of *Ham.*). *P. tenellum*, *Blume Bijl.* 530. *P. hypostictum*, *Miquel in Herb. Hohen.*, No. 971. *P. Banca*, *Herb. Ham.* *P. strictum*, *Allioni*; *Wight Ic.* t. 1800.

Throughout the hotter parts of India, from ASSAM and CHITTAGONG to KASHMIR, and southward to TRAVANCORE, ascends the Himalaya to 6000 ft. CEYLON, ascending to 4000 ft.—DISTRIB. Europe, Temperate and Tropical Asia.

Stem sometimes creeping, 6-10 in. high or long, much branched or simple. *Leaves* usually under 2 in., glabrous or puberulous beneath, or minutely strigose on the midrib beneath; stipules $\frac{1}{4}$ - $\frac{1}{2}$ in., with stiff closely appressed bristles. *Racemes* $\frac{1}{2}$ -1 in., erect; flowers minute. *Nut* orbicular.—The nuts are rather smaller than in European specimens, but I find no other difference. *Wight* describes the Nilghiri plant as 2-3-gynous and 5-6-androus. Small states of *P. serrulatum* are with difficulty distinguished from this.

30. ***P. assamicum***, *Meissn. in DC. Prodr.* xiv. 1. 111; diffusely branched and creeping, and ascending, branches glabrous, leaves dark green when dry petioled elliptic-ovate or lanceolate subacute or acuminate glabrous or with the nerves beneath setulose and margins ciliate, stipules strigose cilia as long as the tube, racemes 1-1 $\frac{1}{2}$ in. very slender and on very slender pedicels, bracts interrupted glabrous truncate ciliate, perianth eglandular, stamens 5 or 6.

ASSAM, *Wallich*, *Masters*; CACHAR, *J. D. H. & T. T.*—DISTRIB. Burma, *Griffith*.

The prostrate habit, dark-green petioled broader leaves, longer cilia of the stipules and more slender interrupted racemes, at once distinguish this remarkable species, which has the colour of *P. tinctorium* when dry. The Burmese specimen is very much stouter than the Assam and Cachar ones, and has leaves 4 by 1 $\frac{1}{2}$ in. The nut is like that of *P. minus*.

†† *Style* 3, rarely 2. *Nut* 3-gonous, rarely biconvex.

31. ***P. viscosum***, *Ham. in Don Prodr.* 71; annual, stem ascending and branches hirsute with spreading bristly hairs and glands, leaves shortly petioled lanceolate acute or acuminate strigose, stipules short hirsute, racemes 1-1 $\frac{1}{2}$ in. erect, bracts close strigose and ciliate, perianth eglandular. *Meissn. Monog. Polyg.* 73; in *Wall. Pl. As. Rar.* iii. 55, and in *DC. Prodr.* xiv. 1. 102; *Wall. Cat.* 1713. *P. strigosum* & *hirsutum*, *Herb. Ham.*

NEPAL, *Hamilton*; KHASIA Mts., SILHET and CACHAR, *De Silva, Griffith*, &c.

Stem 1-3 ft., stout or slender, hollow, hairs flexuous, glandular or not. *Leaves* 2-7 in., glandular or not beneath, usually drying brown, stipules $\frac{1}{2}$ - $\frac{3}{4}$ in. *Racemes*

rather slender; peduncles densely glandular; bracts short; flowers bright red, hardly exerted. *Stamens* 8. *Nut* broadly trigonous, black.—I find no character for Meissner's var. *verrucosum*, of which I think the varnish is due to the glue used in mounting the specimen.

Var. *minor*; smaller, weaker, more slender and sparsely hirsute, green when dry, leaves 1–1½ in. elliptic-lanceolate obtuse. *Wall. Cat.* 1713 C.—Nepal (cult. in Hort. Bot. Calc.); Silhet.

32. *P. stagninum*, *Ham. mss.*; *Meissn. in Wall. Pl. As. Rar.* iii, 56, in *DC. Prodr.* xiv. 1. 104; stem erect or ascending and branches glabrous below above and peduncles subsilkily strigose, leaves 3–5 in. lanceolate or linear-lanceolate acuminate strigosely pubescent on both surfaces glandular or not beneath, stipules strigose cilia shorter than the tube, racemes strict erect, bracts close glabrous or strigose ciliate, perianth eglandular. *P. tomentosum*, *Wall. Cat.* 1709/4 in part, E, G, H. *P. barbatum*, *Wall. Cat.* 1708 F. *P. Bishiræ*, *Ham. mss.*; and *P. conspersum*, *Meissn. in Wall. Pl. As. Rar. l. c.*, and in *DC. l. c.* 102. *P. hispidum*, *Bab. in Trans. Linn. Soc.* xviii. 100 (not of *Don*). *P. Hamiltonii*, *Meissn. in DC. l. c.* 104, excl. syn. *P. hispidum*, (not of *Sprengel*). *P. Goyalpara*, *Herb. Ham.* *P. Hornemannii*, *Meissn. in DC. l. c.* 107.

Throughout the hotter parts of India, from CHITTAGONG, CACHAR and BENGAL to CHAMBA, ascending the Himalaya in Sikkim and Kumaon to 4000 ft. *MYSORE*, *Clarke*. *PEGU* and *BURMA*, *Wallich*.

Annual? *Stem* simple or branched. *Leaves* usually grey when dry, young often silky. *Racemes* stout or slender; peduncles usually long and stout; bracts glabrous or more or less (sometimes densely) strigose, very many-fld.; flowers white. *Styles* long, slender, connate below. *Nut* pitchy black.—Very near *P. barbatum*, and probably a form of it; but the peduncles are invariably strigose, the racemes and cilia of the stipules both shorter. Meissner refers Sprengel's *Hamiltonii* (which is Hamilton's *hispidum*) to the neighbourhood of *P. barbatum*, but I am disposed to place it under *P. flaccidum*, whilst the rest of Meissner's *Hamiltonii* comes here.

33. *P. barbatum*, *Linn.*; *Meissn. in DC. Prodr.* xiv. 1. 104; branches stout erect and peduncles glabrous, or nearly so, leaves 4–7 in. lanceolate or linear-lanceolate acuminate glabrous except the ciliate margins and mid-rib beneath, stipules strigose cilia longer than the tube, racemes 2–4 in. slender erect, bracts close glabrous sparingly and shortly ciliate, perianth eglandular white, stamens 5–8. *Bab. in Trans. Linn. Soc.* xviii. 100; *Wall. Cat.* 1708, excl. F; *Wight Ic. t.* 1798; *Miquel Fl. Ind. Bat.* i. 999. *P. rivulare*, *Kæn., Roxb. Fl. Ind.* iii. 290; *Grah. Cat. Bomb. Pl.* 172; *Dalz. & Gibs. Bomb. Fl.* 214. *P. Hornemannii*, *Meissn. in DC. l. c.* 107. *P. Maromoræ* & *fluviatile*, *Herb. Ham.*

Throughout the hotter parts of India, from ASSAM to the INDUS, and southwards to MALACCA, PENANG and CEYLON.—DISTRIB. Tropical Asia and Africa.

The nearly or quite glabrous stems and peduncles, the long bearded stipules, long weak slender but erect racemes, and shorter weaker cilia of the bracts, best distinguish this from *P. stagninum*; but none of these characters holds good by itself, and I look to Indian botanists for further information. I am not certain that the synonymy of these plants is quite right, there is so much confusion between the names adopted by Hamilton, Wallich and Roxburgh, which last author has different names for the same plant in his Herbarium, his Icones and his Flora. The *barbatum* of "Flora Indica" is, I think, certainly what I have retained as *flaccidum*; that so called on his authority in *Herb. Wallich* is *P. Hydropiper*; that of his *Icones* is undoubtedly *P. tomentosum*; whilst in his Herbarium *P. barbatum* is labelled *P. aquaticum*, which suggests to me that it is the *rivulare* of "Flora Indica," of which there is a poor drawing in his *Icones*, representing a very narrow-leaved plant with short stipules and slender racemes of white flowers.

34. **P. serrulatum**, *Lagasc.*; *Boiss. Fl. Orient.* iv. 1028; stem prostrate and rooting below, branches and peduncles glabrous, leaves 2-4 in. subsessile linear- or elliptic-oblong or -lanceolate acute or acuminate, glabrous or sparsely hairy beneath, base rounded cordate or acute, stipules strigose cilia as long as the tube, racemes $\frac{1}{2}$ -1 $\frac{1}{2}$ in. slender erect, bracts glabrous strongly often squarrosely ciliate, perianth eglandular, stamens 5-8, nut trigonous polished. *Meissn. in DC. Prodr.* xiv. 1. 110. *P. flaccidum*, *Roxb. Fl. Ind.* ii. 291 (not of *Meissn.* or *Boiss.*). *P. mite*?, *Wall. Cat.* 1721 E, G, 1721/a in part. *P. Rapte*, *Herb. Ham.*

Plains and low hills of N. INDIA, from ASSAM and BENGAL to the INDUS, ascending to 4000 ft.; in the HIMALAYA, from Kumaon westwards.—DISTRIB. W. Asia, S. Europe, all Africa, America, Australia.

Habit between small states of *P. barbatum* and *P. minus*, of which latter this is probably a form with stouter racemes and more ciliate bracts and stipules. Specimens with leaves rounded or cordate at the base are distinct enough from both. Boissier describes it as perennial with rosy flowers, but the Indian plant is an annual with white flowers. Meissner and Boissier could not have attended to Roxburgh's description of his *P. flaccidum* (leaves cordate at the base), or they would have identified that plant with this; Roxburgh's figure of this (under the name of *P. flaccidum*) represents the leaves as much broader and more cordate at the base than I have ever seen them to be. A remarkable state from Dufa in Bhotan, collected by Booth, has the under surface of the leaves studded with a yellow secretion in minute dots.

Var. *Donii*; tall, slender, leaves petioled elliptic or lanceolate acuminate at both ends sparsely hairy beneath, racemes long slender erect, bracts close imbricate with one far removed and low on the slender peduncle, cilia as long as the tube. *P. Donii*, *Meissn. Monog. Polyg.* 72, excl. syn., and in *DC. Prodr.* xiv. 1. 105, excl. cit. of *Wight*.—Nepal, *Wallich*.

There are two sheets of this in the Hookerian Herbarium (from Wallich, 1821), one with the narrow leaves described by Meissner, the other with much broader elliptic ones. They closely resemble *P. flaccidum* var. *hispida*, but the closer bracts with long spreading cilia and eglandular perianth distinguish it. From *P. Posumbu* most of the same characters separate it, but it is in many respects intermediate between these two.

35. **P. Posumbu**, *Ham. in Don Prodr.* 71 (not of *Wallich*); flaccid, very slender, stem extensively creeping below and peduncles quite glabrous, leaves 1-3 in. petioled elliptic-lanceolate caudate-acuminate glabrous or sparsely hairy, stipules sparingly strigose, cilia stiff longer than the tube, peduncles and erect racemes filiform sometimes very long, bracts minute close or distant very shortly ciliate, perianth very small eglandular, nut perfectly smooth and polished. *Meissn. in DC. Prodr.* xiv. 1. 105, in part; *Miquel Fl. Ind. Bat.* i. 1000. *P. Donii*, *Wall. Cat.* 1723 B. *P. cæspitosum*, *Blume Bijd.* 532 (of *Herb. Lugd. Bat.*). *P. gracile*, *Herb. Ham.*

TEMPERATE and SUBTROPICAL HIMALAYA; from Sikkim to Nepal. ASSAM, SILHET, CACHAR and the KHASIA Mts., ascending to 5000 ft.—DISTRIB. Munnipore, Java, China and Japan.

Stem creeping for 1-3 ft., then ascending or decumbent for 12-18 in., simple or branched. Leaves very membranous, ciliate; petiole sometimes $\frac{1}{2}$ in. Racemes 1-3 in., always erect, very variable in length, sometimes almost capillary and 5 in. long with distant bracts, at others short with imbricate upper bracts and remote lower ones (these resembling small specimens of *serrulatum*). Nut 3-gonous, very small.—There are no Nepal specimens of this in Hamilton's or Wallich's Herbaria. Hamilton's are from Goalpara in Assam, and are not ticketed *P. Posumbu*, which name nowhere appears in his collection. Meissner's *a tenerum* is the right plant; his β *firmum* is composed of this and of *P. flaccidum*; his γ *macrophyllum* is *P. flaccidum*; his δ ? *cæspitosum* is right; his ϵ ? *ovatum* would appear to be *Ceratogo*

non atriplicifolium, both from the number of Wallich's, which he quotes (1719), and from the length of the petiole (6-8 lines).—Don's publication of *Posumbu* and Blume's of *caespitosum* are contemporaneous.

36. **P. Hydropiper**, Linn.; Boiss. *Fl. Orient.* iv. 1029; glabrous, rather robust, stem erect or ascending branched, leaves sessile or petioled lanceolate or oblong-lanceolate glabrous or with the costa scabrid beneath, stipules glabrous or sparsely strigose very shortly ciliate, racemes filiform decurved interrupted, bracts glabrous glandular or not mouth naked or minutely ciliate, perianth very glandular pink, nut usually trigonous opaque granulate. Meissn. in *DC. Prodr.* xiv. 1. 109; *Fl. Dan.* t. 1376; Reichb. *Ic. Crit.* v. t. 494. P. mite, Wall. *Cat.* 1721 F, H.

Plains and hills of INDIA, in wet places, from ASSAM, SILHET, CHITTAGONG and BENGAL to N.W. INDIA; ascending the KHASIA Mts. to 5000 ft., and the HIMALAYA to 7000 ft. MADRAS (coll. G. Thomson).—DISTRIB. Westward to Europe and N. Africa, Temperate and Subtropical Asia, Java, N. America, Australia.

Annual, roots tufted or shortly creeping; stems and branches rather stout, leafy, 12-18 in. high, always glabrous, often glandular, nodes often swollen. Leaves rarely more than 3 in. long, very variable in width and in the length of the apex, usually covered with impressed glands; stipules glabrous, or with scattered erect appressed hairs that are sunk in the tissue of the stipule. Racemes flexuous/leafy at the base; bracts variable as to ciliation, which is always short, usually broader than in *P. flaccidum*; perianth pinkish. Nut sometimes flat, finely granular.—I cannot distinguish this from the European *P. Hydropiper*, though the cilia of the stipules are often longer and the nut smaller. Hamilton in a note upon his specimen (under the name of *flaccidum*), says that Roxburgh desired that it should bear the name of *Pani-maricha*, i.e. water-pepper. The Eastern specimens have more commonly a scabrid costa (which, however, varies in amount to total absence), and have more often sunk hairs in the stipules. I find these latter in European specimens; in which also I find occasional cilia on the bracts, but never a scabrid costa to the leaf. It is the *P. barbatum* of Roxb., according to a specimen in Herb. Wallich, but not of the "Flora Indica." Zollinger's No. 95 from Java is identical with the Indian plant. The long cilia of the more glabrous species, shorter racemes and more crowded flowers distinguish this from *P. flaccidum*.

Var. ? *eglandulosa*; perianth eglandular, nut compressed.—Western Himalaya, Edgeworth; Kunawur, Jamu and Ladak, Thomson.—But for the more drooping racemes and smaller pink flowers this would be *P. mite*, L., to which I was inclined to refer it, but Mr. Baker regards it as a form of *Hydropiper*.

37. **P. flaccidum**, Meissn. in *DC. Prodr.* xiv. 1. 107, in part, excl. syn. (not of Roxburgh); glabrous or pubescent, stem erect or ascending simple or branched, leaves usually petioled lanceolate or elliptic-lanceolate acuminate, stipules strigose or hirsute, cilia half as long as the tube or longer, racemes very long filiform decurved, bracts usually very distant glabrous glandular, mouth ciliate, nut trigonous rarely compressed opaque granulate. Boiss. *Fl. Orient.* iv. 1029, excl. syn. Donii. *P. barbatum*, Roxb. *Fl. Ind.* ii. 289 (not of Willd.). *P. Posumbu*, Thwaites *Enum.* 245. ? *P. tenellum*, Roxb. *Fl. Ind.* ii. 289. *P. Donii*, Wight *Ic.* t. 1801. *P. mite*?, Wall. *Cat.* 1721/2, 3, D, 1723 1 b, C. *P. Rottleri*, Roth *Nov. Pl. Sp.* 205. *P. rivulare*, Herb. Helf. (ex Meissn.). *P. asperulum*, Wall. *ms.* *P. Bisculatum*, Herb. Ham. *P. ciliatum*, *Ic.* Roxb.

Common throughout INDIA in wet places, ascending the Himalaya to 4000 ft., and extending to CEYLON and MALACCA.—DISTRIB. Malay Archipelago.

Usually a much taller, longer and larger leaved species than *P. Hydropiper*, and differing in other characters indicated under that plant.

Root perennial?, shortly creeping; stems 2-3 ft., usually erect and slender

glabrous or strigose. *Leaves* 2-6 in., glabrous altogether or with the exception of the costa and nerves beneath, or hispidly or strigosely hairy on the surfaces or below only, brown when dry, more or less glandular. *Stipules* usually very strigose with stiff appressed hairs, cilia often as long as the tube. *Racemes* subpaniculate, sometimes 6 in. long and extremely slender; bracts glabrous, more or less ciliate, glandular or not; perianth bright pink, very thickly glandular. *Stamens* 8. *Nut* small, black, minutely granular.—The taller, longer-leaved, hairy forms of this are very distinct from *P. Hydropiper*, but amongst a large suite of specimens of both, some occur that it is difficult to refer to one rather than to the other. As pointed out under *P. serrulatum*, Roxburgh's *P. flaccidum* is that plant. This obliges me to retain the name (*flaccidum*) as Meissner's, though in so doing I am unable to take in his synonymy and his varieties, which are much confused. Boissier gives Afghanistan Griffith as a locality for this species, but I have seen no specimens, and his description quite agrees with the Indian plant. I can hardly doubt this being Roth's *P. Rottleri*, which he received from Heyne (under the name of *P. barbatum*, Rottler), but am puzzled by his description of "style quite simple and stigma capitate"—in allied species he always speaks of stigmas. I do not see how glabrous forms differ from the American *P. acre*, HBk., except, as Meissner observes (in Fl. Bras.), by the granulate (not smooth polished) nut.

Var. *hispidum*; leaves elliptic ovate much smaller 1-1½ in. long, hirsute beneath or on both surfaces, glands of perianth less strong. *P. hispidum*, Ham. in *Don Prodr.* 71, not of Meissn. or Bab. *P. Posumbu*, Meissn. in *DC. l. c.* 105, in part. *P. Hamiltonii*, Spreng. *Syst. Veg.*, Cur. post. 155 (not of Meissn.). *P. Babingtoni*, Endl. *Gen. Pl. Suppl.* iv. 47, excl. syn. *Bab.*, *P. mite*, Wall. *Cat.* 1723, 1 a, in part.—Nepal, Hamilton; Kumaon, at Naini tal, alt. 6400 ft., *Strach. & Winterb.* (No. 17); Hawalbagh, Thomson.—A specimen in Wallich's Herbarium of Hamilton's *P. hispidum* shows that this plant has been misunderstood first by Babington, who described for it a variety of *P. barbatum*, or *P. Bishiræ*, followed by Meissner (in De Candolle), who did the same, adopting the name of *Hamiltonii*, which had been proposed for it by Sprengel (there being an earlier *P. hispidum*); and lastly by Endlicher, who included both Hamilton's and Babington's plants under the third name of *P. Babingtoni*. Beyond this I have been unable to unravel completely the synonymy of this obscure plant, which differs from *P. flaccidum* in its much shorter leaves and less glandular perianth. It resembles *P. serrulatum* var. *Donii*, which differs in the coarse strong cilia of the bracts.

38. ***P. macranthum***, Meissn. in *DC. Prodr.* xiv. 1. 207; tall, erect, stem glabrous or sparsely strigose, leaves 3-6 in. petioled elliptic-lanceolate acuminate glabrous or sparsely hispid beneath, stipules substrigose, cilia as long as the tube, racemes long narrow erect strict, bracts closely imbricate with one or two removed far below glabrous shortly ciliate eglandular, perianth very large, nut large polished. *Polygonum*, No. 21, *Herb. Ind. Or. H. f. & T.*

ASSAM, Wallich, Griffith, &c. SILHET, the JHEELS and KHASIA Mts., ascending to 5000 ft., J. D. H. & T. T., Clarke.

Habit and size of *P. flaccidum*, but at once distinguished by the strict rarely flexuous (never decurved) racemes 3-6 in. long, with closely imbricating bracts and the polished nut.—I have seen but two flowering specimens, in which the perianth is nearly ½ in. diam.; and from the small size of the buds in numerous other specimens I suspect that the perianth may vary much in size. The nut is nearly ½ in. long, jet-black, quite smooth, shining with obtuse angles.

Sect. VIII. CEPHALOPHILON, Meissn.; erect or prostrate unarmed annuals, rarely perennial-rooted, or shrubs. *Leaves* usually broad entire or runcinately lobed or auricled; stipules short, tubular. *Flowers* in single or corymbose heads (spikes in *P. muricatum*); bracts flat, hardly tubular. *Perianth* 4-5-lobed or -partite. *Stamens* 6-8, glands 0 or obscure. *Styles* 2-3, filiform, connate below or throughout, stigmas capitate. *Nut* tri-

gonous or biconvex, enclosed in or adnate to the often enlarged and sometimes fleshy perianth-tube; cotyledons accumbent.

39. **P. humile**, *Meissn. in Wall. Pl. As. Rar.* iii. 59, and in *DC. Prodr.* xiv. 1. 128; small, sparsely glandular-hairy, stem filiform, leaves $\frac{1}{2}$ in. subsessile ovate acute or rhombic-ovate, mouth of stipules very oblique, heads long peduncled small, bracts very small ovate-lanceolate acute, stamens 5-6, nut biconvex striate and punctate. *P. perforatum*, *Wall. Cat.* 1700, in part.

TEMPERATE and ALPINE HIMALAYA; Kunawur, *Grant*; Kumaon, alt. 8500 ft., *Strachey & Winterbottom*; Nepal, *Wallich*; Sikkim, alt. 7-11,000 ft., *J. D. H., Clarke*.

Annual. *Stem* 4-6 in., simple and erect or diffusely branched from the base. *Leaves* very uniform, epunctate, sometimes narrowed into a short broad petiole. *Heads* $\frac{1}{4}$ in. diam., on long slender pedicels, without an involucre leaf; bracts longer than the flowers. *Perianth* greenish, tube closely investing but not cohering with the nut, eglandular; lobes very short, rounded. *Nut* black, coarsely punctate; styles slender, connate below, stigmas capitate.

40. **P. glaciale**, *Hook. f.*; dwarf, flaccid, glabrous, subsucculent, leaves long-petioled broadly ovate obtuse, heads small sessile or peduncled, peduncle minutely glandular at the tip, bracts broadly ovate obtuse glabrous about equalling the 3-gonous nut. *P. perforatum* γ . *glaciale*, *Meissn. in DC. Prodr.* xiv. 1. 128. *P. perforatum*, *Aitchison in Journ. Linn. Soc.* xviii. 90.

ALPINE and SUBALPINE HIMALAYA; Kashmir, alt. 8400-12,000 ft., *Clarke*; Kunawur and Piti, alt. 9000-11,000 ft., *Thomson*; Kumaon, alt. 13,000 ft., *Strachey & Winterbottom*, &c.—DISTRIB. Afghanistan.

Annual, 2-4 in. high, branched from the root, branches diffuse. *Leaves* $\frac{1}{2}$ - $\frac{3}{4}$ in., nerves indistinct, surfaces minutely granular when dry; petiole as long as the blade, winged above only; stipules short, cupular, simple or 2-lobed, glabrous. *Heads* $\frac{1}{2}$ - $\frac{1}{4}$ in. diam., without an involucre leaf. *Perianth* hyaline; lobes subequal, obtuse. *Stamens* 5. *Nut* minute, closely invested by the perianth-tube, black, striolate and punctate.—The long petioles at once distinguish this from *P. alatum*.

41. **P. alatum**, *Ham. mss.*; *Spreng. Syst. Veg., Cur. post.* 154; tall, erect or low and procumbent, glabrous or sparsely hairy, leaves large or small ovate or deltoid-ovate obtuse or acute narrowed into a broadly winged often amplexicaul petiole glandular or not, stipules tubular obliquely truncate, peduncles glandular hispid at the tip, heads usually with an involucre leaf, bracts ovate-lanceolate glabrous not ciliate, perianth 1-5-fid., stamens 7-8, nut biconvex or trigonous striate and punctate. *P. punctatum*, *Ham. in Don Prodr.* 72; *Bab. in Trans. Linn. Soc.* xviii. 105. *P. perforatum*, *Meissn. Monogr. Polyg.* 83, and in *Wall. Pl. As. Rar.* iii. 59, and in *DC. Prodr.* xiv. 1. 128, excl. γ . *glaciale*; *Wall. Cat.* 1700. *P. nepalense*, *Meissn. Monog.* 84, in *Wall. Pl. As. Rar.*, and in *DC. U. c.*; *Fresen. in Mus. Senkenb.* iii. 64; *Bab. l. c.* 106; *Wight Ic.* t. 1804.

Throughout the HIMALAYA; abundant at 4-10,000 ft. elevation, from Sikkim to Kashmir. KHASIA MTS., alt. 4-6000 ft. NILGHIRI MTS. (a weed in gardens), *Wight*, CANARA; Bababudan Hills, *Heyne*. CEYLON, abundant.—DISTRIB. Afghanistan, Java, Japan, Abyssinia.

Annual. *Stem* rarely creeping for a short distance at the base, erect and sub-simple or branched from the base; branches 6-18 in. high, slender or rather stout, flaccid or stiff, erect ascending or prostrate, glabrous or sparsely glandular-hairy. *Leaves* in the largest specimens 2-3 in. long, and the smallest $\frac{1}{2}$ in., base sometimes subcordate, suddenly contracted into the broadly-winged petiole which is often

auricled at the base; stipules glabrous or hairy, sometimes glandular, rarely ciliate. Heads $\frac{1}{4}$ – $\frac{1}{2}$ in. diam.; peduncles short or long, always glandular-hairy above; involucreal leaf often longer than the head, sessile, ovate-cordate, obtuse or acute. *Sepals* white or pale purple, membranous, subequal, very variable in size. *Stamens* included. *Style* long with one or two long arms and capitate stigmas. *Nut* varying in size in the same head, closely invested with and cohering with the thin perianth-tube and crowned with its lobes.—I fail to discriminate between Meissner's *P. perforatum* and *P. nepalense*, and I have taken for both Hamilton's name of *alatum* as adopted by Sprengel for his *punctatum*. The absolute character whereby these supposed species were distinguished, that of the biconvex and trigonous nut, is accompanied by no other, and I have taken typical nuts of both forms from one head of a Nilghiri specimen. Meissner himself observes that his *nepalense* has sometimes trigonous nuts. The character of glandular leaves again is most variable, and eglandular specimens are far the most abundant. Of the following forms some may prove to belong to distinct species, but I doubt it.

P. alatum proper; stems 1–2 ft., leaves large glandular or not, heads large, invol. leaf large, bracts obtuse or subacute, nut trigonous. *P. alatum*, *Spreng. l. c.* *P. punctatum*, *Ham. mss.*—Abundant.

Var. *nepalense*; stems 1–2 ft., leaves large glandular or not, heads large, invol. leaf large, bracts obtuse or subacute, nut biconvex. *P. nepalense*, *Meissn. Monog. l. c. t. 7, f. 2*; *Wall. Cat. l. c.* *P. guttuliferum*, *Miq. Pl. Hohenack.*, No. 968 (*leaves glandular*).—Abundant.

Var. *parviflora*; stem 1–2 ft. slender, leaves about 1 in., heads small on more slender peduncles, bracts acute, lower recurved, nut trigonous. *P. perforatum*, *Meissn. l. c. excl. γ.*; *Wall. Cat. 1700*.—Common, also in Ceylon (nuts flat).

Var. *arenaria*; smaller, diffusely branched, stem elongate prostrate with ascending flowering branches, leaves $\frac{1}{2}$ –1 in. narrower eglandular, petiole shorter, heads large, invol. leaf very small, bracts obtuse, fruiting perianth with a median rib on each face, nut biconvex.—Sikkim, sands of the River Rungeet, &c., *Clarke, Treutler*.

Var. *Metziana*; small, diffusely branched from the base, branches very slender prostrate and ascending, leaves broad $\frac{1}{2}$ –1 in. long glandular or not, petiole short, heads small, peduncles very slender, invol. leaf large or small, bracts acute, nut trigonous or biconvex. *P. Metzianum*, *Miq. in Herb. Hohenack.*, No. 610.—Specimens with 3-gonous nuts are from Sikkim and the Khasia Mts., at 5000 ft.; Kumaon and Dalhousie, 7000 ft.; and with flat nuts from Parusnath, the Khasia Mts., Canara, the Nilghiri Mts. and Ceylon, all at above 4000 ft.

Var. *rigidula*; dwarf, nearly glabrous, stem 2–3 in. strict erect subsimple or dichotomously branched, leaves $\frac{1}{4}$ – $\frac{1}{2}$ in. acute eglandular, petiole short, heads small (large for the size of the plant), invol. leaf large or small, bracts acute or acuminate, flowers purple-red, nut biconvex.—Kunawur, *Grant*; Sikkim, alt. 7300 ft., *Clarke*.—Very like small specimens of *P. humile*.

Var. *tenuicaulis*; very slender, diffusely branched, quite glabrous except the tips of the peduncles, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. very narrow acuminate glandular, heads very small, peduncles capillary, bracts acuminate recurved, nut trigonous.—Khasia Mts., alt. 4–5000 ft., *J. D. H. & T. T., Clarke*.

42. ***P. microcephalum***, *Don Prodr.* 72; glabrous or sparsely hairy, stem rigid tall erect or decumbent below angled and grooved, leaves 3–5 in. hastately ovate-lanceolate or oblong acuminate abruptly narrowed into the long winged petiole, stipules truncate often ciliate, heads small, peduncle filiform quite glabrous, involucreal leaf 0, bracts oblong obtuse more or less ciliate, nut 3-gonous granulate. *Meissn. Monog. Polyg.* 82, in *Wall. Pl. As. Rar.* iii. 59, and in *DC. Prodr.* xiv. 1. 129. *P. staticiflorum*, *Wall. Cat.* 1704, *excl. D.* *P. strigosum*, *Herb. Ham.*; *Wall. Cat.* 1732, under *P. Wallichii*. ? *P. ciliatum*, *Ham. in Don Prodr.* 73.

TEMPERATE HIMALAYA; Nepal, *Wallich*; SIKKIM, alt. 4–5000 ft., *J. D. H. KHASIA Mts. and SILHET*, alt. 0–4000 ft.

Root slender, perennial, woody; stem 2–3 ft., often decumbent and rooting below at the nodes, glabrous or subhispid above. *Leaves* membranous, eglandular, ciliolate,

with the petiole sometimes auricled at the base, uppermost sessile and deeply amplexicaul. *Peduncles* axillary and subterminal, often forked; heads $\frac{1}{4}$ – $\frac{1}{2}$ in. diam.; perianth white, 5-cleft. *Stamens* 8. *Styles* 2–3, slender, connate below, stigma capitate.—It is curious that of 60 specimens examined not one bears ripe fruit. Meissner and Clarke (mss.) describe it as 3-gonous, but I find both digynous and trigynous flowers. Meissner's var. *P. subvillosa* is a hirsute leaved state. Hamilton's *P. ciliatum* is a very doubtful plant; according to Don's description it differs from *P. microcephalum* only in the decumbent stem. Meissner describes the peduncles as sometimes hispidulous, but I never find them so.

43. **P. Wallichii**, Meissn. Monogr. Polyg. 83, t. 7, f. 1, in Wall. Pl. As. Rar. iii. 60, and in DC. Prodr. xiv. 1. 129; glabrous, stem slender decumbent, branches ascending, leaves 1–2 in. ovate-cordate acuminate ciliolate, petiole not winged auricled at the base, stipules ciliolate, heads small, peduncles subterminal short very slender quite glabrous, involucre leaf 0 or small, bracts broadly oblong obtuse eciliate. Wall. Cat. 1702, excl. cit. of Wight.

TEMPERATE HIMALAYA; Nepal, Wallich, Scully; Sikkim, alt. 4000 ft., Clarke.

Root perennial, creeping. *Stems* 2–3 ft., flexuous, stout, angled and grooved, prostrate but not rooting. *Leaves* 1–2 in., rather abruptly acuminate, uppermost cordate amplexicaul, auricles minute green; stipules long, loose, glabrous or hairy. *Peduncles* subterminal; heads as in *P. microcephalum*, but bracts not ciliate. *Perianth* 5-fid. *Stamens* 6–8. *Nut* trigonous.—I have seen only a few specimens. The habit, and naked petioles with minute basal auricles and eciliate bracts distinguish this from *P. microcephalum*. Meissner is in error in citing Wight's t. 1805 for this; it is clearly *P. sphærocephalum*.

44. **P. sphærocephalum**, Wall. Cat. 1703; rarely glabrous, stem very long slender creeping, branches short erect, leaves 1–3 in. ovate or oblong-cordate acuminate ciliolate, petiole not winged nor auricled, stipules truncate mouth naked, peduncles glandular-hairy terminal and axillary, involucre leaf 0, bracts ovate-oblong acute eciliate. Meissn. in Wall. Pl. As. Rar. iii. 60; Bab. in Trans. Linn. Soc. xviii. 107; Gærcke in Bot. Reise Pr. Waldem. 136. *P. Wallichii*, Wight Ic. t. 1805. *P. podocephalum*, Klotzsch in Bot. Reise Pr. Waldem. t. 86.

TEMPERATE HIMALAYA; Nepal, Wallich; Kumaon, alt. 6–8000 ft., Royle, &c. NILGIRI MTS., Wight.

Perennial? *Stems* 2–3 ft. long, rooting at the nodes, angular and grooved; branches erect from the nodes, 2–4 in. high, with 2–3 long-petioled leaves terminating in a solitary 1-headed peduncle. *Leaves* 1–3 in., eglandular, sparsely hairy or glabrous; petiole $\frac{1}{2}$ to 1 in., winged at the top only. *Heads* $\frac{1}{2}$ in. diam.; flowers longer than the bracts, rose-cold. *Nut* flat or 3-gonous.—A specimen in Wight's Herbarium has much larger leaves (3–3 $\frac{1}{2}$ by 2 in.), with petioles winged to near the base; it is marked *P. Wallichii*? and is the only one seen of the Nilgiri plant figured by Wight: In the plate he correctly figures the peduncles as hairy, and the stipules as eciliate, but he describes the former as glabrous, and the latter as shortly ciliate. He has, I suppose, figured *sphærocephalum* from native specimens, and copied Meissner's description of *P. Wallichii*.

45. **P. runcinatum**, Ham. in Don Prodr. 73; stem ascending from a creeping base smooth scabrid or hairy, leaves runcinate-pinnatifid glabrous terminal lobe triangular-ovate acuminate, petiole short with amplexicaul auricles, peduncles glandular-hispid above, heads large, involucre leaf 0, bracts oblong eciliate, nut minute globosely 3-gonous. Meissn. Monogr. Polyg. 85, in Wall. Pl. As. Rar. iii. 60, and in DC. Prodr. xiv. 1. 130; Wall. Cat. 1698. *P. reticulatum*, De Bruyn. in Pl. Jungh. 300.

CENTRAL and EASTERN HIMALAYA; Nepal, Hamilton, Wallich; Sikkim, alt.

7-10,000 ft., *J. D. H.*, &c. KHASIA Mts., alt. 4-5000 ft., *Lobb, J. D. H. & T. T.*, &c.—DISTRIB. Java.

Annual. *Stems* 10-18 in., slender, flaccid, grooved and angled, strict or flexuous, simple or branched. *Leaves* $1\frac{1}{2}$ -6 in., membranous, ciliolate, glabrous or sparsely hairy, uppermost simple and cordate-amplexicaul; lateral lobes 1-3 pairs horizontally spreading, rounded or oblong; auricles very variable, sometimes in mere green rings, at others nearly 1 in. diam.; stipules short, hairy and ciliate. *Peduncles* slender. *Heads* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam.; flowers white or pink. *Perianth* 5-cleft. *Stamens* 7-8. *Styles* 3, slender, connate below. *Nut* opaque.—The var. *P. javanicum* has much larger more ovate trigonous nuts.—Extensively cultivated in Sikkim.

46. *P. sinuatum*, *Royle mss.*; *Meissn. in DC. Prodr.* xiv. 1. 130; glabrous, stem creeping with short erect leafy branches, leaves runcinate-pinnatifid, terminal lobe rhomboid acute, petiole short with amplexicaul auricles, peduncles glabrous axillary, heads solitary, involucre leaf 0, bracts ovate obtuse, nut minute globosely trigonous.

WESTERN HIMALAYA; Kumaon, *Royle*, alt. 9000 ft., *Strachey & Winterbottom*; Garwhal, *Falconer*; Kulu, alt. 8-10,500 ft., *Stewart*.

Perhaps, as *Meissner* suggests, a variety of *P. runcinatum*, but creeping, much smaller in all its parts, and quite glabrous except occasionally the stipules, leaves $\frac{1}{2}$ -1 in., terminal lobe much smaller in proportion to the lateral and of a very different shape, sometimes almost transversely oblong and apiculate. The nut is the same in both.

47. *P. capitatum*, *Ham. in Don Prodr.* 73; stems or branches many stout creeping from a woody rootstock leafy, and stipules glandular-hirsute, leaves $\frac{1}{2}$ - $1\frac{1}{2}$ in. shortly petioled elliptic acute, petiole 2-auricled at the base, stipules short cupular, heads 1-3, peduncles glabrous or glandular-hispid, involucre leaf 0, bracts ovate acute eciliate. *Meissn. Monog. Polyg.* 82, and in *DC. Prodr.* xiv. 1. 129; *Bab. in Trans. Linn. Soc.* xviii. 107. *P. repens*, *Wall. Cat.* 1699; *Meissn. in Wall. Pl. As. Rar.* iii. 60.

SUBTROPICAL AND TEMPERATE HIMALAYA; on rocks, walls, &c., alt. 4-6000 ft., from Chamba to Bhotan. KHASIA Mts., alt. 3-5000 ft.

Perennial; rootstock stout, twisted; stems or branches 6-10 in. long, trailing and rooting below, red-brown; hairs brown. *Leaves* crowded, bifarious, rather thick, brownish when dry, eglandular, base sometimes cordate; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., auricles small rounded. *Heads* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., dense-flid., glandular and hairy; bracts glabrous. *Perianth* pink, 5-cleft; segments obtuse. *Stamens* 8. *Nut* 3-gonous, very small, $\frac{1}{4}$ in., much smaller in proportion to the perianth than in its allies.—*Meissner's* var. *macilentum* appears to have no definite character.

48. *P. chinense*, *Linn.*; *Meissn. in DC. Prodr.* xiv. 1. 130; shrubby, glabrous or sparsely pubescent or glandular-pubescent, leaves petioled 3-5 in. from linear-oblong to oblong- or deltoid-ovate or -rotundate entire or crenulate, base truncate rounded acute or subcordate uppermost cordate amplexicaul, petiole hardly winged usually 2-auricled at the base, stipules long very obliquely truncate acute, heads panicled or corymbose, peduncles usually glandular-hairy, involucre leaf 0, bracts glabrous usually acute, fruiting perianth dry or fleshy, nut trigonous. *Meissn. Monog.* 60, and in *Wall. Pl. As. Rar.* iii. 60; *Bab. in Trans. Linn. Soc.* xviii. 109; *Roxb. Fl. Ind.* ii. 289; *Wight Ic.* t. 1806; *Grah. Cat. Bomb. Pl.* 172; *Dalz. & Gibs. Bomb. Fl.* 214. *P. cymosum*, *Roxb. l. c.* *P. auriculatum*, *Meissn. Monog.* 39, t. 6, and in *Wall. Cat.* 1705. *P. polycephalum*, *Wall. Cat.* 1707. *P. brachiatum*, *Poir. Dict.* iv. 15; *Lamk. Ill.* 315, t. 4; *Wall. Cat.* 1706. *P. patens*, *Don Prodr.* 73; *Meissn. Monog.* 60. *P. corymbosum*, *Willd. Sp. Pl.* ii. 452. *P. ovatum*, *Heyne in Roth Nov. Sp.* 206. *P. adenotrichum*, *Wall.*

mss. *Ampelygonum chinense*, Lindl. in *Bot. Reg.* 1838; *Misc.* 63, No. 118. *P. panduræforme*, Ham. *mss.*; Wall. *Cat.* 1704 D. *Coccoloba crispata*, Ham. in Roxb. *Fl. Ind.* ii. 292.

SUBTROPICAL and TEMPERATE HIMALAYA; from Simla to Bhotan, alt. 4-8000 ft. ASSAM, the KHASIA MTS., SILHET, CACHAR, CRITTAGONG, RANGOON and BURMA to MALACCA. BEHAR, top of Parusnath, alt. 4000 ft. DECCAN PENINSULA; on the Western Ghats from the Concan southward. CEYLON, abundant.—DISTRIB. Sumatra, Java, Philippine Islands, China and Japan.

A rambling or erect shrub, reaching 5 ft.; stems and branches many from the root, stout, flexuous, angled and grooved. *Leaves* extremely variable, rarely orbicular; gland-dotted or not, rigid or membranous, flat or undulate; petiole short, winged above, auricles extremely variable, deciduous usually rounded, sometimes $\frac{1}{2}$ in. broad, at others suppressed; stipules often $\frac{3}{4}$ in. long with long waving points. *Heads* very variable in number, $\frac{1}{4}$ – $\frac{1}{2}$ in. diam.; peduncles divaricate; flowers white, pink or purplish. *Perianth* 5-cleft. *Stamens* 8. *Styles* 3, connate below. *Nuts* variable in size, enclosed in the dry or fleshy perianth.—A polymorphous plant, of which the following forms may show the extent of variation, but are not approximately constant, nor do they comprise all the departures from any assumed type that could be defined by words, which would be a very great many. I cannot conceive what other *Polygonum* than this Roth describes as *P. ovatum*.

P. chinense proper; leaves ovate-oblong or deltoid-ovate base truncate or subcordate, peduncles eglandular.—Var. *Thunbergianum*, Meissn. in Wall. *Pl. As. Rar.* iii. 60, and in *DC. l. c.*

Var. *ovalifolia*, Meissn. l. c.; leaves ovate or oblong-ovate acute at both ends often crenulate glabrous, peduncles glandular-hispid, heads large or small.—Himalaya, Parusnath, common in the Deccan Mts., Ceylon, &c.

Var. *subhastata*, Meissn. l. c.; leaves oblong or lanceolate base cordate or subhastate sometimes very long, peduncles eglandular, heads small.

Var. *corymbosa*, Meissn. l. c.; leaves oblong-lanceolate base acute or acuminate, peduncles eglandular, heads large.

Var. ? *parvifolia*; stem slender prostrate, leaves 1½–2 in. hastate oblong, petiole not auricled, bracts obtuse or subacute.—Silhet, Wallich; Assam, Jenkins.—This may be a different species; the habit is that of *P. Wallichii*, but the leaves are not ciliate.

Var. *hispida*; branches leaves on both surfaces and inflorescence hispidly hairy, hairs on the branches reflexed.—Tenasserim, Gallatly (in *Herb. Calcutt.*).

Sect. IX. ECHINOCAULON, Meissn. Erect prostrate or subscandent often prickly herbs. *Leaves* usually broad, often cordate or hastate; stipules tubular. *Flowers* in simple or panicked heads or spikes; bracts usually shortly tubular, ciliate. *Perianth* 5-lobed. *Stamens* 5–8, with alternating glands. *Styles* 2–3, free, stigmas capitate. *Nut* free, trigonous or biconvex; cotyledons accumbent.

* *Nut exerted.*

49. **P. muricatum**, Meissn. *Monog. Polyg.* 74, in Wall. *Pl. As. Rar.* iii. 58, and in *DC. Prodr.* xiv. 1. 133 (not of Wall. *Cat.*); stem very long and slender flaccid smooth or angles sparsely scabrid, leaves distant lower petioled ovate or oblong-ovate acute or obtuse, base rounded truncate or cordate upper amplexicaul-cordate, stipules glabrous ciliate, heads laxly paniced, peduncles glandular-hispid or glabrous, spikes few-fl'd. *P. asperulum*, Wall. *Cat.* 1724. *Polyg. pedunculare* var. and *Polyg. n.* 57, *Herb. Ind. Or. H. f. & T.*

CENTRAL and EASTERN HIMALAYA; Nepal, Wallich; Sikkim, alt. 10–12,000 ft., J. D. H. KHASIA MTS., alt. 4–5000 ft., J. D. H. & T. T., Clarke.

Perennial? *Stems* creeping and often tufted at the base, above rambling over bushes, sometimes quite smooth even at the nodes. *Leaves* 1–2 in., membranous, sometimes sparsely hairy beneath, ciliolate or not, midrib beneath smooth or scabrid; petiole very slender, smooth or scabrid; stipules truncate, base naked or with a ring of reversed prickles. *Spikes* $\frac{1}{2}$ –1 in. long, on almost capillary peduncles; flowers distant in Himalayan specimens, closer in Khasian; bracts ovate or lanceolate, hispid and ciliate or glabrate. *Perianth* white or pink. *Stamens* 5 or 6. *Styles* very slender, connate below. *Nut* ovoid, with acute angles, pale, smooth, shining.—Wallich's Nepal specimens have the spikes and bracts densely glandular-pubescent or glabrate, and partially exserted nuts. Sikkim ones have perfectly smooth and glabrous stems, stipules, spikes and bracts, eciliate stipules, and smaller flowers with subacute sepals much shorter than the nut; they may form a different species. Khasian ones have subcapitate densely glandular-pubescent spikes, and nuts closely wrapped in the perianth, the segments of which are obtuse as in the Nepal specimens.

50. ***P. arifolium***, Linn.; Meissn. in DC. Prodr. xiv. 1. 134; stem very slender flaccid smooth or angles retrorsely scabrid, leaves long-petioled broadly hastate acuminate basal lobes spreading acute, stipules very short hispid and ciliolate, peduncles glandular-hispid, heads small few-fl., involucreal leaves 1–2 linear, bracts small hispid, nuts broadly trigonous exserted. Polyg. n. 53, *Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA; Dikeeling, alt. 7000 ft., Clarke. KHASIA MTS., in woods, alt. 5000 ft., J. D. H. & T. T.—DISTRIB. N. America.

Stems 2–3 ft., weak. *Leaves* 2–3 in., membranous, ciliolate, glabrous, or sparsely setose on the nerves beneath and on one or both surfaces, base truncate; petiole nearly as long as the blade, very slender, smooth or scabrid; stipules $\frac{1}{4}$ in. long, lax, base naked or with a few retrorse hairs. *Heads* small, very few-fl., on strict forked peduncles, usually subtended by one or two narrow spreading ciliate invol. leaves; bracts very small, lanceolate, acute, ciliate; flowers small. *Perianth* 5-cleft. *Stamens* 5. *Styles* very slender, connate below. *Nut* ovoid, acutely 3-gonous, acute, pale, shining.—This is a slender form of the American plant quite like some Pennsylvanian specimens. Flowers and ripe fruits are formed on short stolons from the creeping base of the stem.

** *Nut included in the perianth.*

51. ***P. perfoliatum***, Linn.; Meissn. in DC. Prodr. xiv. 1. 132; stem rambling or climbing, flexuous angles and petioles with stout recurved prickles, leaves very long-petioled peltate deltoid angles obtuse or subacute, stipules foliaceous orbicular amplexicaul, peduncles smooth or sparingly prickly, racemes solitary short, bracts broad rounded glabrous, nut globose obscurely 3-gonous. *Roxb. Fl. Ind.* ii. 288; *Wall. Cat.* 1696; *Lamk. Ill.* t. 315, f. 3; *Burm. Fl. Ind.* 90, t. 31, f. 2. *Echinocaulos perfoliatus*, Hassk. *Cat. Hort. Bogor.* 85, and *Pl. Rar. Jav.* 220. *Chilocalyx perfoliatus*, Hassk. in *Flor. Bot. Zeit.* 1842, *Beibl.* ii. 20; *Miquel Fl. Ind. Bat.* i. 1013.

CENTRAL AND EASTERN HIMALAYA; Nepal, Wallich; Sikkim, alt. 4–5000 ft., J. D. H.; Bhotan, Booth. KHASIA MTS., alt. 4000 ft., J. D. H. & T. T. BENGAL, in the Jheels, &c. SILHET, Wallich. CACHAR, Keenan.—DISTRIB. Java, China, Japan.

Stem rambling for several feet. *Leaves* 2–5 in. long and broad, membranous, midrib and nerves beneath sometimes prickly; petiole slender, as long as the blade; stipules $\frac{1}{2}$ –1 in. diam. *Peduncles* very short; racemes $\frac{1}{2}$ – $\frac{3}{4}$ in.; bracts membranous; flowers white or lilac, large for the genus. *Perianth-lobes* rounded. *Stamens* 8. *Styles* short, connate below. *Nut* large, black, apiculate, included in the often fleshy perianth. *Cotyledons* very large, radicle short inflexed accumbent.—Leaves acid, eaten in Cachar, Keenan.

52. **P. sagittatum**, Linn.; Meissn. in DC. Prodr. xiv. 1. 132; glabrous, stem suberect or prostrate angles petioles and midrib beneath covered more or less with recurved prickles, leaves petioled 1-2 in. linear-oblong obtuse or acute base sagittate, margins smooth, stipules very short glabrous, heads few small, involucre leaf 0, peduncles slender distantly muricate or smooth, bracts oblong obtuse glabrous, nut 3-gonous. *P. muricatum*, Herb. Griff. Kew Distrib. 4125. *P. Sieboldii*, Meissn. l. c. 133.

WESTERN HIMALAYA, Falconer; Kulu and Kumaon, alt. 7-8000 ft., Edgeworth; Lohoo Ghat, Thomson. EAST BENGAL, Griffith. KHASIA Mts., in marshes at Myrning, alt. 5000 ft., J. D. H. & T. T.—DISTRIB. Siberia, China, Japan, Eastern N. America.

Very similar to slender form of *P. strigosum*, but the leaves are shorter, more glaucous beneath, not truncate or cordate below, but with two long deflexed or incurved obtuse or acute auricles, and their margins are quite smooth.

53. **P. strigosum**, Br. Prodr. 420; stem 2-4 ft. suberect angles petioles and nerves of leaf beneath more or less covered with recurved prickles, leaves shortly petioled linear or linear-oblong acuminate or acute base truncate or shortly cordate, margin retrorsely prickly, racemes panicle oblong or subglobose, peduncles scabrid prickly or glandular-hispid, bracts ovate or oblong ciliate and strigose, nut globosely 3-gonous included in the perianth. Meissn. in DC. Prodr. xiv. 134. *P. horridum*, Roxb. Cat. 29, and Fl. Ind. ii. 291; Meissn. in Wall. Pl. As. Rar. iii. 58, and in DC. l. c. 133. *P. muricatum*, Wall. Cat. 1697 (not of Meissn.), excl. var. *glabrata*; Miguel Fl. Ind. Bat. i. 1011. *P. sagittatum*, Don Prodr. 73 (not of Linn.). *P. sagittatum* β. indicum, Meissn. Monog. Polyg. 65. *P. hispidulum*, Blume Bijl. 535. *P. auriculatum*, Herb. Ind. Or. H. f. & T.

TROPICAL HIMALAYA from Kulu to Bhotan, and the KHASIA Mts., ascending to 5000 ft., in watery places; and southward to the NILGHIRI Mts., CHITTAGONG and PENANG. CEYLON; alt. 5-6000 ft. (C. P. 3348).—DISTRIB. Ava, Malay Archipelago, China.

Stem 1-3 ft., often rather stout, very variable in amount of prickles. *Leaves* 1-5 in., rigid, glabrous or pubescent beneath, sometimes scabrid above, margin with rigid minute recurved prickles, midrib usually prickly; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. or 0; stipules 1 in., ciliate, glabrous or hairy, base with usually a pectinate ring of reversed prickles. *Peduncles* slender; racemes $\frac{1}{2}$ - $\frac{3}{4}$ in., densely many- or few-fl.; flowers pink. *Perianth*-lobes obtuse. *Stamens* 6-8. *Styles* slender, connate below. *Nut* black, opaque, punctulate.—Meissner describes the nuts as sometimes biconvex; I find all the Northern Indian specimens to be trigynous, all the Peninsular digynous, which favours the view that this does not differ from *P. pedunculare*. Bentham indeed (Fl. Austral. v. 268) unites with this *P. pedunculare*, *P. glabratum*, and *P. muricatum*. For the first and second there is something to be said, but *P. muricatum* is an entirely different species. The American *P. Meissnerianum* differs from *P. strigosum* chiefly in the prickles not being recurved.

54. **P. prætermissum**, Hook. f.; small, glabrous, stem 6-8 in. ascending subsimple nearly or quite unarmed, leaves shortly petioled linear obtuse base sagittate with obtuse lobes, stipules glabrous eciliate with a few recurved bristles at the base, flowers very few and distant in forked or simple glabrous axillary racemes, bracts erect oblong glabrous or subciliate; nut globosely 3-gonous included in the perianth. *P. strigosum*, Thwaites Enum., in part; Benth. Fl. Austral. v. 268, in part. *P. muricatum*, var. *glabrata*, Wall. Cat. 1697/3. *P. muricatum*, Herb. Ind. Or. H. f. & T.

SILHET, Wallich. KHASIA Mts., in watery places, alt. 4-5500 ft., J. D. H. & T. T., Clarke. CEYLON, alt. 6-7000 ft., Walker (C. P. 2250).—DISTRIB. Tasmania. *Stem* 4-18 in., creeping and rooting at the base, quite smooth except rarely a few

deflexed prickles beneath the nodes. *Leaves* 1-2 in., perfectly glabrous, margin not ciliate, basallobes deflexed or decurved, rarely horizontal; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., quite smooth; stipules $\frac{1}{2}$ in. *Peduncles* very slender; racemes $\frac{1}{2}$ -1 in. long, with only 3-5 bracts, which are usually very distant. *Sepals* obtuse. *Stamens* 5. *Style-arms* slender. *Nut* pale (ripe?) punctulate.—The inflorescence of this species is very characteristic and constant, and its habit being the same wherever it has been found, I am constrained to regard it as a distinct species, though in doing so I contravene Bentham's opinion as expressed in the "Flora Australiensis." My first knowledge of the plant was from Tasmanian specimens, which (Flora Tasmanica; i. 307) I referred to Brown's *P. strigosum*, and doubtfully to Meissner's plant of that name. I had then no opportunity of consulting Brown's Herbarium, which was during his lifetime closed to botanists. This being now accessible, I find that his *strigosum* is identical with the Indian plant subsequently published by Roxburgh as *P. horridum*. *P. prætermisum* is the *P. muricatum* var. *glabrata* of Wall. Cat. 1697/3, but not the *P. glabratum* of Meissner (in Wall. Cat. 6285), which is referable to *P. pedunculare*.

55. ***P. pedunculare***, Wall. Cat. 1718; glabrous, stem 1-2 ft. ascending unarmed or angles with recurved prickles, leaves petioled elliptic oblong or linear-oblong acute base acute sagittate cordate or truncate, margin smooth or most minutely scaberrulous, racemes panicle oblong or globose, peduncles glabrous or glandular-hispid, bracts acuminate ciliate, nut orbicular biconvex included in the perianth-tube. *Meissn. in DC. Prodr.* xiv. 1. 133, in part; *Miquel Fl. Ind. Bat.* i. 1011. *P. dichotomum*, *Blume Bijdr.* 529? *P. glabratum*, Wall. Cat. 6285.

ASSAM, *Masters*. CACHAR, *Keenan*. The CONCAN, *Stocks*, &c. NILGHIRI and PULNEY MTS., *Wight*, &c. SINGAPORE, *Wallich*. MALACCA, *Cuming*. CEYLON, *Walker*.—DISTRIB. China, Java, Borneo, Philippine Islands, Australia.

It is difficult to define this variable plant in words. It may be a form of *P. strigosum*, but is certainly as distinct as are the species of the *Persicaria* and other sections of this perplexing genus. The following very distinct forms are united by exceptional ones.

P. pedunculare proper; glabrous, stem quite smooth except a few reversed prickles at the nodes and sometimes on the angles, leaves 1-2 in. elliptic-lanceolate or -ovate acuminate at both ends, peduncles and bracts glabrous or glandular pubescent. *Wight Ic. t.* 1802 C.—Singapore, Cachar, Pulney Mts., Ceylon.

Var. *robusta*; tall, stems stout glabrous unarmed or with reversed prickles at the angles and nodes, leaves 3-6 by $\frac{1}{2}$ - $\frac{3}{4}$ in. linear-lanceolate acuminate at both ends, peduncles and pedicels stout glandular-hispid, heads large. *Wight Ic. t.* 1802 B.—Nilghiri and Pulney Mts.

Var. *angustissima*; stem nearly smooth, leaves petioled or upper sessile 4-5 by $\frac{1}{4}$ - $\frac{1}{2}$ in. narrowly linear-lanceolate acuminate at both ends, peduncles very slender glandular-hispid, heads small, bracts glabrous. *Wight Ic. t.* 1802 A; *Polyg.* No. 49, *Herb. Ind. Or. H. f. & T.*—The Concan, Belgaum, &c., *Ritchie*, &c.; Nilghiris.

Var. *nilagirica*; stem nearly smooth, leaves petioled 4-6 by $\frac{1}{2}$ -1 in. flaccid membranous, linear-oblong or oblong-lanceolate obtuse, peduncles very slender glandular-hispid, heads rather large, bracts subciliate.—Nilghiri Mts., at Conoor, alt. 6000 ft., *Clarke*.

Var. *assamica*; small, 6-10 in. high, stem nearly smooth, leaves subsessile or shortly petioled 1-2 by $\frac{1}{4}$ - $\frac{1}{2}$ in. linear-lanceolate acute with an acute base or linear-oblong and obtuse with a contracted hastate base, peduncles very slender sparsely glandular-hispid, heads very small few-fl., bracts subhispid.—Assam, *Masters*; Jynteapore, *Clarke*.—This approaches in habit *P. prætermisum*.

Var. *glabrata*; tall, 12-18 in., stem nearly smooth except a few reversed bristles at the nodes, leaves linear-oblong 2-3 by $\frac{1}{2}$ - $\frac{3}{4}$ in., base rounded and truncate, peduncles and heads as in var. *assamica*. *P. glabratum*, *Meissn. in Wall. Cat.* 6285.—Silhet.

Sect. X. ACONOGON, *Meissn.* Shrubs, rarely perennial-rooted herbs. *Leaves* usually broad; stipules tubular, eciliate. *Flowers* in branched panicles, pedicelled; bracts not tubular, very open. *Perianth* 5-partite. *Stamens* 8, rarely fewer, with or without interposed glands. *Styles* 2-3, short, free or connate below, stigmas capitate. *Nut* trigonous, not tightly enclosed in the perianth; cotyledons accumbent.

* *Tall herbaceous or shrub-like species. Flowers very small $\frac{1}{12}$ - $\frac{1}{8}$ in. diam.; perianth cleft nearly to the cuneate base, segments spreading.*

56. **P. alpinum**, *All. Fl. Pedem.* i. 206, t. 68, f. 1; stem glabrous, or young parts softly pubescent, pale reddish or white, leaves shortly petioled lanceolate or linear-lanceolate acuminate glabrous or puberulous, flowers in terminal thyrsoid dense-fld. pyramidal panicles, perianth $\frac{1}{2}$ - $\frac{1}{4}$ in. diam. cleft nearly to the cuneate base, inner segments obovate-spathulate, nut broadly rhomboid-ovoid acutely 3-gonous pale rather longer than the enlarged perianth. *Meissn. Monog. Polyg.* 56, t. 3 G; *Boiss. Fl. Orient.* iv. 1031. *P. sibiricum*, *Linn. fil. Suppl.* 228 (not of Pallas). *P. acidum*, *Pall. Reise* ii. 25, iii. 316 (*fid. Ledeb.*). *P. divaricatum*, *Vill. Dauph.* iii. 322 (not of Linn.). *P. polymorphum* & *alpinum*, *Meissn. in DC. Prodr.* xiv. 1. 139.

NORTH-WESTERN HIMALAYA; from Kulu to Kashmir, alt. 7-12,000 ft., *Thomson*, &c.—DISTRIB. Turkestan westward to S. Spain, Siberia, N. America.

Root perennial. *Stems* 6 ft., annual, grooved, paler than in any of the following species. *Leaves* 3-5 in., glabrous or finely pubescent beneath especially, margins flat; base acute; stipules long, lax, deciduous above the base. *Inflorescence* a foot long and more, of myriads of white or pale pink flowers; pedicels much longer than the short obtuse bracts, jointed close below the perianth or lower down. *Nut* $\frac{1}{2}$ in. long, shining—This agrees well with the European and N. Asiatic plant. *Boissier* and *Meissner* give Afghanistan as a habitat, but *Griffith's* specimens have much larger sepals which conceal the much smaller nut, and the inflorescence is more corymbose; I refer them to *P. polystachyum*.—Eaten raw and cooked; tastes like rhubarb (*Aitchison*).

57. **P. paniculatum**, *Blume Bijl.* 533; shrubby, quite glabrous, branches terete, leaves petioled elliptic-ovate or lanceolate acuminate or caudate-acuminate base acute or rounded, flowers in terminal large lax-fld. thyrsoid panicles, perianth $\frac{1}{2}$ in. diam., segments oblong, nut very small included in the simple or baccate perianth. *Meissn. Monog. Polyg.* 95, and in *DC. Prodr.* xiv. 1. 137; *Miquel Fl. Ind. Bat.* i. 1012.

TEMPERATE HIMALAYA, *Herb. Griffith*; Garwhal, alt. 5-6000 ft., *Duthie*; E. Nepal and Sikkim, alt. 7-8000 ft., *J. D. H.*—DISTRIB. Java.

A shrub, 4-6 ft., with flexuous branches that are not grooved. *Leaves* 5-7 by 2-3 in., firm, often black when dry. Margins ciliate; nerves 15-30 pairs; petiole $\frac{1}{2}$ -1 in.; stipules with a long limb deciduous above the base. *Panicle* effuse, quite glabrous; pedicels usually short, but here and there long; bracts minute, obtuse; flowers white. *Nut* $\frac{1}{3}$ in. long, turgidly ovoid, 8-gonous, black.—The Indian specimens are perfectly glabrous, Javan have minute pubescence on the midrib and nerves beneath. *Duthie's* Garwhal plant has more membranous fewer-nerved (10-14 pairs) leaves, and pedicels sometimes $\frac{1}{2}$ in. long; but the number of nerves varies remarkably in individual specimens of all the species of this section.

58. **P. rude**, *Meissn. in DC. Prodr.* xiv. 1. 137; shrubby, branches stout terete strigose with depressed hairs, leaves petioled elliptic-lanceolate acuminate softly pubescent beneath or on the nerves only, flowers in large terminal thyrsoid hirsute panicles, perianth $\frac{1}{2}$ in. diam., segments

oblong, nut very small exceeding the simple or baccate perianth. *Wall. Cat.* 1685/2. *P. molle*, in part, *Herb. Ind. Or. H. f. & T.*

KHASIA MTS., alt. 4–5000 ft., *De Silva, Mack, &c.*

A robust shrub, 6–8 ft.; branches stout, not grooved. *Leaves* 4–5 by $1\frac{1}{2}$ –2 in., glabrous or finely pubescent above, base acute, nerves 10–30 pairs; stipules glabrous or sparsely hairy. *Inflorescence* as in *P. paniculatum*, but laxly hirsute with flexuous hairs, flowers (white) and fruit nearly the same.

? *Var. sikkimensis*; branches glabrous except a few deflexed hairs at the nodes.—Sikkim; Lachen, alt. 10,000 ft., *J. D. H.*—Of this I have only a single specimen in fruit; it is unlike either *rude* or *molle* in its all but glabrous branches. The hairs of the nodes and laxly hirsute panicle are those of *P. rude*. The fruiting perianths are not baccate.

59. ***P. molle***, *Don Prodr.* 72; shrubby, branches stout terete villous with erect or spreading hairs, leaves petioled elliptic-lanceolate silkily pubescent tomentose or villous beneath, flowers in large terminal thyrsoid tomentose panicles, perianth $\frac{1}{2}$ in. diam., segments oblong, nut included in the usually baccate perianth. *Meissn. Monog. Polyg.* 56, in *Wall. Pl. As. Rar.* iii. 64 (partly), and in *DC. Prodr.* xiv. 1. 136 (excl. cit. of *Wight Ic.*); *Lindl. in Bot. Reg.* 1841, Misc. 66. *Coccoloba Totnea*, *Ham. in Don Prodr.* 74.

CENTRAL AND EASTERN HIMALAYA; Nepal, *Hamilton, Wallich*; Sikkim, alt. 5–7000 ft., *J. D. H., Clarke*. MISHMI HILLS, *Griffith*.

Habit and general characters of *P. rude*, but more softly tomentose, and with the hairs on the branches never deflexed, and stipules more silky. *Flowers* white.

60. ***P. frondosum***, *Meissn. in DC. Prodr.* xiv. 1. 137; shrubby, quite glabrous, branches stout terete, leaves broadly ovate- or elliptic-oblong acuminate or caudate-acuminate, base rounded or cordate, flowers in short thyrsoid axillary and larger terminal dense-fld. panicles, perianth $\frac{1}{2}$ in. diam., segments oblong, fruiting long-pedicelled, nut small longer than the perianth. *P. Hayii*, *Herb. Strach. & Winterb. Polyg.* n. 34.

WESTERN HIMALAYA; Garwhal, *Falconer*; Kumaon, alt. 7500–9000 ft., *Edgeworth, Strachey & Winterbottom*.

A very distinct species, perfectly glabrous in all its parts, easily distinguished by its very broad leaves, 5–7 by $2\frac{1}{2}$ – $3\frac{1}{2}$ in., of firm texture, long petioles $\frac{1}{2}$ – $1\frac{1}{2}$ in., axillary panicles, and the long pedicels of the fruiting perianths $\frac{3}{4}$ – $1\frac{1}{2}$ in. long; the nuts are, however, so diseased that this last may be an abnormal character.

** *Tall herbaceous or shrub-like species. Flowers* $\frac{1}{4}$ in. diam.; *perianth cleft* nearly to the cuneate base, *segments widely spreading*.

61. ***P. polystachyum***, *Wall. Cat.* 1686; shrubby, glabrous or pubescent, branches grooved, leaves subsessile or petioled oblong-lanceolate caudate-acuminate, base usually contracted and subhastately cordate or truncate, flowers in large pubescent or glabrate terminal thyrsoid spreading panicles with erect or decurved branches, pedicels very slender, perianth $\frac{1}{4}$ in. diam., 3 inner segments broadly obovate-spathulate, nut small triquetrous shorter than the unaltered perianth. *Meissn. in Wall. Pl. As. Rar.* iii. 61, and in *DC. Prodr.* xiv. 1. 137; *Bab. in Trans. Linn. Soc.* xviii. 111. *P. molle*, *Wight Ic.* t. 1807 (not of *Don*). *Polyg.* n. 69, *Herb. Ind. Or. H. f. & T.*

TEMPERATE HIMALAYA; from Mishmi to Kashmir, alt. 7000 to 12,000 ft., and to 14,000 ft. in Sikkim.—DISTRIB. Afghanistan.

Shrubby, 3–6 ft. high. *Leaves* 4–9 by $1\frac{1}{2}$ – $3\frac{1}{2}$ in., nerves very numerous, base of the uppermost usually acute, of the lower sometimes the same, but usually as described above; margins smooth or crisped; stipules ample, glabrous or sparsely hairy.

Panicle very variable in form, effuse, branches sometimes strict and erect or diverging, at others horizontal and decurved; bracts short, obtuse; pedicels sometimes $\frac{1}{2}$ in.; flowers white or pink. *Sepals*, 2 outer oblong, inner much larger and broader. *Nut* pale, not tightly enclosed in the perianth.—The Afghanistan plant of Griffith (Journ. No. 1040) referred by Boissier and Meissner to *P. alpinum*, is, I think, certainly *P. polystachyum*.

Var. *glabra*, Meissn. l. c.; quite glabrous.

Var. *pubescens*, Meissn. l. c.; puberulous pubescent or tomentose with grey or buff tomentum on the leaves beneath.

Var. *longifolia*; leaves linear-oblong 8-9 by 2-2 $\frac{1}{2}$ in. glabrous above finely pubescent beneath, base subcordately truncate, panicle small.—Sikkim; at Yakla, alt. 12-16,000 ft., Clarke.

Var. *crispata*; leaves glabrous margins crisped and undulately crenulate.—Chumba, R. Ellis.

Var. *Griffithii*; leaves densely clothed beneath with silky tomentum, stipules silky.—Mishmi Hills, Griffith.

62. ***P. rumicifolium***, Royle mss.; Bab. in Trans. Linn. Soc. xviii. 112; herbaceous, glabrous or sparsely puberulous or laxly pubescent, stem very robust simple, leaves petioled broadly ovate or ovate-cordate obtuse or subacute, flowers in small axillary and terminal dense-fld. panicles, nut very broadly ovate acutely 3-gonous, about as long as the perianth. Meissn. in DC. Prodr. xiv. 1. 138, excl. var. *oblongum*; Garcke in Bot. Reise Pr. Waldem. 136. *P. ramoso-spicatum*, Klotzsch in Bot. Reise Pr. Waldem. t. 87.

WESTERN HIMALAYA; from Nepal, Wallich, to Kashmir, alt. 10-14,000 ft., Royle, &c.

Root stout, perennial. *Stem* 6-18 in., as thick as a swan's quill or less, pale, grooved. *Leaves* 3-5 by 1 $\frac{1}{2}$ -3 in., succulent, green, margin even or undulate, nerves very slender; petiole $\frac{1}{2}$ -1 in., very stout; stipules large, lax, glabrous. *Panicles* sessile, the axillary ones usually shorter than the leaves; flowers green, $\frac{1}{8}$ - $\frac{1}{4}$ in. diam. *Perianth* cleft to near the cuneate base, segments subequal, orbicular, spreading. *Nut* pale, very broad.—I think that some of Boissier's varieties of *P. alpinum* (*polymorphum*) are referable to this, which closely resembles the *P. alpinum*, var. *lapathifolium* of N.E. Asia and N.W. America, but has much larger flowers. I do not know what Babington's var. β is with retrorsely hairy stems and much smaller leaves. The young parts are acid, and eaten like rhubarb in the Western Himalaya. I find specimens of this distributed by Wallich from Nepal, under the number 1727 (*Rheum emodi*) in Herbs. Hooker and Bentham, but not in the Linnæan Society Herb., where the species is absent.

*** *Tall, herbaceous or shrubby species. Perianth campanulate, cleft two-thirds way down, base rounded; lobes oblong erecto-patent.*

63. ***P. campanulatum***, Hook. f.; pubescent or tomentose, stem creeping and stoloniferous below slender grooved, leaves petioled elliptic ovate or lanceolate acuminate or tip caudate base acute or rounded, flowers nodding or pendulous in terminal cymes with divaricate branches, nut 3-winged rather longer than the campanulate perianth. *P. rumicifolium*, var. γ ? *oblonga*, Meissn. in DC. Prodr. xiv. 1. 138.—Polyg. n. 69 and 71, Herb. Ind. Or. H. f. & T.

TEMPERATE and SUBALPINE HIMALAYA; E. Nepal and Sikkim, alt. 9-12,000 ft., J. D. H., Clarke; Kumaon, alt. 7500 ft., Strachey & Winterbottom.

Stem 2-3 ft. high, prostrate or ascending, dichotomously branched, glabrous or pubescent above. *Leaves* 3-6 by 1-2 $\frac{1}{2}$ in., more or less pubescent on both surfaces with grey, or (beneath) buff tomentum, membranous or rather coriaceous; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in.; stipules ample, deciduous near the base or altogether. *Inflorescence* quite

different from those of the other species of the section, and like that of *Fagopyrum cymosum*; branches pubescent or villous, short or long and flowering towards the extremity only; flowers pale pink or red, shortly pedicelled; bracts small, usually ovate, acute. *Perianth* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, truly campanulate; lobes oblong, obtuse, subequal. *Stamens* 8, filaments very long. *Nut* pale, tip exserted.—A very distinct plant, which I have attempted to identify with the obscure *P. Hagei*, Royle. This, however, is described as having scabridly hairy branches and peduncles, very short petioles, and broad leafless panicles, and as a native of Nagkunda, whence various collectors have sent *P. polystachyum*, but none the *P. campanulatum*, the form of whose perianth could scarcely have escaped notice.

Var. membranifolia; leaves large broad membranous, bright green, pubescence inconspicuous, cymes much smaller than the leaves.—Sikkim, in woods, alt. 6–10,000 ft.

Var. longipes; leaves elliptic ovate sparingly pubescent, branches of cymes dichotomously long naked leafy at the base.

Var. fulvida; leaves clothed beneath with dense matted fulvous tomentum. *P. crispatum*, *Clarke in Journ. Linn. Soc.* xv. 116 (where it is taken for *Roxburgh's Coccoloba crispata*, which is *P. chinense*).

64. ***P. tortuosum***, *Don Prodr.* 71; a low shrub, glabrous or finely pubescent, much dichotomously branched, leaves sessile coriaceous elliptic obovate or orbicular obtuse or acute, panicles short terminal dense-fl., nut trigonous included in the campanulate perianth. *Meissn. in DC. Prodr.* xiv. 1. 138. *P. tataricum*, *Wall. mss.*

WESTERN HIMALAYA; Garwhal, at Gangotri, *Duthie*; Kunawur and Lahul, alt. 9–13,000 ft., *R. Inglis*, &c. WESTERN TIBET, alt. 15,500 ft., *Strachey & Winterbottom*; Ladak, alt. 16,500 ft., *Stewart*.

Root woody; branches 8–16 in., divaricate, geniculate, as thick as a goose-ill below, smooth, shining, red-brown. *Leaves* 1–2 in., pale green, crimson in autumn; nerves very slender; stipules short, truncate. *Panicles* $\frac{1}{2}$ –1 in. long, very dense-fl.; peduncles and very short pedicels pubescent. *Perianth* $\frac{1}{2}$ in. long; lobes oblong, erect. *Stamens* 8, short. *Nut* pale, ovate.—A remarkable species. *Meissner's var. tibetanum* is the common state of the plant, closely allied to and possibly a state of *P. sericeum*, *Pall.* Don's habitat of Nepal is no doubt an error, as Wallich's *mss.* name of *P. tataricum*, cited by Don himself, shows.

Var. spicata; flowers in solitary simple terminal and axillary spikes longer than the leaves.—Dras, alt. 8–9000 ft., *Thomson*.

**** *Small herbaceous species with capitate or racemose panicles.*

65. ***P. sibiricum***, *Laxm. in Nov. Act. Acad. Petrop.* xviii. (1773) 531, t. 7, f. 2; dwarf, quite glabrous, coriaceous fleshy, branches many from the long perpendicular root erect or decumbent, leaves narrowly linear obtuse 2-auricled towards the base, flowers in capitate terminal panicles shorter than the leaves, nut enclosed in the perianth. *Meissn. in DC. Prodr.* xiv. 1. 139; *Ledeb. Fl. Ross.* iii. 527. *P. hastatum*, *Murr. Comm. Goett.* v. (1774) 37, t. 6; *Ledeb. Fl. Alt.* ii. 80, t. 361. *P. crassifolium*, *Murr. in Linn. Syst. Veg.* ed. 14, 378. *P. rumicifolium*, *Pall. (non Royle)*.—*Polyg. n.* 37, *Herb. Ind. Or. H. f. & T.*

WESTERN HIMALAYA; Kangra, alt. 11–12,000 ft., *Edgeworth*. WESTERN TIBET, common; alt. 12–15,000 ft., *Strachey & Winterbottom* (*Polyg. n.* 48), *Thomson*, &c.

Root several inches long, simple. *Stems* or branches 1–6 in., stout (much longer in Siberian specimens). *Leaves* 1–3 by $\frac{1}{16}$ – $\frac{1}{4}$ in., flat, opaque, base cuneate being narrower below the acute or obtuse equal or unequal auricles into a thick petiole; midrib broad, nerves invisible; stipules short, membranous. *Heads of flowers* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam. (effuse in Siberian specimens); bracts minute; pedicels short or long. *Perianth* $\frac{1}{16}$ in. long, subglobose, pink, segments broadly oblong. *Stamens* 5–8,

filaments short. *Nut* oblong-ovate, 3-gonous, black, shining, about as long as the perianth.—The larger Tibetan specimens are the size of small Siberian ones; the smallest Tibetan are quite minute.—Eaten in Tibet.

66. **P. acaule**, *Hook. f. Ic. Pl.* t. 1490 B; dwarf, diœcious, hirsute, leaves all radical sessile oblong obtuse, flowers in an erect narrow terminal peduncled panicle bearing short lateral dense-fl. branches, perianth very small subglobose or campanulate, nut 3-gonous exceeding the perianth. *Polyg.* n. 70, *Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA; Donkia and Kangra lama passes, on the Tibetan frontier, alt. 17,000 ft., *J. D. H.*

Rootstock very stout, ending below in a thick woody tap-root, simple or divided above into two or more very short branches clothed with membranous stipules. *Leaves* many, spreading or erect, 1 in. long or less, coriaceous, hirsute on both surfaces or beneath only, nerves above impressed; stipules glabrous or hirsute. *Panicle* with its peduncle 2–4 in. high; peduncle stout, naked (rarely with a single leaf), and rachis hirsute; branches $\frac{1}{2}$ – $\frac{1}{4}$ in. long, horizontal or drooping; flowers crowded, often drooping. *Perianth* $\frac{1}{2}$ in. long, segments unequal oblong or rounded. *Stamens* 8, minute and imperfect in the female flower; filaments short. *Styles* 3, short, free. *Nut* (unripe) oblong, trigonous, base contracted (as if stipitate).—A remarkable species, evidently of this section, but very unlike any other.

67. **P. nummularifolium**, *Meissn. in DC. Prodr.* xiv. 1. 127; very small, stems creeping and forming matted tufts, nodes hairy, leaves $\frac{1}{10}$ – $\frac{1}{8}$ in. petioled orbicular ciliate, stipules tubular hairy, clusters many-fl., flowers pedicelled subdiœcious?, sepals orbicular, stamens 5, nut orbicular biconvex.

ALPINE HIMALAYA; on rocks, Kumaon, *Edgeworth*, alt. 14–15,000 ft., *Strachey & Winterbottom*; Kashmir, alt. 13,400 ft., *Clarke*; Sikkim, alt. 14–17,000 ft., *J. D. H.*

Perennial. *Stems* one inch or two long, internodes short. *Leaves* rather fleshy, brown when dry; petiole as long as the blade; stipules truncate. *Flowers* numerous and large for the size of the plant, white or bright pink, males largest. *Stamens* very short; anthers purple. *Nut* included, smooth, pale; stigmas 2 minute subsessile.—The smallest species of the genus, and very unlike any other, referred by Meissner to § *Cephalophilon*, but the flowers are not capitate, and the minute styles are quite free.

Sect. XI. TINIARIA, *Meissn.* Twining unarmed annuals or with perennial roots. *Leaves* broad, cordate or hastate; stipules tubular, eciliate. *Flowers* axillary, or in slender racemes; bracts short, not tubular. *Perianth* 5-partite, 3 outer sepals at length enlarged and dorsally winged. *Stamens* 8 without interposed glands. *Styles* 3, very short, stigmas capitate or fimbriate. *Nut* 3-gonous; cotyledons accumbent.

68. **P. Convolvulus**, *Linn.*; *Boiss. Fl. Orient.* iv. 1032; annual, prostrate or twining, leaves sagittate-cordate, flowers in axillary clusters and terminal cymes, 3 outer sepals obtusely keeled rarely winged, pedicels short jointed above the middle. *Meissn. in DC. Prodr.* xiv. 1. 135; *Fl. Dan.* t. 744.

WESTERN HIMALAYA; Kunawur, *Royle*. WESTERN TIBET; Nubra, *Thomson*.—DISTRIB. N. and W. Asia, Europe, N. Africa.

Annual. *Stem* 1–4 ft., angles puberulous. *Leaves* $1\frac{1}{2}$ –4 in., gradually acuminate, angles obtuse or acute, puberulous beneath; petiole slender; stipules short. *Racemes* suberect, short, slender, pedicels recurved. *Perianth-segments* obtuse, green with white margins, $\frac{1}{2}$ in. in fruit. *Nut* black, $\frac{1}{10}$ in. long.

69. **P. dumetorum**, Linn.; Boiss. *Fl. Orient.* iv. 1032; st. ... twining or prostrate, leaves broadly ovate-cordate or subhastately cordate acuminate, fruiting perianth broadly oblong or obovate, 3 outer sepals broadly winged, pedicels very slender, not winged to the base, usually jointed below the middle, nut $\frac{1}{2}$ in. long. Meissn. in DC. *Prodr.* xiv. 1. 135; *Fl. Dan.* t. 756; *Engl. Bot.* t. 2811.

TEMPERATE HIMALAYA; from Kunawur to Kashmir, alt. 4-9000 ft.—DISTRIB. Europe, N. and W. Asia.

Habit of *P. Convolvulus*, but stem terete, flowers more racemose, pedicels capillary, and fruiting perianth very different. This last varies exceedingly in size and shape from elliptic oblong $\frac{1}{2}$ in. long, to cuneate-obovate $\frac{1}{4}$ in. long and tapering into the shortly winged pedicel. I find no difference between nuts of this and *P. Convolvulus*.

70. **P. pterocarpum**, Wall. *Cat.* 1690; stem twining, leaves broadly ovate-cordate acuminate, fruiting perianth cuneate-obovate rarely broadly oblong, 3 outer sepals broadly winged, pedicel very slender winged often to the base, nut $\frac{1}{2}$ in. long. Meissn. in Wall. *Pl. As. Rar.* iii. 62, and in DC. *Prodr.* xiv. 1. 135; Bab. in *Trans. Linn. Soc.* xvii. 113.—Polyg. n. 62, *Herb. Hook. f. & T.*

TEMPERATE HIMALAYA; from Sikkim to Simla, alt. 6-9000 ft.,—also in Kashmir, Stewart.

Probably only a state of *P. dumetorum*, but the fruiting perianth is usually much larger, sometimes $\frac{1}{2}$ in. long, or even $1\frac{1}{4}$ in. including the winged petiole, and the nut is always larger. In both there are obscure lines of pubescence on the stem and petioles.

DOUBTFUL AND IMPERFECTLY KNOWN SPECIES.

P. (Bistorta?) **GRIFFITHII**, Hook. f.; very stout, leaves 6-7 in. long-petioled coriaceous oblong-lanceolate acuminate pubescent beneath, petiole as long as the blade, raceme incurved very stout, bracts lanceolate densely imbricate.—Bhotan Himalaya; on rocks above Sanah, alt. 9500-10,000 ft., Griffith (Itin. Notes, p. 410, n. 637).—A remarkable plant, and quite unlike any other, probably near to *P. Bistorta*, but much more robust. The curvature of the top of the peduncle is possibly due to this terminating a pendulous branch. The specimens are very imperfect, consisting of old, apparently radical leaves, and hollow glabrous stems or peduncles, a foot long and as thick as a goose-quill, each bearing the remains of two cauline leaves, and terminated by a stout incurved raceme $2\frac{1}{2}$ in. long. The raceme is clothed with membranous bracts enclosing each many pedicels, from which the perianths have fallen. The stipules on the stem are 1-2 in. long, quite glabrous, with free tips.

P. **HAGEI**, Royle mss; Bab. in *Trans. Linn. Soc.* xviii. 110; Meissn. in DC. *Prodr.* xiv. 1. 139, from Nagkunda, is probably *P. polystachyum*, a common plant of that locality.

P. **PALUDOSUM**, Griff. *Rep. Bot. Gard. Calcutt.* 1843, 39, is a mss. name and unidentifiable.

POLYONEARUM FAMILIÆ SEDIFOLIA, Wall. *Cat.* 6286, see p. 22.

4. **FAGOPYRUM**, Gærtn.

Erect herbs. Leaves deltoid, hastately deltoid, or -cordate. Flowers in terminal or axillary cymes. Perianth 5-partite; segments subequal, not enlarged in fruit. Stamens 8, alternating with glandular disk-lobes. Ovary 3-gonous; styles 3, stigmas capitate. Nut much longer than the perianth, 3-gonous. Cotyledons very broad, twisted, or rolled round the ascending radicle.—Species 3, Europe and Temp. Asia, one cultivated.

1. **F. esculentum**, Moench *Method.* 290; annual, glabrous, leaves triangular-cordate acute, flowers in axillary and terminal peduncled subcapitate many-fl. cymes, nut ovate angles acute. Meissn. in *Wall. Pl. As. Rar.* iii. 63, and in *DC. Prodr.* xiv. 1. 143; Bab. in *Trans. Linn. Soc.* xviii. 117. *F. emarginatum*, Meissn. in *DC. l. c.*, excl. var. β .; Bab. *l. c.* 118. *Polygonum Fagopyrum*, Linn.; Roxb. *Fl. Ind.* ii. 292; Wall. *Cat.* 1687. *P. dioicum*, Ham. mss. *P. emarginatum*, Roth *Catalect. Bot.* i. 48; *Don Prodr.* 73.

Cultivated in the KHASIA MTS., throughout the HIMALAYA and WESTERN TIBET at elevations of 2000 to 12,000 ft., and in the NILGHIRI HILLS.—DISTRIB. Centre of Europe and N. Asia.

Stem 1–3 ft. *Leaves* 1–4 in. diam. (5 in very large specimens). *Flowers* pink or white, in heads or compound cymes $\frac{1}{2}$ – $\frac{3}{4}$ in. diam. *Nut* $\frac{1}{4}$ – $\frac{1}{2}$ in. long, pale.

2. **F. cymosum**, Meissn. in *Wall. Pl. As. Rar.* iii. 63, and in *DC. Prodr.* xiv. 1. 144; puberulous, root perennial, leaves triangular, flowers secund on the long recurved branches of peduncled terminal and axillary cymes, nut ovate angles acute. Bab. in *Trans. Linn. Soc.* xviii. 119; Lindl. *Bot. Reg.* 1847, t. 26. *F. triangulare*, Meissn. *l. c.* *F. emarginatum*, var. kunawarens, Meissn. in *DC. l. c.* 143. *Polygonum cymosum*, Treviran. *Dlect. Sem. Hort. Vratisl.* 1824; Reichb. *l. c. Exot.* ii. t. 176. *P. acutatum*, Lehm. *Cat. Sem. Hort. Hamb.* 1820. *P. triangulare*, Wall. *Cat.* 1689. *P. emarginatum*, Wall. *Cat.* 1688 (not of Roth). *P. dibotrys*, Don *Prodr.* 73. *P. volubile*, Turcz. in *Bull. Soc. Imp. Nat. Mosq.* 1840, 77. *P. rugosum*, Herb. Ham.

TEMPERATE HIMALAYA; in woods, &c., from Kashmir to Sikkim, alt. 5–11,000 ft. KHASIA MTS., alt. 4–5000 ft.—DISTRIB. Yunnan.

A tall branching perennial-rooted sparsely pubescent species. *Leaves* large, usually 3–4 in. diam., angles acute or obtuse, upper usually narrow and amplexicaul; petiole long, slender. *Inflorescence* very lax, branches of panicle 2–5 in. long; flowers pedicelled, white. *Nut* $\frac{1}{4}$ – $\frac{1}{2}$ in., more than twice as long as the perianth.—I suspect that Meissner has described the fruit of *tataricum* under his *F. triangulare*.

3. **F. tataricum**, Gært. *Fruct.* ii. 182, t. 119, f. 6; annual, glabrous, leaves very broadly triangular-cordate or hastate, flowers in axillary and terminal peduncled subcapitate cymes, nut with 3 deep grooves and rounded angles. Meissn. in *DC. Prodr.* xiv. 144. *F. rotundatum*, Bab. in *Trans. Linn. Soc.* xviii. 117; Meissn. *l. c.* *Polygonum tataricum*, Linn.; Don *Prodr.* 74; Meissn. *Monog. Polyg.* 62, t. 4, 8; Dalz. & Gibs. *Bomb. Fl. Suppl.* 74.

Cultivated throughout the HIMALAYA, at elevations of 3–12,000 ft.—DISTRIB. N. Europe and N. Asia.

Stem 2–3 ft., usually simple. *Leaves* 1–2 in. diam. *Flowers* white or pink. *Nut* $\frac{1}{2}$ in. long, conico-ovoid, opaque, rounded, angles keeled towards the tip.

5. **RHEUM**, Linn.

Stout herbs with woody large roots. *Leaves* large, entire toothed or lobed; stipules scarious. *Flowers* clustered in panicked racemes usually 2-sexual. *Sepals* 5. *Stamens* 6–9. *Ovary*, 2–4-angled; styles 2–4. stigmas dilated capitate or horseshoe-shaped. *Nut* 2–4-winged, very much larger than the usually unchanged sepals. *Embryo* straight, cotyledons broad.—Species 20, Central Asia and the Himalaya.

* *Stemless species.* *Flowers* in a spike-like raceme.

1. **R. spiciforme**, Royle *Ill.* 318, t. 78; leaves all radical thickly

coriaceous orbicular broadly ovate or cordate glabrous or stellately puberulous beneath, racemes 1-3 glabrous, fruit broadly ellipsoid or oblong, wings broader than the disk. *Meissn. in DC. Prodr.* xiv. 1. 36. *R. Moorcroftianum*, *Meissn. l. c. (not of Royle)*; *Herb. Ind. Or. H. f. & T.*

WESTERN HIMALAYA; in the drier ranges, from Kumaon, alt. 14-16,000 ft. westwards to WESTERN TIBET, alt. 9-14,000 ft., abundant.—DISTRIB. Afghanistan.

Root short or long, thicker than the thumb. *Leaves* all radical, 6-12 in. diam., very leathery, with prominent radiating nerves and reticulated nervules beneath, red-brown in age; petiole 3-6 in., very stout, glabrous or puberulous. *Racemes* 1-3, radical, 4-12 in., strict, dense-fl.; peduncle and rachis stout, glabrous; bracts minute, ovate, scarious; flowers $\frac{1}{10}$ in. diam., on capillary pedicels. *Fruit* $\frac{1}{4}$ - $\frac{1}{2}$ in. long, 3-4 times as long as the oblong obtuse sepals, tip rounded or notched, wings membranous; pedicel half as long as the fruit or less.

2. *R. Moorcroftianum*, *Royle Ill.* 315, 318; leaves all radical thickly coriaceous orbicular glabrous or stellately puberulous beneath, racemes pubescent, fruit ovoid, wings narrow. *Wall. Cat.* 1727, *in part.*

WESTERN HIMALAYA; Kumaon, *Moorcroft in Herb. Wallich.*

I am uncertain about this plant, which differs from *R. spiciforme* in the very much larger pubescent peduncles and racemes, which together are two feet long, and in the form of the fruit. The only specimens are Wallich's, are very bad, and have neither locality nor collector's name. They are ticketed "large broad-leaved small-stalked Rhubarb; the root more purgative than the long-stalked." Another sheet has attached to it a ticket in the same handwriting, "narrow round-leaved long-stalked Rhubarb." *R. Moorcroftianum* is written in pencil on the sheets, I think by Royle (certainly not by Wallich). Hence they are no doubt the plants mentioned by Royle (*Ill. Pl. Himal.* 315) as brought by Moorcroft from Niti, alt. 12,000 feet, in Kumaon, and of which Royle says that "Major Hearsay, Moorcroft's companion, has described two kinds to me, one round-leaved and short-stalked, and the other short-stalked, but large and broad-leaved (*R. Moorcroftianum*, nob.) with the root more purgative than that of the former." From this it appears that Royle, not Wallich, as hitherto supposed, is the author of *R. Moorcroftianum*; and that Meissner is further in error in describing it as everywhere glabrous.

** *Stemless species. Flowers panicle; panicles leafless.*

3. *R. tibeticum*, *Maxim. mss.*; leaves very coriaceous orbicular-cordate and short thick petioles scaberulous, fruit nearly orbicular notched at both ends, wings very broad. *Rheum*, No. 6, *Herb. H. f. & T.*

WESTERN HIMALAYA; Zaskar, *Thomson*; Kashmir, Barji la, alt. 12,000 ft., *Clarke*. WESTERN TIBET; common, alt. 12-14,000 ft., *Thomson*, &c.

Root very stout. *Leaves* 6-12 in. diam., entire or crenulate, nerves 5 very stout radiating from the petiole which is 4-8 in. long and as thick as the finger. *Panicles* puberulous or quite glabrous, with the peduncle 4-10 in. high, fruiting a foot high; branches erecto-patent, simple or again branched; fruiting peduncle very thick, deeply grooved; bracts very minute; flowers $\frac{1}{10}$ in. diam., pedicels short. *Fruit* $\frac{1}{2}$ in. long and broad, four times as large as the unchanged sepals; wings much broader than the nucleus.—Resembles *R. leucorhizum*, *Pall.*, but none of the sepals enlarge in fruit.

*** *Stem branched and panicle leafy.*

4. *R. emodi*, *Wall. Cat.* 1727; stem tall leafy, leaves long-petioled very large orbicular or broadly ovate obtuse base cordate 5-7-nerved, panicle papilloely puberulous fastigiate branched and leafy, flowers dark purple, fruit ovoid-oblong base cordate apex notched wings narrow. *Meissn. in Wall. Pl. As. Rar.* iii. 65, and in *DC. Prodr.* xiv. 1. 35 (*exclude syn. Webbium*); *Bot. Mag.* t. 3508. *R. emodium*, *Wall. mss.*; *Nees & Eberm.*

Med. Pharm. Bot. i. 455. ? *R. australe*, *Don Prodr.* 75, *Hayne Arnz. Gewachs.* 12, t. 6; *Nees Pl. Offic. Suppl.* 5, t. 5, 6; *Sweet, Brit. Fl. Gard.* t. 269.

SUBALPINE and ALPINE HIMALAYA; Nepal, *Wallich*; Sikkim, *Is. Cathcart*; ? Simla, on Choor, alt. 11–12,000 ft., *Edgeworth*.

Root very stout; stem very stout, 5–6 feet high, streaked green and brown. *Radical leaves* often 2 ft. diam., papillose beneath, subscaberulous above; petiole 12–18 in., very stout, scaberulous. *Panicle* 2–3 ft., with erect strict branches; flowers $\frac{1}{2}$ in. diam. *Fruit* $\frac{1}{2}$ in. long, purple, wings narrower than the disk.—I am not quite satisfied as to the synonymy of this plant, for it is difficult to distinguish it in a dried state from *R. Webbianum*. *Wallich's* are the only native specimens I am sure about; for the Sikkim locality I depend on an excellent drawing in the Kew collection, made by Mr. Cathcart's artists in Darjiling. *Edgeworth's* has the larger flowers of this, but the habit and glabrous panicle of *emodi*.

5. *R. acuminatum*, *Hook. f. & Thoms. mss. in Bot. Mag.* t. 4877; stem leafy, leaves long-petioled triangular- or orbicular-ovate acuminate base cordate 5–7-nerved, panicles papillosely puberulous fastigiate branched and leafy, flowers dark red, fruit ovoid-oblong base cordate tip entire or notched, wings narrower than the nucleus.

SIKKIM HIMALAYA; alt. 10–13,000 ft., *J. D. H., Clarke*.

Probably only a small form of *R. emodi* with acuminate leaves, but the flowers are considerably larger, and though long under cultivation it does not attain half the size of that plant, or vary in its character.

6. *R. Webbianum*, *Royle Ill.* 318, t. 17 a; stem leafy, leaves long-petioled orbicular-cordate or reniform 5–7 nerved papillose or glabrous, tip rounded or subacute, panicles axillary and terminal quite glabrous, flowers pale yellowish, fruit broadly oblong or orbicular notched at both ends. *R. emodi*, *Wall. Cat.* 1727 C; *Herb. Strach. & Winterb.*; *Herb. H. f. & T.*

CENTRAL and WESTERN ALPINE HIMALAYA; from Nepal to Kashmir, alt. 10–14,000 ft.

Very variable in size, from 1 to 6 ft. high, with leaves 4 in.–2 ft. in diameter; flowers very much smaller than in *R. emodi*, the panicle less strict and quite glabrous, and the fruit broader ($\frac{1}{2}$ in. diam.), with broader wings more like that of *C. spiciforme*.—*Royle* describes the leaves as somewhat hairy above, but they are quite glabrous in most of the specimens. The habit differs a good deal from that of *R. emodi*, the inflorescence being more axillary, and its branching more diffuse after flowering. The flowers are not above $\frac{1}{2}$ in. diam., on capillary pedicels without bracts.

**** *Stem simple; panicles axillary concealed by bullate bracts.*

7. *R. nobile*, *Hook. f. & Thoms.; Ill. Himal. Pl.* t. 19; stem simple densely clothed with reflexed inflated imbricating (downwards) bladder-like reticulated bracts which conceal the short axillary panicles, leaves ovate-oblong or rounded base cuneate or cordate, fruit broadly ovoid 2–4-winged, disk tuberculate. *Meissn. in DC. Prodr.* xiv. 1. 36.

SIKKIM HIMALAYA; in the interior ranges, alt. 13–15,000 ft., *J. D. H., Clarke*.

Root very long, 3 in. diam. and under. *Leaves* very coriaceous, 1 foot diam. and under, usually edged with red, upper passing into the bracts; petiole 2–6 in., stout; stipules voluminous, 6–8 by 4–6 in., rose-red. *Stem* 3–4 ft., as thick as the wrist below, deeply grooved. *Bracts* orbicular, 6 in. diam., pale straw-coloured, reticulate, deciduous in age. *Panicles* 3–4 in., branched, glabrous; and flowers crowded, $\frac{1}{10}$ in. diam., green. *Fruit* $\frac{1}{2}$ in. long.—*Gill*, in his "River of the Golden Sands," speaks of

a plant inhabiting the lofty regions of East China bordering Tibet, which is probably this or an allied species.

6. **OXYRIA**, *Hill*.

An erect herb, with stout rootstock. *Leaves* chiefly radical, orbicular-cordate or reniform; stipules broad, lax. *Flowers* in paniced racemes, 2-sexual. *Sepals* 4, 2 outer reflexed; 2 inner larger, erect, appressed. *Stamens* 6. *Ovary* compressed; styles 2, short, stigmas fimbriate. *Nut* biconvex, 2-winged. *Embryo* lateral, nearly straight, cotyledons linear-oblong.

O. digyna, *Hill*; *Boiss. Fl. Orient.* iv. 1004; leaves cordate or reniform. *O. reniformis*, *Hook. Fl. Scot.* 111; *Meissn. in DC. Prodr.* xiv. 1. 37; *Engl. Bot.* t. 910. *O. elatior*, *Br. in Wall. Cat.* 1726; *Meissn. in Wall. Pl. As. Rar.* iii. 64, and in *DC. l. c.*; *Royle Ill. Pl. Him.* 314; *Hook. Ic. Pl.* t. 483.

ALPINE HIMALAYA; from Sikkim to Kashmir, alt. 10–14,000 ft. WESTERN TIBET, alt. 12–17,500 ft.—DISTRIB. Mts. of Europe, N. Asia and America, Arctic Regions.

Glabrous, fleshy. *Rootstock* tufted, with many erect succulent stems 4–18 in. high. *Leaves* radical, many, long-petioled, 1–4 in. diam., rarely 3-lobed or sub-hastate, cauline 1–2; petiole sometimes 8 in. *Racemes* slender, lax-fl'd.; pedicels jointed in the middle, tip thickened. *Outer sepals* spreading or reflexed; inner spatulate, 3–5-nerved. *Fruit* $\frac{1}{2}$ – $\frac{1}{4}$ in. diam., orbicular-cordate, wing membranous veined top notched.—A most agreeable salad, raw and cooked. Except in often attaining a very large size (18 in. high), the Himalayan plant does not differ from the European.

7. **RUMEX**, *Linn.*

Perennial herbs, or annuals, rarely shrubby. *Leaves* various; stipules often disappearing with age. *Flowers* in axillary clusters or in whorls arranged in simple or paniced racemes. *Sepals* 6 (rarely 4); outer unchanged, inner enlarging entire or toothed, midrib or disk often enlarged or tubercled. *Stamens* 6. *Ovary* 3-gonous; styles 3, stigmas fimbriate. *Nut* included in the usually enlarged inner sepals (valves) angles acute. *Embryo* lateral, nearly straight; cotyledons linear or oblong.—Species described about 100 (probably greatly exaggerated), in all temperate and some tropical countries.

I think that this genus wants revision and a very great reduction of species, when most of the Indian ones will be referred to European, in the directions I have indicated under each.

Sect. I. **Lapathum**, *Meissn.* *Flowers* 2-sexual. *Styles* terminal. *Inner sepals* (valves) coriaceous much enlarged in fruit. *Leaves* not hastate.

* *Inner fruiting-sepals quite entire, disk tumid or not.*

1. **R. orientalis**, *Bernh. & Boiss. Fl. Orient.* iv. 1009; tall, stout, leaves elongate-oblong obtuse base cordate, racemes in an open lax or thyrsoid dense panicle, whorls crowded, pedicels about equalling the fruiting perianth, valves broadly orbicular-cordate obtuse reticulate quite entire with or without a small tubercle. *Meissn. in DC. Prodr.* xiv. 1. 51. *R. Dioscoridis*, *Hayne Arzneik.* xiii. 5, t. 5.

WESTERN HIMALAYA; Kumaon to Kashmir, alt. 6–9000 ft., *Falconer, &c.*

WESTERN TIBET; alt. 11-13,000 ft., Thomson, &c.—DISTRIB. Westward to Asia Minor, Syria and Greece.

Stem 3-4 ft., often very stout, deeply grooved. *Lower leaves* 1-2 ft., upper narrow at the base. *Valves* $\frac{1}{4}$ - $\frac{1}{2}$ in. long, quite entire in all Indian specimens, pale, flat, finely reticulate.—The Indian specimens with no tubercle resemble *R. aquaticus*, L., and those with a tubercle *R. Patientia*, and I do not see why all these should not be united.

**** Inner fruiting-sepals with very narrow margins and few or no teeth.**

2. ***R. maritimus***, Linn.; Meissn. in DC. Prodr. xiv. 1. 59; annual, leaves lanceolate narrowed into the petiole, panicle leafy to the top, valves rhombic- or oblong-ovate with a lanceolate tip all with an oblong tubercle unarmed or with 2-3 long needle-like spines. *Fl. Dan.* t. 1208. *R. palustris*, Sm. *Fl. Brit.* i. 394; *Fl. Dan.* t. 1873; Boiss. *Fl. Orient.* iv. 1014. *R. Wallichii*, Meissn. l. c. 48. *R. Wallichianus*, Meissn. in Wall. *Pl. As. Rar.* iii. 64. *R. acutus*, Roxb. *Fl. Ind.* ii. 208. *R. Roxburghianus*, Wall. *Cat.* 1731, in part. *R. comosus* & *setaceus*, Ham. mss.; Wall. *Cat.* 6287, 6288. *R. chinensis*, Campd. *Rum.* 63, 76.

Marshes in ASSAM, SILHET, CACHAR, and BENGAL, common.—DISTRIB. Europe, Asia, N. Africa, N. and S. America.

Stem 1-4 ft., angled and deeply grooved. *Leaves* 3-10 in., petioled, base always narrowed into the petiole. *Whorls* of flowers lax or dense, many- or few-fl'd. *Fruiting perianths* all unarmed, or, on the same plant, some armed and some unarmed, yellow brown when ripe, tubercle smooth, with a narrow sometimes reticulate margin; spine sometimes 4 times as long as the valve, tip straight or slightly hooked.—The fruit varies greatly in size and number and length of the spines or the valves, and I am quite unable to discriminate between the various plants I have here referred to *R. maritimus*.

3. ***R. nigricans***, Hook. f.; annual, leaves linear-oblong obtuse contracted above the cordate base, flowering branches rigid divaricate leafy or leafless, fruiting perianths densely crowded in globose distant or confluent heads, turning black in drying, pedicels short, valves with very large oblong dark tubercles and lanceolate tips, margins very narrow entire or with one or two short straight teeth or spines. *R. dentatus*, Wall. *Cat.* 1730 (not of Linn.).

BENGAL, Clarke. KHASIA MTS., Griffith. BEHAR, J. D. H. DECCAN PENINSULA, Herb. Heyne (Wallich).

Stem 6-18 in., angled and grooved. *Leaves* 6-8 by 1-1½ in., thin; petiole long, slender. *Fruiting perianth* much larger than in *R. maritimus*, very dark when dry, as is the whole raceme.—Closely resembles *R. conglomeratus*, but the leaf is *panduriform*, and the tips of the valves acute.

***** Inner fruiting-sepals with broad much-toothed wings.**

4. ***R. dentatus***, Linn.; Boiss. *Fl. Orient.* iv. 1013; annual, leaves oblong obtuse often contracted above the rounded or cordate base, often waved or crisped, whorls distinct leafy or not, fruiting perianth ovate or oblong-ovate with an oblong smooth tubercle and broad densely reticulated wings which are irregularly toothed, teeth short stout straight. Meissn. in DC. Prodr. xiv. 1. 56 (excl. syn. Wall. Cat.). *R. Roxburghianus*, Wall. *Cat.* 1731, in part. *R. Klotzschianus*, Meissn. l. c. 57. *R. obtusifolius*, Herb. Ham., Wall. *Cat.* 6289. *Rumex*, No. 3, Herb. Strach. & Winterb.

From ASSAM and SILHET to the INDUS, common, ascending the Himalaya to 1000 ft. SCINDE, Stocks. The CONCAN, Law, &c.

Habit of *R. Patientia*, L., to which this is closely allied. Distinguishable from

the other Indian annual species by its broad irregularly-toothed wings, the teeth of which are not hooked.—A specimen from Oude has very narrow wings, and thus shows a transition to *nigricans*. I cannot in Herbarium specimens distinguish large specimens of this with petioled floral leaves cordate at the base from states of *R. nepalensis*. Except for its shorter pedicels, this would pass for *R. obtusifolius*, L.

5. ***R. nepalensis***, *Spreng. Syst.* ii. 159; perennial?, tall, branched, radical leaves large oblong ovate-oblong or triangular-ovate acute or obtuse base widely or narrowly cordate, upper sessile or petioled similar or with narrowed bases, racemes elongate, whorls distant, valves orbicular-ovate one or all with an oblong tubercle broadly winged, wing pectinately toothed strongly reticulate, teeth usually hooked at the tip. *Boiss. Fl. Orient.* iv. 1011; *Wall. Cat.* 1728; *Meissn. in Wall. Pl. As. Rar.* iii. 64, in *Linnaea* xiv. 192, and in *DC. Prodr.* xiv. 1. 55; *Wight Ic.* t. 1810. *R. Roxburghianus*, *Schultes fil. Syst.* vii. 1402 (not of Wallich). *R. hamatus*, *Trevir. in Nov. Act. Leopold.* xiii. 174; *Meissn. in DC. l. c.* 56. *R. ramulosus*, *Meissn. in DC. l. c.* *R. peregrinus*, *Boiss. Diagn. Ser.* 1, v. 46. *R. tuberosus*, *Roxb. in Herb. Willd.* (ex *Meissn.*). *R. uncinatus*, *Hort.*

TEMPERATE HIMALAYA; from Bhotan to Kashmir, alt. 4–9000 ft. (12,000 on the Chenab, *Stewart*). KHASIA MTS. ? WESTERN PENINSULA; on the Ghats from the Concan to the Nilghiris.—DISTRIB. Westward to Asia Minor, Java, S. Africa.

Root with tuberous fibres (*Boissier*). Stem 2–4 ft., stout, erect. Lower leaves often 6–14 by 3–5 in., undulate or not; petiole very slender, upper petioled or sessile.—Probably not specifically different from *R. pulcher*, L.

Sect. II. ***Acetosa***, *Tournef.* Flowers unisexual or polygamous. Styles arising from the angles of the ovary, inner sepals (valves) much enlarged, membranous, entire, midrib with a deflexed tubercle near its base. Leaves hastate.

6. ***R. scutatus***, *Linn.*; *Boiss. Fl. Orient.* iv. 1015; perennial, polygamous, papillose, stem creeping below branched, leaves all long-petioled hastately cordate or sub-3-lobed lateral lobes rounded suddenly contracted into the narrower midlobe, racemes very slender, whorls 2–4-fl. distant, valves cordate at the base. *Meissn. in DC. Prodr.* xiv. 1. 69; *Campd. Rum.* 132, t. 2, f. 6. *R. hastifolius*, *M. Bieb. Fl. Taur. Cauc.* i. 290.

WESTERN HIMALAYA; Simla, *Thomson*.—DISTRIB. Persia and westward to Middle and South Europe and N. Africa.

Somewhat glaucous. Branches slender, 1–2 ft., flexuous, dichotomously divided, ending in long lax panicles. Leaves 1–2 in. diam., the lobes all broad. Flowers small; pedicels jointed about the middle, elongating in fruit.—The specimens are not in fruit.

7. ***R. hastatus***, *Don Prodr.* 74; glaucous, polygamous, branches erect from a stout shrubby base all petioled rhombic deltoid or hastately 3-lobed with the lobes all narrow, racemes very slender paniced, whorls few-fl. distant, valves orbicular notched at both ends. *Meissn. in Wall. Pl. As. Rar.* iii. 64, and in *DC. Prodr.* xiv. 1. 72; *Wall. Cat.* 1729.

HIMALAYA; from Kumaon to Kashmir, alt. 1–8000 ft. BHOTAN, *Booth*.—DISTRIB. Afghanistan.

Rootstock woody, often as thick as the thumb; branches much divided, slender, 1–2 ft., obscurely angled. Leaves $\frac{1}{2}$ –1 in., coriaceous, nerveless. Racemes ending the branches, rachis filiform; flowers very small, pedicels lengthening in fruit. Valves $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., often pink, very delicately veined.

8. ***R. acetosa***, *Linn.*; *Boiss. Fl. Orient.* iv. 1015; perennial, diœcious,

green, stem subsimple, radical leaves petioled oblong obtuse base cordate hastate or sagittate, cauline sessile, racemes lax, whorls 6-8-fl., outer sepals reflexed, valves orbicular. *Meissn. in DC. Prodr.* xiv. 1. 64; *Fl. Dan.* t. 2534; *Engl. Bot.* t. 127.

WESTERN HIMALAYA; from Kumaon to Kashmir, alt. 8-12,000 ft.—DISTRIB. N. Asia, Europe from the Caucasus westward, N. America.

Root of slender fibres, from a short woody stock. Stem 1-2 ft., deeply grooved. Leaves 2-6 in.; petiole of lower slender; stipules ragged. Panicle contracted; branches strict, erect, leafless. Sepals of male with scarious margins. Valves of ripe female perianth broadly ovate-cordate, pink or crimson.

9. **R. vesicarius**, Linn.; Boiss. *Fl. Orient.* iv. 1017; annual, monœcious, glabrous, branched from the root, rather fleshy, leaves petioled elliptic ovate or oblong 3-5-nerved, base cuneate rarely cordate or hastate, racemes short terminal and leaf-opposed leafless, flowers pedicelled sometimes 2-nate and connate, valves large orbicular 2-lobed at each end very membranous and reticulate without a marginal nerve. *Meissn. in Wall. Pl. As. Rar.* iii. 64, and in *DC. Prodr.* xiv. 1. 70; Roxb. *Fl. Ind.* ii. 209; *Campd. Rum.* 129, t. 3, f. 1. 8; *Wall. Cat.* 1732.

WESTERN PANJAB; on the Salt range, and trans-Indus hills; cultivated and an escape in other parts of India.—DISTRIB. Afghanistan, Persia, the Levant, and N. Africa.

Pale green, 6-12 in. high, dichotomously branched. Leaves 1-3 in., obtuse or acute; petiole as long as the blade. Racemes 1-1½ in.; pedicels slender, jointed about the middle or unjointed. Fruit ½ in. diam., white or pink, valves hyaline.

SECT. III. **Acetosella**, Meissn. Flowers diœcious. Styles arising from the angles of the ovary. Inner sepals herbaceous, hardly enlarged in fruit. Leaves hastate.

10. **R. acetosella**, Linn.; Boiss. *Fl. Orient.* iv. 1018; perennial, stem slender simple or branched from the base, lower leaves petioled lanceolate or hastate, uppermost sessile, racemes leafless, flowers minute, pedicels jointed at the top. *Meissn. in DC. Prodr.* 63; *Fl. Dan.* 1161; *Engl. Bot.* t. 1674.

EASTERN HIMALAYA; Sikkim, at Darjeeling, alt. 7-8000 ft., Clarke; introduced? —DISTRIB. Europe, N. Africa, N. Asia.—Introduced elsewhere.

Glabrous, often bright red in autumn; rootstock creeping, much branched. Leaves ½-2 in., variable in breadth and form; stipules silvery, torn. Racemes erect; male fl. largest. Fruiting sepals oblong, erect, closely appressed to the small 3-gonous fruit.—*Sheep-sorrell*.

ORDER CXX. **PODOSTEMONACEÆ.**

Aquatics, growing on stones in tropical streams, annual or perennial. Stem branched with leaves, or with these confluent into amorphous fronds. Inflorescence various, often of a 1- or many-flowered scape, naked or arising from a tubular sheath. Flowers 1-sexual, rarely diœcious, usually enclosed in a spathe. Perianth 0, or membranous, lobed or partite or of a few scales. Stamens definite or not, free or connate, hypogynous or perigynous, filaments flat; anthers 2-lobed. Ovary free, sessile or stalked, smooth or ribbed, 1-3-celled; styles 2-3, or one and columnar, stigma one capitate, or 2-3, simple toothed or lacinate; ovules many, anatropous, axile or parietal. Capsule 1-3-celled; septicidal or septifragal, valves 2-3. Seeds

minute, testa mucilaginous, albumen 0; embryo straight, cotylédons 2, radicle inferior.—Genera 21; species about 120, chiefly tropical.

An Order of very doubtful affinity, some genera of which I am disposed to regard as perhaps consisting of reduced forms of *Scrophularinæ* or *Lentibularinæ*. The species are probably very numerous in India, though unknown in rivers having snow-feeders. I have followed Weddell's most careful monograph in describing the Indian species, reducing the genera in accordance with Bentham's revision of these in the *Genera Plantarum*. I suspect that an examination of more copious materials will modify the characters of the species, and perhaps bring some of them together as varieties or forms of dimorphic or polymorphic plants.

Tribe I. **Tristicheæ**. *Flowers* 2-sexual. *Stamens* 1-3. *Ovary* 3-celled. *Styles* 3.

Stamens 3 1. **TERNIOLA**.

Tribe II. **Eupodostemeæ**. *Perianth* of 2 rarely 3 scales. *Stamens* 1, or 2-3 with the filaments connate.

Stigmas subsessile, broad, flat, crested. Stamens 2 2. **HYDROBRYUM**.
Stigmas short, linear or ovate, entire. Stamens 2 3. **PODOSTEMON**.

1. **TERNIOLA**, *Tulasne*.

Stems confluent into an expanded horizontal lobed frond, or in one species long and floating. *Leaves* minute, setaceous. *Flowering-buds* adnate to the base of the stem, or scattered along the elongated branches; pedicel solitary, with a ring of scale-like leaves usually forming a short sheath round its base. *Flowers* 2-sexual. *Perianth* hyaline, 3-lobed. *Stamens* 3, filaments free. *Ovary* 3-celled; styles 3, spreading, inner, linear; placentæ thick, in the inner angles of the cells. *Capsule* ovoid, septically 3-valved, valves equal, septa vanishing.—Species 7, all Indian.

* *Stems* frond-like horizontal.

1. **T. zeylanica**, *Tul. Monogr. Podost.* 190, t. 13, f. 3; plant flat suborbicular or irregularly lobed, leaves some very narrow in rosettes, others connate into a short broad tubular or cup-shaped echinate sheath with a ciliate mouth. *Wedd. in DC. Prodr.* xvii. 46. *T. ceylanica*, *Wight Ic.* t. 1919. *Tristicha zeylanica*, *Gardn. in Calc. Journ. Nat. Hist.* vii. 177. *Lawia zeylanica*, *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 112. *Dalzellia zeylanica*, *Wight l. c.* 34. *Mnianthus zeylanicus*, *Walp. Ann.* iii. 443.

CEYLON; on smooth gneiss rocks in streams at Peradeniya.

Plant frond-like, attached to stones, about 1 in. diam. *Leaves* simple, sometimes forked or lacerate, $\frac{1}{2}$ in. long, mixed with papillæ. *Sheath* bristling with rigid teeth (tips of connate leaves). *Pedicel* equalling the flower, at length elongate and $\frac{1}{2}$ in. long. *Perianth* oblong. *Stamens* included. *Capsule* ellipsoid, subsessile, 9-ribbed, crowned with 3 recurved stigmas.

2. **T. pulchella**, *Tul. Monogr. Podost.* 192, t. 13, f. 4; plant minute narrow flat lobed, leaves distichous short linear acute, sheath cylindric of slender connate leaves mouth ciliate. *Wedd. in D.C. Prodr.* xvii. 46. *Lawia pulchella*, *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 113. *Mnianthus pulchellus*, *Walp. Ann.* iii. 443.

THE CONCAN; near Bombay.

Plant frond-like, $\frac{1}{8}$ – $\frac{1}{2}$ in. diam.; lobes very short, terminated by buds. *Leaves* $\frac{1}{8}$ in.

long, with a white mesial line, upper shorter, *Pedicel* about as long as the leaves. *Perianth* obtusely 3-lobed. *Capsule* obovoid, crowned with 3 short stigmas.

3. **T. Lawii**, *Wedd. in DC. Prodr.* xvii. 47; plant very minute flat, leaves sublanceolate crowded round the base of the sheath which is formed of connate leaves with free recurved tips, pedicel very short. *Tulasnea Lawii*, *Wight Ic.* t. 1919, f. 3. *Dalzellia Lawii*, *Wight l. c.* 35.

The CONCAN; in the Salset River, *Law*.

Plant about $\frac{1}{8}$ in. diam. *Flowering buds* crowded round the margins of the frond. *Perianth-segments* obtuse. *Capsule* ellipsoid, obscurely ribbed.

4. **T. longipes**, *Tul. Monogr. Podost.* 193, t. 13, f. 2; plant minute, narrow, lobed, leaves crowded round the base of the sheath subdistichous linear-elongate acute longer than the pedicel, sheath broad formed of connate leaves ciliate. *Wedd. in DC. Prodr.* xvii. 47. *Lawia longipes*, *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 113. *Mnianthus longipes*, *Walp. Ann.* iii. 443.

The CONCAN; in streams near Bombay, *Law*.

Similar to *T. Lawii*; margins of the lobes studded with buds. *Leaves* flat; broad at the base, $\frac{1}{2}$ – $\frac{1}{4}$ in. long. *Pedicel* lengthening to $\frac{3}{8}$ in.

5. **T. pedunculosa**, *Wedd. in DC. Prodr.* xvii. 47; plant flat lobed, leaves short subulate all connate into a sheath that is much shorter than the pedicel. *Dalzellia pedunculosa*, *Wight Ic.* 35. *Tulasnea pedunculosa*, *Wight l. c.* t. 1919, f. 4.

The CONCAN; Bombay, in the Salset River, *Law*; North Canara, *Talbot*.

Probably only a variety of *T. longipes*, as surmised by Weddell, but considered distinct by Wight; the capsule is the same.

6. **T. foliosa**, *Wedd. in DC. Prodr.* xvii. 47; plant broad flat lobed, leaves elongate linear crowded round the base of the pedicel and much shorter than it, none of them connate into a sheath. *Dalzellia foliosa*, *Wight Ic.* 35. *Tulasnea foliosa*, *Wight l. c.* t. 1919, f. 2.

The CONCAN; Bombay, in the Salset River, *Law*.

Plant about $\frac{1}{4}$ in. broad; margin of lobes studded with buds. *Leaves* numerous in a cluster, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, very narrow, flat, very acute, translucent. *Pedicel* $\frac{1}{2}$ in. long.

** *Stems elongate, filiform.*

7. **T. ramosissima**, *Wedd. in DC. Prodr.* xvii. 47; stem filiform very long floating much branched, branches some like the stems, others short and flowering, leaves alternate narrowly linear almost acicular, sheath very short of connate leaves much shorter than the pedicel. *Dalzellia ramosissima*, *Wight Ic.* 35. *Tulasnea ramosissima*, *Wight l. c.*

MALABAR; rivers in Cochin, *Johnson*.

A foot or more long; leafy, stems submerged; flowering branches floating, attached to the upper face of the stem and accompanied by two very slender branchlets. *Leaves* on the sterile branches almost acicular, shorter than on the flowering. *Sheath* hardly any, its outer leaves short and very acute. *Pedicel* $\frac{1}{2}$ – $\frac{3}{4}$ in. long. *Perianth* 3-lobed almost to the middle. *Filaments* at length exserted; anthers oblong, base sagittate. *Capsule* oblong, narrowed at both ends, 9-ribbed; stigmas slender, suberect.

2. **HYDROBRYUM**, *Endl.*

Plants small, green, herbaceous, frond-like, spreading over stones, sending up buds clothed at the base with distichous scale-like leaves. *Flowers*

2-sexual, each enclosed in a sessile membranous sheath. *Perianth* 0. *Stamens* 2, filaments united below; staminodes 2, linear. *Ovary* ovoid, 2-celled; stigmas 2, subsessile, broad, flat, spreading, crested or toothed, deciduous. *Capsule* long-pedicelled, ovoid; valves equal 5-ribbed.

H. Griffithii, *Tul. in Ann. Sc. Nat. Ser. 3*, xi. 104, and *Monogr. Podost.* 141; *Wedd. in DC. Prodr.* xvii. 67. *Podostemon* [Griffithii, *Wall. mss.*; *Griff. in As. Res.* xix. 105, t. 17, and *Ic. Pl. As.* t. 541, f. 2, & t. 544. P. Griffithii, *Gardn. in Calc. Journ. Nat. Hist.* 1850, 40, 41.

KHASIA MTS., on rocks in streams, alt. 2-3000 ft., *Griffith, J. D. H. & T. T.*

Plants consisting of small coriaceous green frond-like lobed patches about 1 in. broad adhering firmly to stones, with buds irregularly scattered over the surface; flowering buds of 6 distichously imbricating leaves about $\frac{1}{10}$ in. long, the lower of which have often filiform tips. *Spathe* about $\frac{1}{10}$ in. long. *Stamens* as long as the ovary; anthers oblong; staminodes with subspathulate tips, appressed to the ovary in bud. *Ovary* subglobose; style very short, stigmas cuneate. *Capsule* oblong-lanceolate, valves delicately ribbed.

3. **PODOSTEMON**, *Michaux.*

Herbs of various habits. *Pedicels* scattered and adnate to the stem or in terminal or lateral very short branches which are naked or scaly at the base. *Flower* 2-sexual sessile in a little spathe, with 2 linear staminodes at the side of the staminal column. *Stamens* 2, filaments united below. *Ovary* ovoid, 2-celled; styles short linear subulate or ovate acute. *Capsule* long-pedicelled, ovoid, or ellipsoid; valves 3-5-ribbed, persistent or one deciduous. —Species about 20, American, Madagascarian and Indian.

Sect. I. **Dicræa**. *Stems* branched, floating. *Flower-buds* few, lateral on the branches.

1. **P. dichotomus**, *Gardn. in Calc. Journ. Nat. Hist.* vii. 165; stems dichotomously branched compressed floating, flowering branches elongate flexuous, flowers distichously alternate on short leafy branches, sheath of connate leaves the lower of which are scale-like the upper subulate, capsule ellipsoid. *Dicræa dichotoma*, *Tul. in Ann. Sc. Nat. Ser. 3*, xi. 101, and *Monogr. Podost.* 119, t. 9, f. 1.; *Wedd. in DC. Prodr.* xvii. 69.

DECCAN PENINSULA, in streams of the Western Ghats.

P. dichotomus proper; stems slender flexuous and angled. *Dicræa dichotoma*, *Tul. in Ann. Sc. Nat. Ser. 3*, xi. 100, and *Monogr. Podost.* 114; *Wight Ic.* t. 1916, f. 2.—Nilghiri Mts.; in the Pycarrah River, *Wight*.

Var. *Wightii*, *Wedd. l. c.*; stems and branches shorter broader more flexuous, leaves subulate, flowers more numerous. *P. Wightii*, *Gardn. l. c.*; *Wight Ic.* t. 1916, f. 3. *Dicræa Wightii*, *Tul. ll. c.*—Nilghiri Mts.; in the Pycarrah River, *Wight*.

Var. *longifolia*, *Wedd. l. c.*; habit of var. *Wightii*, but leaves longer only born on the lower buds. *Dicræa longifolia*, *Wight l. c.* 1916, f. 4.—Malabar, *Johnson*.

Var. *rigida*, *Wedd. l. c.*; stems and branches stouter more rigid flowering throughout, leaves all scale-like and connate into a tubular 2-fid sheath. *P. rigidus*, *Gardn. l. c.* *Dicræa rigida*, *Tul. ll. c.*; *Wight Ic.* t. 1916, f. 5.—Nilghiri Mts.; in the Pycarrah River, *Wight*.

2. **P. stylosus**, *Benth. in Gen. Pl.* iii. 112; stems very long branched compressed margins floriferous, leaves 4 distichously imbricate inner obtuse subcuspidate sheathing the spathe, stigmas pubescent equalling or exceeding

the ovary, capsule 6-ribbed. *Dicræa stylosa*, *Wight Ic.* t. 1917, f. 2; *Wedd. in DC. Prodr.* xvii. 70.

MALABAR; in mountain streams, near Calicut, *Johnson*. TRAVANCORE; in streams of the Anamallay Hills, *Wight*.

The long stigmas distinguish this species.

3. ***P. elongatus***, *Gardn. in Calc. Journ. Nat. Hist.* vii. 188; stems long filiform subsimple terete floating below and branches flowering, tips elongate leafy flowerless, leaves acicular, flowers distichous in spikes or racemes terminating short branches, capsule ellipsoid. *Dicræa elongata*, *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 102, and *Monogr. Podost.* 124, t. 9, f. 2; *Wight Ic.* t. 1917, f. 1; *Wedd. in DC. Prodr.* xvii. 70.

CEYLON; in the Mahawalle Gunga River, below Peradenya, *Gardner*.

Stems tufted, 1-2 in., clothed with distichous buds; upper buds flowerless, consisting of clusters of linear or subspathulate leaves $\frac{1}{2}$ - $\frac{1}{3}$ in. long.; lower buds of boat-shaped acute keeled leaves connate at the base and enclosing the flower. *Spathe* funnel-shaped, mouth 2-fid. *Filamen'* stout, equalling the ovary and subulate staminodes; anthers oblong. *Capsule sessile* on the fruiting pedicels, which terminate short leafless branches, 8-12-ribbed; stigmas ovate, acute.

4. ***P. algæformis***, *Benth. in Gen. Plant.* iii. 112; stems long compressed floating simply or dichotomously branched from the base, branches strap-shaped simple or forked obtuse, flowers on the margins of the stem below or branches, pedicel with minute leaves at the base, of which the inner are large and concave, capsule elliptic-oblong 8-ribbed. *Dicræa algæformis*, *Beddome in Trans. Linn. Soc.* xxv. 223, t. 24; *Wedd. in DC. Prodr.* xvii. 70; *Warm. in Videlsk. Selsk. Skr.* vi. 2, t. 12; *Trim. in Journ. Bot.* xxiii. (1855) 173.

TRAVANCORE; on rocks in streams of the Anamallay Mts., *Beddome*. CEYLON; near Kandy, *Trimen*.

Stems tufted, dark green, $\frac{3}{4}$ in., like a *Fucus*; branches unequal, alternate or clustered. *Spathe* with a dilated 2-3-fid mouth. *Staminodes* 2-3, subulate, as long as the ovary. *Filaments* connate below; anthers oblong. *Stigmas* subulate.—Mr. Hemsley, who has examined the Ceylon specimens, regards them as intermediate between *P. algæformis* and *Wallichii*.

5. ***P. subulatus***, *Gardn. in Calc. Journ. Nat. Hist.* vii. 184; stem short simple or dichotomous, branches short leafy, leaves amplexicaul distichous elongate-subulate, pedicels short, stigmas subulate-lanceolate. *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 103, and *Monogr. Podost.* 135, t. 9, f. 4; *Wedd. in DC. Prodr.* xvii. 74; *Wight Ic.* t. 1918, f. 1; *Thwaites Enum.* 222. *P. dendroides*, *Thw. mss.*

CEYLON; on rocks in the Mahawalle Gunga River, near Holnicut.

Stems stout, rough, 1-1 $\frac{1}{2}$ in., attached to stones by a small fleshy depressed rootstock. *Leaves* 1-2 $\frac{1}{2}$ in., base very broad, with rarely a short stipule on the margin of the sheath. *Spathe* broadly tubular, 2-4-lobed unequally. *Filament* much longer than the ovary; staminodes shorter, narrowly linear. *Capsule* ellipsoid, usually longepeduncled; valves 8-ribbed, one falling before the other.

Sect. II. **Polypleurum.** *Stem* flat dilated frond-like. *Flower-buds* scattered or submarginal, with few scales.

6. ***P. Hookerianus***, *Wedd. in DC. Prodr.* xvii. 74; plant an irregularly dilated thickish sinuate or lobulate frond with marginal 1-fid. buds of about 6 distichously imbricate ovate obtuse or acuminate leaves, capsule

smooth. *Mniopsis Hookeriana*, *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 104, and *Monogr. Podost.* 147, t. 8, f. 5; *Wight Ic.* t. 1918, f. 4.

The CONCAN; near Bombay, in streams, *Law.* N. CANARA, in the Kala nuddi, *Talbot.*

Plant 1-2 in. broad, appressed to rocks, &c. *Leaves* not keeled, lower short obtuse, upper $\frac{1}{2}$ in. long. *Spathe* tubular, mouth 2-lobed. *Pedicel* about $\frac{1}{2}$ in. *Filament* flat; staminodes linear, acute, shorter than the ovary. *Ovary* sessile, globose; stigmas long, subulate-lanceolate. *Capsule* subglobose, one valve falling away before the other.—Mr. Hemsley regards the Canara specimens as intermediate between *P. stylosus* and *algaformis*.

7. **P. Johnsonii**, *Wedd. in DC. Prodr.* xvii. 75; plant an irregularly dilated membranous suborbicular or lobed frond, buds on the upper surface 1-fl. of 4-6 distichously imbricate ovate obtuse keeled leaves, capsule smooth or with 8 confluent broad ribs. *Mniopsis Johnsonii*, *Wight Ic.* t. 1919, f. 5.

MALABAR; in rivers, *Johnson.*

Plant 1-1 $\frac{1}{4}$ in. broad, appressed to the stones, &c. *Leaves* $\frac{1}{2}$ in., spreading, rigid when dry, upper rather the longest. *Spathe* ovoid, subcompressed, split ventrally and at the tip. *Filament* longer than the ovary; anthers ovate; staminodes very narrow, incurved above, equalling the ovary. *Ovary* globose, sessile; stigmas short, linear. *Capsule* ellipsoid.

8. **P. olivaceus**, *Gardn. in Calc. Journ. Nat. Hist.* 181; plant a membranous irregularly lobed flat frond, buds crowded on its upper surface 1-fl. of 6 equitant oblong obtuse acutely keeled leaves, capsule with 8 thick ribs. *Wedd. in DC. Prodr.* xvii. 75. *P. griseus*, *Gardn. l. c.* *Hydrobryum olivaceum* & *griseum*, *Tul. in Ann. Sc. Nat. Ser.* 3, xi. 104 and *Monogr. Podost.* 138, 140, t. 9; *Wight Ic.* t. 1918, f. 2. ? *P. Gardneri*, *Harv. mss.*; *Thwaites Enum.* 223.

NILGHIRI MTS.; in the Pycarrah River, *Wight.* CEYLON; in the Mahawalle Gunga River, *Gardner*, &c.

Plant about 1 in. broad, appressed to rocks, &c., its lobes sometimes imbricating. *Leaves* $\frac{1}{2}$ in., upper larger. *Spathe* elliptic-oblong, incumbent on the frond, at length split longitudinally. *Pedicel* at length $\frac{1}{2}$ in. long. *Filament* compressed, arms short, anthers ovate; staminodes linear, shorter than the ovary. *Ovary* sessile; stigmas short, triangular-lanceolate. *Capsule* ellipsoid, ribs of the persistent valve decurrent on the pedicel.—*P. Gardneri*, which consists of a simple terete stem crowned with capillary leaves, and grows on the rootstock of *P. olivaceus*, is supposed to be an abnormal foliaceous development of that plant.

9. **P. acuminatus**, *Wedd. in DC. Prodr.* xviii. 75; plant a flat frond radiately lobed, buds in the sinus and angles between the lobes 1-fl. of 6 equitant leaves terminating in long subulate caducous points, capsule broadly 8-ribbed.

KHASIA MTS., in the Bogapane and Kalapane Rivers, *J. D. H. & T. T.*

Plant minute, membranous, subdichotomously irregularly shortly forked or lobed and toothed. *Buds* horizontal; lower leaves shorter, obtuse. *Spathe* ellipsoid, narrowed below, at length split longitudinally. *Pedicel* ascending, $\frac{1}{10}$ in. *Filament* flattened, arms short, spreading, staminodes linear, half as long as the ovary. *Stigmas* subulate-lanceolate. *Capsule* obliquely ellipsoid, ribs of the persistent valve decurrent on the pedicel.

10. **P. microcarpus**, *Wedd. in DC. Prodr.* xvii. 76; plant a dichotomous flat branching frond bearing scattered 1-fl. buds of 6-8 equitant subacute compressed keeled leaves, spathe boat-shaped, capsule obovoid

ellipsoid not ribbed. *Hydrobryum lichenoides*, *Kurz in Journ. As. Soc. Beng.* xlii. 2. 103.

TENASSERIM; on branches of shrubs near waterfalls at Tavoy and Moulmein, *Parish*.

Plant 1-2 in. broad, adhering to bark, irregularly or subradiately spreading. *Leaves* $\frac{1}{2}$ in. long, upper largest. *Spathe* open, rather shorter than the pedicel. *Stamens* unknown.—I have seen no specimen of Kurz's *Hydrobryum lichenoides*, of which the description is very meagre; as, however, he states it to have been received from Parish and collected in Burma, there is little room to doubt its identity. Weddell describes the plant as not ribbed, Kurz as broadly 8-ribbed.

11. **P. Wallichii**, *Br. in Wall. Cat.* 5225; plant a minute flat veined lobulate frond, buds on the edges of the lobes 1-fld. continuous with the veins, of 5-7 scale-like subdistichous fleshy at length deciduous leaves, spathe tubular, capsule 8-ribbed. *Griff. in As. Research.* xix. 103, t. 17, and *Notul.* 378, and *Ic. Pl. Asiat.* t. 541, f. 1, 542, 543; *Gardn. in Calc. Journ. Nat. Hist.* 183; *Royle Ill.* i. 331. *Dicræa Wallichii*, *Tul. in Ann. Sc. Nat. Ser. 3*, xi. 101, and *Monogr. Podost.* 118; *Wight Ic.* t. 1916, f. 1; *Meissn. in DC. Prodr.* xvii. 70. *Lacis Wallichii*, *Steud. Nomencl. Polypleurum orientale*, *Tayl. mss.* *Blandovia striata*, *Lehm. mss.*

KHASIA Mts., *Wallich*; at the falls near Churra, *Griffith*. AVA; at Cheppedong, *Wallich*.

Plant ascending, about 1 in. long, veins radiating. *Buds* usually from between the lobes, rarely superficial. *Leaves* irregularly disposed, more or less connate. *Pedicel* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Spathe* dilated at the mouth, invaginate about the middle. *Filament* subterete; anthers broadly ovate; staminodes 2 or with a third arising from the fork of the filament. *Ovary* ovoid; stigmas thick, subulate, unequal, divaricate. *Capsule* narrowed into the pedicel; valves persistent, incurved.

12. **P. pterophyllus**, *Benth. in Gen. Pl.* iii. 112; plant a very small flat-veined lobed frond, lobes entire or forked, buds arising from the veins at about the middle of the frond of 4-6 distichous leaves with winged keels, capsule ellipsoid 8-12-ribbed. *Dicræa pterophylla*, *Wedd. in DC. Prodr.* xvii. 71.

KHASIA Mts.; in rivulets, *J. D. H.*

Plant variable in form, appressed; veins radiating from the centre; lobes or segments short or sometimes $1\frac{1}{4}$ in. long. Upper leaves the longest, about $\frac{1}{4}$ in. long, keel dilated into an oblong wing. *Pedicels* $\frac{1}{4}$ - $\frac{1}{2}$ in. *Stigmas* (imperfect) ovate or ovate-lanceolate. *Capsule* about $\frac{1}{16}$ in.

13. **P. minor**, *Benth. in Gen. Pl.* iii. 112; plant a minute stellately lobed flat veinless frond, lobes narrow simple or subdichotomously branched, buds on the margins and upper surface of the fronds leafless, spathe enclosed in a very obliquely funnel-shaped sheath, capsule ellipsoid 10-ribbed. *Dicræa minor*, *Wedd. in DC. Prodr.* xvii. 71.

KHASIA Mts.; *Griffith*.

Plant fragmentary, fragments $1\frac{1}{4}$ in. long and less, very narrow, olive-brown when dry. *Sheath* split to the base on one side, margin waved or lobed, fleshy; spathe seated in the sheath, tubular, mouth 2-lobed, longer than the pedicel. *Filament* equalling the capsule; anthers ovate; staminodes very slender, half as long as the filament. *Capsule* sessile, subacute, dorsal nerve acute; stigmas linear, acute.

Sect. III. **Selaginoides**. *Stems* of two forms, flowering densely fascicled elongate, clothed with imbricating tetrastichous thick scales; leaves of the flowerless stem with very long filiform tips.

14. **P. selaginoides**, *Benth. in Gen. Pl.* iii. 113; stems densely tufted simple erect the flowerless naked below, flowering densely clothed from the base with 4-ranked imbricating scales, flowers terminal subsessile, capsule ellipsoid smooth. *Mniopsis selaginoides*, *Beddome in Trans. Linn. Soc.* xxv. 223, t. 28. *Dicræa selaginoides*, *Wedd. in DC. Prodr.* xvii. 68.

SOUTH DECCAN; in streams of the Anamallay Hills, *Wight, Beddome*.

Rootstock small, depressed, stems 2-3 in. rather fleshy. *Leaves* of the flowerless stems $\frac{1}{2}$ - $\frac{3}{4}$ in. long, semiterete below then strap-shaped, those of the flowering stems subclavate, the upper $\frac{1}{10}$ in., lower shorter, keeled at the back, channelled in front; filiform tips jointed at the base and deciduous. *Spathe* amongst the upper leaves, saccate, mouth 2-lobed. *Ovary* ellipsoid, obtuse, stigmas unequal. *Filament* equaling the ovary, anthers oblong; staminodes narrowly linear. *Capsule* $\frac{1}{2}$ in. long.

DOUBTFUL SPECIES.

DICRÆA APICATA, *Tul. Monogr. Podost.* 204; *Wedd. in DC. Prodr.* xvii. 71; stems $\frac{1}{2}$ - $\frac{3}{4}$ in. compressed simple naked crowned with a brush of filiform branchlets, flowers as in *P. dichotomus*.—N ilghiri Mts., *Wight*; in streams at Pycarra, *Gardner*. ? Ceylon, *Thwaites* (C. P. 2989). Probably (according to Tulasne) an abnormal form of *P. dichotomus* var. *rigida*.

ORDER CXXI. NEPENTHACEÆ.

Climbing or prostrate evergreen undershrubs. *Leaves* alternate, exstipulate; midrib stout, produced into a peduncle which bears a pitcher of various forms, nerves parallel; pitcher with 2 longitudinal ribs or wings in front, at first closed by a lid which opens and becomes erect or reflected, inner surface covered below the middle with glands that secrete water; mouth with a revolute and closely ribbed margin (*peristome*). *Inflorescence* terminal or lateral; flowers racemose rarely paniced, diœcious, small, green or brownish. *Perianth* 4-, rarely 3-partite; segments oblong, glandular within. *MALE FL.* *Stamens* 4-16, united in a column crowned by the usually connate anthers with extrorse dehiscence. *FEMALE FL.* *Ovary* superior, 4- rarely 3-gonous, 4-3-celled; stigma sessile, discoid, 4-3-lobed. *Ovules* numerous, in many series, attached to the septa, anatropous, ascending. *Capsule* coriaceous, loculicidally 4-3-valved. *Seeds* very numerous, minute, imbricate, testa membranous, produced into a thread at each end; albumen fleshy; embryo axile, straight, cotyledons linear, radicle short inferior.—Genus 1, species about 30, Tropical Asia, Malay Islands, N. Australia, New Caledonia, Madagascar and the Seychelles.

NEPENTHES, Linn.

Character of the Order.

* *Flowers paniced.*

1. **N. distillatoria**, *Linn.*; *Hook. f. in DC. Prodr.* xvii. 93; glabrous, leaves elliptic-lanceolate, petiole broadly winged $\frac{1}{2}$ -amplexicaul, pitcher cylindric hardly inflated below, mouth subcordate, ribs not winged, peristome narrow not dilated behind, lid smooth within. *Burm. Fl. Ind.* 190; *Gartn. Fruct.* ii. 18, t. 33; *Thwaites Enum.* 290. *N. indica*, *Poir. Encycl.* iv. 458; *Brongn. in Ann. Sc. Nat.* i. 43, t. 5, f. 1. *Bandura zeylanica*, *Burm. Thes. Zeyl.* 42, t. 17.

CEYLON; south of the island, common.

A tall climber. *Leaves* 5-12 by 1-2 $\frac{1}{2}$ in., coriaceous, acute or acuminate. *Pitchers*

4-6 in. long; peristome very narrow; lid orbicular. *Panicle* 8-12 in., puberulous. *Flowers* $\frac{1}{4}$ in. diam.

**** Flowers in a raceme with at its base short branches with scorpioid inflorescence.**

2. **N. ampullaria**, *Jack in Mal. Misc. ex Hook. Comp. Bot. Mag.* i. 271; stem stout rusty-pubescent, leaves elliptic- or obovate-lanceolate or obcuneate pubescent beneath narrowed into a short winged $\frac{1}{2}$ -amplexicaul petiole, lower pitchers fascicled globose leafless, upper saccate, wings fimbriate, peristome broad and deep, lid linear reflexed, peduncle short and inflorescence rusty-tomentose. *Hook. f. in DC. Prodr.* xvii. 93; *Lambert, Pinus II. App.* t. 8; *Korth. Verh. Nat. Gesch.* 39, t. 13; *Hook. Bot. Mag.* t. 5109. *N. ampullacea*, *Blume Mus. Bot.* ii. 9; *Wall. Cat.* 2243 A, in part.

SINGAPORE, *Jack*. MALACCA, *Cuming, Griffith*.—DISTRIB. Sumatra, Borneo.

Stem prostrate below, with a whorl of many short pitchers, above erect. *Leaves* 3-12 by 1-4 in., nerves 2-4 on each side. *Pitchers* green, purple-spotted, lower 1-2 in. diam., upper cylindric cup-shaped or hemispheric, often gibbous or inflated in front; mouth orbicular; throat glandular to the top; peristome forming a deep curtain in the pitcher; lid very much smaller than the mouth, eglandular, *Racemes* 4-10 in., dense-fld. *Flowers* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam. *Capsule* 1-1 $\frac{1}{2}$ in.

***** Flowers simply racemose; pedicels rarely 2-fld.**

3. **N. Rafflesiana**, *Jack in Mal. Misc. ex Hook. Comp. Bot. Mag.* i. 270; stem stout cylindric, lower leaves lanceolate upper oblong to linear-lanceolate, petiole long $\frac{1}{2}$ -amplexicaul, lower pitchers ventricose below, wings fimbriate upper funnel-shaped not winged, neck elongate, peristome convex dilated and pectinate posteriorly, lid smooth within. *Wall. Cat.* 2242, 2243 A, in part; *Hook. f. in DC. Prodr.* xvii. 96; *Hook. Bot. Mag.* t. 4285; *Fl. des Serres*, t. 213, 214; *Korth. in Ann. de Gand.* iii. 7, t. 105; *De Vriese Tuinbow Flor.* i. 208, t. 5. *N. Hookeri*, *Alphand Prom. de Paris, cum Ic.*

SINGAPORE, *Jack*, &c.—DISTRIB. Sumatra, Borneo.

Stem long, stout, and young leaves thinly woolly. *Leaves* 4-18 in., lower membranous; petiole 3-8 in. *Pitchers* puberulous, peduncle stout, lower 3-4 in. diam., greenish yellow blotched with purple, mouth oblique contracted; peristome $\frac{1}{2}$ in. broad; upper pitchers 6-12 in. long; wings narrow, ciliate or not; lid with large glands. *Racemes* 6-10 in., white and woolly, dense-fld.; flowers $\frac{1}{2}$ in. diam. *Capsule* 1-1 $\frac{1}{2}$ in.—Varies from glabrous to white-woolly.

4. **N. phyllamphora**, *Willd. Sp. Pl.* iv. 2. 874; stem cylindric, leaves elliptic-oblong or lanceolate young denticulate and ciliate, petiole long $\frac{1}{2}$ -amplexicaul, pitchers subcylindric, peristome narrow, lid oblong or orbicular, racemes pubescent, pedicels slender. *Wall. Cat.* 2244; *Brongn. in Ann. Sc. Nat.* i. 458; *Jack in Mal. Misc. ex Hook. Comp. Bot. Mag.* i. 271; *Korthals in Verh. Nat. Gesch.* 28, t. 15; *Hook. f. in DC. Prodr.* xvii. 97. *N. fimbriata* & *macrostachya*, *Blume l. c.*; *Miquel III. Fl. Ins. Archip.* 3, t. 2, and 5, t. 6. *Phyllamphora mirabilis*, *Lour. Fl. Coch.* 606.—*Rumph. Herb. Amboin.* v. t. 121.

SINGAPORE, *Wallich*; MALACCA, on Mt. Ophir, *Lobb*.—DISTRIB. Malay Archipelago, China, New Guinea.

Stem short, creeping and climbing. *Leaves* 4-18 in., young puberulous, nerves many; petiole 1 $\frac{1}{2}$ -5 in. *Pitchers* 4-6 in. long, narrowed at the base, not winged; peristome $\frac{1}{2}$ - $\frac{1}{2}$ in. diam., lid densely glandular within. *Racemes* slender, mealy and hairy; flowers $\frac{1}{2}$ - $\frac{1}{2}$ in. diam. *Capsule* $\frac{1}{2}$ - $\frac{3}{4}$ in. long.

5. **N. sanguinea**, *Lindl. in Gard. Chron.* 1849, 580, with wood-cut; stem stout 3-gonous, leaves sessile obovate-oblong or cuneate cordately amplexicaul, pitchers large young short ventricose below narrowly 2-winged, old cylindric narrowed below, peristome broad dilated posteriorly, lid densely glandular within, racemes lax-flid., pedicels long capillary. *Hook. f. in DC. Prodr.* xvii. 100. *N. sanguinea*, *Griff. Posth. Papers*, iv. 348.

MALACCA; at Goonong Ledang, *Griffith*; Mt. Ophir, *Lobb*.

Often epiphytic; branches short, stout. *Leaves* with imbricating bases; nerves 2-3 hairs, obscure. *Pitchers* 12 by $2\frac{1}{2}$ - $3\frac{1}{4}$ in., blood-red, scurfy; mouth broad, ovate, produced behind; peristome $\frac{1}{2}$ - $\frac{3}{4}$ in. broad, inner margin inflexed; lid membranous. *Racemes* pubescent, male a foot long, female shorter; pedicels 1- $1\frac{1}{2}$ in.; flowers small, $\frac{1}{4}$ - $\frac{1}{2}$ in. diam.

6. **N. khasiana**, *Hook. f. in DC. Prodr.* xvii. 102; stem cylindric, leaves sessile amplexicaul lanceolate base shortly decurrent penninerved, pitchers large subcylindric inflated below, mouth contracted, peristome broad, racemes robust puberulous, pedicels short. *N. distillatoria*, *Wall. Cat.* 2244, *in part*; *Grah. in Bot. Mag.* t. 2798. *N. phyllamphora*, *Herb. Ind. Or. H. f. & T.*

KHASIA and JYNTEA MTS., *Wallich*, &c.

Stem short, stout, elongate under cultivation, prostrate, leafy. *Leaves* 1-2 ft. by $1\frac{1}{2}$ - $3\frac{1}{2}$ in., acute or acuminate, base narrowed, nerves numerous. *Pitchers* 4-7 by $1\frac{1}{2}$ -3 in., membranous, glabrous, green, reddish above, young shortly winged; mouth orbicular; peristome cylindric; lid membranous. *Racemes* lateral and terminal, puberulous; pedicels $\frac{1}{2}$ in.; flowers $\frac{1}{2}$ in. diam., green. *Capsule* $\frac{3}{4}$ -1 in. long.—A specimen of this in *Herb. Wallich* is marked as from "Courtallam, *Herb. Heyne*," but has never been found there by any subsequent collector, and it is inconceivable that the natives should not know so remarkable a plant.

7. **N. albo-marginata**, *Lobb ex Lindl. in Gard. Chron.* 1849, 580, with wood-cut; stem subcylindric and racemes and pitchers hoary-pubescent, leaves subsessile with a shortly decurrent $\frac{1}{2}$ -amplexicaul base elliptic-lanceolate acuminate, pitchers cylindric or funnel-shaped, or younger ventricose below, with a white velvety band on the neck, peristome narrow, lid orbicular glandular within, racemes long, pedicels very slender. *Hook. f. in Trans. Linn. Soc.* xxii. 422, t. 73, and in *DC. Prodr.* xvii. 102. *N. tomentella*, *Miquel Fl. Ind. i. at. i. pt. 1*, 1075, and *Ill. Fl. Ins. Archip.* v., t. 5. *N. distillatoria*, *Wall. Cat.* 2244, *in part*.

SINGAPORE, *Wallich*.—DISTRIB. Borneo.

Hoary-pubescent. *Stem* elongate, subtomentose or subsilky. *Leaves* 8-14 by $\frac{1}{2}$ - $1\frac{1}{4}$ in.; nerves 1-2 on each side, slender. *Pitchers* 3-5 by $1\frac{1}{2}$ in., green purple or mottled with purple and red, stellately downy, lower ventricose below with fimbriate wings, upper narrower. *Racemes* elongate, lax-flid.; pedicels $\frac{3}{4}$ -1 in.; flowers $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. *Capsule* $1\frac{1}{2}$ -2 in.

8. **N. Reinwardtiana**, *Miquel in Plant. Jungh.* i. 168, and *Fl. Ind. Bat.* i. pt. 1, 1075, and *Illust. Pl. Ins. Archip.* 4, t. 4; stem glabrous obtusely 3-gonous, 2-3-winged above, leaves sessile $\frac{1}{2}$ -amplexicaul linear-lanceolate acuminate shortly decurrent glabrous, pitchers subcylindric inflated below glabrous, mouth dilated produced posteriorly, peristome narrow smooth, lid densely glandular within, racemes downy lax-flid., pedicels slender. *Hook. f. in DC. Prodr.* xvii. 103. *N. distillatoria*, *Wall. Cat.* 2244, *in part*.

SINGAPORE, *Wallich*.—DISTRIB. Sumatra, Borneo.

Stem subcylindric below, winged above by the decurrent leaf bases. *Leaves* 5-10

by $\frac{3}{4}$ –1 in., lower long acuminate, upper shorter often obtuse, nerves 3–4 on each side. *Pitchers* 4–8 in., violet; mouth 2–2 $\frac{1}{2}$ in. wide; peristome very obscurely if at all striate. *Racemes* 5–7 in. long; female shorter, tomentose; pedicels $\frac{1}{2}$ –1 in.; flowers small, $\frac{1}{4}$ – $\frac{3}{8}$ in. diam. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in.—Differs from *N. gracilis* in the glandular lid and smooth peristome.

9. **N. gracilis**, *Korthals in Verh. Nat. Gesch.* xxii. t. 1 and 4, f. 1–38; stem glabrous 3–4 angled, leaves sessile linear-lanceolate decurrent, pitchers cylindric inflated below, contracted in the middle, mouth orbicular, peristome very narrow ribbed, lid orbicular with few glands within, racemes narrow downy, pedicels short. *Hook. f. in DC. Prodr.* xvii. 104; *Blume Mus. Bot.* ii. 10; *Miquel Fl. Ind. Bat.* i. pt. 1, 1071; *Spach Suites à Buffon Veg. Phan.* t. 144. *N. Korthalsiana*, *Miquel l. c.* 1071, and *Fl. Ins. Archip.* 7, t. 1. *N. lævis*, *Korth., in part.*

MALACCA and SINGAPORE; *Jack, Wallich.*—DISTRIB. Borneo.

Stem slender, angles obtuse. *Leaves* 4–7 by 1 in., glabrous, coriaceous; nerves 3–5 pairs, conspicuous. *Pitchers* 2 $\frac{1}{4}$ –4 in. long, glabrous, membranous, lower winged; mouth rather dilated; peristome very narrow or almost filiform; glands of lid very few and large. *Racemes* tomentose or glabrate, pedicels $\frac{1}{2}$ – $\frac{1}{2}$ in. *Flowers* $\frac{1}{6}$ – $\frac{1}{3}$ in. broad. *Capsule* slender, $\frac{3}{4}$ –1 $\frac{1}{2}$ in. long, glabrous.

ORDER CXXII. CYWINACEÆ.

Leafless brown reddish or yellowish parasites, or with leaves reduced to scales. *Flowers* solitary or in a spadix-like spike, or clustered on the root or branch of the host. *Perianth* superior, 3–10-cleft, segments or lobes imbricate or valvate. *Stamens* 8 or more, forming a fleshy ring round the style, or inserted on the perianth, 2-celled, bursting by pores or slits. *Ovary* 1-celled, or with many spurious cells formed of branching fleshy pendulous or parietal placentas; stigmas various. *Ovules* excessively numerous, orthotropous or anatropous. *Fruit* fleshy, 1-celled. *Seeds* innumerable, very minute, sometimes sunk in the placentas, nucleus homogeneous, or albumen cellular with a most minute embryo.—Genera 7, species 22, mostly tropical.

1. **SAPRIA**, *Griff.*

Plant diœcious, consisting of a solitary large flower sessile in a cup formed of the bark of a vine-stem, surrounded at the base by large broad opposite imbricating bracts. MALE FL. *Perianth-tube* hemispheric and solid below, cupular above and marked with 20 radiating ridges; limb 10-partite, segments rounded or oblong imbricate in two rows, spreading; from the base of the tube rises a stout columnar style crowned with a broad cup-shaped very hairy disk. *Anthers* about 20, sessile in a ring under the disk, subglobose, 2–3-celled, opening outwards by one pore. FEM. FL. *Perianth* of the male. *Ovary* traversed by longitudinal sinuous cells the walls of which are covered with anatropous ovules; stigma, a papillose cone in the centre of the disk. *Fruit* the swollen globose ovary crowned with the perianth.

S. himalayana, *Griff. in Proc. Linn. Soc.* i. 216, and in *Trans. Linn. Soc.* xix. 314, t. 34, 35; *Hook. f. in DC. Prodr.* xvii. 112. *S. Griffithii*, *Brown in Trans. Linn. Soc.* xix. 244.

EASTERN ASSAM; in the Mishmi Hills, on the roots of a vine, alt. 3–5000 ft., *Griffith.*

Buds globose; bracts white and pink. *Flowers* fœtid, 5-6 in. diam., tube blood-red within; segments fleshy, warted; ring at throat clothed with filiform processes; disk of column rosy.

ORDER CXXIII. **ARISTOLOCHIACEÆ.**

Herbs or shrubs, often climbing. *Leaves* alternate, entire or 3-5-lobed, exstipulate. *Flowers* 2-sexual, often large, usually lurid, terminal axillary or lateral, solitary racemose or cymose, bracteate or not. *Perianth* superior, regular or irregular, 3-lobed or tubular and variously shaped, lobes valvate. *Stamens* 6 or more, subsessile in a ring round the base of the style, cells parallel opening by dorsal slits. *Ovary* 4-6-celled, placentas parietal, free or meeting in the axis; style columnar, stigma lobed; ovules numerous, anatropous. *Fruit* capsular or baccate. *Seeds* numerous, various, albumen copious fleshy; embryo minute.—Genera 5, species about 200, chiefly tropical.

Perianth short, regular, 3-lobed. Ovary very short	1. ASARUM.
Perianth short, regular. Stamens 1-seriate. Ovary linear	2. BRAGANTIA.
Perianth regular. Stamens 2-seriate. Ovary linear	3. THOTTEA.
Perianth tubular with an inflated base, irregular	4. ARISTOLOCHIA.

1. **ASARUM**, Linn.

Perennial herbs; rootstock stout, woody. *Leaves* radical. *Flowers* solitary, terminal, peduncled, purple. *Perianth* shortly campanulate, regular, persistent, 3-lobed. *Stamens* 12, connective produced. *Ovary* inferior or $\frac{1}{2}$ -inferior, 6-celled; styles 6, tubular, grooved or 2-fid. *Fruit* coriaceous, bursting irregularly. *Seeds* boat-shaped, convex face wrinkled, opposite face winged or with a fleshy raphe.—Species 13, N. temperate hemisphere.

A. himalaicum, Hook. f. & Thoms. mss.; Duchartre in DC. Prodr. xv. 1. 424; leaves long-petioled rounded-ovate deeply cordate finely acuminate. Klotzsch in Monatsb. Berl. Akad. 1859, 385; Braun Ind. Sem. Hort. Berol. App. 1861, 12.

SIKKIM HIMALAYA; alt. 9-11,000 ft., J. D. H.

Rootstock slender. *Leaves* 3-4 in. diam., membranous; petiole 4-8 in., slender. *Peduncle* 1-2 in. *Perianth* broadly campanulate, lurid purple, $\frac{3}{4}$ in. diam., puberulous, lobes triangular. *Connective* with a subulate tip.—Belongs to the section *Eusasarum* with a European and N.W. American species.

2. **BRAGANTIA**, Lour.

Shrubs or undershrubs; hairs stellate. *Leaves* petioled, 3-5-nerved; veins closely reticulate beneath. *Flowers* axillary or subradical, cymose, bracteate. *Perianth* shortly campanulate, equally 3-lobed, deciduous. *Stamens* 6-12, 1-seriate, free or connate, connective thick. *Ovary* elongate, 4-celled; style short, stigmas 3 or more linear; ovules 2-seriate. *Capsule* elongate, 4-gonous, septicidally 4-valved, valves separating from a placentiferous column. *Seeds* oblong, 3-gonous, rugose or deeply pitted, often coated with remains of the placenta.—Species 4 or 5, Malayan and Indian.

* *First pair of basal nerves reaching far beyond the middle of the leaf. Cymes axillary. Stamens* 9-12.

1. **B. corymbosa**, *Griff. in Trans. Linn. Soc. xix. 335*; shrubby, branches leaves beneath and inflorescence finely puberulous, leaves distichous oblong-ovate acuminate glabrous above, flowers in cymose spikes, perianth-tube 0, segments cordate acute, anthers 8-10, stigma discoid. *Duchartre in DC. Prodr. xv. 1. 429*. *B. melastomæfolia*, *Duchartre l. c.* *Asiphonia piperiformis*, *Griff. l. c. 333, t. 37*, and *Notul. 344*, and *l. c. Pl. Asiat. t. 528*; *Ann. Sc. Nat. Ser. 3, vii. 338*. *Strakæa melastomæfolia*, *Presl Epimel. Bot. 221*.

MALACCA, *Griffith, Lobb, Cuming*.

Branches slender, terete. Leaves 5-6 by 2-2½ in., shining above; petiole very short, base rounded. Cymes much shorter than the leaves; spikes peduncled, divaricate. Flowers ¼ in. diam. Capsule 1 foot long, torulose. Seeds ½-¾ in. long, lanceolate, 3-gonous, rugose.

2. **B. Wallichii**, *Br. in Wall. Cat. 7415*; shrubby, branches and leaves beneath finely pubescent or glabrate tips and inflorescence tomentose, leaves oblong-lanceolate glabrous above, flowers in small irregular few-fl. cymes not spicate, perianth hemispheric, segments broadly ovate. *Duchart. in DC. Prodr. xv. 1. 430*; *Wight l. c. t. 520*; *Wight & Arn. in Ed. Phil. Journ. 1833, 181*; *Dalz. & Gibs. Bomb. Fl. 225*. *B. siliquosa*, *Miq. Pl. Ind. Or. Hohenack. n. 64*. *Apama siliquosa*, *Lamk. Encycl. i. 91*, and *Ill. t. 640*. *Trimeriza piperina*, *Lindl. in Bot. Reg. under t. 1543*. — *Rheede Hort. Mal. vi. t. 28*.

DECCAN PENINSULA; in the western forests, from the Southern Concan southwards. Ceylon; ascending to 4000 ft.

Branches angled. Leaves 5-8 by 1½-2 in., base acute or rounded. Cymes ½-1 in. long, rarely longer. Flowers 1 in. diam. Capsule 3-4 in., straight. Seeds ⅓ in. long, 3-gonous, deeply pitted.

Var. *brachycarpa*; leaves ovate-oblong or oblong acuminate finely puberulous beneath, flowers in cymose spikes, capsule 2½ in. *B. brachycarpa*, *Thwaites mss.*

Var. *latifolia*, *Duchart. l. c.*; leaves larger broader obovate-oblong tomentose beneath. *B. hispida*, *Thwaites mss.*

3. **B. Dalzellii**, *Hook. f.*; shrubby, stout, leaves very large oblong-lanceolate acuminate finely puberulous beneath, capsules 5-8 in. long torulose, seeds ½ in. long 3-gonous rugose and deeply pitted.

THE CONCAN? *Herb. N. A. Dalzell*.

A very fine species with leaves a foot long by 3 in. broad, and very long pods and large seeds. From the remains of the inflorescence its branches do not appear to have been spicate. Seeds lemon-yellow.

** *First pair of basal nerves not reaching the middle of the leaf. Cymes from the base of the stem. Stamens 6.*

4. **B. tomentosa**, *Blume Enum. Pl. Jav. 82*; herbaceous, low, stem simple and leaves beneath densely tomentose, leaves 1-3 oblong or ovate cordate, flowers in simple spikes. *Duchart. in DC. Prodr. xv. 1. 431*; *Bennett Plant. Jav. Rar. 43, t. 11*; *Griff. in Trans. Linn. Soc. xix. 335*; *Miquel Fl. Ind. Bat. B. khasiana*, *Griff. l. c. B. latifolia*, *Lindl. in Bot. Reg. under t. 1543*. *Bragantia*, n. sp., *Br. in Trans. Linn. Soc. xiii. 219*. *Ceramiu tomentosum*, *Bl. Bijdr. 1135*. *Cyclodiscus tomentosus & latifolius*, *Klotzsch in Monatsb. Berl. Akad. 1859, 592*. *Aristoloch.*, *Wall. Cat. 9108*.

SILHET, *De Silva*; Moulmein, *Lobb, Parish*. — DISTRIB. JAVA.

Stem creeping below, and rooting, then ascending, 6-12 in., simple, angular,

geniculate, tomentose. *Leaves* 4-6 by $2\frac{1}{2}$ -4 in., smooth but opaque above, 6-9-nerved at the base and penninerved beyond. *Flowers* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam.; bracts oblong, persistent. *Perianth-lobes* rounded-cordate, acute. *Capsule* 2 in. long, straight. *Seeds* $\frac{1}{2}$ in. long, 3-gonous, rugose.

Var. *lanuginosa*; leaves densely woolly beneath.—South Andaman Islands, Kurz.

3. **THOTTEA**, Rottb.

Shrubs, erect or straggling. *Leaves* broad, coriaceous, 3-5-nerved. *Flowers* axillary, cymose. *Perianth* broadly campanulate or urceolate, equally 3-lobed, deciduous. *Stamens* numerous, 2-seriate; connective broad. *Ovary* elongate, 4-celled; style broad, stigmas 5-25, radiating; ovules 2-seriate. *Capsule* elongate, 4-gonous, septicidally 4-valved, placentas usually free. *Seeds* oblong, 3-gonous, rugose, coated with remains of the placenta.—Species 5, Malayan.

1. **T. grandiflora**, Rottb. in *Dansk. Vidensk. Selks. Schrift.* ii. 530, t. 2; tomentose, leaves obovate-oblong oblong or elliptic-oblong or -lanceolate acute or acuminate, corolla very large campanulate. Griff. in *Trans. Linn. Soc.* xix. 325, t. 36, and in *Notul.* iv. 346, and *Ic. Pl. Asiat.* t. 530, 531; *Ann. Nat. Hist. Ser.* 3, vii. 328; *Bennett Pl. Jav. Rar.* i. 45; *Klotzsch in Monatsb. Berl. Akad.* 1859, 589; *Duchart. in DC. Prodr.* xv. 1. 428.

MALACCA, Ringit (1779), Griffith, Maingay. SINGAPORE, Oxley, Lobb.—DISTRIB. BORNEO?

Branches stout, woody, sometimes villous with spreading hairs. *Leaves* 1-1 $\frac{1}{2}$ ft. by 6-8 in., coriaceous, basal nerves 3-5; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., stout. *Spikes* 1-2 in., bracts $\frac{1}{4}$ - $\frac{1}{2}$ in. *Perianth* attaining 5 in. long and as broad, ribbed, mottled with purple, pubescent outside, arachnoid within. *Style rays* 12-15. *Capsule* 4-6 in., straight or twisted, angles acute, pubescent. *Seeds* $\frac{1}{2}$ in. long, 3-gonous, acute at both ends, tubercled.—The doubtful Bornean plant has a rounded leaf 1 foot by 10 in.

2. **T. dependens**, Klotzsch in *Monatsb. Berl. Akad.* 1859, 589; glabrous, leaves lanceolate or elliptic-lanceolate acuminate, corolla urceolate base inflated. *Duchart. in DC. Prodr.* xv. 1. 428. *Lobbia dependens*, *Planch. in Hook. Lond. Journ. Bot.* vi. (1847) 144, t. 3. *Piper arborescens*, *Rowb. ex Wall. Cat.* 6648 B.

SINGAPORE; Wallich, Lobb.

Branches slender, terete. *Leaves* 6-10 by $2\frac{1}{2}$ -3 $\frac{1}{2}$ in., thinly coriaceous; petiole $\frac{1}{2}$ in. *Spikes* simple or cymose, quite glabrous. *Flowers* 1 in. long. *Ovary* 1-1 $\frac{1}{2}$ in., very slender. *Perianth-base* inflated; tube above it short, cylindric, lobes broader than long.

3. **T. tricornis**, Maingay mss.; branches and leaves beneath hoary, leaves elliptic-oblong or oblong-lanceolate or oblanceolate acute or subacute base acute or rounded, cymes short not spicate, perianth depressed acutely 3-angled in bud, broadly lanceolate.

MALACCA; Maingay (Kew Distrib. 1819).

Branches stout, terete or obtusely angled. *Leaves* 7-9 by 3-4 in., coriaceous; petiole $\frac{1}{2}$ in. *Cymes* $\frac{1}{2}$ -1 in., branched, and perianth densely tomentose. *Flowers* $\frac{3}{4}$ in. diam., tomentose. *Ovary* short. *Stamens* 12 in 2 rows. *Capsules* 7-8 in. long, downy with brown pubescence, straight or twisted, not torulose. *Seeds* nearly $\frac{1}{2}$ - $\frac{3}{4}$ in. long, 3-gonous, tubercled.—This has more the habit of a *Bragantia* than a *Thottea*. The two genera may well be united.

4. **ARISTOLOCHIA**, Linn.

Shrubs or perennial herbs, often twining. *Leaves* entire or lobed;

petiole with a dilated base, and with often the stipule-like leaf of an undeveloped bud in the axil. *Perianth* coloured, tube inflated at the base, then contracted, hairy within; limb dilated, obliquely 1-2-lipped. *Anthers* 6, rarely 5, or more; style very short, 3-6-lobed. *Capsule* septicidally 6-valved or splitting through the placentas. *Seeds* various, often covered with the remains of the placenta.—Species about 180, chiefly tropical.

Sect. I. **Diplolobus**, *Duchart*. Column 6-lobed. *Anthers* 6.

1. **A. bracteata**, *Retz*. *Obs.* v. 29; quite glabrous, stem slender decumbent, leaves reniform or broadly cordate tip obtuse or subacute margins flat or waved glaucous beneath, flowers solitary, peduncle bracteate. *Roxb. Fl. Ind.* iii. 490; *Wall. Pl. As. Rar.* ii. 3, and *Cat.* 2706; *Grah. Cat. Bomb. Pl.* 178; *Dalz. & Gibs. Bomb. Fl.* 224; *Klotzsch in Monatsb. Berl. Akad.* 1859, 598. *A. bractiolata*, *Lamk. Encycl.* i. 258; *Klotzsch l. c.* *A. mauritiana*, *Pers. Encheir.* ii. 527. *A. Kotschyi*, *Hochst. ex A. Rich Tent. Fl. Abyss.* ii. 237. *A. manorum* and *A. abyssinica*, *Klotzsch l. c.* (not of *Lin.*).

DECCAN PENINSULA, northward to BUNDELKUND, *Wallich*, *Edgeworth*, &c. SCINDE, *Vicary*. CEYLON; north of the island, *Gardner*.—DISTRIB. Arabia, Trop. Africa.

Root slender, perennial. *Stem* or branches 12-18 in., angled and striate. *Leaves* $1\frac{1}{2}$ -3 in. long and broad, widely and shallowly cordate at the base; petiole $1-1\frac{1}{4}$ in. *Peduncle* short; bract usually orbicular, variable in position, sometimes basal. *Perianth* $1-1\frac{1}{2}$ in., base globose, tube cylindric erect slender; lip erect, linear, as long as the tube, dark purple with revolute edges, villous with purple hairs. *Fruit* pyriform, 1 in. long, many-grooved. *Seeds* triangular-cordate.

2. **A. indica**, *Linn.*; *Duchart. in DC. Prodr.* xvi. 479; shrubby, quite glabrous, twining, leaves from linear to obovate-oblong or subpanduriform base cuneate rounded or shallowly cordate 5-nerved, flowers 1-3, bract opposite the base of the peduncles. *Roxb. Fl. Ind.* iii. 489; *Wall. Cat.* 2704; *Klotzsch in Monatsb. Berl. Akad.* 1859, 595; *Grah. Cat. Bomb. Pl.* 178; *Dalz. & Gibs. Bomb. Fl.* 224. *A. lanceolata*, *Wight Ic.* t. 1858. *Klotzsch l. c.* *A. mayorensis*, *Fisch. mss.* *A. pandurata*, *Wall. mss.* *Aristolochia*, *Griff. Notul.* iv. 348, and *Ic. Pl. Asiat.* t. 529.—*Rheede Hort. Mal.* viii. t. 25.

Throughout the low country of INDIA from NEPAL, *Hamilton*, and lower BENGAL, *Clarke*, to CHITTAGONG, *J. D. H. & T. T.*; and the DECCAN PENINSULA, from the Concan southward. CEYLON common up to 3000 ft.

Stem woody below, branches slender. *Leaves* membranous, excessively variable, in the narrowest forms 4 by $\frac{1}{2}$ - $\frac{3}{4}$ in., in the broadest 4-5 by 3 in., broadest part at the base or middle or above the middle, abruptly or gradually obtusely acuminate or apiculate, often oblong and quite obtuse; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., very slender. *Perianth* straight, greenish, base globose, tube shortly funnel-shaped, mouth oblique trumpet-shaped gradually passing into the short oblong obtuse glabrous brownish lip. *Capsule* $1\frac{1}{2}$ -2 in. long, oblong, grooved. *Seeds* flat, triangular, winged.—*Wight's A. lanceolata* occurs both in the Peninsula and Ceylon.

3. **A. Roxburghiana**, *Klotzsch in Monatsb. Berl. Akad.* 1859, 596; quite glabrous, shrubby, twining, leaves large cordate upper often narrow subsagittately lanceolate lower or all ovate or broadly ovate-oblong pedately 5-7-nerved, upper with the 2 principal nerves produced far beyond the middle, lower with all the nerves spreading, flowers in racemose puberulous cymes, lip of perianth villous. *Duchart. in DC. Prodr.* xv. 1. 480. *A. acuminata*, *Roxb. Fl. Ind.* iii. 489 (not of *Lamarck*); *Wall. Cat.* 2705; *Wight*

l.c. t. 771; *Miq. Fl. Ind. Bat.* i. 1086; *Grah. Cat. Bomb. Pl.* 178; *Dalz. & Gibs. Bomb. Fl.* 224. *A. acuminata*, *Duchart. l. c.*

EASTERN HIMALAYA; from Sikkim, alt. 2-5000 ft., *J. D. H.*, to Mishmi, *Griffith*. ASSAM, SILHET, CHITTAGONG, &c., south to PENANG, *Wallich*, &c. DECCAN PENINSULA; and the Ghats from the Concan southward. CEYLON, *Gardner*.—DISTRIB. Java, Borneo.

A stout lofty climber. *Leaves* 4-8 in.; upper 2-3 in. broad, lower 3-5; broadest at the cordate base, sinus deep or shallow, basal lobes sometimes incurved. *Cymes* 1-3 in., lax-flid.; peduncle and pedicels slender; bracts small, oblong. *Perianth* 2-2½ in. long, pale green; base globose, tube curved, mouth oblique with recurved margins; lip linear, straight, obtuse, villous, as long as the tube. *Capsule* very variable, globosely pyriform or oblong, with the long stipes 1-2½ in. long, membranous. *Seeds* most variable, obtusely triangular in the smaller capsules, ¼-½ in. broad, with narrow wings and one face studded with tubercles; in larger capsules the seeds are larger and more broadly winged and lip tubercled; in the largest capsules the seeds are ½ in. diam., with very broad wings, and a thin disk quite smooth or sparsely tubercled on one face.—The variations in the leaves of this plant are remarkable, but not so much so as are those of the capsule and seeds. I long thought that these indicated at least two species.

4. ***A. atropurpurea***, *Parish mss.*; slender, herbaceous, stem straggling and petiole and cymes pubescent, leaves ovate-lanceolate acuminate base cordate, cymes few-flid. subsessile, lip of perianth glabrous, capsule ½ in.

TENASSERIM; on limestone rocks at Moulmein, *Parish*.

Rootstock woody; stem 1-2 ft., pendulous, zigzag, angular and grooved. *Leaves* purple, 5-7 by 2½-5 in., membranous; 5 basal nerves diverging, slender; petiole 2-3 in. *Cymes* very short. *Perianth* 1-1½ in., very like in form *P. Roxburghii*, base globose, tube funnel-shaped, mouth oblique passing into the straight obtuse glabrous lip with recurved edges. *Capsules* globose, shortly stipitate.

Sect. II. ***Siphisia***, *Duchart.* *Column* 3-lobed. *Anthers* 6.—(Lofty climbers; stem in all woody below; branches twining. *Leaves* large. *Flowers* axillary or chiefly in villous cymes on the old wood. *Perianth* sharply bent back upon itself, lower half on obovoid sac, upper trumpet- or cup-shaped, as long.)

5. ***A. platanifolia***, *Duchart. in DC. Prodr.* xv. 1. 437; branches glabrous or pubescent, leaves very broad deeply digitately 3-lobed glabrous or tomentose beneath lobes pinnatifidly lobulate, flowers axillary and solitary also in villous cymes on the old wood, perianth tomentose or villous, mouth obtusely 6-angled lips recurved villous with purple papillose hairs.

EASTERN HIMALAYA; Mishmi Mts., *Griffith*; Sikkim and E. Nepal, alt. 3-6000 ft., *J. D. H.*, &c. KHASIA Mts., alt. 4000 ft., *J. D. H. & T. T.*

A stout lofty climber; old wood with corky rugged fissured bark. *Leaves* a foot long and as broad or broader, cleft to near the base with a rounded sinus, glabrous and shining above, glaucous glabrous pubescent tomentose or woolly beneath, base rounded-cuneate or cordate, lobes very variable, lobules few acute or acuminate; petiole 2-3 in. often stout and twining. *Cymes* shortly peduncled; pedicels 1-1½ in. *Perianth* yellowish with purple veins externally, sac 1½ in. long, tube as long golden yellow within, mouth 1 in. diam. *Capsule* 4-6 by 1-1½ in. diam., linear-oblong with 6 ribs divided by deep furrows.

6. ***A. saccata***, *Wall. Pl. As. Rar.* ii. 2, t. 103, and *Cat.* 2707; branches tomentose or glabrate, leaves ovate- or linear-oblong or linear-lanceolate acuminate base deeply cordate glabrous or puberulous above,

beneath pubescent silky or densely tomentose rarely nearly glabrous and glaucous, cymes villous with long hairs, mouth of perianth nearly circular with a narrow reflexed purple papillose border. *Duchart. in Ann. Sc. Nat. Ser. 4, ii. t. 5, 6, and in DC. Prodr. xv. 1. 436; Bot. Mag. t. 3640.* *Siphisia saccata, Klotzsch in Monatsb. Berl. Akad. 1859, 603.*

EASTERN and CENTRAL HIMALAYA; Nepal, *Wallich*; Sikkim, *J. D. H.*; Bhotan, *Griffith*. ASSAM, *Griffith*. KHASIA MTS., alt. 1-4000 ft., *J. D. H. & T. T.* SILHET, *Bruce*.

Habit and stature of *A. platanifolia*, of which *Duchartre* suggests it may be a form, but no intermediates have occurred. *Leaves* very variable in size and pubescence, largest 12 by 6 in., longest 16 by 4 in., narrowest (var. *angustifolia*, *Duchart. l. c.*) 12 by 2½ in., cordate base deep or shallow, petiole 1-2 in. *Cymes* and perianth much more villous than *A. platanifolia*.

Var.? *dilatata*, lips of perianth greatly dilated ½-¾ in. diam.—Kumaon, *Blinkworth (Wall. Cat. 2707 B)*; alt. 7-8000 ft., *Strachey & Winterbottom*.

7. **A. Cathcartii**, *Hook. f.*; branches petioles and leaves beneath densely silky villous, leaves rounded-cordate acute or ovate-lanceolate acuminate, cymes and perianth densely villous with very long spreading hairs, perianth bearded with long hairs, mouth very wide square with very broad recurved lips fringed with long purple papillose hairs. *A. saccata. var. villosa, Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA and KHASIA MTS.?, alt. 2-3000 ft., *J. D. H. & T. T.*

Habit of *A. saccata*, but leaves shorter broader with dense silky shaggy wool beneath, and a very different perianth, the tube of which is far more dilated, with a much broader square mouth. *Capsule* as in *A. saccata*.—A fine drawing of this, made by Mr. Cathcart's artists, represents so different a plant from *A. saccata*, that it can hardly be a variety.

8. **A. Griffithii**, *Hook. f. & T. in Herb. Ind. Or.; Duchart. in DC. Prodr. xv. 1. 437*; branches glabrous with villous tips, leaves broadly ovate- or orbicular-cordate acute densely tomentose beneath, flowers axillary, perianth densely pubescent, tube above the sac abruptly dilated into a hemispheric cup 3-4 in. diam. with erect margins. *Aristolochia, Griff. Notul. iv. 190, No. 1015.*

EASTERN HIMALAYA; Bhotan, alt. 8000 ft., *Griffith*; Sikkim, alt. 7-9000 ft., *J. D. H.*

A tall climber. *Leaves* 4-6 in. long and often as broad, woolly but not shaggy beneath; petiole 2-4 in. *Flowers* apparently all solitary and axillary (extra-axillary, *Griffith*); peduncle villous, 2-3 in., with one or two leafy bracts. *Perianth* uniformly closely pubescent; sac ribbed and veined; limb or cup "ochreous yellow with radiating lines of clavate red warts, throat blood-red; tube yellow and spotted red within," *Griffith*. *Capsules* 7 inches long, shortly stipitate, twisted at the base, with 6 strong ribs and as many deep furrows. *Seeds* orbicular, convex on one face, concave with a median ridge on the other.—A remarkable species. The extracts translated from *Griffith's Notulæ* must be accepted cautiously, the Latin not being very intelligible.

DOUBTFUL AND EXCLUDED SPECIES.

ARISTOLOCHIA SPECIES.—Western Himalaya; Chamba, alt. 5000 ft., *Clarke*.—A slender climber, branches puberulous, leaves shortly petioled, 4-5 by 1-1½ in., membranous lanceolate finely acuminate from a truncate or broadly cordate base, basal nerves short.—This flowerless plant referred to *Aristolochia* doubtfully by Mr. *Clarke*, and I should think correctly, is far beyond the geographic range of any other Indian species.

A. THWAITESII, *Hook. Bot. Mag. t. 4918, and under 5295*, was erroneously supposed to be a Ceylon species. Its native country is unknown.

ORDER CXXIV. PIPERACEÆ.

Herbs or shrubs, rarely subarborescent, aromatic. *Leaves* alternate opposite or whorled, often pellucid-dotted, entire; stipules 0 or 2 connate, or adnate to the petiole. *Flowers* minute, 1-2-sexual, in axillary or terminal catkin-like spikes subtended by a peltate bract. *Perianth* 0. *Stamens* 2-6, rarely 7-8, hypogynous; anthers often jointed on the filaments, bursting longitudinally, or with the cells confluent. *Ovary* 1-celled, or of 3 or more carpels free or connate below; stigmas sessile, simple or penicillate. *Ovules* 1 or more, orthotropous. *Fruit* small, of the 1-celled genera indehiscent, of the pluri-carpellar forming cocci or follicles. *Seeds* globose ovoid or oblong; testa thin, albumen copious floury; embryo minute, enclosed in a sac, radicle superior.—Genera 8, species enumerated about 1000 (probably exaggerated), chiefly Tropical American.

Tribe I. **Saurureæ**. *Ovary* of 3-4 free or connate carpels.

Stamens 3-6. *Ovary* 1-celled 1. **HOULTUYNIA**.

Tribe II. **Pipereæ**. *Ovary* 1-celled.

Anther-cells distinct. *Fruit* not minute, stigmas 3-5 confluent . 2. **PIPER**.

Anther-cells confluent. *Fruit* minute, stigma usually penicillate 3. **PEPEROMIA**.

1. **HOULTUYNIA**, *Thunb.*

Perennial herbs? *Leaves* alternate, usually cordate; stipules broad, membranous. *Spikes* terminal and leaf-opposed, peduncled, involucrate; involucre of 4-6 white petaloid bracts. *Flowers* minute. *Perianth* 0. *Stamens* 3-6; filaments below adnate to the ovary; anthers oblong. *Ovary* of 3-4 partially connate 1-celled carpels; styles free, erect, stigmatose on the inner surface; ovules many, on parietal placentas. *Fruit* subglobose, bursting between the styles. *Seeds* globose, testa membranous.—Species 2 or 3; Eastern Asiatic and Californian.

H. cordata, *Thunb. Fl. Jap.* 234, t. 26; leaves cauline cordate, bracteoles minute. *Cas. DC. in Prodr.* xvi. 1. 238; *Poir. Encycl.* ii. t. 739; *Bot. Mag.* t. 2731; *Schnizl. Icon.* t. 82; *Roxb. Fl. Ind. Ed. Wall. & Carey*, i. 360. *Polypara cochinchinensis*, *Lour. Fl. Coch.* i. 78.

TROPICAL HIMALAYA; from Garwhal to Sikkim, alt. 1-5000 ft. ASSAM and KHASIA MTS., *Griffith, &c.* DISTRIB.—Siam, China, Japan.

Rootstock creeping; stem 1-3 ft., herbaceous, erect, leafy, subsimple, angular, pubescent at the nodes. *Leaves* $1\frac{1}{2}$ - $2\frac{1}{2}$ in. long and broad, very broadly ovate-cordate, acuminate, 5-nerved, abruptly narrowed into the petiole, glabrous or nerves pubescent beneath, gland-dotted; petiole 1-2 in., base sheathing; stipules long, linear-oblong, obtuse. *Bracts* $\frac{1}{2}$ - $\frac{1}{2}$ in., rounded or oblong. *Spike* $\frac{1}{2}$ in., elongating in fruit to 1-2 in., dense-fl'd. *Stamens* 3.

2. **PIPER**, *Linn.*

Shrubs, rarely herbs or trees, with swollen nodes, often glandular and aromatic. *Leaves* entire, often unequal-sided; stipules various. *Flowers* very minute, diœcious, very rarely 2-sexual, spiked, each in the axil of a bract with or without lateral bracteoles; bracts peltate, or cupular and adnate to the rachis, sometimes decurrent on the rachis with or without raised margins; bracteoles if present forming low ridges on each side of the flower,

or connate in a semilunar form. *Perianth* 0. *Stamens* 1-4, rarely more, filaments short; anthers 2-celled, cells often confluent by dehiscence. *Ovary* 1-celled; style conic beaked or 0, stigmas 2-5; ovule solitary, erect. *Berry* ovoid or globose. *Seed* usually globose, testa thin, albumen hard.—Species described about 500 (probably greatly exaggerated), all tropical or subtropical.

A most difficult genus, Herbarium materials for the analysis of which have never been intelligently collected, whilst the descriptions of the published species are quite inadequate for their accurate determination. Wallich's Herbarium, and the diagnoses in Vahl's "Enumeratio" and in Roxburgh's "Flora Indica" form the basis of the works of the only two authors who have attempted the revision of the Indian species, namely Miquel and Casimir De Candolle. Of these Wallich's specimens are so mixed that in some cases three or four species are included under one name and number, and even on one sheet; whilst of Vahl's diagnoses not one is sufficient to identify the plant he means, and of Roxburgh's only one or two species are recognizable. Wallich, it is true, often attaches to his specimens names given by Roxburgh, but these are rarely the names that are taken up in the "Flora Indica;" or if they are, they do not apply to the plants described in that work. The only considerable collections of Indian *Piperaceæ* made since Wallich's were distributed, are Wight's Peninsular, Griffith's Transgangetic Indian, and Thomson's and my own from Sikkim, Bengal, the Khasia Mts., &c. Wight published good figures of several, but confined himself to such as were named by Miquel and to the reproduction of a few of Roxburgh's unpublished *Icones*, procured from the Calcutta Botanic Gardens. Griffith's specimens were hurriedly collected, with no attempt to match the sexes, or the flowering with the fruiting specimens, for doing which his rapid journeys precluded the possibility. Unfortunately the Ceylon peppers were not thoroughly studied by either Gardner or Thwaites, the only two botanists who had opportunities for so doing previous to Dr. Trimen's incumbency of the Botanical Gardens, and who will doubtless elucidate them. In the process of attempting (with little success, I fear) to discriminate the Indian species for this work, and to unravel their intricate synonymy, I have been much impressed by the correctness of Miquel's views as to the ordination of the species, and the skill with which he has grouped them. When he undertook to monograph the Order, the materials were very bad, were in a chaotic state of confusion, and were so scattered in the British and Continental herbaria, that he could bring no two large collections under his eye at one time. Yet he traced the outlines of a good system, gave characters to a large proportion of well-defined species, and founded genera, which though now reduced to sections of one genus are for the most part natural groups. In the discrimination and elucidation of species he was too hasty by far. For the rest I must leave the further study of the Order to local botanists in the four great centres of its Indian distribution, namely its transgangetic provinces, the South Deccan, the Malayan Peninsula, and Ceylon; in each of which the species should be examined on the spot, with a view to matching the sexes, and flowering with fruiting specimens, and to observing the transition from young to old foliage, and the effects of locality and climate on the characters of each species.

Sect. I. **Muldera**. *Spikes* solitary. *Flowers* dicæious, the males sunk in a fleshy stipitate or sessile receptacle formed of the greatly enlarged bract (and bracteoles?). *Berries* sessile; stigmas sessile.—The female plants of this section are imperfectly known, and may possibly be confounded with others.

* *Receptacle of male fl. stipitate.*

1. **P. Schizonephros**, *Cas. DC. in Prodr.* xvi. 241; quite glabrous, leaves coriaceous elliptic-lanceolate acuminate 3-nerved at the very base, male spikes hoary, receptacles distant stipitate not recurved about 8-androus. *Schizonephros glaucescens*, *Griff. Notul.* iv. 383.

MALACCA; at Ching, *Griffith*.

Branches very slender, terete, stiff; nodes much thickened. *Leaves* 3-5 by 1-2 in., base unequal; petiole stout, $\frac{1}{2}$ - $\frac{1}{2}$ in. *Spikes* 6-7 in., very slender; receptacles reniform, about $\frac{1}{10}$ in. diam., tomentose within.—*Cas. DC.* unites with this a Javan plant in fruit which is named by Junghuhu *P. Cubeba*, possibly rightly; but the leaves are more narrowed at the tip and the spike is not hoary. I have altered the misprint "*Schizonephos*" to "*-nephros*," as in *Griffith's* mss., the derivation from *νεφρός* a kidney being obvious.

2. ***P. Maingayi***, *Hook. f.*; leaves thickly coriaceous elliptic-ovate or lanceolate acuminate 5-7-nerved quite glabrous, male spikes finely tomentose, receptacles stipitate not recurved 3-5-androus.

SINGAPORE and MALACCA. *Maingay*.

Branches stout. *Leaves* 4-5 by 2-2 $\frac{1}{2}$ in., nerves prominent on both surfaces, nervules obsolete; petiole $\frac{1}{2}$ - $\frac{1}{2}$ in. *Spikes* 1-2 in.; peduncle short. *Receptacles* of male peltate, $\frac{1}{10}$ in. diam.; of female minute, cupular. *Berry* about $\frac{1}{2}$ in. diam.—The leaf is like *P. firmum*, but the pubescent spikes very different.

3. ***P. galeatum***, *Cas. DC. in Prodr.* xvi. 242; quite glabrous, leaves thinly coriaceous elliptic-ovate or lanceolate finely acuminate 3-nerved from the very base, male spikes slender, receptacles distant stipitate recurved diandrous. *Muldera galeata* (in part), *Miquel in Hook. Lond. Journ. Bot.* v. 557. *M. Wightiana*, *Wight Ic. t.* 1943, right-hand figure only; *Miquel l. c.*

TRAVANCORE; at Courtallam, *Wight*.

Branches slender, nodes thickened. *Leaves* 3-5 by 1 $\frac{1}{2}$ -2 in., nervules distinct beneath; petiole $\frac{1}{2}$ - $\frac{1}{2}$ in. *Male spike* 6-10 in., quite glabrous; receptacles obliquely kidney-shaped, recurved, longer than the stipes, mouth very small.—*Miquel* describes female flowers, but I find none in *Wight's* Herbarium. Some authentically-named specimens in *Arnott's* Herbarium ticketed *M. Wightiana* are identical with *galeata*.

** *Receptacle of male spikes sessile or unknown.*

4. ***P. trichostachyon***, *Cas. DC. in Prodr.* xvi. 1. 242; glabrous, leaves elliptic-lanceolate acuminate moderately coriaceous with 3 basal nerves and 2 subopposite from the midrib above them, spike stout hoary, male receptacles sessile globose diandrous. *Muldera trichostachya*, *Miquel in Hook. Lond. Journ. Bot.* v. 556; *Wight Ic. t.* 1944.

DECCAN PENINSULA; The Concan and Canara, *Stocks, &c.*; Kandella, *Dalzell*. NILGHERRY and SHEVAGHERY HILLS, *Wight*.

Stem stout, woody; branches stout or slender. *Leaves* 5-6 by 1-2 in., 2nd pair of nerves often stronger than the first, nervules slender. *Spikes* stout, 3-4 in. *Receptacles* tomentose at the mouth. *Fruit* globose, $\frac{1}{2}$ in. diam.

5. ***P. pachyphyllum***, *Hook. f.*; glabrous, leaves shortly petioled very thickly coriaceous oblong or orbicular-obovate or elliptic acute or acuminate, nerves broad faint 2-3 pairs basal and one higher up, all lost above in the thick texture of the leaf, fruiting spike very stout, sunk in the fleshy rachis.

MALACCA, *Griffith*.

Leaves 4-6 by 2-4 in., probably fleshy, pale yellowish when dry, nerves obscure; petiole $\frac{1}{2}$ - $\frac{1}{2}$ in., very stout. *Fruiting spike* 2 $\frac{1}{2}$ in.; peduncle much longer than the petiole, very stout; rachis glabrous, bract and bracteoles forming a ring round the base of the smooth globose fruit.—I place this in *Muldera* from its resemblance to *P. Maingayi* in foliage, but which has a very different fruiting-spike. I have seen no male or female flowers.

Sect. II. **Cubeba**. *Spikes* solitary; flowers diœcious; bracts of female spikes peltate. *Fruit* contracted at the base into a pedicel.

* *Quite glabrous* (see also *P. caninum* var. *glabra*).

6. **P. ribesioides**, *Wall. Pl. As. Rar.* i. 79, t. 9, and *Cut.* 6637; quite glabrous, very robust, leaves 8–12 in. very coriaceous linear- or ovate-oblong acuminate base deeply cordate 5–9-nerved at the very base 3-nerved higher up, petiole 1–2 in., fruiting spike short stout, pedicel glabrous as long as the globose apiculate fruit. *Cas. DC. in Prodr.* 342. *Cubeba Wallichii*, *Miq. Syst. Pip.* 289, and *Ill. Pip.* 47, t. 46, 47.

TENASSERIM, *Helper, Falconer*. PENANG and SINGAPORE, *Wallich, Maingay*. BURMA; at Chappedong, *Wallich*.

A very stout climber; branches pale, as thick as a goose-quill, deeply furrowed when dry. *Leaves* variable, sometimes 5 in. broad, basal sinus 1–1½ in. deep, lobes rounded equal or not; nerves very strong beneath, nervules slender; petiole very stout; young leaves small, lanceolate, subsagittately cordate. *Spikes* 1–3 in.; bracts short coriaceous, rachis of spike stout rigid; bracteoles together semilunar. *Fruit* ½ in. diam.

7. **P. sumatranum**, *Cas. DC. in Prodr.* xvi. 1. 343; quite glabrous, very robust, leaves 8–12 in. very coriaceous oblong or linear-oblong acuminate 5–7-nerved at the very shortly cordate base and 3-nerved higher up, petiole 1–1½ in., fruiting spike 2–3 in. very stout, pedicel glabrous as long as the globose apiculate fruit is broad. *Cubeba sumatrana*, *Miq. Comm. Phyt.* 42, t. 5 a; *Syst. Pip.* 290, and in *Fl. Ind. Bat.* i. 2. 448, and *Suppl.* 186. *P. pedicellosum*, *Wall. Cat.* 6646 B?

TENASSERIM and ANDAMAN ISLANDS, *Helper*. PENANG, *Wallich*. SINGAPORE, *Maingay*.—DISTRIB. Sumatra.

Very closely allied to *P. ribesioides*, and perhaps only a state of that plant, which the fruit entirely resembles, but the leaves are narrower, more contracted at the base, with a very small short sinus. The male flowers are unknown in both. Possibly they are both large forms of *P. Cubeba*, L. fil.

8. **P. pedicellosum**, *Wall. Cat.* 6646 A; quite glabrous, robust, leaves 2–4 in. very coriaceous elliptic or ovate-cordate obtuse 5–7-nerved near the base, petiole ¼–½ in., fruiting spikes 1–1½ in. very stout, pedicel hoary as long as the subovoid obtuse fruit. *Cas. DC. in Prodr.* xvi. 1. 343. *Cubeba Neesii*, *Miq. Syst. Pip.* 292, and *Fl. Ind. Bat.* i. 2. 449.

SINGAPORE, *Wallich*.

This resembles *P. Cubeba*, Linn. f., but has hoary pedicels of the fruit. The smaller leaves, short petiole, and fruit, distinguish it from *P. ribesioides* & *sumatranum*.

9. **P. Griffithii**, *Cas. DC. in Seem. Journ. Bot.* 1866, 163, and in *Prodr.* xvi. 1. 343; quite glabrous, branches slender, leaves thinly coriaceous ovate or elliptic 3–5-nerved at the base and 3-nerved higher up, fruiting spikes 6–8 in., pedicels slender longer than the very small globose fruit.

ASSAM, *Masters, Griffith*.

Branches terete or obscurely furrowed when dry. *Leaves* 4–6 by 2–3½ in., base rounded or subacute; nerves very slender, nervules faint; petiole ¼–½ in. *Female spikes* slender; bracts obscure in fruit, cup-shaped, adnate to the glabrous rachis, bracteoles short. *Fruits* numerous, globose, ⅓ in. diam.

** *Leaves more or less pubescent beneath* (glabrous in vars. of *P. caninum*).

10. **P. caninum**, *Blume in Verh. Batav. Genoots.* xi. 214, f. 26, and *Enum. Pl. Jav. fasc.* 1. 72; hirsute pubescent or glabrate, branches slender terete, leaves petioled membranous ovate ovate-cordate or lanceolate acuminate rarely elliptic-lanceolate 3-5-nerved towards the base, male spikes slender, fruiting slender, fruit very small, pedicel sometimes very short. *Cas. DC. in Prodr.* xvi. 1. 341. *P. Cubeba*, *Vahl Enum.* i. 332; *Roxb. Fl. Ind.* i. 159; *Ed. Carey & Wall.* i. 161; *Wall. Cat.* 6645; *Nees Plant. Med.* t. 22. *Cubeba canina*, *Miq. Comm. Phyt.* 33, t. 3; *Syst. Pip.* 293, and *Fl. Ind. Bat.* i. 2. 449, and in *Ann. Mus. Lugd. Bat. fasc.* v. 137.

TENASSERIM (or Andaman Islands?), *Helper*. MALACCA, *Griffith*, *Maingay*. PENANG, *Wallich*.—DISTRIB. Malay Islands.

A rambling climber, more or less hirsute with flaccid hairs, rarely quite glabrous. *Leaves* 2-4 by $1\frac{1}{2}$ -2 in., usually broadest at the base which is rarely unequal-sided, nerves slender; petiole $\frac{1}{4}$ -1 in., slender. *Male spikes* 2-3 in.; bracts adnate by a broad base, stamens 2, anther-cells distinct. *Fruiting spike* $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; peduncle slender; bracts peltate, villous. *Fruit* $\frac{1}{8}$ in. diam., pedicel variable in length, always shorter than the fruit.

P. caninum proper; branches glabrate, except the younger, leaves glabrous above, finely pubescent beneath.

Var. glabra; leaves quite glabrous.—Tenasserim (or Andaman Islands), *Helper*.

Var. lanceolata; leaves elliptic-lanceolate finely acuminate very sparsely hairy beneath, pedicel of fruit very short. *P. Lonchites*, *Wall. Cat.* 6644 B, *in part* (the centre plant of the four on the sheet). Penang, *Wallich*.—*Wallich* tickets this *P. lanceolatum*, *Roxb.*, but *Roxburgh's* plant of that name is, I think, clearly *P. miniatum*.

Var. angustifolia, *Miq. mss.*; leaves smaller linear-lanceolate 2-2 $\frac{1}{2}$ by $\frac{1}{2}$ - $\frac{2}{3}$ in. nearly glabrous.—Malacca, *Maingay* (*Kew Distrib.* 1333/4).—This appears the same as *Zollinger's* No. 698 f. from Java, named *Cubeba canina* var. *angustifolia*, *Miq. Mant. Pip.*

Var. lanata; branches and leaves beneath hirsute. *P. lanatum*, *Roxb. Fl. Ind.* i. 159; *Ed. Carey & Wall.* i. 161; *Wall. Cat.* 6647; *Cas. DC. in Prodr.* xvi. 1. 341. *P. Lonchites*, *Wall. Cat.* 6644 A, *in part*. *P. Cubeba*, *Wall. Cat.* 6645 (not of *Linn. f.*). *P. javanicum*, *Cas. DC. l. c.* 343. *Cubeba lanata*, *Miq. Syst. Pip.* 298, and *Fl. Ind. Bat.* i. 2. 450. *C. Lowong* var. *quintuplinervis*, *Miq. l. c.* 298.—Penang, *Wallich*.

Var. ? Thwaitesii; branches glabrous, leaves ovate-lanceolate glabrous or sparsely pubescent beneath, fruiting spikes nearly glabrous, fruit very shortly pedicelled. *P. arcuatum*, *Thwaites Enum.* 293, *in part* (not of *Blume*). *P. arborescens*, *Thwaites l. c.* (not of *Roxb.*). *P. Thwaitesii*, *Cas. DC. l. c.* 357. *P. bantamense*, *Cas. DC. l. c.* 362 (the Ceylon plant only).—Ceylon, *Thwaites* (*C. P.* 35 *in part*, and 2178).

11. **P. muricatum**, *Blume in Verh. Batav. Nat. Genoots.* xi. 219, f. 1, and *Enum. Pl. Jav. fasc.* i. 68; branches stout hirsute or glabrate, leaves large membranous elliptic or elliptic-oblong acuminate 7-9-nerved sparsely hairy above tomentose beneath, female spike 5-6 in. stoutly pedicelled tomentose, rachis stout, bracts peltate, fruit sessile and pedicelled. *Miquel Syst. Pip.* 326; *Ill. Pip.* 55, t. 55, *in Hook. Lond. Journ. Bot.* iv. 438, and *Fl. Ind. Bat.* i. 2. 2454; *Cas. DC. in Prodr.* xv. 1. 341. *P. birmanicum* β . *macrostachyum*, *Cas. DC. l. c.* 338.

MALACCA, *Griffith*.—DISTRIB. Sumatra, Java, Borneo.

Stem evidently stout and soft; branches as thick as a goose-quill, roughly hairy. *Leaves* 6-9 by 3 $\frac{1}{2}$ -6 in., base rounded or subcordate rarely subacute, equal or unequal; petiole $\frac{1}{2}$ -3 in. *Spike* 1-2-sexual, erect or drooping; peduncle $\frac{1}{2}$ in.; bracts glabrous above, subsessile, orbicular. *Fruit* unripe on thick pedicels, many imperfect, the pedicel being truncate. "*Seed*, subglobose," *Miquel*.—The leaves are most variable in form and pubescence.

Var. *glabrata*; branches glabrous below, above hispid, as are the petioles peduncles and leaf-nerves beneath.—Mishmi Hills in Upper Assam, *Griffith*.

Sect. III. **Chavica**. Spikes solitary; flowers diœcious. Bracts orbicular, peltate. Fruit very small, in dense cylindric rarely globose spikes, sessile.

* Fruiting spikes much longer than broad. Stigma sessile.

† Leaves quite glabrous (see also 23. Hapnium) sometimes slightly pubescent in *P. sylvaticum*.

12. **P. longum**, Linn. *Sp. Pl.* 29; glabrous, branches soft angular and grooved when dry, lower leaves long-petioled ovate-cordate upper narrower oblong-cordate sessile amplexicaul, fruiting spikes short suberect. *Cas. DC. in Prodr.* xvi. 1. 355; *Vahl Enum.* i. 334; *Roxb. Fl. Ind.* i. 156, and *Ed. Carey & Wall.* i. 156; *Grah. Cat. Bomb. Pl.* 199; *Dalz. & Gibs. Bomb. Fl. Suppl.* 84; *Wall. Cat.* 6640; *Nees Med. Bot.* t. 23; *Woodv. Med. Bot.* iv. t. 247; *Bentl. & Trim. Med. Pl.* iii. t. 244. *P. sarmentosum*, Wall. *Cat.* 6641. *P. latifolium*, Hunter in *As. Research.* ix. 390. *Chavica Roxburghii*, *Miq. Syst. Pip.* 239, *Ill. Pip.* 35, t. 30, and *Fl. Ind. Bat.* i. 2. 440; *Hayne Arnz. Gewachs.* xiv. t. 20; *Wight Ic.* t. 1923. *C. sarmentosa*, *Miq. in Hook. Lond. Journ. Bot.* iv. 433, v. 531 (not of *Syst. Pip.*?).—*Rheede Hort. Mal.* vii. 27, t. 14.

Hotter provinces of India, from EAST NEPAL to ASSAM, the KHASIA MTS. and BENGAL, westward to BOMBAY, and southward to TRAVANCORE, CEYLON and MALACCA, wild or cultivated.—DISTRIB. Malay Islands.

Stems creeping below; "young shoots downy, branches prostrate or creeping with broad leaves, flowering shoots erect," *Roxb. Lower leaves* 2-3 in., often rounded-ovate, acuminate, 7-nerved, sinus rounded but narrow, basal lobes equal; petiole 1-3 in.; upper leaves much narrower, with often unequal basal lobes. Male spikes 1-3 in.; female $\frac{1}{2}$ - $\frac{3}{4}$ in. Fruit about $\frac{1}{10}$ in. diam.—The Malabar plant referred to *P. sarmentosum* by Miquel (*Lond. Journ. Bot.* l. c.), and a Malacca one so named by him, seem to me undistinguishable from *P. longum*, and I doubt *sarmentosum* being a distinct species. Of the Mergui *P. sarmentosum* (*Fl. Ind. Bat.*) I have seen no specimens. Wallich's *P. sarmentosum* (No. 6641) has broader upper leaves, and is perhaps the true plant. He is the authority for referring Hunter's *P. latifolium* to it.

13. **P. peepuloides**, *Roxb. Fl. Ind.* i. 159, and *Ed. Carey & Wall.* i. 158; glabrous, branches slender rigid terete often warted, leaves membranous shortly petioled very uniform oblong linear- or ovate-oblong caudate-acuminate, base rounded 3-5-nerved nearly to the tip, fruit minute. *Wall. Cat.* 6650 A. *P. brachystachyum*, *Wall. Cat.* 6656, in part. *Chavica peepuloides*, *Miq. Syst. Pip.* 237; *Cas. DC. in Prodr.* xvi. 1. 389. *C. Neesiana*, *Miq. l. c.* 249.

TROPICAL HIMALAYA; from Nepal, Wallich, to Bhotan, Griffith. ASSAM, SILHET and the KHASIA MTS., common, ascending to 3000 ft. CHITTAGONG, *J. D. H. & T. T.*

A slender bush, climbing below with free spreading slender branches. Leaves 2-5 by 1-2 in., variable in breadth, sometimes narrowed to a minutely cordate base; petiole of upper leaves $\frac{1}{2}$ - $\frac{1}{4}$ in., of lower rarely $\frac{1}{2}$ in. Male spikes slender, 2-3 in., clothed with peltate bracts; stamens 2-4; female $\frac{1}{2}$ - $\frac{3}{4}$ in., cylindric, longer than their peduncle. Fruit $\frac{1}{10}$ in. diam.—The branches are frequently warted as in *P. brachystachyum*, to which this is most closely allied.

14. **P. Chaba**, Hunter in *As. Research.* ix. 391 (not of Blume); quite glabrous, stem stout climbing and rooting, leaves very short-petioled rather

coriaceous oblong-ovate or lanceolate acuminate 3-5-nerved at the very obliquely cordate auricled base penninerved above it, fruiting spike stoutly peduncled suberect conico-cylindric. *Roxb. Fl. Ind.* i. 156, and *Ed. Carey & Wall.* i. 158. *P. maritimum*, *Blume Herb. Lugd. Bat.* *P. longum*, *Blume Verh. Bat. Genoots.* ix. 197, and *Enum. Pl. Jav.* i. 70 (*excl. various syn.*). *P. callosum*, *Opiz in Reliq. Hænk.* iii. 152. *P. officinarum*, *Cas. DC. in Prodr.* xvi. 356. *P. Arnottianum*, *Cas. DC. l. c. excl. syn.* *P. glabrum*, *Roxb. Ic. pict. ined.* *P. peepuloides*, *Wall. Cat.* 6650 E, F. *Chavica officinarum*, *Miq. Syst. Pip.* 256, *Ill. Pip.* 39, t. 34, and *Fl. Ind. Bat.* i. 2. 444; *Hayne Arnz. Gewachs.* xiv. t. 21. *C. maritima*, *Miq. Syst.* 262. *C. peepuloides*, *Wight Ic.* t. 1927 (*not of Roxb.*).—*Rumph. Herb. Amb.* v. 333, t. 116, f. 1.

Cultivated in various parts of INDIA and the Malay Islands.

Branches flexuous, terete, hard, finely striate when dry, pale. *Leaves* 5-7 by $2\frac{1}{2}$ - $3\frac{1}{2}$ in., rather shining above, pale when dry, base very variable, nerves 3-6 pair above the 3-5 basal; nervules arching; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Fruiting spikes* 1-2 in. long, $\frac{1}{2}$ in. diam., broadest at the base, obtuse, forming a fleshy cone of innumerable fruits $\frac{1}{4}$ in. diam.—The alternate nerves of the main portion of the leaf, all starting from the midrib, are very characteristic of this species. I have seen no certain male fl. Rumph's figure, quoted by Hunter, is very characteristic of the venation above the base, but it omits the basal nerves.

15. ***P. sylvaticum***, *Roxb. Fl. Ind.* i. 156, and *Ed. Carey & Wall.* i. 158; glabrous, stem flaccid creeping angular and furrowed when dry, leaves membranous long-petioled broadly ovate or ovate-cordate acuminate 5-7-nerved from the base or the inner pair higher inserted, upper leaves elliptic or oblong-lanceolate shorter petioled, male spikes 2-3 in. slender, fruiting female short erect $\frac{3}{4}$ -1 $\frac{1}{2}$ in., fruit free. *Cas. DC. in Prodr.* xvi. 1. 355; *Wall. Cat.* 6653 A, B. ? *P. Betle*, *Wall. Cat.* 6652 C. *P. Malamiri*, *Roxb. ex Wall. Cat.* 6642 A (*not of Roxb.*). *Chavica sylvatica*, *Miq. Syst. Pip.* 248; *Wight Ic.* t. 1930.—*Chavica*, No. 19, *Herb. Ind. Or. Hook. f. & T.*

Upper and lower ASSAM, *Masters, Griffith, &c.* Jheels of BENGAL, *J. D. H. & T. T.* (? NEPAL) and AVA, *Wallich.* TENASSERIM; at Mergui, *Griffith.*

A low creeping species; stems succulent, several feet long, contracting much in drying; branches short, erect, or ascending, flexuous. *Leaves* rarely puberulous on the nerves beneath, lower 3 by $2\frac{1}{2}$ -3 in., nerves slender; upper as long but narrower; petiole of lower 2-4 in. *Spikes* shortly peduncled; males as in *P. peepuloides*, but bracts larger; stamens generally 4 (*Roxburgh*, I find 2); anthers reniform, cells confluent, dehiscing over the crown, female always erect. *Fruit* $\frac{1}{2}$ - $\frac{1}{3}$ in. diam.—A very distinct species, something like *P. attenuatum* with more the habit of *P. longum*; it is probably not uncommon in marshy districts. It may be *Roxburgh's P. Malamiri*, as *Wallich's* ticket says; but the original of *P. Malamiris* of Linnæus (*Sp. Pl. Ed.* i. p. 29) consists of a mixture of plants, for which he cites the *Flora Zeylanica*, *Plukenet*, and the *Amalago* of *Rheede*, giving as the native country both the East and West Indies.

16. ***P. petiolatum***, *Hook. f.*; quite glabrous, branches stout, leaves large long-petioled thinly coriaceous rounded-ovate acuminate 7-nerved nervules arching, fruiting peduncle very short spike short cylindric. *Chavica petiolata*, *Cas. DC. in Prodr.* xvi. 1. 389 (*excl. the Khasian plant*).

UPPER ASSAM; Mishmi Hills, *Griffith.*

There are only 2 specimens, both in fruit; each consists of a stout branch 6 in. long and with 4 leaves, each 6 by 3 $\frac{1}{2}$ -5 in. with rounded bases, opaque above with the nerves obscure, the latter strong beneath, connected by the arching venules; fruiting spike 1-1 $\frac{1}{2}$ in.; fruit globose, $\frac{1}{4}$ in. diam., yellow.

17. **P. Betle**, Linn. *Sp. Pl.* 28; quite glabrous, or with the petioles puberulous, stem and branches stout climbing compressed when dry, leaves large coriaceous petioled obliquely ovate-oblong or rounded ovate-cordate 5-7-nerved, base often unequal, petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in., male spikes 3-6 in., female long-peduncled, fruiting stout 1-5 in. pendulous. *Hunter in As. Res.* ix. 390; *Vahl Enum.* i. 328; *Roxb. Fl. Ind.* i. 158, and *Ed. Carey & Wall.* i. 166; *Dalz. & Gibs. Bomb. Fl. Suppl.* 89; *Wall. Cat.* 6652 A; *Bot. Mag.* t. 3132; *Cas. DC. in Prodr.* xvi. 1. 359; *Burm. Fl. Ind.* 14, and *Fl. Zeyl.* t. 82, f. 2. *P. Siriboa*, Linn. *Sp. Pl.* 29; *Hunter l. c.* 391; *Vahl l. c.* 332. *P. Betle* var. *Siriboa*, *Cas. DC. l. c.* *P. peepuloides*, *Wall. Cat.* 6650 C. *P. Chavya*, *Ham.*; *Cas. DC. l. c.* *Chavica Betle*, *Miq. Syst. Pip.* 224, and *Fl. Ind. Bat.* i. 2. 439; *Wight Ic.* t. 2926. *C. Siriboa*, *Miq. l. c.* 228, in *Hook. Lond. Journ. Bot.* iv. 433, and in *Fl. Ind. Bat.* i. 1. 438; *Thwaites Enum.* 292. *C. Chuyva*, *Miq. Syst. Pip.* 267, and *Ill. Pip.* 42, t. 39.—*Rheede Hort. Mal.* vii. 29, t. 15.

Cultivated in the hotter and damper parts of INDIA and CEYLON, and in the Malay Islands.

Apparently a larger and stouter plant than the other species of this section, with more coriaceous usually broadly ovate leaves, sometimes 4-5 in. diam.; spikes longer and longer-peduncled; fruit $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., very fleshy and often confluent into a cylindric fleshy red mass. *P. Chuyva* and *Siriboa* are, I suppose, large-leaved cultivated forms; the latter is described as having pubescent young leaves, which I do not observe, though the petioles are sometimes, but not always, puberulous.

18. **P. miniatum**, *Blume in Verh. Bat. Genoots.* xi. 166, and *Enum. Pl. Jav. fasc.* i. 65; quite glabrous, branches rigid terete, nodes much swollen, leaves very shortly petioled large coriaceous elliptic-oblong or lanceolate caudate-acuminate 5-nerved from the very base, spikes very long erect most dense-flid., fruit very minute. *Cas. DC. in Prodr.* xvi. 1. 354. *P. auriculatum*, *Blume ll. c.* 171 and 66. *P. glandulosum*, *Opiz in Presl. Rel. Hænk.* 158. *P. arborescens*, *Wall. Cat.* 6648 A. *P. lanceolatum*, *Rorb. Fl. Ind.* i. 159. *P. Lonchites*, *Wall. Cat.* 6644 A, the two upper specimens only. *P. moluccanum*, *Spreng. Syst. Veg.* i. 112. *Chavica miniata*, macrostachya & ? lanceolata, *Miq. Syst. Pip.* 234 and 236, *Ill. Pip.* 32, 33, t. 28, 29, and *Fl. Ind. Bat.* i. 2. 440. ? *C. lanceolata*, *Miq. Syst. Pip.* 264, and *Fl. Ind. Bat.* i. 1. 445. *Cubeba macrostachya*, *Miq. Comm. Phyt.* 38.

MALACCA, *Griffith (Kew Distrib.* 1327). SINGAPORE, *Lobb.* PENANG, *Wallich.*—DISTRIB. Java, Banda, Philippines.

Branches as thick as a crow-quill, very hard and smooth. Leaves 3-7 by $1\frac{1}{2}$ -3 $\frac{1}{2}$ in., rigid, shining above, base nearly equal, nerves stout, nervules transverse; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. Spikes most dense-flid. of any Indian species; fruiting $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., tapering from the base; bracts minute, peltate, hairy; stamens 3. Fruit $\frac{1}{20}$ in., ellipsoid; stigmas 3.—Miquel describes a Sumatran variety with hairy shoots and nerves beneath. *llis C. lanceolata* is a very doubtful plant.

19. **P. bœhmeriæfolium**, *Wall. Cat.* 6654 A; tall, quite glabrous, branches subterete when dry, often warted, leaves membranous very shortly petioled or the upper sessile obliquely oblong or linear-oblong acuminate often narrowed at the very unequal almost auricled base 5-7-nerved, nerves distant, male and female spikes 3-6 in., peduncles slender much longer than the petioles. *Cas. DC. in Prodr.* xvi. 1. 348. *Chavica bœhmeriæfolia*, *Miq. Syst. Pip.* 265, and *Ill. Pip.* 41, t. 37.

TROPICAL EASTERN HIMALAYA; Sikkim, ascending to 5000 ft., *J. D. H. Bhotan, Griffith.* ASSAM, SILHET and the KHASIA MTS., *Wallich, &c.* PEGU, *Kurz.* TENASSERIM, *Parish.*—DISTRIB. Ava.

Branches not stout, rather soft. Leaves very variable, in the typical form

(Wallich's) 6-7 by $1\frac{1}{2}$ -2 $\frac{1}{2}$ in., broadest above the middle with narrow unequal 'sides; in some Khasian specimens much broader and larger, 8-9 by $5\frac{1}{2}$ in.; in Sikkim and Bhotan ones much smaller and more symmetrical, 3-3 $\frac{1}{2}$ by 2-3 in.; petiole rarely $\frac{1}{2}$ in. *Spikes* flexuous; bracts of male pedicelled, the pedicel sometimes elongate; anthers 2 sessile 2-celled. *Fruit* $\frac{1}{8}$ in. diam.—The long peduncles at once distinguish this from *P. peepuloides*, which is included with it under Wallich's No. 6654.

20. ***P. pothiforme***, *Wall. ex Cas. DC. in Prodr.* xvi. 1. 351; tall, quite glabrous, leaves membranous petioled 7-9 by 3 in. linear-oblong acuminate base oblique cordate, nerves 5 of which 3 run to the tip, fruiting spike 3 in., rachis and fruits coalescing into a fleshy cylindric mass 1 in. diam. *P. pothoides*, *Wall. Cat.* 6639 B?

BURMA; at Chappedong, *Wallich*.

Habit of the large forms of *P. bæhmeriaefolium*, but the petioles are longer and the fruiting spike very different. Wallich's specimen is the only one known.

†† *Leaves more or less pubescent.* (See also 15. *sylvaticum*.)

21. ***P. anisotis***, *Hook. f.*; branches densely shortly tomentose, leaves membranous subsessile obliquely oblong acuminate from a very unequal auricled base 5-7 nerved from the very base, sparsely hairy above beneath rusty tomentose on the veins especially, fruiting spikes $\frac{1}{2}$ in.

UPPER ASSAM; Thaumathaya, in the Mishmi Hills, *Griffith*.

Habit of the branches of *P. longum*, but the leaves are more unequal-sided and more cordate. *Leaves* 3-5 by $1\frac{1}{2}$ -2 in., very thin, finely acuminate, nerves slender, nervules transverse. *Fruiting spikes* cylindric, like those of *P. peepuloides*; peduncle hispidly hairy, slender; bracts minute, peltate. *Fruit* about $\frac{1}{8}$ in. diam.

22. ***P. aurantiacum***, *Wall. Cat.* 6658 A; stems climbing and rooting glabrous, leaves all petioled coriaceous ovate elliptic- or orbicular-ovate caudate-acuminate 5-nerved hairy or glabrate beneath base rounded or acute, spikes $1\frac{1}{2}$ -3 in., stigmas very minute, young fruit angular ripe globose. *Cas. DC. in Prodr.* xvi. 1. 357. *Chavica Wallichii*, *Miq. Syst. Pip.* 254, and *Ill. Pip.* 38, t. 33, and *Fl. Ind. Bat.* i. 2. 143.

NEPAL; at Sheopore, *Wallich*. ASSAM, from Suddya and elsewhere, *Griffith*.

A rather stout climber, of a yellowish colour when dry; branches not hard or woody, glabrous. *Leaves* or young trailing shoots with petioles 2-3 in. long; leaves on the main stem and branches 3-4 in. long, with petioles $\frac{3}{4}$ -1 in., upper surface almost shining; nerves very slender above, strong beneath; nervules indistinct on both surfaces. *Spikes* drooping, peduncle of both sexes about as long as the petioles; flowers densely crowded; bracts peltate, quite glabrous; stamens 2, anthers reniform, cells confluent dehiscing across the tip; fruiting spikes variable in length. *Fruit* distinctly pyramidal when young and dry, when ripe about $\frac{1}{2}$ in. diam., not so crowded as usual in the section from many not ripening. It is curious that this very distinct species has not been collected in Sikkim or Bhotan.

23. ***P. Hapnium***, *Ham. in Wall. Cat.* 6650 D; climbing, branches stout rooting warted below, leaves petioled rugose oblong or oblong-lanceolate acuminate 7-nerved above the base nerves beneath pubescent or glabrate, base very unequal auricled on one side, peduncles longer than the leaves, fem. spikes short cylindric. *P. Siriboa*, *Herb. Heyne in Wall. Cat.* 6651 B. *P. nigrum*, 6643 C, the centre specimen only. *Chavica Arnotiana*, *Miq. Syst. Pip.* 268, and *Ill. Pip.* 43, t. 40 (not *P. Arnottianum*, *Cas. DC.*).

TRAVANCORE, *Heyne*; Courtallam, *Wight*. "Phuranbari," *Hamilton*.

Branches hoary; warts minute. *Leaves* 3-4 by $1\frac{1}{2}$ -2 in., the older ones very

rugosely reticulated, basal auricle sometimes incurved and overlapping the petiole, at others absent, nerves impressed above; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., slender. *Female spike* young, $\frac{3}{4}$ in. long; peduncle as long hoary.—An obscure but very distinct plant, of which the specimens are insufficient. Miquel unites with it Wallich's 6651 A (P. Chuvya, Hunter?), which is a Siam plant collected by Finlayson and is quite different, having glabrous leaves; it is in too imperfect a state for determination. Cas. De Candolle quotes *Chavica Arnottiana*, Miquel, and Wall. Cat. 6651 A, B, under his *P. Arnottianum*, but describes from Wall. Cat. 6650 E, F, which are unquestionably *P. Chaba*. I do not know where Phuranbari, Hamilton's habitat, is

** Fruiting spikes globose. Stigmas sessile.

24. **P. brachystachyum**, Wall. Cat. 6656, *in part*; quite glabrous, branches slender rigid lower warted, leaves petioled thinly coriaceous elliptic-lanceolate or -ovate obtusely caudate-acuminate 5-nerved, base acute, fruiting spike globose very shortly peduncled. *P. vasculosum*, Wall. Cat. 6660. *P. Mullesua* & Guigual, *Don Prodr.* 20; *Cas. DC. in Prodr.* xvi. 1. 338, 339. *Chavica sphærostachya*, *Miq. Syst. Pip.* 279, *Ill. Pip.* 44, t. 42, 43, *in Hook. Lond. Journ. Bot.* v. 551, and *Fl. Ind. Bat.* i. 2. 446, t. 27 B, *excl. var. β*; *Cas. DC. in Prodr.* xvi. 1. 388; *Wight Ic.* t. 1931. *C. Mullesua* & Guigual, *Miq. Syst. Pip.* 280.

SUBTROPICAL HIMALAYA; from Simla to Bhotan, alt. 2–5000 ft. KHASIA MTS., alt. 3–5000 ft. NILGHIRI HILLS, alt. 5000 ft., *Noton*, &c.

A much-branched twiggy shrub, 5–6 ft. high; branches terete, woody. *Leaves* membranous, rarely coriaceous, 3–7 by 1–3 $\frac{1}{2}$ in., nerves strong beneath, nervules transverse; petiole slender, $\frac{1}{4}$ – $\frac{1}{2}$ in.; young leaves in Kumaon specimens are rounded-cordate. *Male spikes* only seen on Nilghiri specimens, 2–3 in., slender, drooping; bracts minute, peltate; stamens 2; anthers reniform, cells confluent, dehiscing across the tip. *Female spikes* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., rachis pubescent. *Fruit* $\frac{1}{10}$ in. diam.; stigmas 3, very minute.—Only to be distinguished from *P. peepuloides* by the globose fruiting spikes, having like it the frequently warted branches. Amongst a host of specimens I have not one collected as male in the Himalaya, and suspect that the males are mixed up with those of *P. peepuloides*, *hasianum* and *nepalense*, which are often undistinguishable in young foliage.

Var. rhombica; leaves more coriaceous rhombic-ovate 7-nerved, fruiting spikes larger, $\frac{1}{2}$ – $\frac{3}{4}$ in. diam.—Assam, mouth of the Now Dihong River, *Griffith*.

25. **P. Thomsoni**, *Hook. f.*; scandent, quite glabrous, branches stout herbaceous, leaves long-petioled ovate-oblong, or -lanceolate acuminate 5-nerved at the rounded or cordate often oblique base, fruiting spike shorter than its peduncle subglobose. *Chavica Thomsoni*, *Cas. DC. in Prodr.* xvi. 1. 389. *C. petiolata*, *Cas. DC. l. c.*, the *Khasian specimen*.—*Chavica* No. 18, *Herb. Ind. Or. H. f. & T.*

SIKKIM HIMALAYA, alt. 7000 ft., *Treutler*. KHASIA MTS., alt. 3–4000 ft., *J. D. H. & T. T. Cachar*, *Keenan*.

Branches as thick as a crow-quill and more, rooting at the nodes, not woody, black when dry. *Leaves* 4–7 by 2 $\frac{1}{2}$ –3 $\frac{1}{2}$ in., thick, nervules indistinct; petiole 1–2 $\frac{1}{2}$ in. *Male spikes* 1–2 in., bracts peltate. *Fruiting spikes* very young, $\frac{1}{2}$ in.—A very distinct-looking species, I think, but hardly in condition for description; the fruiting spikes are too young to judge of their mature form.

*** Fruiting spike long or short. Ovary produced into a distinct style. RHYNCHOLEPIS, *Miq.*

26. **P. rostratum**, *Roxb. Fl. Ind.* i. 160, and *Ed. Carey & Wall.* i. 163; stem erect, branches petioled leaves beneath and peduncles roughly tomentose, leaves large membranous shortly petioled oblong orbicular or somewhat

fiddle-shaped acuminate 7-nerved at the rounded or cordate often unequal base, peduncle short, fruiting spikes short cylindric, style elongate. *Cas. DC. in Prodr.* xvi. 1. 377; *Miq. Syst. Pip.* 284, and *Fl. Ind. Bat.* i. 2. 447. *P. stylosum*, *Miq. in Ann. Mus. Bot. Lugd. Bat.* i. fasc. 5, 139; *Cas. DC. l. c.* 344. *P. birmanicum*, *Cas. DC. l. c.* 338, *excl. var. β.* *Rhyncholepis*? *Roxburghii*, *Miq. Syst. Pip.* 284, and *Fl. Ind. Bat.* i. 2. 447.

MALACCA, *Griffith*. SINGAPORE, *Maingay*.—DISTRIB. Sumatra.

Stem 18 in. from a creeping stock, rusty-tomentose, suberect, dichotomously branched, lower nodes thickened. *Leaves* 5–7 by 2–4 in., base usually narrowed, glabrous or puberulous above, nerves slender; petiole stout, $\frac{3}{8}$ – $\frac{1}{2}$ in. *Male spikes* not seen. *Fruiting spikes* $\frac{1}{2}$ –1 in. long; peduncle very short; bracts orbicular. *Fruit* globose, $\frac{3}{8}$ – $\frac{1}{2}$ in. diam.; style very variable in length, as long as the fruit or shorter.—I have not seen authentic specimens of Roxburgh's *P. rostratum*, but there seems no reason to doubt that Miquel's *P. stylosum* is the same.

27. ***P. penangense***, *Cas. DC. in Prodr.* xvi. 1. 353; erect, quite glabrous, branches terete, leaves petioled membranous oblong or ovate-lanceolate caudate-acuminate 5-nerved, base acute or subacute, peduncle equalling the very short fruiting-spike, style elongate. *P. Lonchites*, *Wall. Cat.* 6644 B, in *Herb. Hook. only*. *Chavica penangensis*, *Miq. Syst. Pip.* 279, and *Ill. Pip.* 45, t. 44 (not *Miq. in Hook. Lond. Journ. Bot.*).

PENANG, *Wallich*. SINGAPORE? *Lobb*.

A shrub; branches hard, smooth. *Leaves* 3–5 by $1\frac{1}{2}$ –2 in., nerves slender, alternate, bases rather distant; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Female spikes* $\frac{1}{2}$ in. or less, peduncle slender; bracts peltate. *Fruits* few $\frac{1}{10}$ – $\frac{1}{8}$ in. diam. globose, styles slender equalling their diameter.—Miquel cites *Wall. Cat.* 6642 B for this, no doubt a mistake for 6644 B, which, however, he must have taken from the Hookerian Herbarium, as there is no specimen at all of this species in the Linnean Society's, where 6642 B is *P. attenuatum*.

Sect. IV. ***Pseudochavica***. *Spikes* solitary; flowers diœcious. *Fruits* forming a loose interrupted spike, usually much larger than in Sect. *Chavica*; fruits and stigmas sessile. *Bracts* peltate, orbicular, margins free all round.

28. ***P. Hamiltonii***, *Cas. DC. in Prodr.* xvi. 1. 359, *in part*; quite glabrous, shrubby, branches finely striate, leaves petioled coriaceous elliptic or almost rounded obtuse or subacute 5–7-nerved from above the base, bracts orbicular ciliate, fruiting spikes slender, fruit ovoid. *P. plantagineum*, *Herb. Ham. in Wall. Cat.* 6659 A, B *in part*. *P. Betle*, *Wall. Cat.* 6652 B, *the two left-hand specimens only*; *Cas. DC. l. c.* p. 359, *in part*; *Miq. Syst. Pip.* 229, *in part*.

SIKKIM TERAI, J. D. H. ASSAM, *Simons*. SILHET and KHASIA MTS., *Wallich*, &c. CHITTAGONG; at Seetakoond, J. D. H. & T. T.

Stem stout, flexuous, scandent and rooting below; branches subterete or angular. *Leaves* remarkably uniform, 2–3 by 1–2 $\frac{1}{2}$ in., pale when dry, nerves strong, nervules transverse, base nearly equal, never cordate; petiole $\frac{1}{2}$ –1 in. *Male spikes* slender, $1\frac{1}{2}$ –3 in.; flowers 2–3-androus. *Fruiting spikes* 4–6 in., flexuous; peduncle $\frac{1}{2}$ in., slender; rachis glabrous, except the ciliate pits.—This is one of the most constant of Indian species in the form of the leaf. The name *P. plantagineum*, Hamilton, has been overlooked by Miquel and *Cas. DC.*, though the type of Wallich's No. 6659. *Cas. DC.* has described with *P. Hamiltonii* Wallich's 6659 C (misprinted G), which is a very different plant, with caudate-acuminate leaves, and is referred by Miquel (*Syst.* 225) to *Chavica Siriboa*. It is, I think, neither *Hamiltonii* nor *Siriboa*, and is in too young a condition of flowering to determine.

29. ***P. Hookeri***, *Miq. in Hook. Lond. Journ. Bot.* iv. 437; shrubby,

branchlets petioles peduncles and leaves beneath sparsely hirsute, leaves petioled rather coriaceous ovate ovate-oblong or -lanceolate obtusely acuminate 5-7-nerved from the rounded or subcordate equal or oblique base, spikes long slender, bracts orbicular. *Cas. DC. in Prodr.* xvi. 1. 366; *Dalz. & Gibs. Bomb. Fl.* 115.

The CONCAN and CANARA; Mahableshwar and Bababoodan Hills, *Law, Cleg-horn, &c.*

Branches stout, terete, angled when dry. *Leaves* 3-5 by $1\frac{1}{2}$ -2½ in., brownish when dry, glabrous above, nerves beneath slender, nervules transverse; petiole $\frac{1}{4}$ -¾ in. *Male spikes* 3-6 in., flexuous, peduncle equalling the petiole; bracts glabrous; stamens 2. *Fruiting spikes* 3-6 in.; bracts sometimes adnate below and shortly decurrent; scar glabrous within.—A distinct species, but the fruiting spikes are immature, and the bracts being sometimes decurrent, it should perhaps be removed to *Sect. Eupiper*.

30. **P. Schmidtii**, *Hook. f.*; shrubby, quite glabrous, branches woody terete, leaves petioled very coriaceous ovate-oblong or -lanceolate acuminate 5-nerved from above the base, nerves alternate, base rounded or acute strongly reticulated on both surfaces, peduncles longer than the petioles, male spikes 4-6 in., female shorter fruiting with a very thick flexuous rachis, fruit globose or ovoid, bracts orbicular. *P. arborescens, in part, Miq. Syst. Pip.* 320; *Wight Ic. t.* 1940, *right-hand figure*; *Cas. DC. in DC. Prodr.* xvi. 1. 359, *the Nilghiri plant only*. *P. nigrum, Wall. Cat.* 6643 D, *the lower specimen only*. ? *P. arcuatum, γ. quintuplinervium, Cas. DC. l. c.* 360.

NILGHIRI MTS., *Schmidt, Wight, &c.*

A large shrub, clothing trunks of trees; branches usually drying black. *Leaves* 3-4 by 1-2 in., drying brown; nerves beneath very stout, sometimes whitish beneath, margin often recurved; petiole stout, $\frac{1}{2}$ in. *Male spikes* stout, peduncle twice as long as the petiole; female stout, very dense-fld. *Fruiting spike* variable, often tortuous, rachis usually very thick.—*Fruit* in some very fleshy and described by Wight as oblong, in others less fleshy and quite globose.—I cannot imagine this to be what Roxburgh intended as the Moluccan *P. arborescens*, and of which he says the peduncles are about as long as the petioles, and which Miquel describes as having puberulous nervules beneath, and short male spikes. The Ceylon plant (*C. P.* 2461), referred to by Thwaites and *Cas. DC.* as *P. arborescens*, is *P. argyrophyllum*. Wallich's 6643 E from Penang, referred by Miquel both to *P. arborescens* (*Syst. Pip.* 320) and to *P. attenuatum* (p. 307), is *P. phyrophyllum*.

31. **P. nepalense**, *Miq. Syst. Pip.* 318; shrubby, quite glabrous, leaves petioled membranous or thinly coriaceous elliptic-ovate or -oblong or -lanceolate more or less caudate-acuminate 5-7-nerved above the equal or oblique acute or rounded base, male spikes long slender, fruiting spike long or short, rachis densely tomentose, bracts orbicular, fruit ovoid sessile granulate. *Cas. DC. in Prodr.* xvi. 1. 357. *P. peepuloides, Wall. Cat.* 6650 B.—*Piper* Nos. 5 and 20 (*for the most part*), *Herb. Ind. Or. H. f. & T.*

SUBTROPICAL HIMALAYA, alt. 3-5000 ft., from Garwhal, *Edgeworth*, to Bhotan and Mishmi, *Griffith*. KHASIA MTS., alt. 3-5000 ft., *Griffith, &c.*

Branches slender. *Leaves* very variable, 3-5 by 1-3 in., base rarely rounded or cordate; petiole $\frac{1}{2}$ -¾ in. *Spikes* 2-7 in.; bracts sessile. *Fruiting spikes* often 6 in., puberulous, straight or flexuous. *Fruit* $\frac{1}{2}$ in. long, pointed.—The commonest Himalayan and Khasian species. No. 20 *Herb. H. f. & T.* appears to be a form with broader and more coriaceous leaves, for the flowers and fruit afford no character.

32. **P. khasianum**, *Cas. DC. in Prodr.* xvi. 349, *in part*; glabrous or peduncles and petioles sparsely pubescent, leaves petioled membranous lanceolate or oblong-lanceolate caudate-acuminate 5-nerved above the equal

acute or rounded base, peduncle longer than the petiole, fruiting spike short, rachis tomentose, bracts orbicular, fruit small globose obscurely pedicelled.

NEPAL? *Wallich*. SIKKIM HIMALAYA, alt. 2-6000 ft., *Clarke*. UPPER ASSAM, *Griffith*. KHASIA MTS., alt. 3-5000 ft., *J. D. H. & T. T.*

It is difficult without the fruit to distinguish this from *P. nepalense*; the leaves are never so large, not exceeding 5 in., and are narrower with much longer often falcately curved points. The spikes are never more than $1\frac{1}{2}$ in., and the small fruits are only $\frac{1}{2}$ - $\frac{1}{4}$ in. diam.—I find no specimen of this in Wallich's Herbarium, but good ones in Herb. Hook. received from him. I have retained the name of *khasianum*, though the description in the Prodrômus is drawn up in part from *P. Hamiltonii* and from *P. nepalense*, whence the fruit is described as ovoid.

33. **P. Lonchites**, *Roem. & Sch. Syst. i. Mant.* 241; quite glabrous, branches woody terete, nodes much enlarged, leaves shortly petioled thinly coriaceous elliptic- or oblong-lanceolate subacute 3-5-nerved from near the base, peduncles longer than the petioles, male spikes $\frac{1}{2}$ -1 in., fruiting females 1-2 in. flexuous, rachis tomentose, bracts orbicular. *Miq. Syst. Pip.* 331, *Ill. Pip.* 56, t. 57, and *Fl. Ind. Bat. i.* 2. 454; *Wall. Cat.* 6644 B, the left-hand and lower right-hand specimens. *Chavica penangensis*, *Miq. in Hook. Lond. Journ. Bot.* iv. 433 (not of *Syst. Pip.*).

PENANG, *Porter, Wallich*.

Branches rigid, internodes short. Leaves very uniform, $2\frac{1}{2}$ -3 by $1-1\frac{1}{4}$ in., subacute at both ends, tip not at all caudate, nervules reticulate, uppermost oblique and subauricled at the base; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. Male spikes uniformly short; bracts ciliate; female much longer. Fruits unripe, sessile, ovoid.—A very distinct species, the authorship of which is attributed in the Prodrômus to Miquel, and no allusion made to Roemer and Schultes, who profess to have described from Wallich's No. 6644 B, quoting "*P. lanceolatum* Roxb." which is inscribed on one of Wallich's tickets. As, however, there are 3 species on the sheet of 6644 B, it is doubtful to which Roemer and Schultes refer.

Sect. V. **Eupiper**. Spikes solitary; flowers diœcious, rarely polygamous. Fruits forming loosely interrupted spikes usually larger than in Sect. *Chavica*; fruits and stigmas sessile. Bracts and bracteoles either wholly adnate to the rachis or with raised membranous margins.

* Bracts of the female spike forming (when dry) a short hemispheric cup under the ovary, margins not or very slightly raised; bracteoles forming a semilunar ridge above the ovary.

34. **P. nigrum**, *Linn. Sp. Pl.* 28; quite glabrous, stem stout climbing and rooting terete, leaves petioled coriaceous usually broadly ovate oblong or nearly orbicular base usually rounded and oblique 5-9-nerved above the base, nerves strong alternate, peduncles longer or shorter than the petioles, flowers often polygamous, bracts of female short cupular wholly adnate without raised margins, fruit globose. *Vahl Enum. i.* 329; *Roxb. Fl. Ind. i.* 150, and *Ed. Carey & Wall. i.* 153; *Hunter in As. Research.* ix. 383; *Burm. Fl. Ind.* 13; *Blume in Verh. Bat. Genoots.* xi. 191, f. 11-17; *Wall. Cat.* 6643 A, B, C in part, D in part; *Miq. Syst. Pip.* 308, *Ill. Pip.* 50, t. 50, in *Hook. Lond. Journ. Bot.* v. 552, and *Fl. Ind. Bat. i.* 2. 451; *Cas. DC. in Prodr.* xvi. 1. 363; *Marsden Sumatr.* t. 1; *Bot. Mag.* t. 3139; *Hayne Arnz. Gewachs.* xiv. t. 6; *Nees Pl. Med.* t. 21; *Woodv. Med. Bot.* iv. t. 246; *Bentl. & Trim. Med. Pl.* t. 245; *Dict. Sc. Nat.* t. 291; *Spach Suites Buff.* t. 125. *P. trioicum*, *Roxb. ll. c.*; *Miquel Syst.* 310, and in *Hook. Journ.* iv. 438, v. 552; *Wight Ic.* t. 1935. *P. nigrum var. trioicum*, *Cas. DC. l. c.* *P. malabarens* and *P. baccatum* (the Indian synonyms only), *Cas.*

DC. l. c. 242. Muldera multinervis & Wightiana, Miq. in Hook. Lond. Journ. Bot. v. 557-8.—Rheed. Hort. Mal. vii. 23, t. 12.

Native in the forests of the CIRCARS and ? of ASSAM and MALABAR; cultivated in hot damp parts of India, Ceylon and the tropics generally.

Branches stout, trailing and rooting at the nodes. *Leaves* 5-7 by 2-5 in., most variable in breadth, sometimes glaucous beneath; base acute rounded or cordate, equal or unequal; nerves stout, 2-3 pairs basal, with another pair higher up which run to the tip; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in., stout. *Flowers* usually diœcious, but often the female bears 2 anthers, or the male a pistillode; anthers 2-celled. *Fruiting spikes* very variable in length and robustness, rachis glabrous. *Fruit* globose, sessile, red, pulp thin.—The distinctions, if any, between the wild and cultivated black Peppers (*P. nigrum* and *trioicum*) want careful study, from fresh specimens. Roxburgh, who first distinguished them, gives no other character than that the leaves of *P. trioicum* are glaucous beneath. Miquel, who retained both species in his *Systema*, observes that *P. trioicum* has less coriaceous narrower more lanceolate leaves, less white beneath, and in the Fl. Ind. Bat. he simply refers to *trioicum* as perhaps the wild form of *nigrum*. Clarke has collected in the Khasia (at Amwee, alt. 3000 ft.) a membranous-leaved pepper otherwise like *P. nigrum* with young female spikes. I have examined authentic specimens of *Muldera Wightiana* and *multinervis* in Arnott's Herbarium, and do not see how they differ from *P. nigrum*; those of *M. Wightiana* are in male flower only. The transversely dehiscing female receptacle of *M. multinervis* described by Miquel seems to me to be formed of the ordinary bracts and bracteoles of *P. nigrum*. I however advance this with hesitation, for our knowledge of the specific limits of *P. nigrum* are as vague as of its geographical.

35. **P. zeylanicum**, *Miq. in Lond. Journ. Bot. iv. 436*; quite glabrous, branches terete stout woody, nodes much thickened, leaves small long-petioled coriaceous broadly ovate or ovate-cordate acuminate 3-5-nerved from the base, nerves and nervules impressed above very prominent beneath, peduncles longer than the petioles, fruiting spikes short robust, bracts adnate tips raised in fruit, fruit globose smooth densely crowded. *Cas. DC. in Prodr. xvi. 1. 366. P. arcuatum, Thwaites Enum. 293, in part (C. P. 2177).*

CEYLON; in the higher parts of the central province, *Walker, &c.*

Dark brown when dry, much branched. *Leaves* 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ by 1-1 $\frac{1}{2}$ in., paler beneath, often bullate above, base usually equal; petiole $\frac{1}{2}$ -1 in. *Male spikes* 1-1 $\frac{1}{2}$ in.; bracts closely imbricate, the lowest sometimes oblong and peltate; stamens 2, filaments very broad. *Fruiting spikes* 1-1 $\frac{1}{2}$ in., flexuous.—A very distinct-looking species. I do not find the filaments to be margined beneath the anthers as described by Miquel. The *forma major* of that author, from the Deccan (Mayabam, Sir F. Adam), is a very doubtful plant, in fact indeterminable.

36. **P. trineuron**, *Miq. in Hook. Lond. Journ. v. 555*; quite glabrous, branches slender rigid, leaves thin elliptic-lanceolate subacute or acuminate 3-nerved nearly to the tip, peduncles longer than the petioles, male spikes slender shorter than the leaves, male and female bracts closely adnate to the rachis, stamens 2, fruits distant globose quite smooth. *Cas. DC. in Prodr. xvi. 362. P. insulare & ceylanicum, Cas. DC. l. c. 242. Muldera diandra, Thwaites Enum. 428 (omitted in DC. Prodr.).*

CEYLON, in damp forests in the south of the island, *Walker, Thwaites.*

Branches slender, black, nodes much enlarged. *Leaves* 3-5 by $\frac{3}{4}$ -1 $\frac{1}{2}$ in., base acute; principal nerves 1-2 pair, slender; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Male spikes* 2-3 in.; bracts semicircular, rather distant. *Fruiting spike* rigid; bracts forming a thick cup; rachis black, naked between the fruits.—This is certainly not a *Muldera*, though it resembles *P. arcuatum*, Blume, of Java.

37. **P. leptonema**, *Hook. f.*; quite glabrous, branches terete firm,

nodes much enlarged, leaves petioled thinly coriaceous broadly elliptic or rounded abruptly acuminate, 5-nerved from near the rounded rarely subcordate base, peduncles slender longer than the petioles, female spikes very slender longer than the leaves, flowers very minute in separate whorls. *P. Lonchites*, *Wall. Cat.* 6644 B, *the right-hand upper specimen only*.

PENANG, *Wallich, Maingay*.—DISTRIB. JAVA (*Zollinger*, 3771/8).

Apparently shrubby. *Leaves* very symmetrical for the genus, dull brown when dry, 3–4 by 2–3 in., nerves slender, nervules distinct on both surfaces; petiole slender, $\frac{1}{2}$ in. *Female spikes* alone seen; flowers sometimes in a broken spiral, but usually in distinct whorls; bracts cupular, confluent below with the slender quite glabrous rachis. *Fruit* $\frac{1}{2}$ in. long, ellipsoid, with a very short style when dry.—A very distinct species, which Miquel appears to have overlooked in Wallich's Herbarium, where the only specimen is fastened on a sheet with two other species (*P. caninum* and *Lonchites*). In the Hookerian Herbarium he has named it "a *P. acre*, Bl., vix diversum;"—it differs from *P. acre* totally in the bracts and flowers.

** *Bracts of the female spike adnate to the rachis with decurrent raised more or less membranous margins which are confluent with the bracteoles on either side of the ovary.* (The species of this group are involved, and I have failed in the attempt to dissociate Nos. 40 to 43.)

38. ***P. rhytidocarpum***, *Hook. f.*; a stout quite glabrous climber, leaves long-petioled large coriaceous elliptic ovate oblong or orbicular acuminate not glaucous beneath 3–5-nerved above the rounded acute or cordate base, spikes very long, fruiting females 8–12 in., bracts with slightly raised margins, fruit granulate (when dry). *P. aurantiacum*, *Wall. Cat.* 6658 B. *P. nigrum*, *var. macrostachyum*, *Cas. DC. in Prodr.* xvi. l. 363.

ASSAM, SILHET and the KHASIA MTS., ascending to 4000 ft., common, *Wallich, Griffith, &c.* CHITTAGONG, *J. D. H. & T. T.*

Habit and foliage of *P. nigrum*, but distinguished by the long petioles, often 2 in. long, larger leaves, attaining 7 in. in breadth, very long spikes, raised margins of the bracts and granulate fruit.—Miquel has named a specimen without fruit in *Herb. Hook.* as *P. trioicum*? and alludes to it in *Syst. Pip.* (314, parag. 3).

39. ***P. attenuatum***, *Ham. in Wall. Cat.* 6642 B, C, D *in part*; branches soft compressed angled and grooved when dry, leaves long-petioled membranous orbicular-ovate or cordate abruptly acuminate upper more ovate glabrous or puberulous beneath 7-nerved from near the base, fruiting female spikes very long slender, bracts decurrent with raised membranous margins, fruit small globose. *Miq. Syst. Pip.* 306, *Ill. Pip.* 49, t. 49, and in *Fl. Ind. Bat.* i. 2. 451; *Cas. DC. in Prodr.* xvi. l. 363; *Wight Ic.* t. 1933. ? *P. Sirium*, *Cas. DC. l. c.* 361. *P. Malamiris*, *Roxb. Fl. Ind.* i. 160, and *Ed. Carey & Wall.* i. 162.

EASTERN TROPICAL HIMALAYA; Sikkim, *J. D. H.*, &c.; Bhotan, *Griffith*. ASSAM, SILHET and the KHASIA MTS., *Hamilton*, &c. NILGHIRI HILLS; on the Eastern slopes, *Wight*, &c.—DISTRIB. ? Penang and Java.

Apparently a rambling species, not unlike *P. sylvaticum*. *Branches* stout, but evidently soft, flexuous, glabrous. *Leaves* 2½–6 in., often as broad as long, from finely downy to glabrous beneath; base usually equal rounded truncate or cordate, of the upper usually acute; nerves slender; petiole 1–3 in., rarely shorter. *Male spikes* slender; bracts adnate, cupular; bracteoles slender; stamens 2–4. *Female spikes* very slender, lengthening in fruit to 9 in.; rachis glabrous, except in the ciliate scars left by the fruit; ovaries ovoid; stigmas minute. *Fruit* globose, $\frac{1}{2}$ in. diam.—The 7 basal nerves seem to distinguish this from the following. *Cas. DC.* refers the *Sirium* of Rumph (V. 119, t. 2) and Vahl's *P. diffusum* to it, but the evidence is very slight. According to Miquel, a specimen of Roxburgh's *P. Malamiris* so named by himself

in Delessert's Herbarium is this; unfortunately Roxburgh's names of *Polygonum* and *Peppers* are often at issue both with his descriptions, and these again with his *Icones*; he quotes Linnæus for his *Malamiris*, but Linnæus includes plants of both the old and new worlds under *Malamiris*. Rheedé's figure of Linnæus' plant of that name, Amalago (vii. t. 16), cited by Roxburgh, cannot well be *P. attenuatum*.

40. **P. sylvestre**, Lamk. *Ill.* 79?; quite glabrous, branches subterete, leaves petioled hardly coriaceous elliptic or ovate acuminate base acute rounded or subcordate 5-nerved from near the base, spikes long very slender, bracts of male cupular adnate to the rachis, of the female with raised margins glabrous within, rachis glabrous, fruit globose. *Miq. Syst. Pip.* 314, and in *Hook. Lond. Journ. Bot.* iv. 438, and v. 552; *Thwaites Enum.* 293 (C. P. 3688); *Cas. DC. in Prodr.* xvi. 1. 361; *Wight Ic.* t. 1937.

ASSAM and SILHET, Wallich, Griffith. DECCAN PENINSULA, at Courtallam, Wight. CEYLON, Walker; south end of the island, Thwaites.

A branching climbing shrub, with apparently soft branches, much compressed and furrowed when dry in the Ceylon specimens. *Leaves* 4-5 by 2-3 in., more coriaceous than in *P. attenuatum*, with much shorter petioles, and never rounded-ovate as in that plant, base acute or rounded rarely cordate, nerves not so basal; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. *Male spikes* 5-6 in., flowers rather distant; stamens 2-4; female lengthening much in fruit, rachis slender, glabrous. *Fruit* $\frac{1}{2}$ to nearly $\frac{1}{4}$ in.—I accept this as Lamarck's *P. sylvestre* with great doubt, and I find it difficult to define it by description from narrow-leaved forms of *P. attenuatum*, and from some states of *P. argyrophyllum*, but feel sure it is quite distinct from the former. A specimen in Wight's Herbarium is marked *P. trioicum*, as is another from Roxburgh's Herbarium, but the fruit seems too small for that form of *nigrum*, the rachis too is slender, and leaves too membranous. I refrain from citing any of the extra-Indian descriptions or habitats for *sylvestre*, but there is in Herb. Hook. a plant said to be from Mauritius which tallies with this, and is marked *P. sylvestre* by Miquel; it is probably a garden specimen, and is in male fl. only.

41. **P. Hymenophyllum**, *Miq. in Hook. Lond. Journ. Bot.* v. 554; petioles and leaves beneath pubescent with crisped hairs, branches terete, leaves shortly petioled very membranous ovate elliptic-ovate or oblong or ovate-cordate acuminate base acute or rounded 2-3-nerved towards the base, nerves slender alternate, spikes very long and slender, fruiting rachis very slender glabrous or pubescent in the scars, bracts confluent with the rachis. *Cas. DC. in Prodr.* xvi. 1. 364; *Wight Ic.* t. 1942. *P. Malamiris*, Wall. *Cat.* 6642 G, H. *P. nilghirianum*, *Cas. DC. l. c.* *P. lanatum*, *Wight mss*; *Miq. l. c.* 553 (not of Roxb.). *P. Wightii*, *Miq. in Hook. Lond. Journ. Bot.* v. 552 for the most part.

DECCAN PENINSULA; on the Nilghiri, Shevagherry and Travancore Mountains, Wight, &c.

A slender climber, with branches that do not appear to shrink in drying. *Leaves* 3-5 in., very variable in breadth, always thinly membranous, base usually equal; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Male spike* very slender; bracts with free rounded tips, peduncle longer or shorter than the petiole. *Fruiting spikes* 3-6 in., rachis very variable; bracts usually inconspicuous being entirely confluent with the rachis, but sometimes they have more or less conspicuously raised margins and are ciliated within. *Fruit* oblong when unripe, with often a distinct style, globose and $\frac{1}{8}$ - $\frac{1}{4}$ in. diam. when ripe.—Wight, not having seen male plants, is disposed to regard this as the female of *P. argyrophyllum*, and though males are now known, they do not help to distinguish them. The pubescence, which is the best character for this, is far from constant in amount, and is sometimes almost evanescent. So too the development of the bracts in the fruiting rachis is very various. A Javan plant of Zollinger's (II. No. 304) closely resembles this.

42. **P. argyrophyllum**, *Miq. Syst. Pip.* 330, *Ill. Pip.* 55, t. 56, and

in *Hook. Lond. Journ. Bot.* v. 555; quite glabrous, shrubby, branches terete, leaves petioled membranous or coriaceous lanceolate or elliptic- or ovate-lanceolate acuminate sometimes silvery beneath 5-nerved above the base, nerves distant alternate, base acute often oblique, male spikes very slender, peduncles longer than the petioles, fruiting spike 3-6 in., bracts usually decurrent with raised margins, scars naked or ciliate. *Cas. DC. in Prodr.* xvi. 1. 365; *Wight Ic.* t. 1941. *P. Malamiri*, *Wall. Cat.* 6642 E, F, I. *P. Wightii*, *Miq. in Hook. Lond. Journ.* l. c. 552, in part.

DECCAN PENINSULA, *Heyne*; Travancore Mts., *Wight*. CEYLON; in the central province.

Some states of this appear to differ from *P. Hymenophyllum* only in being glabrous, others have the much more coriaceous foliage of other forms, and the leaves are normally more white beneath. There is so much variation in the development of the bracts that possibly there is more than one species here. The following appear to me to be probably varieties of this.

1. *P. argyrophyllum proper*; leaves long 4-6 by $1\frac{1}{2}$ -2 in. whitish beneath, petiole nearly 1 in., peduncle very slender, fruiting spike $\frac{1}{2}$ -2 $\frac{1}{2}$ in., rachis very slender glabrous, bracts almost confluent with the rachis, fruit small $\frac{1}{8}$ in. diam. *Wall. Cat.* 6642 F.—This was sent to Wallich by Wight, but I find no specimen in the Herbarium of the latter. There are, however, good ones in Arnott's Herbarium.

2. Leaves smaller shorter petioled more elliptic sometimes bullate not white beneath, fruiting spikes 5-7 in., rachis slender, bracts with raised margins, scars distant with fimbriate edges, young fruit oblong subtruncate with a distinct style globose when ripe. *Wall. Cat.* 6642 E, I.—Courtallam, *Wight*. Concan?, *Sticks*.

3. Leaves elliptic more coriaceous less acuminate not white beneath, bracts with conspicuous sinuate raised margins which embrace the bases of the young fruits, ripe fruit globose $\frac{1}{4}$ in. diam. *P. nepalense*, *Wight Ic.* t. 1938 (not of Miquel).—Courtallam, in dense forests.—This resembles *P. sylvestre* in the form of the leaf, and *P. Wightii* in their texture.

4. Leaves coriaceous 3-5 by $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. elliptic-lanceolate acuminate bullate above silvery beneath, nerves stronger more distant, petiole $\frac{1}{2}$ in., fruiting spikes 4-6 in., bracts with raised sinuate margins, fruit large "yellow" (*Clarke*). *P. argyrophyllum*, *Thwaites Enum.* 293.—Nilghiri Hills, alt. 7000 ft., *Clarke*. Ceylon (C.P. 3625).—This should perhaps be referred to *P. Wightii*, but the alternate nerves are very constant.

5. Leaves much smaller 2-2 $\frac{1}{2}$ by 1 in. elliptic-lanceolate, petiole short $\frac{1}{4}$ in., fruiting spikes 1-2 in. slender, rachis slender, bracts with hardly raised margins, scars ciliate, fruit $\frac{1}{8}$ in. diam.—Nilghiri or Kurg Hills, *G. Thomson*.—This very small form a little resembles *P. khasianum*.

6. Leaves thinly coriaceous elliptic-lanceolate or oblong ovate silvery or not beneath, fruiting spikes 2-7 in., bracts with raised sinuate margins, rachis rather slender, fruit globose $\frac{1}{2}$ in. diam. *P. Walkeri*, *Miq. in Hook. Lond. Journ. Bot.* iv. 439; *Cas. DC. l. c.* 3362. *P. arborescens*, *Thwaites Enum.* 293, excl. syn.—Ceylon, *Walker*, *Thwaites* (C. P. 35 in part, and 2461).—I do not find the minute hairs described by Miquel.

43. *P. Wightii*, *Miq. in Hook. Lond. Journ. Bot.* v. 552, in part; quite glabrous, branches stout terete, leaves petioled coriaceous broadly ovate or orbicular rarely elliptic or oblong often glaucous beneath base rounded or cordate rarely acute 5-7-nerved near the base, spikes 2-3 in. stout, bracts with prominent sinuate margins. *Wight Ic.* t. 1939 (*P. Wightiana* on plate). *P. nigrum*, *Wall. Cat.* 6643 D, the upper right-hand specimen only.

NILGHIRI and TRAVANCORE HILLS, *Wight*, &c.

The robust habit, broader leaves with stronger more basal nerves, longer petioles, and often stouter fruiting-spikes with almost winged bracts, best distinguish this

from the coriaceous-leaved plants referred to *P. argyrophyllum*. Whether, however, what I have described above should be regarded as Miquel's *P. Wightii* is perhaps doubtful, there being much confusion in both Wight's and Arnott's Herbaria, where alone authentic specimens of Miquel's plants are preserved. Miquel's description of leaves sparsely hairy on the nerves, together with specimens named by Miquel *P. Wightii* in Herb. Arnott with this character, obviously apply to *P. Hymenophyllum*; others equally authentically named *P. Wightii*, and quite glabrous, with membranous leaves, are identical with forms of *P. argyrophyllum* (perhaps *sylvestre*); whilst still a third series, with coriaceous leaves and more basal stronger nerves, also named *Wightii* by Miquel, represent that plant as here limited. Furthermore, specimens of this last in Arnott's Herbarium are named by Miquel "*P. nigrum forma sylvestre*." In short the confusion is inextricable, and I cannot say whether *P. sylvestre*, *argyrophyllum*, *Hymenophyllum* and *Wightii* represent as many species, or fewer, or one only. Lastly, *P. Wightii* must be carefully distinguished from *P. Schmidtii* (*P. arborescens* Miq. not of Roxb.), which though not easily distinguishable by words is a very different species.

44 **P. leptostachyum**, Wall. Cat. 6649; quite glabrous, branches stout contracted angled and grooved when dry, leaves large coriaceous petioled obliquely ovate oblong-ovate or lanceolate acuminate 5-nerved above the base, nervules transverse, fruiting spike 7 in., peduncle much longer than the petiole, rachis stout glabrous, bracts with obscure margins, scars glabrous. *Miq. Syst. Pip.* 315. *P. indicum*, *Miq. fid. Cas. DC. Prodr.* xvi. 1. 498.

BURMA; banks of the Attran River, Wallich.

Branches white when dry, internodes long, nodes hardly swollen. Leaves very pale, 5-8 by 2-4 in., base acute rounded or cordate; petiole stout, $\frac{1}{2}$ -1 in. Spikes pendulous, scars narrow. Fruit scattered, globose, unripe with a distinct style, ripe globose $\frac{1}{2}$ in. diam.—A very handsome species, of which the male is unknown. Cas. DC. changes Wallich's name to *P. indicum*, citing as the authority Miquel's Systema (p. 315), where, however, the name *leptostachyum* is preserved, and I find no authority in Miquel for the name *P. indicum*. The *P. leptostachyum* of A. Richard is undescribed, and only mentioned in Grisebach's Cat. Pl. Cub. 69. Miquel's citation of Wall. Cat. 1540 for this is an error.

Sect. VI. **Heckeria**. Spikes subumbellate. Flowers 2-sexual.

45. **P. subpeltatum**, Willd. Sp. Pl. i. 166; shrubby, branches very stout soft, leaves very large long-petioled membranous orbicular-cordate glabrous or puberulous beneath, nerves flabellate, spikes erect. Cas. DC. in *Prodr.* xvi. 1. 333; *Vahl Enum.* i. 337, excl. syn. Lam.; Wall. Cat. 6638. *Heckeria subpeltata*, Kunth in *Linnaea* xiii. 171. Pothomorphe subpeltata, Miquel Syst. Pip. 213, Ill. Pip. 29, t. 26, in Hook. Lond. Journ. Bot. iv. 431, and Fl. Ind. Bat. i. 2. 437; Wight Ic. t. 1925.

DECCAN PENINSULA; from the Concan Hills, alt. 5000 ft., southwards, Heyne Wight, &c. PENANG, Wallich. CEYLON, ascending to 4000 ft., Walker, &c.—DISTRIB. Malay Islands, Tropical Africa and Madagascar.

A succulent shrub, 4-5 ft. high, with very thick stem and branches. Leaves a foot diam. or less, acute or tip rounded, deeply cordate with a narrow sinus; petiole 6-10 in., with a narrow deciduous wing. Spikes 3-7 together, 3-5 in. long, very shortly pedicelled; bracts pedicelled, peltate, triangular or $\frac{1}{2}$ -lunar, ciliate; flowers very minute; stamens 2; stigmas 3. Fruit very minute, trigonous, cuneiform, truncate.

UNDETERMINABLE AND EXCLUDED SPECIES.

P. AMALAGO, Linn. Fl. Zeyl. No. 28.—Miquel (Syst. Pip. 258) correctly observes that Linnæus's Amalago is a mixture of various species from the old and new worlds. The Amalago of Rheede (vii. t. 16) with elliptic leaves and very long peduncles is not recognizable.

P. ARBORESCENS, *Roxb. Fl. Ind.* i. 159, and *Ed. Carey & Wall.* i. 161.—To this Miquel refers Wallich's No. 6643 E, a native of Penang, which is a flowerless barren state with variegated leaves of a plant called *Cissus*? *porphyrophyllus* by Lindley. At p. 307, however, he refers the same number to *P. attenuatum*. He also refers a Nilghiri plant of Perrottet to it; this plant I have not seen, but assume it to be *P. Schmidtii*. Lastly he figures his *P. arborescens* (Ill. Pip. 54, t. 54), but does not state where the figured specimen comes from. The only authority for Roxburgh's plant is his citation of Rumph (V. t. 28, f. 1), which is not recognizable as depicting any of the above-mentioned plants.

P. ARCUATUM, *Blume*, var. *nervis remotioribus*, *Miq. Syst. Pip.* 334; from the Nilghiri Mts., Perrottet.—This is, I assume, the *P. arcuatum* var. *β. quintuplinervium*, *Cas. DC. in Prodr. xvi.* 1. 360. It is probably *P. Schmidtii*.

P. ARANEUM, *Wall. Cat.* 6661; from Taong-dong in Ava, has neither flower nor fruit, and is indeterminate.

P. CLYPEATUM, *Wall. Cat.* 6655 (*P. obtusissimum* and *P. manillanum*, *Miq. Syst. Pip.* 337, 339)—are both species of *Ficus*.

P. CORIACEUM, *Vahl Enum.* i. 314, is doubtfully referred to *P. Cubeba* by Miquel (*Syst. Pip.* 289), and omitted by *Cas. DC.*

P. DIFFUSUM, *Vahl Enum.* i. 333, from Ceylon, is referred by *Cas. DC.* (*Prodr.* xvi. 1. 364) to *P. attenuatum*, but I have seen no specimen of this from Ceylon. *Cas. DC.* omits this habitat, as does Miquel (*Syst. Pip.* 327), who gives Java and Amboyna.

P. EXASPERATUM, *Vahl Enum.* i. 322; *Cas. DC. in DC. Prodr.* xvi. 1. 378. (*Chavica*? *exasperata*, *Miq. Syst. Pip.* 275), is indeterminate.

P. FALLAX, *Vahl Enum.* 335, is doubtfully referred by *Cas. DC.* to *P. nigrum* var. *trioicum*, and by Miquel to *P. longum* or *P. sarmentosum* (*Syst. Pip.* 241).

P. LÆVE, *Vahl Enum.* i. 332; *Cas. DC. in Prodr.* xvi. 1. 362; *Miq. Syst. Pip.* 335, is indeterminate.

P. MALAMIRIS, *Linn. Sp. Pl.* 29; *Vahl Enum.* i. 327 (see Nos. 15, 39, 41, 42).

P. NIGRUM?, *Wall. Cat.* 6643 E, F; from Malacca, Singapore and Penang.—These are young plants, with broadly cordate rounded leaves variegated green white and purple, of a *Piper*, species unknown, and are the *Cissus*? *porphyrophyllus*, *Lindl. in Journ. Hort. Soc.* i. 225, and *Flore des Serres Ser.* 2, iv. t. 1491. It is *P. porphyrophyllum*, *N. E. Brown in Gard. Chron.* (1884) xxii. 438.

P. POTHOIDES, *Wall. Cat.* 6639 A; *Cas. DC. in Prodr.* xvi. 1. 351 (*Chavica pothoides*, *Miq. Syst. Pip.* 266).—There are two species on this sheet, neither in flower or fruit. Of one of these there is a specimen in *Herb. Kew* from the Andamans, collected by Kurz, in an equally imperfect state.

P. RETROFRACTUM, *Vahl Enum.* i. 314; *Cas. DC. in Prodr.* xvi. 1. 378 (*Chavica retrofracta*, *Miq. Syst. Pip.* 275), is indeterminate.

P. SUIPIQUA, *Ham. in Don Prodr.* 20; *Cas. DC. in Prodr.* xvi. 1. 378 (*Chavica Suipiqua*, *Miq. Syst. Pip.* 275), is no doubt a common Nepal species, but I cannot guess which.

P. SYLVESTRE, *Lour.*; *Vahl Enum.* i. 326, is evidently a mixture.

P. SYRINGÆFOLIUM, *Vahl Enum.* i. 328; *Cas. DC. in Prodr.* xvi. 1. 378 (*Chavica syringæfolia*, *Miq. Syst. Pip.* 275), is indeterminate.

P. THERMALE, *Vahl Enum.* i. 328; *Cas. DC. in Prodr.* xvi. 1. 3378 (*Chavica thermalis*, *Miq. Syst.* 276), from hot springs at Tranquebar, should be obtained and determined by botanists in Madras by means of the locality.

P.? *VENUSTUM*, *Wall. Cat.* 6666; *Cas. DC. in Prodr.* xvi. 1. 378, from Singapore, is a *Pothos* in a very young state, not distinguishable from *P. remotiflorus*, *Hook.*, of Ceylon.

P. ZUCCARENII, *Cas. DC. in Prodr.* xvi. 1. 365, from India, *Griffith* in *Herb. Munich*, is indeterminate. The petiole is described as sheathing throughout its length, which I have not observed in any Indian *Piper*. It is probably a *Pothos*.

3. *PEPEROMIA*, *Ruiz & Pav.*

Annual or perennial, usually succulent herbs. *Leaves* alternate opposite

or whorled, quite entire, pellucid-punctate, exstipulate. *Spikes* terminal or leaf-opposed, solitary or fascicled, rarely axillary. *Flowers* 2-sexual, minute, sessile or sunk in the rachis, often whorled, erect, bracteate. *Perianth* 0. *Stamens* 2, very short; anther-cells confluent. *Ovary* obtuse acute or beaked, 1-celled; stigma lateral or terminal, usually penicillate; ovule 1, erect. *Fruit* minute, indehiscent. *Seed* with a membranous testa.—Species 3-400, chiefly tropical and American.

* *Leaves alternate.* (See also *P. Wightiana.*)

1. ***P. exigua***, *Miq. Syst. Pip.* 77, and *Fl. Ind. Bat.* i. 2. 432; quite glabrous, stem very slender decumbent, leaves alternate petioled rounded-ovate-cordate or subdeltoid 5-7-nerved, tip rounded, spikes solitary axillary and terminal, fruit sessile, stigma terminal. *Cas. DC. in Prodr.* xvi. 1. 403. *Micropiper exiguum*, *Miquel Comm. Phyt.* 56, t. 9 D. *Piper exiguum*, *Blume in Verh. Bat. Genoots.* xi. 232. *P. hyalinum*, *Wall. Cat.* 6662.

BURMA; hills opposite Prome, *Wallich*.—DISTRIB. Java, Philippines, ? West Africa.

Stems 3-6 in., sparingly branched. *Leaves* hyaline when dry, $\frac{1}{2}$ -1 in. diam., base sometimes truncate; petiole $\frac{1}{2}$ -1 in. *Spikes* $\frac{1}{4}$ in., filiform. *Fruit* ovoid, beaked.

2. ***P. moulmeiniana***, *Cas. DC. in Seem. Journ. Bot.* 1866, 140, and in *DC. Prodr.* xvi. 1. 415; quite glabrous, stem succulent straggling, leaves alternate shortly petioled elliptic-lanceolate obtuse 5-nerved from the base, spikes slender panicle, fruit globose, stigma minute.

TENASSERIM; at Moulmein, *Parish*.

Stems tufted, 6-8 in. high, sparingly branched; branches divaricate. *Leaves* 2-2 $\frac{1}{2}$ in. long, succulent, nerves faint; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Spikes* 1-1 $\frac{1}{2}$ in. *Fruit* not so broad as the rachis.

3. ***P. pseudo-rhombea***, *Cas. DC. in Prodr.* xvi. 1. 440; quite glabrous, stem stout erect succulent, leaves alternate petioled fleshy elliptic-lanceolate acute 3-nerved, spikes solitary axillary and terminal shorter than the leaves. *P. courtallensis*, var. β ., *Thwaites Enum.* 292.

CEYLON; Central Province, alt. 3-5000 ft., *Thwaites*.

Stem simple, 1 foot high, as thick as a goose-quill. *Leaves* 2 in., narrowed into the short petiole, nerves obscure.—I have seen but one specimen, and in young flower only.

4. ***P. Thomsoni***, *Hook. f.*; quite glabrous, erect, branched, leaves alternate petioled elliptic-ovate subacute 5-nerved, spikes slender axillary and terminal. *Peperomia* No. 9, *Herb. Ind. Or. H. f. & T.* *Piper ovalifolium*, *Wall. Cat.* 6663 B, the lower specimen.

DECCAN PENINSULA; Nilgiri or Kurg Mts., *G. Thomson*; Courtallam, *Wight*; Dindigul, alt. 2500 ft., *Wight in Herb. Wall.* ? CEYLON, *Thwaites*.

Stem very stout, erect or ascending at the base, naked below, as thick as a swan's quill; branches all reaching about the same height, leafy. *Leaves* all alternate, 2-3 in. long, succulent, 3 principal nerves broad; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. *Spikes* when flowering as long as the leaves, much longer in fruit.—A specimen of this in *Herb. Arnott* is mentioned by *Miquel* (in *Hook. Lond. Journ. Bot.* v. 549) as a glabrous, luxuriant, alternate-leaved var. of *P. dindigulensis*, from which it appears to me to be widely different, and to be very near *pseudo-rhombea* of Ceylon.

** *Leaves mostly opposite or whorled.*

5. ***P. Wightiana***, *Miq. in Hook. Lond. Journ. Bot.* v. 548; suberect, rather slender, glabrous or with the tips of the leaves ciliate, leaves opposite and alternate petioled obovate elliptic oblong or orbicular obtuse, 3-nerved, spikes 1-3 usually terminal. ? *P. Wightiana*, *Cas. DC. in Prodr.* xvi. 1. 420. *P. ceylanica*, *Miq. l. c.* 550; *Cas. DC. l. c.* 457.

The CONCAN, on trees, *Stocks*. MALABAR, *Wight*. NILGHIRIS, *G. Thomson*. CEYLON, *Walker*; Central Province, alt. 6000 ft., *Thwaites* (*C. P.* 3954).

Stems 6-10 in., straggling and rooting below, glabrous or puberulous. *Leaves* $\frac{1}{2}$ -1 in., very variable, rarely obovate, succulent, glabrous except at the tip; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Spikes* 1-2 in., very slender, sometimes paniculate.—*Cas. DC.* describes the stem as pubescent, but it is glabrous in authentic specimens (in *Herb. Arnott*), and Miquel does not describe it as pubescent. *Wight's* figure is, I think, taken from *P. dindigulensis*. I suspect this is only a variety of *P. Heyneana*. Specimens from the Nilghiris have all the leaves alternate: Miquel's *P. ceylanica* has most minute pubescence on the branches; the leaves are chiefly opposite.

6. ***P. dindigulensis***, *Miq. Syst. Pip.* 122, in *Hook. Journ. Bot.* v. 549, and *Ill. Pip.* 19, t. 13; stem and leaves pubescent, leaves opposite rarely alternate or 3-nately whorled petioled elliptic-ovate or rounded obtuse or acute 3-5-nerved, spikes slender axillary and terminal solitary or paniced. *Cas. DC. in Prodr.* xvi. 1. 442; ? *Wight Ic.* t. 1921. *P. Heyneana*, *Wight Ic.* t. 1922; *Thwaites Enum.* 292. ? *P. Wightiana*, *Wight Ic.* t. 1924. *P. Thwaitesii*, *Cas. DC. l. c.* 448. *Piper ovalifolium*, *Wall. Cat.* 6663 A and B (except the lower specimen).

DECCAN PENINSULA; from the Concan southward, in the moist ghats.

Very variable, sometimes 18 in. high, with a stem as thick as a goose-quill and suberect, at others more slender and straggling; stem simple or branched. *Leaves* 1-1½ in., succulent, narrowed into the petiole. *Spikes* 1-3 in. long.—I find nothing answering to *Wight's* figure of *P. Wightiana* in his or *Arnott's* Herbarium; its alternate leaves resemble *P. Wightiana*, but the hairiness is that of *P. dindigulensis*. His figure of *P. dindigulensis* represents a glabrous plant, unlike any species I have seen; but for its opposite leaves I should refer it to *P. Thomsoni*. I have seen no specimens of *P. Thwaitesii*, *Cas. DC.*, but the description entirely accords with *P. dindigulensis*.

7. ***P. portulacoides***, *A. Dietr. Sp. Pl.* i. 172; quite glabrous, tufted, stem very stout branched and succulent, leaves opposite or the upper whorled petioled obovate or subrhomboid tip rounded 3-nerved, spikes stout longer than the leaves axillary and terminal. *Miq. Syst. Pip.* 130, and in *Hook. Lond. Journ. Bot.* v. 550; *Cas. DC. in Prodr.* xvi. 1. 443; *Wight Ic.* t. 1922. *P. Candolleana*, *Miq. Syst.* 146. *Piper portulacoides*, *Lamk. Ill.* 82; *Vahl Enum.* i. 350. *P. trifolium*, *Herb. Willd.*

TRAVANCORE mountains; at Courtallam, *Wight*.—DISTRIB. Mauritius, Bourbon, Madagascar, Seychelles.

Stem erect from a creeping base, sometimes as thick as a swan's quill, leafy. *Leaves* all opposite, 1-2 in. long, very variable in width and thickness, very succulent; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Spikes* 1-2 in., axillary and terminal.

Var. *courtallensis*; smaller, leaves narrower. *P. courtallensis*, *Miq. in Hook. Lond. Journ. Bot.* v. 594; *Cas. DC. in Prodr.* xvi. 1. 463. Courtallam, *Wight*.—I see no material difference between this and *P. portulacoides*; and they inhabit the same locality.

8. ***P. confusa***, *Hook. f.*; quite glabrous, stem and branches diffuse creeping and rooting, leaves sessile succulent opposite and 3-nately whorled oblong obtuse 3-nerved narrowed at the base, spikes axillary and terminal paniced stout erect more or less thickened upwards. *P. courtal-*

lensis, *Thwaites Enum.* 292, and *Cas. DC. in Prodr.* xvi. 1. 463 (not of *Miquel*).

CEYLON; Central Province, alt. 3-5000 ft., *Gardner, Thwaites* (C. P. 2173).

Stems 6-10 in. long, diffusely branched, as thick as a crow-quill, naked below, rooting at the distant nodes. *Leaves* $\frac{3}{4}$ -1 in., narrowed into a very short petiole. *Spikes* $\frac{1}{2}$ - $\frac{3}{4}$ in., stoutly peduncled, obtuse.—This is the *P. courtallensis* of *Cas. DC.*, who cites *Miquel*, but omits the Continental Indian localities where *P. courtallensis* proper alone is found, and the number (831) which he quotes is of *Gardner's* (not *Thwaites's*) collection. This differs from *P. portulacoides* in habit, and the form of the subsessile leaves, and the spikes.

9. **P. Heyneana**, *Miq. Syst. Pip.* 123; quite glabrous, stem diffusely branched creeping and rooting, leaves opposite and 3-4-nately whorled petioled linear- or obovate-oblong obtusate or orbiculate rarely orbicular 3-nerved, spikes slender axillary terminal and paniced. *Cas. DC. in Prodr.* xvi. 1. 453. *Piper oblongum*, *Wall. Cat.* 6663 C?

SUBTROPICAL HIMALAYA; from Kumaon, alt. 3500 ft., *Strachey & Winterbottom*, to Sikkim, alt. 5-6000 ft. KHASIA MTS., alt. 4-5000 ft., *J. D. H. & T. T. Patkoye Mts. in UPPER ASSAM, Griffith.*

A small prostrate tufted very variable species. *Stem* 4-10 in. long, rather slender. *Leaves* $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long, thinly fleshy, drying green; petiole $\frac{1}{8}$ - $\frac{1}{2}$ in. *Spikes* $\frac{1}{2}$ -1 $\frac{1}{2}$ in.—It is unfortunate that *Miquel* should have attached the name of *Heyne* to a species which *Heyne* never saw, and which grows very far from the region which that author rendered botanically classical.

10. **P. reflexa**, *A. Dietr. Sp. Pl.* i. 180; stem pubescent stout densely branched and tufted leafy, leaves sessile or shortly petioled coriaceous 4-nately whorled orbicular or nearly so 3-nerved pubescent beneath or glabrate, spikes solitary axillary and terminal stout much exceeding the leaves. *Miq. Syst. Pip.* 169, in *Hook. Lond. Journ. Bot.* iv. 426, *Fl. Ind. Bat.* i. 2. 436, and in *Mart. Fl. Bras.* iv. 17; *Wight Ic.* t. 1933. *P. reflexa*, *vars.* ζ . *Berlandieri & \eta*. *parviflora*, *Cas. DC. in Prodr.* xvi. 1. 452. *Piper saxatile*, *Wall. Cat.* 6664. *P. pusillum*, *Blume in Verh. Bat. Nat. Genoots.* xi. 382, f. 37. *Micropiper pusillum*, *Miq. Comm. Phyt.* t. 5.

SUBTROPICAL HIMALAYA; from Garwhal, alt. 4-6000 ft., *Edgeworth*, to Sikkim, ascending to 7000 ft., and to UPPER ASSAM, *Griffith.* KHASIA MTS., alt. 4-6000 ft. TRAVANCORE, at Courtallam, *Wight.* CEYLON, Central Province, ascending to 6000 ft.—DISTRIB. Malay Islands, China, Australia, Africa, America.

Stem or branches 3-10 in., rooting at the lower nodes, lower as thick as a goose-quill in Courtallam specimens, which are nearly glabrous, more slender in others. *Leaves* very uniform, rarely opposite or 6-nate, $\frac{1}{2}$ in. long, rarely more, sometimes elliptic, lower shortly petioled, wrinkled and yellowish when dry. *Spikes* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., stoutly pedicelled, obtuse.

ORDER CXXV. CHLORANTHACEÆ.

Herbs shrubs or trees, usually aromatic. *Leaves* opposite, usually toothed, petioles often connate and forming a sheath; stipules small, subulate. *Flowers* in terminal or pseudo-axillary spikes, heads or panicles, 1-sexual (one of each sex sometimes cohering). FL. ♂. *Perianth* 0. *Stamens* 1 or 3 connate, filaments very short and thick; anthers 2-celled, or the lateral when 3 are connate 1-celled. FL. ♀. *Perianth* 0, or adnate to the ovary, with a 3-toothed limb. *Ovary* 1-celled; style very short linear or subclavate or 0; ovule 1, orthotropous, pendulous from the top of the cavity. *Drupe* small ovoid or globose. *Seed* pendulous, testa membranous, albumen copious fleshy; embryo minute, far from the hilum, cotyledons diverging,

radicle inferior.—Genera 3, species 25, tropical and subtropical (not African).

—The above character does not embrace the anomalous genus *Circæaster* which is appended to the Order.

CHLORANTHUS, Swartz.

Perennial herbs, or shrubs. *Flowers* in terminal simple or paniced spikes, connate ♂ and ♀ in pairs. *Stamens* 1, or 3 confluent; central anther 2-celled, lateral anthers 1-celled. *Ovary* naked; stigma subsessile, truncate.—Species 8, Eastern Asiatic.

1. *C. officinalis*, *Blume Enum. Pl. Jav.* 79; *Fl. Jav.* iii. 10, t. 1; leaves subsessile elliptic or elliptic-lanceolate acuminate finely gland-serulate, anthers 3 connate by their connective. *Solms in DC. Prodr.* xvi. 1. 474; *Miq. Fl. Ind. Bat.* i. 1. 804. *C. elatior*, *Br. in Bot. Mag.* t. 2190. *C. erectus*, *Sweet*; *Wall. Cat.* 6881. *Cryphea erecta*, *Ham. in Brewst. Ed. Journ.* 1825, 11, t. 2.

EASTERN HIMALAYA; Sikkim, in hot valleys, *J. D. H. BHOTAN*, *Clarke*. ASSAM, SILHET and the KHASIA Mts., ascending to 4000 ft., *Wallich*, &c., and southward to PENANG, the ANDAMAN ISLANDS, and MALACCA, *Maingay*.—DISTRIB. Yunan, Malay Archipelago, Philippine Islands.

An evergreen erect undershrub, 1–3 ft., quite glabrous and shining. *Leaves* very variable in size and breadth, subsessile, from 3 by 1 in. to 10 by 4 in.; petiole $\frac{1}{2}$ – $\frac{1}{4}$ in. *Spikes* 1–2 in., in panicles 2–5 in. long; flowers minute, distant. *Berries* $\frac{1}{4}$ in. diam., white.

2. *C. brachystachyus*, *Blume Fl. Jav. fasc.* viii. 13, 14, t. 2; leaves shortly petioled elliptic or elliptic-lanceolate acuminate coarsely callously serrate, anthers solitary 4-celled. *Solms in DC. Prodr.* xvi. 1. 475; *Miq. Fl. Ind. Bat.* i. 2. 801, and *Ann. Mus. Lugd. Ind. Bat.* iii. 129. *C. monander*, *Br. in Bot. Mag.* t. 2190 in note. *C. ceylanicus*, *Miq. l. c.* 802. *C. denticulatus*, *Cord. in Adæus* iii. 296. *Ascarina serrata*, *Bl. En. Fl. Jav.* i. 79. *Sarcandra chloranthoides*, *Gardn. in Calc. Journ. Nat. Hist.* viii. 348; *Wight Ic.* t. 1946; *Cord. l. c.* 301.

KHASIA Mts., alt. 4–5000 ft., *Jenkins*, &c.—TRAVANCORE; on the Pulney Mts., *Wight*. PENANG, *Porter*, *Wallich*, *Maingay*. CEYLON; Central Province, alt. 8–5000 ft., *Walker*, &c.—DISTRIB. China, Philippine Islands, Japan.

Habit of *C. officinalis*, but taller and more woody, with deeply serrate leaves and red berries.

UNDETERMINABLE AND EXCLUDED SPECIES.

C. GRANDIFOLIUS, *Miq. Fl. Ind. Bat.* i. 1. 802; *Solms in DC. Prodr.* xvi. 1. 477; “branches warted, leaves petioled membranous 7–8 in. long, obversely oblong acuminate remotely callously mucronate-serrate base acute or subcuneate, nerves 8–10 erecto-patent, petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., spikes brachiately subopposite or alternate, bract ovate boat-shaped tip subcallous. *Herb. Wight*, n. 878.”—I can form no guess as to what this is, having found nothing corresponding to the description in *Wight’s Herbarium*.

C. INCONSPICUUS, *Swartz in Phil. Trans.* lxxviii. 359, t. 15; *Solms l. c.* 474. *C. indicus*, *Wight Ic.* t. 1915.—The specimens of this from which *Wight’s* published drawing was made are in his Herbarium, but without locality, nor is any locality given with his description in the *Icones*; they are no doubt from China.

ANOMALOUS GENUS.

CIRCÆASTER, Maxim.

A small, inconspicuous, very slender annual, with a simple filiform

erect stem, bearing at the top a whorled fascicle of leaves and many axillary few-fl. short peduncles. *Leaves* membranous, rhomboidly spathulate, cuneate and quite entire below the middle, above it semicircular and toothed. *Flowers* minute, 2-sexual or female. *Sepals* 2-3, minute, scale-like, persistent. *Petals* 0. *Stamens* 1-2, alternate with the sepals, persistent, filaments linear flattened; anther subglobose, cells rather diverging, opening laterally. *Carpels* 1-4, free, linear-oblong, 1-celled; stigma sessile, oblique; ovule pendulous from the top of the cell. *Ripe carpels* oblong, terete, pericarp membranous, narrowed at the base, sparsely clothed with hooked bristles. *Seed* oblong, testa membranous adherent to the hard fleshy albumen; embryo in the axis of the albumen terete, cotyledons linear, radicle superior.

C. agrestis, Maxim. in *Bull. Acad. St. Petersb.* xxvii. 556; *Mel. Biol.* xi. 345.

WESTERN HIMALAYA; Kumaon, alt. 8000 ft., *Strachey & Winterbottom*, *Duthie*.—DISTRIB. W. China.

Stem 3-5 in., ending in fibrous roots. *Leaves* very many in a solitary false whorl, formed of crowded pairs, pale green, narrowed into a broad petiole and together with it 1-1½ in. long, nerves flabellate; immediately below the whorl of leaves are two linear 1-nerved ones, which are the primordial leaves. *Pedicels* shorter than the petioles, very slender. *Sepals* $\frac{1}{10}$ in. long, ovate-oblong. *Stamens* twice as long. *Ripe carpels* cylindric, $\frac{1}{2}$ in. long, green, tip acute.—A very obscure plant, of doubtful or indeed unknown affinity, but regarded by Bentham as near *Chloranthaceæ*. It occurs in fields in W. China, and in Kumaon on mossy rocks in woods, &c. The hooked bristles on the carpels are such aids to dispersion that it may be supposed to be common, though so inconspicuous as to be overlooked.

ORDER CXXVI. MYRISTICÆÆ.

Evergreen trees, often stellately tomentose. *Leaves* alternate, quite entire, exstipulate, often pellucid-punctate. *Flowers* dioecious, small, regular, fascicled umbelled or paniced; bracteoles persistent or caducous. MALE FL. *Perianth* 3-(2-4)-lobed, valvate in bud. *Anthems* 3 or more, connate in a sessile or stipitate column head ring or disk, 2-celled. FEM. FL. *Perianth* of the male. *Staminodes* 0. *Ovary* superior, free, sessile, 1-celled; style short or 0; stigma capitate discoid or lobed; ovule 1, basal, erect, anatropous. *Fruit* fleshy, at length 2- rarely 4-valved. *Seed* erect, enclosed in a thin or fleshy entire or lacerate often highly coloured aril, testa thin or crustaceous, albumen hard densely ruminant; embryo basal, small, cotyledons rounded spreading often wrinkled, radicle short inferior.—Species about 80, Tropical East Asiatic, Malayan and American; a few African, and one Australian.

Previous to the publication of the "Flora Indica" of Dr. Thomson and myself, the British Indian Nutmegs were known only through the named but undescribed specimens distributed by Wallich; for the species contained in Roxburgh's Flora are for the most part from the Archipelago, and were quite undeterminable by that author's brief descriptions. Wallich's types are therefore the foundation of our knowledge; but then there are often several species under one name, and most are in so incomplete a condition, that it is impossible to draw up satisfactory descriptions from them alone, and very difficult to identify other collections by them. Nor is their imperfection the only obstacle; more serious ones are, the excessive variability of the foliage of individual species, throughout the genus, in size, form, texture, pubescence and number of nerves; and the alterations in all these characters in leaves taken at different stages of growth of the same tree. The only other Indian collections available for the "Flora Indica" were Griffith's, and these were assiduously compared

with Wallich's in the endeavour to unravel the intricacies of the genus and limit its species. The arrival of Maingay's splendid Malay Peninsular Herbarium, and his notes on this genus, have enabled me in the present work to correct several erroneous determinations of the "Flora Indica," and to approach nearer to a satisfactory description of the species; but much still remains to be done, which can only be accomplished by a study of living specimens at different times of the year. For every species, flowers of both sexes and ripe fruit are all absolutely necessary for its exact limitation, and the knowledge of its affinities, as well as for establishing sections of the genus. Hitherto for the latter purpose most importance has been given to the structure of the staminal column, which from its minuteness (in most of the species) is difficult of analysis, in dried specimens especially; and I am inclined to think that this organ is more variable than has been supposed, and that some sections founded on it by Alph. De Candolle and others must be abandoned. In the following descriptions, that of the colour of the foliage applies only to dried specimens. This genus affords a fine field for study, but to do this effectually requires a careful comparison of the materials in the Herbaria of Holland, Florence, and Kew. Until this is done, it will be impossible to say which of many of the Indian species are natives of the Malay Archipelago.

MYRISTICA, Linn.

Character of the Order.

Sect. I. **Eumyristica**. *Male flowers* racemed or panicled; perianth with a persistent scale-like bracteole at its base. *Anthers* elongate, firmly connate in a shortly stipitate or sessile column.

M. fragrans, *Houtt. Hist. Nat.* ii. 3. 233; glabrous, leaves 3-3½ in. elliptic-oblong or -lanceolate acuminate glaucous beneath, nerves about 8 pair slender, flowers bracteolate males in lax slender supra-axillary racemes. *Alph. DC. in Prodr.* xiv. 1. 189; *Blume Rumph.* 180, t. 55; *Miquel Fl. Ind. Bat.* i. 2. 53; *Bentl. & Trim. Med. Pl.* iii. t. 218. *M. officinalis*, *Linn. f. Suppl.* 265; *Gærtn. Fruct.* i. 194, t. 41 (*excl. syn. Rumph.*); *Hook. Exot. Bot.* t. 155, 156, and *Bot. Mag.* t. 2756, 2757; *Spach Suites Buff.* t. 143. *M. moschata*, *Thunb.*; *Wall. Cat.* 6785; *Roxb. Fl. Ind.* iii. 843; *Reichb. Ic. Exot.* t. 276, 277; *Woodv. Med. Bot.* iv. t. 238; *Hayne Arnz. Gewachs.* ix. t. 12; *Nees Pl. Med.* t. 133; *Guimp. & Schl.* t. 73, 74. *M. aromatica*, *Lamk. in Act. Par.* 1788, 155, t. 5-7, and *Ill. Gen.* t. 832; *Roxb. Cor. Pl.* iii. 267.—*Rumph. Herb. Amb.* ii. 14, t. 4.

Cultivated in the MALAYAN PENINSULA, PENANG and the MALAY ISLANDS;—native of the Eastern Moluccas.

A lofty tree; branches slender. *Leaves* coriaceous, sometimes oblanceolate, and tip caudate, base acute, pale yellow brown, paler with red-brown nerves beneath; petiole ¼-½ in. *Male racemes* 1-2 in.; flowers ¼ in. long, ellipsoid or urceolate, nodding; bracteole a scale under the glabrate perianth; anthers 9-12, connate in a cylindric stipitate column. *Fruit* ovoid, subglobose or pyriform, 1½-2 in. long.—*Alph. DC.* describes the perianth as strigose with appressed hairs, but I find them to be nearly or quite glabrous; *Blume* says very sparsely strigose.

1. **M. elliptica**, *Wall. Cat.* 6798 A; glabrous, leaves 8-10 in. linear-oblong subacute subglaucous beneath, nerves about 12 pair slender, male fl. in short axillary racemes bracteolate urceolate, fem. fl. few fascicled on short supra-axillary peduncles. *H. f. & T. Fl. Ind.* 162; *Alph. DC. in Prodr.* xiv. 1. 190; ? *Kurz For. Fl.* ii. 282.

PENANG and SINGAPORE, *Wallich.* MALACCA, *Maingay (Kew Distrib.* 1296). ? Andaman Islands, *Kurz.*

A tree; branches stout. *Leaves* very pale; petiole ½-1 in., stout. *Male perianth*

elongate-urceolate or ellipsoid, $\frac{1}{2}$ in. long, 3-toothed; bracteole orbicular; connective apiculate; *fem.* urceolate; ovary stipitate strigose, stigma oblong. *Fruit* $2\frac{1}{2}$ in. long, oblong, glabrous; "aril blood-red lacinate," *Maingay*.—I have seen no Andaman specimens, and Kurz's description is quite at variance with Wallich's plant in the scurfy tomentose inflorescence (see *M. andamanica*). Wallich's "6798 B? fructu maximo" is doubtful.

2. *P. laurifolia*, *Hook. f. & T. Fl. Ind.* 163; glabrous except the inflorescence, leaves 6–9 in. shortly petioled very coriaceous linear-oblong or lanceolate obtuse or subacute glaucous beneath, nerves 12–20 pair, male fl. bracteolate tomentose densely crowded in a very short stout axillary peduncle. *Alph. DC. in Prodr.* xiv. 1. 191; ? *Beddome Fl. Sylv.* t. 267. *M. diospyrifolia*, *Alph. DC. l. c.* *M. tomentosa*, *Thwaites, fid. Alph. DC. l. c.*

DECCAN PENINSULA; on the Western Ghats from Canara to Cape Comorin, from the plains up to 5000 ft., *Beddome, &c.* CEYLON, Central Province, alt. 1500–4000 ft., *Walker, &c.*

Branches moderately stout. *Leaves* variable, shining above with impressed nerves, pale brown or whitish beneath, base acute rounded or cuneate; nerves sometimes very faint; petiole 1–1 $\frac{1}{2}$. *Peduncle* very stout indeed, $\frac{1}{2}$ in. long or less; flowers densely crowded, sessile or stoutly pedicelled, nearly $\frac{1}{2}$ in. long, silkily pubescent, shortly 3-lobed.—*Beddome's* figure represents a much more slender plant than any of the specimens I have seen, with slender petioles and pedicels, the latter loosely clustered on an almost obsolete peduncle. *Fruit* in *Beddome's* figure $2\frac{1}{2}$ in. diam., globose, apiculate, with a deep longitudinal furrow; aril deeply cut into linear lacerate lobes, nearly enclosing the seed.—*Alph. De Candolle* gives *M. tomentosa*, *Thwaites* (not *H. & T.*), as a synonym of *M. diospyrifolia*, but I do not find that name of *Thwaites*, and as the plant is glabrous, I suspect some error of citation.

Var. *lanceolata*; leaves lanceolate 6 by 1 $\frac{1}{2}$ in., petiole very stout, nerves very faint.—*S. India, Beddome.*

Var. *zeylanica*; leaves linear-oblong obtuse 7–8 by 2–2 $\frac{1}{2}$ in., petiole more slender, pedicels longer. *M. ceylanica*, *Alph. DC. in Ann. Sc. Nat. Ser. 4*, iv. 29, and in *Prodr.* xiv. 1. 190. *M. zeylanica*, *Thwaites Enum.* 11 and 399.—*Ceylon, Thwaites.*—*Beddome's* figure more resembles this than it does the other Ceylon form of the species, which is identical with the peninsular Indian.

3. *M. andamanica*, *Hook. f.*; glabrous, leaves petioled membranous elliptic-oblong subacute not glaucous beneath, nerves 12–15 pair very slender, male flowers in sessile or peduncled clusters on the branches very shortly pedicelled, bracteole large, perianth globose 3-lobed, staminal column oblong obtuse. ? *M. elliptica*, *Kurz For. Fl.* ii. 282 (not of *Wall.*).

ANDAMAN ISLANDS; *Herb. Hort. Bot. Calcutta.*

Branches slender, quite glabrous, youngest shoots rustily hoary. *Leaves* almost membranous, 3–4 in. diam., pale brown when dry on both surfaces, base acute, nerves spreading; petiole $\frac{3}{4}$ –1 $\frac{1}{2}$ in., slender. *Clusters of flowers* sessile or on a thick 3–6 fld. peduncle $\frac{1}{4}$ – $\frac{1}{2}$ in. long; pedicel $\frac{1}{2}$ in., stout, rather scurfy; perianth quite glabrous and smooth, $\frac{1}{8}$ – $\frac{1}{6}$ in. diam.—Apparently a very distinct species, but approaches *M. malabarica*.

4. *M. malabarica*, *Lamk. in Act. Par.* 1788, 162; nearly glabrous, flowering branches slender, leaves 4–8 by 1 $\frac{1}{2}$ –4 in. linear-oblong or elliptic-lanceolate subacute glaucous beneath, nerves 8–14 pair, male fl. in subcymose panicles bracteolate, peduncles and pedicels slender, perianth globose, anthers 10–15, fruit narrowly oblong pubescent. *Blume Rumph.* i. 185; *Hook. f. & T. Fl. Ind.* 163; *Alph. DC. in Prodr.* xiv. 1. 195; *Dalz. & Gibs. Bomb. Fl.* 4; *Beddome Fl. Sylv.* t. 269. ? *M. tomentosa*, *Grah. Cat. Bomb. Pl.* (not *H. f. & T.*). *M. dactyloides*, *Wall. Cat.* 6786 (hardly of *Gärtner*). *M. notha*, *Wall. Cat.* 6787.—*Rheede Hort. Mal.* iv. t. 5.

The CONCAN, CANARA and N. MALABAR, *Heyne*, &c.

A tall tree. *Leaves* thinly coriaceous on the flowering branches, thick and leathery on the fruiting, more or less shining above, nerves very slender; petiole $\frac{3}{4}$ –1 in. *Male panicles* 1–1½ in., axillary and supra-axillary; peduncle naked below, subumbellately cymose above; bracteole an orbicular scale; perianth $\frac{1}{8}$ in., puberulous, 3-toothed; anthers connate in a cylindric shortly stipitate-column. *Female panicles* few-fl.; flowers larger. *Fruit* 2 by 1 in., pubescent.—A fruiting specimen apparently of this species from Dalzell (marked *amygdalina*?) has oblong leaves 10 by 4 in. and rounded at the base; the detached fruit accompanying it is, however, long and pubescent as in Rheedé's and Beddome's figures of *malabarica*. On the other hand, fruits that accompany Wight's Malabar specimens of *malabarica* are shorter broader and only 1½ in. long.

5. *M. malaccensis*, *Hook. f.*; quite glabrous, branches rather slender, leaves 8–10 in. linear-oblong acute or acuminate, nerves 15–20 pair slender, male fl. in subcymose fascicles bracteolate subglobose, anthers about 7.

MALACCA, *Maingay* (*Kew Distrib.* 1305).

Habit of *M. malabarica*, but leaves longer, usually rounded at the base but sometimes acute, petiole rather short $\frac{1}{3}$ –½ in., panicle longer 3–4 in., with more numerous much smaller flowers $\frac{1}{10}$ in. long, on slender rather longer pedicels. *Perianth* 3-toothed; anthers connate in a broad sessile column, tips acute.—The probable fruiting state of this, according to Dr. Maingay's Herbarium notes (*Kew Distrib.* 1304) in specimens of which the leaves 6 in. long are elliptic-oblong obtuse very leathery acute at the base with a very stout petiole, "Fruit subglobose 1½ by 1½ in., glabrous, pale-yellowish; pericarp thick, fleshy, $\frac{2}{10}$ – $\frac{3}{10}$ in. thick; aril complete, slightly lobed at the tip, clear reddish orange, testa slightly crustaceous pale brown."

6. *M. magnifica*, *Beddome Fl. Sylv.* t. 268; young parts clothed with golden pubescence, leaves 10–24 in. thickly coriaceous linear-oblong acute or acuminate densely stellately tomentose beneath glabrate in age, nerves 20–26 pairs, male flowers tomentose dense crowded on very short stout axillary peduncles bracteolate, fruit large oblong.

SOUTH TRAVANCORE; in the plains, *Beddome*.

An immense gregarious tree, 100 feet high, described by Beddome as having buttressed trunks, most like *M. laurifolia*, but different looking, with different pubescence venation and antheriferous column, and a larger fruit. Except in the much larger size and pubescence, I see no difference between this and *laurifolia*. The specimen communicated by Beddome, and which he says was pronounced at Kew to be *M. malabarica*, consists of a single leaf 20 by 6 in., with 20 pairs of nerves, and a very stout petiole and midrib; it is perfectly glabrous, presents no definite character but size and corresponding number of nerves; both the texture, colour and nervation occur in leaves of *M. laurifolia* and *malabarica*.

7. *M. Maingayi*, *Hook. f.*; branches stout black, shoots and inflorescence rusty-tomentose, leaves 7–10 in. linear-oblong acute or acuminate glabrous, nerves 14–18 pairs, male panicles axillary and supra-axillary, peduncle and pedicels short very stout, perianth bracteolate ovoid, column of anthers slender acute.

MALACCA, *Maingay* (*Kew Distrib.* 1289).

A lofty tree. *Branches* much angled by the contraction of the bark in longitudinal ridges. *Leaves* very coriaceous, 2–2½ in. broad, pale brown, nerves slender, base acute or rounded; petiole 1 in. *Male panicles* decurved, 8–10-fl.; peduncle compressed; pedicels about ¼ in.; perianth as long, broadly ovoid; bracts caducous; bracteole broad half as long as the perianth; anthers 9, stipes very short, pubescent.—Approaches *M. hyposticta*, Miquel, of Java, but the stout branches with black bark and very coriaceous leaves not glaucous beneath appear to distinguish it.

Sect. II. **Pyrrhosa**, *Blume* (*Irya*, *H. f. & T.*, *Horsfieldia* & *Gymna-cranthera*, *Alph. DC.*). *Male flowers* ebracteolate (bracteoles fugacious) generally minute, in many-fld. compound panicles (or paniculate heads in *M. Horsfieldii*). *Anthers* combined in a fleshy oblong turbinate spherical or 3-gonous sessile (rarely stipitate) column or cup.

* *Anthers* produced to the base of the column, closely combined throughout their length (not separable), or the tips alone free.

† *Panicles* more or less tomentose.

8. **M. superba**, *Hook. f. & Thoms. Fl. Ind.* 162; branchlets leaves beneath and panicles scurfily rusty-tomentose, leaves 12-18 in. elliptic-lanceolate or oblanceolate, nerves 25-30 pair, male panicles robust, perianth glabrous, staminal column subsessile solid ovoid obtuse, anthers 10. *Alph. DC. in Prodr.* xiv. 1. 194.

. PENANG, *Phillips*.

Branches stout. *Leaves* coriaceous, 4-8 in. broad, bright red brown, and loosely stellately tomentose beneath; nerves firm, nearly straight; petiole $\frac{3}{4}$ in. *Male panicles* in the axils of fallen leaves, 4-6 in. long; perianth $\frac{1}{2}$ in. long, ellipsoid, obtuse, 3-4-toothed; pedicel as long, very stout; anthers closely confluent to their tips in a subsessile column not apiculate. *Female fl. and fruit* unknown.

9. **M. Murtoni**, *Hook. f.*; branchlets young leaves beneath and panicles rustily tomentose, leaves 10-12 in. oblong very coriaceous glaucous beneath, base rounded or cordate, nerves 20-30 pair slender spreading, male fl. $\frac{1}{2}$ in. long broadly ovoid in short stout dense-fld. panicles very shortly pedicelled, staminal column fusiform sessile, anthers with the tips free.

SINGAPORE, *H. J. Murton*.

Branches very stout. *Leaves* 3-5 in. broad, brown and shining above, old quite glabrous beneath; petiole $\frac{3}{4}$ - $\frac{1}{2}$ in., very stout, glabrous. *Male panicles* 1-2 in. long; flowers densely crowded, perianth lobed $\frac{1}{2}$ -way down; anthers slightly twisted. *Fem. fl. and fruit* unknown.—This appears to be nearest to *M. superba*, differing in the much smaller flowers and fewer anthers with free tips.

10. **M. tomentosa**, *Hook. f. & Thoms. Fl. Ind.* 161; branchlets leaves beneath and panicles softly rusty-tomentose, leaves 5-12 in. elliptic-oblong lanceolate or oblanceolate at length glabrate, nerves 12-20 pair, male panicles robust, perianth $\frac{1}{4}$ in. diam. globose glabrous granulate, staminal column sessile turbinate solid top depressed. *Alph. DC. in Prodr.* xiv. 1. 204.—*Myristicaceae*, *Wall. Cat.* 9025.

PENANG, *Porter, Phillips*. MALACCA, *Maingay* (*M. Wallichii*, *Kew Distrib.* 1284).—DISTRIB. Borneo?.

Branches stout, bark grey. *Leaves* 2-2 $\frac{1}{2}$ in. broad, thinly coriaceous, dull brown above, bright red-brown beneath; base acute or cuneate; petiole $\frac{1}{2}$ in. *Male panicles* like those of *M. Wallichii*, but not so long and stout; pedicels slender; perianth 3-4-cleft, glabrous; anthers about 15, quite confluent; tips incurved but not free.—A Bornean plant entirely resembles this, except in that it has a much smaller staminal column, with only about 10 anthers. I greatly doubt the constancy of the characters drawn from the number of anthers in this genus.

11. **M. Wallichii**, *Hook. f. & Thoms. Fl. Ind.* 161; shoots ashy grey, leaves 8-12 in. oblong or linear-oblong acute or acuminate glabrous or sparingly rusty-tomentose beneath, nerves 20-25 pair, male panicles very stout rusty-pubescent, perianth $\frac{1}{4}$ in. diam. subsessile glabrous, staminal column a depressed 3-gonous 3-lobed fleshy sessile cup with incurved

anther-cells. *Alph. DC. Prodr.* xiv. 1. 203. *M. Horsfieldii*, *Blume?* *Wall. Cat.* 6806, *in part.*

MALACCA, *Maingay* (*Kew Distrib.* 1284). SINGAPORE, *Wallich, Lobb, Maingay* (*M. crassifolia*, *Kew Distrib.* 1283).

A tall tree, branches robust. *Leaves* 2-3½ in. broad, very coriaceous, dull brown above, red brown beneath, nerves spreading; petiole 1-1½ in., often stout. *Male panicles* axillary and from the axils of fallen leaves, branched from the base which is often as thick as the petiole, branches stout; flowers pedicelled, thickly coriaceous, in globose clusters of 8-10, 3-4-cleft; anthers 10-12 (24-27 cells?, *Maingay*), forming a low obconic 3-gonous fleshy column of firmly united cells. *Female panicles* short; fruit (unripe) very shortly and stoutly pedicelled.—This species, which is probably a variety of *M. tomentosa*, was founded on the young fruit and leaves of one of a mixed lot of species comprised under Wallich's No. 6806, of which he says "forsan duæ species mixtæ." There are two sheets of specimens under this number; one contains the fruiting specimens taken up as *Wallichii*, together with a panicle of male fl. of *M. crassifolia*; the other contains scraps of *M. polyspherula* and *M. crassifolia*.

12. *M. Kingii*, *Hook. f.*; leaves 8-10 in. long-petioled obovate or oblanceolate obtusely acuminate thinly coriaceous quite glabrous not glaucous beneath, nerves 15-20 pair very slender, panicles 4-6 in. sparsely rusty-tomentose flowers pedicelled, male perianth globose ½ in. diam. 3-4 cleft, staminal column sessile depressed-globose top concave, anthers firmly united with incurved tips.

SIKKIM HIMALAYA; near Sivoke, alt. 10,000 ft., *King*. ? ASSAM, *Masters in Herb. Calcutt.*

Branches very stout with rough bark and large scars of fallen leaves. *Leaves* 3½-5 in. broad, pale brown on both surfaces when dry, nerves spreading; petiole 1-1½ in. *Panicles* rather stout, from the axils of fallen leaves, much and loosely branched, flowers not very crowded; pedicels short stout. *Perianth* thick. *Staminal column* small; anthers about 20?—This differs from *M. glabra*, to which it is perhaps too closely allied, in the pubescent panicle, longer petiole, larger leaves with more numerous veins and stouter panicles and pedicels, larger perianth and small depressed staminal column. The Assam specimens are of leaves only, 12-18 in. long by 5-7 broad.

13. *M. Horsfieldii*, *Blume Bijl.* 577, and *Rumph.* i. 192; leaves very coriaceous 8-12 in. oblong or elliptic-oblong rusty-tomentose beneath at length glabrate, nerves 16-30 pair very strong, male panicles rusty-tomentose, flowers sessile in dense globose heads, perianth ⅓ in. long clavate angled 3-4-toothed, anthers 6 confluent in a clavate sessile column depressed at the top. *Hook. f. & T. Fl. Ind.* 164; *Alph. DC. in Prodr.* xiv. 1. 200; *Bedd. For. Man.* 176. *M. Iryadghedhi*, *Gærtn. Fruct.* i. 196, t. 41, f. 4, *excl. syn.* *M. ferruginea*, *Wall. Cat.* 6803. *Pyrrhosa Horsfieldii*, *Wight Ic.* t. 1857. *Horsfieldia odorata*, *Willd. Sp. Pl.* iv. 872.

CEYLON; in the Ambagamowa and Ratnapoora districts. SINGAPORE (*cult.?*), *Wall.*—DISTRIB. *Cult.* in Java.

A tall tree, branches very stout, densely woolly, at length glabrate. *Leaves* 2½-4 in. diam., pale bright-brown above, rufous at first beneath, or red brown; petiole very stout, ½-1 in. *Male panicles* 3-6 in., rachis and branches very stout; heads of flowers ¼-½ in. diam., quite globose; perianths subsessile, compacted, glabrous, hardly pedicelled; bracteoles orbicular, retained amongst the flowers but caducous, densely woolly outside; anthers quite confluent to the tips. *Female panicles* short, few-fl., ovary tomentose. *Fruit* shortly stoutly peduncled, ovoid, 1 in. long, rusty-tomentose; aril fleshy, entire.

** *Panicles glabrous.*

14. *M. amygdalina*, *Wall. Pl. As. Rar.* i. 79, t. 90, and *Cat.* 6797;

glabrous, leaves 6-8 in. elliptic-lanceolate acute at both ends, nerves 8-12 pair, male panicles much branched, perianths $\frac{1}{10}$ in. diam. globose 2-3-fid, staminal column cupular subglobose, anthers firmly united, fruit ellipsoid, aril nearly entire yellow. *Hook. f. & Thoms. Fl. Ind.* 160; *Alph. DC. in Prodr.* xiv. 1. 203; ? *Kurz For. Fl.* ii. 283. *M. exaltata*, *Wall. Cat.* 6804 B?.

TENASSERIM; at Tavoy and Moulmein, *Wallich*.

A tall perfectly glabrous tree. *Leaves* $1\frac{1}{2}$ -2 in. diam., coriaceous, pale brown on both surfaces, narrowed into a petiole $\frac{1}{2}$ in. long. *Male panicles*, from the axils of fallen leaves, 3-5 in. long and nearly as broad, branched from the base, quite glabrous; flowers loosely clustered, pedicels as long as the perianth, slender; staminal column globosely trigonous, fleshy, concave; anthers about 8, wholly combined. *Fruit* shortly peduncled, $1\frac{1}{2}$ in. long; pericarp rather thin, glabrous; aril yellow, lacerate at the tip only.—This species again was founded on fruiting specimens of *Wallich's*, but I think there is no doubt that his *M. exaltata*, B?, from the same country is the same in male flowering state. In the "Flora Indica" there are united with it two very similar Malaccan plants, which have, however, quite different stamens (one is *M. polyspherula*, the other perhaps the same). I am in doubt as to *Kurz's M. amygdalina*; his description agrees with that here described except in that the leaves have 12-19 pairs of nerves and the panicles are supra-axillary. A plant of Helfer's differs only in having more anthers and rather larger flowers, tending to unite the following with this.

15. *M. glabra*, *Blume Bijl.* 575, and *Rumphia* i. 191, t. 64, fig. 1; quite glabrous, leaves 3-8 in. elliptic-lanceolate or oblong obtuse acute or acuminate, base acute, nerves 7-14 pair, male panicle much branched, perianths $\frac{1}{4}$ - $\frac{1}{10}$ in. diam. ovoidly globose 2-4-cleft glabrous, staminal column oblong or turbinate, anthers firmly united tips incurved or inflexed, fruit oblong or ellipsoid, aril thin scarlet. *Hook. f. & Thoms. Fl. Ind.* 161; *Alph. DC. in Prodr.* xiv. 1. 202. *M. integra* and *M. floribunda*, *Wall. Cat.* 6799, 6805.

SILHET, *Wallich, J. D. H. & T. T.* ? TENASSERIM, *Helfer (Kew Distrib.* 4858). SINGAPORE, *Wallich, Murton.* MALACCA, *Maingay (Kew Distrib.* 1286).—DISTRIB. Java.

Leaves coriaceous, not glaucous beneath, rather pale brown, very variable in size and apex, but base always acute and petiole short, hardly exceeding $\frac{1}{2}$ in. *Male panicles* 2-6 in., quite glabrous, branched from the base; peduncles and pedicels slender. *Staminal column* variable in length, top rounded; anthers 12-15, the tips meeting in a concavity or not. *Fruit* broadly oblong or ellipsoid, 1 in. long, deeply grooved on one side towards the base; valves thick. I doubt this being different from *M. amygdalina*. Helfer's specimens have much smaller flowers than the Silhet ones, and more numerous anthers.

16. *M. bivalvis*, *Hook. f.*; quite glabrous, leaves 7-10 in. linear-oblong obtusely acuminate, nerves 15-20 pair, male panicles much branched, perianths $\frac{1}{2}$ in. diam. broader than long transversely 2-valved, staminal column a laterally compressed 2-fid fleshy cup clothed with numerous and deeply inflexed anthers.

SINGAPORE; in jungles behind the Botanical Gardens, *Murton*.

A bushy tree, 30-40 ft. high, bark grey. *Leaves* 2-2 $\frac{1}{4}$ in. diam., darker brown above, pale not glaucous beneath; nerves very spreading; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. *Male panicles* quite glabrous; perianths the largest of the group, turgid, transversely oblong; pedicel as long as the valves; anther column an obconic compressed sessile fleshy cup, or rather a cup formed of the firmly united anther-cells, which are incurved as two inflexed opposite flaps, tips of the cells not free.—A plant from Roxburgh's Herbarium resembles this closely, but the leaves are more membranous

with more oblique nerves, and the inflexed anthers are confined to the upper part of an obconic stipes, as in *Irya*. It is probably one of the species described by Roxburgh in terms too brief to be of any use in identifying the plants intended.

** Anthers produced to the base of the column or not, cells more or less free, easily separable.

17. **M. Farquhariana**, *Wall. Cat.* 6795; glabrous except the panicle, leaves 5-10 in. oblong or linear- or elliptic-oblong acute or acuminate usually very glaucous beneath, nerves 8-20 pair, male panicles spreading, perianth bell-shaped 3-fid pubescent within, staminal column sessile, anthers free above, tips erect acute. *Hook. f. & Thoms. Fl. Ind.* 162; *Alph. DC. in Prodr.* xiv. 1. 200; *Beddome Fl. Sylv.* t. 270. *M. paniculata*, *Alph. DC. in Ann. Sc. Nat. Ser. 4*, iv. 31, and in *Prodr. l. c.*

DECCAN PENINSULA; from the Concan to Wynaad and Tinnevely, ascending the Ghats to 2000 ft. MALACCA, PENANG and SINGAPORE, *Wallich, &c., Griffith (Kew Distrib.* 4355), *Maingay (Kew Distrib.* 1290, 1293, ?1302).—DISTRIB. Philippine Islands.

A tall tree, young parts pubescent; branches stout, grey. *Leaves* extremely variable in size, form and texture, nerves faint or strong; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. *Male panicles* 3-8 in., rather slender, branched from the base; flowers fascicled, perianth $\frac{1}{2}$ in.; anthers 7-11, narrow, connectives attached behind and from the base to about the middle only, so that the anthers are easily detached by dissection. *Female panicles* 6-10-fid. *Fruit* 1-1 $\frac{1}{4}$ in., subglobose, glabrous, aril lacerate.—This species is founded on Wallich's Singapore fruiting specimen; the identity in foliage of those and a Malaccan plant of Griffith with small flowers suggested their union in the "Flora Indica." As stated under *M. Griffithii*, there are specimens of that plant as like Wallich's type in foliage. In the "Flora Indica" the anthers are described as having involute tips, but this is not the case. *Alph. DC.* separates the Malayan specimens from the Deccan ones on characters taken from the foliage, but the leaves vary greatly in both countries, and identical forms are common to both.

18. **M. crassifolia**, *Hook. f. & Thoms. Fl. Ind.* 160; nearly glabrous, leaves 8-12 in. thickly coriaceous oblong obtuse or acute, base rounded or cuneate, nerves 12-15 pair, male panicle sparsely rusty-pubescent, perianth $\frac{1}{2}$ in. glabrous usually 2-fid, anthers 3-5 in a depressed ring, cells separable. *Alph. DC. in Prodr.* xiv. 1. 204. *M. Horsfieldia*, *Blume?*, *Wall. Cat.* 6806, in part. *M. Irya*, var. *crassifolia*, *Miquel in Herb.*

MALACCA, *Griffith (Kew Distrib.* 4550). SINGAPORE, *Wallich, Anderson*.—DISTRIB. Borneo.

Branches very robust. *Leaves* 3-4 $\frac{1}{2}$ in. diam., grey-brown above, red-brown beneath, nerves slender; petiole $\frac{3}{4}$ -1 in., very stout. *Male panicle* 3-4 in., branched from near the base; flowers clustered, globose; anther-cells 6-10, slightly cohering by their backs, sessile, tips free, hardly incurved.

19. **M. polyspherula**, *Hook. f.*; glabrous except the panicle, leaves 6-10 in. linear-oblong or lanceolate obtuse acute or acuminate, nerves 8-16 pair base rounded or acute, male panicle rusty-tomentose, perianth globose $\frac{1}{2}$ in. diam. glabrous 2-4-cleft, anthers 4-6 in a depressed column, cells separable. *M. globularia*, *Hook. f. & Thoms. Fl. Ind.* 160; *Alph. DC. in Prodr.* xiv. 1. 202 (not of *Blume*). *M. Horsfieldia*, *Blume?*, *Wall. Cat.* 6806, in part.

SINGAPORE, *Wallich*. MALACCA, *Griffith (Kew Distrib.* 4351 *amygdalina*, and 4352 *globularia*); *Maingay (Kew Distrib.* 2286, *glabra*).

Branches stout, shoots slightly scurfy, bark grey. *Leaves* rarely 2 in. broad,

coriaceous, greenish grey above, brown beneath; nerves slender, nearly horizontal; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., stout. *Male panicles* 3–3 $\frac{1}{2}$ in., branching from near the base, flowers pedicelled, glabrous, yellow, black when dry; anthers in a sessile broadly obconic trigonous truncate mass, anther-cells incurved and meeting in a tricurral line.—Specimens of *M. globularia* from Amboyna show that this was erroneously referred to that plant in “*Flora Indica*.” From *M. amygdalina*, with which it was confounded in “*Flora Indica*,” the stamens at once distinguish it.

20. *M. Griffithii*, Hook. f.; glabrous except the finely pubescent panicles and flowers, leaves 5–6 in. linear-lanceolate finely acuminate shining above glaucous beneath, base acute, nerves 8–10 pair very faint, male panicles slender, perianth globose $\frac{1}{10}$ in. diam. 2–3-cleft, anthers 8 in a globose sessile mass, cells separable.

MALACCA, Griffith (*Kew Distrib.* 4356). SINGAPORE, Maingay (*Kew Distrib.* 1306).

Leaves 1 $\frac{1}{2}$ –1 $\frac{3}{4}$ in. broad, very coriaceous (smaller in Maingay’s specimens), and 2 $\frac{1}{2}$ –3 by 1–1 $\frac{1}{4}$ in., pale brown above, very glaucous beneath with a reddish midrib; petiole $\frac{1}{2}$ in. *Male panicle* narrow, rachis and distant branches very slender, naked below; flowers clustered, pedicel slender; anthers easily separable, curved, attached by the back with free tips and sides; cells confluent. Fruit “racemed, size of a cherry, pedicel $\frac{1}{2}$ in., pericarp thick with a deep longitudinal furrow; aril white, as long as the seed,” Griffith mss.—In Maingay’s specimens fruit “elliptic or subglobose $\frac{1}{4}$ in. long dirty orange minutely scurfy, aril complete pinkish convolute lacerate at the tip,” Maingay mss. I cannot be certain of Maingay’s and Griffith’s plants being conspecific; their foliage is identical, but this is all undistinguishable from states of *M. Farquhariana*.

21. *M. Irya*, Gært. *Fruct.* i. 195, t. 41; leaves 6–10 in. linear- or elliptic-oblong acuminate glabrous, nerves 12–20 pair slender, perianth globose $\frac{1}{10}$ in. diam. glabrous 2–3-cleft, anthers 6–8 free in a ring crowning an obconic receptacle, fruit paniced globose. Hook. f. & T. *Fl. Ind.* 159; *Alph. DC. in Prodr.* xiv. 1. 202; *Miquel Fl. Ind. Bat.* i. 2. 64; *Beddome Forest. Man.* 176. *M. javanica*, *Blume Bijl.* 576, and *Rumph.* i. 190, t. 62. *M. sphaerocarpa*, *Wall. Pl. As. Rar.* i. 79, t. 89, and *Cat.* 6796. *M. exaltata*, *Wall. Cat.* 6804, in part.

TENASSERIM, Wallich. SOUTH ANDAMAN ISLANDS, Kurz. MALACCA, Griffith (*Kew Distrib.* 4357), Maingay (*Kew Distrib.* 1291, 1292). CEYLON, not uncommon.—DISTREB. Sumatra, Java, Borneo.

A tree, buds ashy. Leaves 2–3 in. broad, membranous at length coriaceous, dark brown above, lighter beneath, base rounded cuneate or acute; petiole $\frac{1}{2}$ in. *Male panicles* 3–6 in., very many-flid.; fem. shorter, perianths larger. Fruit 1 in. diam., glabrous; pericarp coriaceous; aril thin, entire, yellow or reddish, seed globose.—With the habit inflorescence and minute flowers of Sect. *Pyrhrosa*, this has nearly the staminal column of a *Knema*.

Sect. III. *Knema*. *Male flowers* fascicled on the top of a short stout peduncle or tubercle; pedicels with a persistent bracteole about the middle (under the flower in *M. Cantleyana*). *Anthers* short, in a whorl round a peltate disk.

22. *M. Hookeriana*, Wall. *Cat.* 6802 A; branchlets very stout leaves beneath and panicle most densely flocculent and woolly, leaves 1–2 ft. at length glabrate and glaucous beneath linear-oblong or narrowed downwards obtuse or acute, petiole short thick, nerves 20–30 pair, male fl. $\frac{1}{2}$ in. diam. densely clustered on a short peduncle or tubercle 3-cleft, anthers about 20 on the margin of a long-stipitate orbicular peltate disk. *Hook. f. & Thoms. Fl. Ind.* 156; *Alph. DC. in Prodr.* xiv. 1. 204.

PENANG, *Wallich, Porter*. MALACCA, *Griffith, Maingay* (*Kew Distrib.* 1279).

Branches as thick as the fore-finger; wool tawny, $\frac{1}{2}$ in. thick, flocculent. *Leaves* very variable in breadth, narrowest 12 by $2\frac{1}{2}$ in., broadest 24 by 8 in., thickly coriaceous, pale brown and shining above, wool on under-surface deciduous in large flakes leaving the surface perfectly glabrous. *Male fl.* "crimson within," *Maingay*; pedicels $\frac{1}{2}$ –1 in. long, with a persistent bracteole about the middle; stamens pale rose, filaments very short, anthers deflexed; *fem.-fl.* not seen. *Ovary* "rusty tomentose; stigma subsessile, disciform, concave, crenate-serrate," *Maingay*. *Fruit* $2\frac{1}{2}$ in. long, ellipsoid, most densely woolly, perianth very thick; aril fleshy, lobed.—*Wallich's* 6802 B, without flower or fruit, is probably *Laurineous*.

23. **M. Cantleyi**, *Hook. f.*; branchlets robust and petioles and young leaves and inflorescence densely rusty-tomentose, leaves 9–12 in. oblong or linear-oblong coriaceous glaucous beneath, nerves 20–30 pair strong, male fl. clustered on a tubercle shortly stoutly pedicelled, perianth bracteolate at the base 3-fid, anthers 6–8 on the margin of a stoutly clavately stipitate small disk.

SINGAPORE, *N. Cantley*.

Branches stout with pale bark. *Leaves* 3–5 in. diam., dark brown above, young clothed with flocculent rusty fagacious wool which is more persistent on the midrib above, beneath finely pubescent (probably glabrate in age); petiole very short, stout. *Male fl.* $\frac{1}{6}$ – $\frac{1}{4}$ in. diam., with the pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. long; bracteole orbicular, appressed to the perianth; perianth-lobes short; staminal column small, anthers short sessile separate. *Fem. fl.* and *fruit* unknown.—This appears to be most nearly allied to *M. Hookeriana*; it differs from the other Indian species of this section in the bracteole being close under the perianth.

24. **M. longifolia**, *Wall. Cat.* 6801; branches scurfy or glabrous, leaves 1–2 ft. linear or linear-oblong or obovate-oblong obtuse glabrous glaucous beneath base rounded cordate or acute, nerves 20–40 pair stout, male fl. clavate $\frac{1}{4}$ in. diam. fascicled on a tubercle pedicelled 3-cleft, anthers 12–18 on the teeth of a long-stipitate circular disk, style long glabrous, stigma small toothed. *M. longifolia*, *in part*, *Hook. f. & Thoms. Fl. Ind.* 156; *Alph. DC. Prodr.* xiv. 1. 204; *Kurz For. Fl.* ii. 283. ? *M. linifolia*, *Roxb. Fl. Ind.* iii. 847.

SIKKIM HIMALAYA, in hot valleys, *Thomson*. ASSAM, SILHET and the KHASIA MTS., *Wallich, &c.* CHITTAGONG, *J. D. H. & T. T.* PEGU, MATABAN and TENASSERIM, *Kurz*.—DISTRIB. Ava.

A lofty tree, branchlets stout or slender, sometimes tomentose. *Leaves* extremely variable, usually linear, 12–18 by 2– $2\frac{1}{2}$ in., sometimes much broader, 18–24 by 6–7 in. and narrowed below the middle, thickly coriaceous, pale yellow-brown and shining above, nerves arched or nearly horizontal; petiole $\frac{1}{2}$ –1 in., stout, glabrous or tomentose. *Male fl.* very variable in size, $\frac{1}{2}$ – $\frac{1}{4}$ in. diam., densely tomentose, scarlet within; pedicel $\frac{1}{6}$ – $\frac{3}{8}$ in., bracteole obscure; anther-disk concave or plane; pedicel grooved, contained in the tubular base of the perianth; anthers short, deflexed. *Female* pedicels very short; ovary densely tomentose. *Fruit* 1–2 in. long, subglobose or ellipsoid, tomentose; aril pale, thin, lobed above the middle.—The Malayan plant referred to under this species in "*Flora Indica*" is *M. furfuracea*.

Var. *erratica*; leaves smaller 6–10 by $1\frac{1}{2}$ – $2\frac{1}{2}$ in. *M. erratica*, *Hook. f. & Thoms. Fl. Ind.* 156; *Alph. DC. in Prodr.* xiv. 1. 205. *M. corticosa*, *Hook. f. & Thoms. l. c.* 156, *in part*.—Khasia Mts. and Chittagong.—I fear this is only a small-leaved state of *M. longifolia*, and not even a variety; the stigma is identical, and the character taken from the top of the antheriferous disk being flat (in opposition to concave in *longifolia*), cannot be relied on. The flowers are, however, much more trigonously globose, and the stalk of the anther-disk is shorter.

25. **M. attenuata**, *Wall. Cat.* 6791; branchlets and inflorescence furfuraceously tomentose, leaves 5–9 in. elliptic-oblong or -lanceolate acute

or acuminate glaucous beneath, nerves 14–20 pair, male fl. fascicled on a short peduncle, pedicels slender, perianth subglobose 3-fid $\frac{1}{4}$ in. diam., anthers 12 on the toothed margin of a stipitate peltate disk, fruit ovoid beaked. *Hook. f. & Thoms. Fl. Ind.* 157; *Alph. DC. in Prodr.* xiv. 1. 205; *Beddome For. Man.* 176. *M. corticosa*, *Bedd. Fl. Sylv.* t. 271 (not of *H. f. & T.*). *M. amygdalina*, *Grah. Cat. Bomb. Pl.* 175; *Dalz. & Gibs. Bomb. Fl.* 4.

On the CONCAN GHATS, *Heyne, Dalzell, &c. TRAVANCORE MTS.*, alt. 2–3000 ft., *Beddome*.

Branches slender, at length glabrous. Leaves 2–3 in. diam., thinly coriaceous, pale brown above; midrib and spreading nerves beneath stout, tomentose when young; base acute or rounded; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. Male peduncle $\frac{1}{2}$ in.; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in., bracteolate above the middle. Female flower not seen; pedicels of fruit about as long as of the male fl. Fruit 1– $1\frac{1}{2}$ in. long, ellipsoid or ovoid with a short point or beak, densely furfuraceous rusty-tomentose; pericarp thin; aril entire, except towards the lobed apex.—Wallich's specimens (from Heyne) have nearly globose fruits; the Concan and Travancore ones have longer fruits with acute tips.

26. ***M. glaucescens***, *Hook. f. & Thoms. Fl. Ind.* 157; branchlets and inflorescence rusty-hairy, leaves 4–6 (rarely 12) in. linear-oblong obtuse acute or acuminate glaucous beneath, nerves 12–20 pair, male and female fl. few fascicled on a very short peduncle long-pedicelled, male perianth subglobose, female turbinate, anthers about 10 on the toothed margin of a subsessile peltate disk with a flat top, stigma subsessile peltate toothed, fruit small subglobose, aril nearly complete. *M. intermedia* β . minor, *Miquel Fl. Ind. Bat.* i. 270. ? *M. sumatrana*, *Blume Rumph.* i. 187. *M. corticosa*, in part, *Hook. f. & T. l. c.* 158; *Alph. DC. in Prodr.* xiv. 1. 205, in part; *Kurz. For. Fl.* 284. *M. missionis*? & *lanceolata*, *Wall. Cat.* 6788, 6794. ? *M. angustifolia*, *Roxb. Fl. Ind.* iii. 847. ? *Knema glaucescens*, *Jack in Mal. Misc.* No. vii. 35, and in *Hook. Comp. Bot. Mag.* i. 149 (not of Wallich). ? *K. corticosa*, *Lour. Fl. Coch.* 742.

TENASSERIM, *Griffith, Helfer (Kew Distrib.* 4343, 4344, 4349), &c. ANDAMAN ISLANDS, *Kurz. SINGAPORE, Wallich. MALACCA, Griffith (Kew Distrib.* 4343), *Cunning (No. 2315), Maingay (Kew Distrib.* 1280, 1282, 1299). SINGAPORE, *Wallich, Murton*.—DISTRIB. Sumatra, Java.

I have retained the name adopted for this plant in the "Flora Indica," though there is no certainty of its being the *Knema glaucescens* of Jack; it, however, agrees with it in the important character of its very small fruit, which is ovate-oblong as described in the Flora, or nearly globose or ellipsoid (*Kurz*). It is no doubt the *M. lanceolata* and probably *missionis* of Wallich; the latter, from Heyne's Herbarium, was probably collected in the Straits and sent to that missionary. Whether it is the *M. sumatrana* of Blume and *M. angustifolia* of Roxburgh is altogether doubtful. The copious specimens received since the date of the "Flora Indica," show that the Tenasserim and Malayan plants included under *M. corticosa* in that work are not different from *M. glaucescens*. With regard to *M. glauca*, Blume, referred also in that work to *M. corticosa*, its fleshy aril divided low down should (according to his plate) separate it from *glaucescens*, but Javanese specimens named *glauca* and *corticosa* by Miquel and others only differ from the Indian plant in the larger fruit, and *Kurz* describes the aril of *corticosa*, *H. f. & T.*, as "blood-red somewhat fleshy and lacerate;" and as to Loureiro's *Knema corticosa*, much more complete specimens are wanted before it can safely be identified with any Malayan species. The Andaman specimen of *Kurz* has leaves fully a foot long. The small leaves, subglobose male flowers $\frac{1}{4}$ in. diam., and turbinate female ones $\frac{1}{4}$ in. long, together with the subsessile or short styled peltate stigma, and small fruit $\frac{3}{8}$ in. long, with their furfuraceous pericarp and almost entire thin aril, well distinguish this species, whose proper name can only be determined when more is known of the plants quoted under it.

27. **M. laurina**, *Blume Rumph. i.* 139, t. 61; branches inflorescence and leaves beneath especially the nerves scurfily tomentose, leaves 9–12 in. oblong or linear-oblong acute or acuminate glaucous beneath, nerves 20–30 pair, base rounded or cordate, fruit 2–3 in. long subsessile on tubercles of the branch oblong-ovoid, pericarp thick densely scurfily tomentose, aril scarlet entire except at the lacerate tip, seed oblong. *Alph. DC. in Prodr. xiv.* 1. 206; *Miquel Fl. Ind. Bat. i.* 2. 70. *M. tomentosa*, *Blume Bid.* 577 (not of Thunb.).

MALACCA, *Maingay (Kew Distrib.* 1294).—DISTRIB. ? Java, Sumatra.

Without flower it is not possible to identify this, which may be a form of *M. furfuracea*, with any described plant. It agrees with Blume's figure and description of *M. laurina*, except in the more numerous nerves, and very much longer fruit. A plant from the Andamans, collected and named *M. laurina* by Kurz, resembles the Malacca plant except in the fruit, which is that of *glaucescens*, to which I refer it.

28. **M. intermedia**, *Blume Rumph. i.* 187; glabrous except the inflorescence and fruit, leaves 6–12 in. linear-oblong acuminate glabrous glaucous beneath, nerves 12–20 pair; male fl. $\frac{1}{2}$ in. diam. fascicled on tubercles of the branches pedicelled 3-gonously globosely scurfily tomentose 3-cleft, anthers 12–18 on the toothed margin of a peltate disk with a pyramidal boss, fruit pedicelled ovoid-oblong finely pubescent base intruded. *Hook. f. & T. Fl. Ind.* 158; *Alph. DC. in Prodr. xiv.* 1. 206; *Miquel Fl. Ind. Bat. i.* 270 (excl. var. β).

MALACCA, *Griffith (Kew Distrib.* 4359), *Maingay (Kew Distrib.* 1281, 1288). SINGAPORE, *Lobb*.—DISTRIB. Java.

Branchlets usually slender. *Leaves* narrow, $\frac{3}{4}$ –2 $\frac{1}{2}$ in. broad, rarely elliptic-oblong, very coriaceous, nerves strong, base acute obtuse or rounded, pale brown and shining with very prominent closely reticulated nerves above; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., stout, quite glabrous. *Male fl.* rufous-tomentose, pedicel $\frac{1}{2}$ – $\frac{1}{2}$ in., stout, bracteolate in the middle; perianth subpyramidal; staminal disk subsessile, circular or trigonous, central boss 3-gonous; anthers short. *Fruit* $1\frac{1}{4}$ in. long, broadly oblong with a groove on one side, top rounded; aril thin, entire except at the tip.—The tubercles from which the flowers spring are often diseased and present a mass of brown floccose hairs, probably caused by insect puncture.

29. **M. gibbosa**, *Hook. f. & Thoms. Fl. Ind.* 158; glabrous except the inflorescence and fruit, leaves linear-lanceolate acuminate at both ends hardly glaucous beneath, nerves 15–30 pair, male fl. pedicelled fascicled on a peduncle urceolately campanulate 3-fid, anthers 10–12 on the margin of a long-stalked circular disk, fruit pedicelled oblong base gibbous and intruded. *Alph. DC. in Prodr. xiv.* 1. 205.

KHASIA Mts., *Griffith (Kew Distrib.* 4348); near Churra, *J. D. H. & T. T. PEGU, McClelland*.

Branchlets slender, glabrous. *Leaves* long and narrow, $1\frac{1}{4}$ –2 in. broad, thinly coriaceous, nerves strong, pale brown, hardly shining above, sometimes a little glaucous beneath, nerves slender; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., slender, glabrous. *Male fl.* $\frac{1}{4}$ in. long, rufous-pubescent, a good deal like the female of *M. glaucescens*, constricted below the 3-fid limb; pedicel of antheriferous disk clavate. *Fruit* 1– $1\frac{1}{2}$ in. long, rather like *M. intermedia*, but gibbous at the base; aril entire, except at the top.

30. **M. furfuracea**, *Hook. f. & Thoms. Fl. Ind.* 159; branchlets petioles and inflorescence densely scurfily tomentose, leaves 6–14 in. linear-oblong obtuse acute or acuminate glaucous beneath, nerves 10–40 pair, male fl. fascicled on short peduncles or tubercles globosely 3-gonous 3-fid pedicelled, anthers about 10 on the toothed margin of a 3-gonous peltate shortly stipitate disk, fem. fl. larger sessile on tubercles, stigma sessile discoid

crenulate. *Alph. DC. in Prodr.* xxiv. 1. 206. *M. longifolia*, *Hook. f. & T. Fl. Ind.* 156 (the *Malayan plant*). *Knema glaucescens*, *Wall. Cat.* 6810 (not of Jack).

PENANG, *Porter. MALACCA, Griffith (Kew Distrib.* 4346, ? 4345), *Maingay (Kew Distrib.* 1287). SINGAPORE, *N. Cantley.*

Branchlets stout, older with black shining cracked bark. *Leaves* most variable in size, $\frac{3}{4}$ –1½ in. diam., usually pale brown and shining above, base acute obtuse or cordate; nerves strong, arched; petiole usually very short, thick, and thickly furfuraceous, but sometimes more slender and glabrate. *Male fl.* about $\frac{1}{2}$ in. diam., pedicels $\frac{1}{4}$ –½ in., bracteolate about the middle; antheriferous disk orbicular or 3-gonous, flat; pedicel short but distinct. *Fem. fl.* ovoid, nearly $\frac{1}{2}$ in. long; stigma concave, many-toothed. *Fruit* 1½ in. long, ovoid-oblong, densely scurfily tomentose; pericarp thick; aril entire except at the tip.—The black bark of the older branchlets seems a good character for this species. *Griffith's No.* 4345, from Malacca, has very numerous crowded flowers on a very short thick peduncle, with pedicel $\frac{1}{2}$ in. long, and 18 anthers on a less toothed disk.

DOUBTFUL, INDETERMINABLE AND EXCLUDED SPECIES.

M. FINLAYSONIANA, *Wall. Cat.* 6793, is *Melodorum fulgens* H. f. & T. (see vol. i. p. 82).

M. EUGENIEFOLIA, *Alph. DC. in Prodr.* xxiv. 1. 190, described from leaf and fruit only, and placed in Section *Eumyristicæ*, is indeterminable.

M. GLAUDESCENS, *Wall. Cat.* 6790, is *Tetranthera venulosa*, *Meissn.*

M. HEYNEANA, *Wall. Cat.* 6789; *Alph. DC. l. c.* 207, without flower or fruit, is probably Laurineous.

M. HOOKERI, *Wall. Cat.* 6802 B, is indeterminable.

M. INTEGRIFOLIA, *Steud. Nom.*, is *Myrica integrifolia*, *Wall.*

M. MICRANTHA, *Wall. Cat.* 6807; *A. DC. l. c.* 208, is a Siam plant, and not Indian.

M. MONTANA, *Roxb. Fl. Ind.* iii. 846; *Wall. Cat.* 6792, is referred by A. DC. (*Prodr.* xxiv. 1. 190) to *M. iners*, *Blume*. It has not been found in British India.

M. ? OBTUSIFOLIA, *Wall. Cat.* 6808; *H. f. & T. Fl. Ind.* 163; *A. DC. l. c.* 194, from Singapore, is indeterminable.

M. SAPIDA, *Steud. Nom.*, is *Myrica sapida*, *Wall.*

M. SESQUIPEDALIS, *Wall. Cat.* 6809 “an Laurin. fam.,” from Penang, is *Actinodaphne sesquipedalis*, *Hk. f. & T.*

MYRISTICA? *Wall. Cat.* 9017, from Silhet, *Gomez*, is not of this genus.

MYRISTICA; Malacca, *Maingay (Kew Distrib.* 1298), in fruit only, is a very fine probably new species, with very coriaceous large glabrous leaves rounded at the base, dark brown when dry, and oblong fruit 2½ in. long, in large long-peduncled panicles; pericarp very thick; seed ellipsoid, 2 in. long, beautifully mottled, pale brown and white.—The following is Dr. Maingay's description of the fruit: “ovoid-elliptic, 2 by $\frac{3}{8}$ in., dark green, perfectly glabrous, dotted with black; seed 2 in., cylindric-elliptic; aril complete, fleshy, blood-red, tip lacerate.”

MYRISTICA; Malacca, *Maingay (Kew Distrib.* 1301), has slender pale glabrous branchlets with finely tomentose fulvous tips; elliptic pale greenish leaves 2½–3 in. long, shining above paler beneath with 6–10 pair of very slender nerves; fruit ovoid, 1–1½ in. long, long-peduncled, fascicled on a tubercle of the stem, keeled on one side and gibbous at the intruded base, pericarp thin, aril entire, seed small ovoid.—The following is from Dr. Maingay's notes: “Fruit elliptic-ovate, 1½ by 1 in., suddenly narrowed into a short stalk, keeled at the suture of the valves, pale greenish-orange, rusty-puberulous; seed $\frac{9}{10}$ by $\frac{1}{10}$ in. elliptic; aril complete, blood-red, tip lobulate, testa pale membranous, tegmen crustaceous.”

MYRISTICA; Singapore, *Maingay (Kew Distrib.* 1297), closely resembles *M. fur-*

furacea in habit and foliage; fem. flowers densely crowded forming almost globose fascicles on tubercles of the stem, clavate, with the stout pedicel $\frac{1}{4}$ in. long, densely rufous-tomentose; stigma sessile with 3-4 radiating teeth.—Apparently the same species is sent by Murton also from Singapore, with leaves glabrous and glaucous beneath.

ORDER CXXVII. **MONIMIACEÆ.**
